Element 105. See hahnium.

elemi. A soft, balsam-like resin obtained from a tree in the Philippines; soluble in coal-tar hydrocarbons, but not in petroleum solvents, alcohols, and ketones. Uses: Plasticizer; adhesion of lacquers to metals; cements and adhesives; wax compositions; printing inks; textile and paper coatings; perfumery; waterproofing; engraving.

"Elorine" Chloride.¹⁰⁰ Trademark for tricyclamol chloride (q.v.).

"Elprene."⁴¹ Trademark for a self-curing synthetic rubber coating of the neoprene type used as a general maintenance coating.

"El-Sixty."⁵⁸ Trademark for 1,3-bis-(2-benzothiazolylmercaptomethyl)urea (q.v.), a rubber accelerator.

elutriation. A process of washing, decantation and settling which separates a suspension of a finely divided solid into parts according to their weight. It is especially useful for very fine particles below the usual screen sizes and is used for pigments, clay dressing, and ore flotation.

"Elvacet."²⁸ Trademark for a non-molding polyvinyl acetate resin available as an emulsion or solution.

"Elvanol."²⁸ Trademark for various grades of polyvinyl alcohol (q.v.).

"EMA."⁵⁸ Trademark for ethylene-maleic anhydride copolymers. Water-soluble resins which serve as dispersing agents in cold-water detergents, thickeners, binders, stabilizers and emulsifiers.

embrittlement. Hardening of a metal (especially steel) or of an ABS resin, resulting in loss of strength and impairment of other physical properties. In metals the primary cause is exposure to hydrogen, though other factors such as corrosion also are involved. In copolymer plastics such as ABS resins embrittlement is due to formation of a vitreous matrix as well as to oxidation of the butadiene particles in the matrix.

"Emcol."¹⁰⁴ Trademark for a series of emulsifiers, germicides and detergents.

"Emeen."²⁴² Trademark for fatty imidazolines.

emerald green. A pigment consisting of copper acetoarsenite.

Hazard: Highly toxic by ingestion.

emeralds, synthetic. Artificial crystal produced by a high pressure-high temperature process from beryl-lum aluminum silicate containing a small amount of chromium.

Uses: Lasers; masers; semiconductors.

"Emerest."²⁴² Trademark for a series of fatty esters. Used as wetting agents, detergents, softeners, anti-stats, defoamers, lubricants, stabilizers, emulsifiers, corrosion inhibitors and other applications not requiring food-grade products.

"Emerex."²⁴² Trademark for a series of dimer acid-based polyamide resins. Used for the manufacture of printing inks, hot melt adhesives, and thixotropic paints.

"Emerox."²⁴² Trademark for azelaic acid. Supplied in two grades.

"Emersol."²⁴² Trademark for a series of fatty acids including linoleic, oleic, palmitic, and stearic acid of improved stability and color.

emery. See corundum; abrasive.

"Emete-con."²⁹⁹ Trademark for an antiemetic agent (q.v.).

emetine $C_{29}H_{40}O_4N_2$. An alkaloid from ipecac. Properties: White powder; m.p. 74°C; very bitter taste; darkens on exposure to light. Soluble in alcohol and ether; slightly soluble in water.

Derivation: By extraction from root of *Cephalis ipecacuanha* (ipecac), or synthetically.

Hazard: Toxic by ingestion.

Use: Medicine (usually as hydrochloride).

"Emfac."²⁴² Trademark for pelargonic acid (q.v.).

"EMI-24."⁴⁷² Trademark for 2-ethyl-4-methyl imidazole.

"Emid."²⁴² Trademark for a series of fatty amides.

"Emisaloy."¹⁵⁵ Trademark for an alloy composed of nickel, 80% and cobalt, 20%.

Properties: M.p. 1500°C; sp. gr. 8.84; resistivity at 20°C 11.0 microhm cm; tensile strength at 20°C, 85,000 lb/sq. in.

Use: Electron tubes.

emission spectroscopy. Study of the composition of substances and identification of elements by observa-

tion of the wavelengths of radiation they emit as they return to a normal state after excitation by an external energy source. When atoms or molecules are excited by energy input from an arc, spark, or flame, they respond in a characteristic manner; their identity and composition are signaled by the wavelengths of incident light they emit. The spectra of elements are in the form of lines of distinctive color, such as the yellow sodium D line of sodium; those of molecules are groups of lines called bands. The number of lines present in an emission spectrum depends on the number and position of the outermost electrons and the degree of excitation of the atoms. The first application of emission spectra was identification of sodium in the solar spectrum (1814). See also spectroscopy.

emodin (frangula emodin; frangulic acid)

$C_{14}H_8O_5(OH)_3CH_3$. 1,3,8-Trihydroxy-6-methylanthraquinone. Occurs either free or combined with a sugar in a glucoside, in rhubarb, cascara sagrada, and other plants. A synthetic product is also available. Orange crystals; m.p. 256°C; soluble in alcohol; *insoluble in water. Used in medicine.*

"Emolein."²⁴² Trademark for synthetic lubricant esters. Used for the compounding of synthetic jet engine lubricants to meet both military and civilian specifications. They include diisooctyl azelate; di-2-ethylhexyl azelate; dipropylene glycol dipelargonate; isodecyl pelargonate.

empirical formula. See formula, chemical.

"Empol."²⁴² Trademark for dimer acids; 36-carbon aliphatic dibasic acids; used as modifiers of synthetic polymers, soaps, corrosion inhibitors, etc. Six grades available.

"Emralon."⁴⁶ Trademark for a series of resin-bonded tetrafluoroethylene solid film lubricants. Colloidal TFE resin is dispersed in phenolic resin, acrylic resin latex, epoxy resin, or thermoplastic resin solutions. Flash point varies from 40 to 58°F.

Hazard: Flammable, dangerous fire hazard.

"Emsal."²⁴² Trademark for sulfated fatty alcohols.

"Emsorb."²⁴² Trademark for sorbitan and ethoxylated sorbitan esters.

"Emtal."²⁴² Trademark for a line of fractionated tall-oil fatty acids and distilled tall oils.

EMTS. Abbreviation for ethylmercury-para-toluene-sulfonanilide.

"Emulphogene BC."³⁰⁷ Trademark for a series of tri-decyloxopoly(ethylenecoxy)ethanols.

"Emulphor."³⁰⁷ Trademark for a series of nonionic emulsifying agents and dispersants. Some are poly-ozetylated vegetable oils, alcohols, and fatty acids.

emulsifier. A surface-active agent. See emulsion.

"Emulsifier STH."³⁰⁷ Trademark for a corrosion inhibitor, sodium salt of an N-(alkylsulfonyl)glycine; 88% active (min).

emulsifying oil. See soluble oil.

emulsin (synaptase; amygdalase; beta-glucosidase). An enzyme catalyzing the production of glucose from beta-glucosides.

Properties: White powder; odorless and tasteless; capable of hydrolyzing glucosides such as amygdalin

to glucose and the other component substances. Soluble in water; insoluble in ether and alcohol.

Source: Sweet almonds.

Derivation: By extracting an emulsion of almonds with ether filtering the clear solution and precipitating the emulsion with alcohol.

emulsion. A stable mixture of two or more immiscible liquids held in suspension by small percentages of substances called emulsifiers. These are of two types: (1) Proteins or carbohydrate polymers, which act by coating the surfaces of the dispersed fat or oil particles, thus preventing them from coalescing; these are sometimes called protective colloids. (2) Long-chain alcohols and fatty acids, which are able to reduce the surface tension at the interface of the suspended particles because of the solubility properties of their molecules. Soaps behave in this manner; they exert cleaning action by emulsifying the oily components of soils. All such substances, both natural and synthetic, are known collectively as detergents (q.v.).

Polymerization reactions are often carried out in emulsion form; a wide variety of food and industrial products are emulsions of one kind or another, e.g., floor and glass waxes, drugs, paints, shortenings, textile and leather dressings, etc.

All emulsions are comprised of a continuous phase and a disperse phase; in an oil-in-water (o/w) emulsion (milk), water is the continuous phase and butter fat (oil) the disperse phase; in a water-in-oil (w/o) emulsion (butter) free fat (from crushed fat globules) is the continuous phase, and unbroken fat globules plus water droplets are the disperse phase. See also colloid, protective; phase (2); detergent; surface-active agent; wetting agent.

emulsion breaker. See demulsification.

emulsion paint. See paint, emulsion.

emulsion polymerization. Polymerization (q.v.) reaction carried out with the reactants in emulsified form. Performed at normal pressure at -20 to $+60^{\circ}\text{C}$. Many copolymers (synthetic rubbers) are made in this way.

"Emulsol."²⁴⁴ Trademark for a series of raw fish oils emulsified with soap.

Uses: Leather processing.

"Emulvin."⁴⁷⁰ Trademark for non-ionic emulsifying, stabilizing and wetting agent for latex processing.

en. Abbreviation for ethylenediamine used in formulas for coordination compounds, e.g., the cobalt complex $\text{Co}[\text{en}]_3(\text{NO}_3)_3$. See also dien; pn; py.

enamel. (1) A type of paint consisting of an intimate dispersion of pigments in a varnish or resin vehicle. The vehicle may be an oil-resin mixture, or entirely synthetic resin. Those containing drying oils are converted to films by oxidation; those comprised wholly of synthetic resins may be converted by either heat or oxygen, or both. See also baking finish. (2) Porcelain enamel (q.v.).

enamine. A group of amino olefins; the name refers especially to unsaturated tertiary amines of the general formula $\text{R}_2\text{N}-\text{C}=\text{C}-$, where R is any alkyl group. Though of little use as end products, enamines are valuable intermediates for many organic syntheses.

enanthaldehyde. See heptanal.

enanthic acid. See n-heptanoic acid.

enanthyl alcohol. See 1-heptanol.

enantiomer (enantiomorph). One of a pair of optical isomers containing one or more asymmetric carbon atoms C^* whose molecular configurations have left- and right-hand (chiral) forms. These forms are conventionally designated dextro (D) and levo (L) because they compare to each other structurally as do the right and left hands when the carbon atoms are lined up vertically. This is apparent in the enantiomorph forms of glyceraldehyde; the two structures are mirror images of each other and cannot be made to coincide:

Several pairs of enantiomers are possible, depending on the number of asymmetric carbon atoms in the molecule. Compounds in which an asymmetric carbon is present display optical rotation. See also asymmetry; optical isomer; optical rotation.

enantiomorph. See enantiomer.

"Enbond."¹⁴² Trademark for alkaline compounds for the cleaning of metal surfaces prior to electroplating, painting, or other processes.

encapsulation. The process in which a material, or an assembly of small, discrete units, is coated with, or imbedded in, a molten film, sheath, or foam, usually of an elastomer. A foam-forming plastic may be used to fill the spaces between various electrical or electronic components so that they are imbedded in and supported by the foam. Plastics and other materials used for this purpose are often called potting compounds. A specialized use of this technique is in growing crystals for semiconductors, in which a coating of liquid boric oxide is the encapsulating agent. See also microencapsulation.

"Endic" Anhydride.³¹⁶ Trademark for endo-cis-bicyclo-(2.2.1)-5-heptene-2,3-dicarboxylic anhydride ($\text{C}_9\text{H}_8\text{O}_3$). Properties: White crystals; m.p. 163°C ; soluble in aromatic hydrocarbons, acetone, ethyl alcohol.

Uses: Elastomers, plasticizers, fire retardant chemicals, resins, and epoxy curing systems.

endo- A prefix used in chemical names to indicate an inner position, specifically (a) in a ring rather than in a side chain, or (b) attached as a bridge within a ring. See also exo-

endophenolphthalein. See diacetyldihydroxydiphenylsatin.

"Endor."²⁸ Trademark for a rubber peptizing agent containing activated zinc salt of pentachlorothiophenol ($\text{C}_6\text{Cl}_5\text{S}$)₂Zn, and 80% inert filler. Grayish green powder; sp. gr. 2.39.

endosulfan. Generic name for 6,7,8,9,10,10-hexachloro-1,5,5a,6,9,9a-hexahydro-6,9-methano-2,4,3-benzodioxathiepin 3-oxide $\text{C}_8\text{H}_6\text{Cl}_6\text{O}_3\text{S}$.

Properties: (commercial product): Brown crystals; m.p. $70-100^{\circ}\text{C}$ (pure m.p. 106°C); mixture of two isomers, m.p. $108-109^{\circ}\text{C}$ and $206-208^{\circ}\text{C}$.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.1 mg per cubic meter of air. Use may be restricted.

Use: Insecticide for vegetable crops.

endothal. Generic name for 7-oxalobicyclo-[2.2.1]-heptane-2,3-dicarboxylic acid $\text{C}_8\text{H}_{10}\text{O}_5$.

Hazard: Toxic; strong irritant to eyes and skin.

Uses: Plant growth regulator.

Note: Various derivatives of endothal are used as defoliants, herbicides, etc.; the mono-N,N-dimethylal-kylamine salt in aqueous solution shows promise of increasing yields from sugarcane.

endothermic. A process or change that takes place with absorption of heat and requires high temperature for initiation and maintenance. An example is production of water gas by passing steam over hot coal: $\text{H}_2\text{O} + \text{C} + \text{heat} \rightarrow \text{CO} + \text{H}_2 - \text{heat}$.

endothion. Generic name for S-[(5-methoxy-4-oxo-4H-pyran-2-yl)-methyl] O,O-dimethyl phosphorothioate
 $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{SCH}_2\text{C}:\text{CHC}(\text{O})\text{C}(\text{OCH}_3):\text{CHO}$.

Properties: Crystals; m.p. 90–91°C. Very soluble in water; soluble in chloroform and ethanol.

Hazard: Highly toxic by ingestion. Cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

Shipping regulations: (Rail, Air) Organic phosphate, solid, n.o.s., Poison label. Not acceptable on passenger planes.

"Endox."¹⁴² Trademark for alkaline rust-removal and descaling products supplied in powder form. These products are added to water and the solutions are used both electrolytically and non-electrolytically for removal of rust, etc. from iron and steel.

endoxan. See cyclophosphamide.

end point. (1) In chemical analysis, the point during a titration at which a marked color change is observed, indicating that no more titrating solution is to be added. See indicator.

(2) The highest temperature reached during an assay distillation of hydrocarbon liquids, indicating the overall volatility of the liquid (ASTM).

endrin ($\text{C}_{12}\text{H}_8\text{OCl}_6$). Generic name for 1,2,3,4,10,10-hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octahydro-1,4-endo-endo-5,8-dimethanonaphthalene. A stereoisomer of dieldrin which is the endo-exo isomer. See also aldrin.

Properties: White crystalline powder; m.p. approx. 200°C (rearranges above this point); insoluble in water, methanol. Moderately soluble in other common organic solvents. Compatible with non-acidic fertilizers, herbicides, fungicides and insecticides.

Hazard: Highly toxic by inhalation and skin absorption. Tolerance, 0.1 milligram per cubic meter in air. Use may be restricted. A suspected carcinogen.

Use: Insecticide.

Shipping regulations: (Rail) Organic phosphate, solid, n.o.s., Poison label. (Air) Poison label.

"Enduro."²⁵¹ Trademark for a series of stainless and heat-resisting steels: low nickel group (200 Series); chromium-nickel group (300 Series); straight-chromium group (400 Series).

enercology. A coined word defined as the balanced relationship between energy and ecology. A foundation devoted to practical applications of this relationship has been established at Alma College, Michigan.

energy. The fundamental active entity in the universe, defined by physicists as either $E = mc^2$ (Einstein) or $E = h\nu$ (Planck). More simply, it is considered as the capacity for doing work. These equations show that energy cannot be completely divorced from

mass, as the two are to some extent interconvertible. The law of conservation of energy, simply stated, is that the sum total of energy in the universe is constant; therefore, energy cannot be either created or destroyed, but only converted from one form to another.

Radiant energy (light) comprises the electromagnetic spectrum; all wavelengths of light are composed of photons, or packets of energy, traveling at the speed of light. Theoretically, they have no mass except that associated with their speed. Protons, electrons, and neutrons are forms of highly condensed energy which possess determinable mass but move at lower speeds.

Energy is directly related to chemical phenomena in the formation and decomposition of compounds, the many important reactions that occur in electrochemistry, and in the release of energy in nuclear fission and fusion. Free energy is a thermodynamic function; in chemical reactions it is a measure of the extent to which a substance can react. Kinetic energy (the energy of motion) is most clearly exhibited in gases, in which molecules have much greater freedom of motion than in liquids and solids. See also radiation; matter; thermodynamics; free energy.

Note: "One of the most difficult challenges we face is to find ways to ensure that all peoples of the world share more equitably the vast human benefits that energy can bring."

"The foundation of worldwide energy policy must be based on energy conservation and the development of additional sources through a judicious application of science and technology..."

Glenn T. Seaborg, ACS meeting, April, 1976.

energy converter. Any element or compound having the ability to convert the radiant energy of sunlight into electrical, thermal or chemical energy. Prominent among them are silicon, selenium and tellurium, as well as the chlorophyll of plants in photosynthesis. See also solar cell; magnetohydrodynamics.

Energy Research and Development Administration. A Federal agency established in 1974 to plan and execute a research and development program for energy sources of all types. It replaces the former Atomic Energy Commission.

energy sources. See coal; geothermal energy; nuclear energy; breeder; fission; fusion; oil sands; ocean water (note); shale oil; methane; solar cell; waste treatment; natural gas; gasoline; petroleum; gasification; biogas; cellulose; fuel oil; synthetic natural gas; thermoelectricity; fuel cell; battery; radiation; hydrogen.

Mechanical energy sources to which considerable engineering research is being devoted include water power facilities, harnessing of tides, and use of windmills. Commercial production of energy from alternative sources is not expected to attain significant volume before 1985. Of those listed above, coal and nuclear energy appear to be the most immediate possibilities, though there is growing interest in solar energy.

In 1973 sources of energy for U.S. requirements were approximately as follows: petroleum and natural gas liquids, 46%; natural gas, 31%; coal, 18%; hydroelectric, 4%; nuclear 1% (Bureau of Mines). A new scientific journal entitled "Energy Sources: an International Interdisciplinary Journal of Science and Technology" made its appearance in 1974.

enfleurage. Extraction of odoriferous components of flowers by means of fats or mixtures of fat and tal-

low, the process being carried out at room temperature to avoid decomposition of the desired perfumes. The latter are separated from the fat by washing with alcohol. See also essential oil; perfume.

engineering plastic. See plastic.

enhancer. A food additive that brings out the taste of a food product without contributing any taste of its own. Sodium glutamate (q.v.) is the most widely used substance of this class; its effective concentration is in parts per thousand. See also potentiator.

"Enjay."²⁹ Trademark for a series of elastomeric materials, including copolymers and terpolymers, in both solid, semi-liquid and liquid states.

enol. A chemical grouping containing both a double bond (ene) and a hydroxyl group (OH), forming an intermediate and reversible product. Enols are characteristic of racemic compounds (q.v.).

enolase. An enzyme active in glycolysis which catalyzes the conversion of 2-phosphoglyceric acid to the phosphorylated enol form of pyruvic acid.

"Enovid."⁷⁰ Trademark for norethynodrel with mestranol. Oral contraceptive approved by FDA.

enrichment. (1) In food technology, the addition to a foodstuff of various nutrient substances during manufacture to increase the dietary value of the food, e.g., addition to wheat flour of vitamins B₁, B₂, niacin, and iron. In this way the food is brought up to a specific nutritional standard.

(2) Increase in the abundance of certain isotopes of an element by any of several methods. (a) By a chemical reaction accompanied by irradiation from a laser beam; enrichment of boron, chlorine and sulfur isotopes has been achieved in this way in a number of research laboratories. Uranium enrichment is also possible, either by adding previously prepared U-235 to natural uranium or by the laser technique. (b) Uranium can also be enriched by gas centrifugation and gaseous diffusion. The latter is the usual procedure.

(3) Addition of oxygen to air to increase its combustion-supporting ability.

enterokinase. An enzyme found in the small intestine which converts trypsinogen into trypsin.

"Enth-Acid."¹⁴² Trademark for a blend of acid salts, activators and surfactants which can be used as a replacement for liquid acids. Used for acid dipping of iron, steel, brass, copper, or zinc die castings prior to plating.

"Enthol."¹⁴² Trademark for phosphoric acid-solvent mixtures designed for degreasing and oxide removal for such metals as steel, aluminum, and zinc. Materials are supplied in the liquid form.

"Enthonite."¹⁴² Trademark for a polyvinyl platisol coating used for coating metals; primarily for imparting resistance to acid, alkaline, and electroplating solutions. Contains 100% solids and is applied by dipping.

"Enthox."¹⁴² Trademark for salts that are added to water for producing chromate coatings on zinc and cadmium to withstand 100 or more hours in 20% salt spray.

entrainer. An additive for liquid mixtures that are difficult to separate by ordinary distillation. The entrainer usually forms an azeotrope with one of the compounds of the mixture and thereby aids in the

separation of such a compound from the remainder of the mixture.

environmental chemistry. That aspect of chemistry associated with water pollution and purification, pesticides, air pollution, and waste disposal of various types (solid, liquid, gaseous, and radioactive). See also eutrophication; biodegradability; smog; waste, industrial; ecology; chemodynamics.

Environmental Protection Agency (EPA). A Federal agency established in 1970 for the purpose of controlling all aspects of air and water pollution and the manufacture and transportation of any toxic materials that may enter into or affect the environment. It includes an Office of Hazardous Materials Control which administers Congressional legislation pertaining to this field. The EPA may require manufacturers to conduct tests on materials or products which may adversely affect the environment or public health and safety. One of the most important aspects of its activities is the establishment and supervision of automotive emission standards. It is also concerned with pesticides, fungicides and other potentially detrimental materials, as well as industrial waste disposal. It operates in close conjunction with the U.S. Dept. of Agriculture and the Food and Drug Administration. The construction of new plants for manufacturing a wide range of chemicals and chemically treated products must conform to EPA standards, especially as regards effluents that contribute to water pollution. See also toxic material.

"Enzose."³⁰ Trademark for a liquid carbohydrate in two grades with dextrose equivalent (D.E.) of 72 or 87 and pH of 3.8-4.4 or 4.0-5.0. Shipped in tank cars. Uses: Chemicals, colorants; drugs, pharmaceuticals.

enzyme. A complex organic substance formed in the living cells of plants and animals; they are catalysts for the chemical reactions of biological processes, such as digestion. The first synthesis of an enzyme was reported in 1969 (ribonuclease). Enzymes are highly specific in their catalytic behavior; a given enzyme is effective for only one particular reaction. Enzymes are often classified by the kind of substance (substrate) consumed in the reactions catalyzed. Enzymes that break down proteins by hydrolytic cleavage are called proteolytic.

A partial list of enzymes follows; a number of these are used in industrial processes, especially those involving fermentation.

amylase	starch hydrolysis
carboxylase	decomposes pyruvic acid
cellulase	converts cellulose to glucose
invertase	converts sucrose to glucose and fructose
lipase	hydrolysis of fats
maltase	converts maltose to glucose
pepsin	hydrolysis of proteins
protease	hydrolysis of peptide linkages
rennin	hydrolysis of proteins
ribonuclease	decomposes RNA
trypsin	splits proteins to amino acids
urease	decomposes urea to NH ₃ and CO ₂
zymase	converts sugars to alcohol and CO ₂

eosin (bromeosin; tetrabromofluorescein) C₂₀H₈Br₄O₃. CI No. 45380.

Properties: Red, crystalline powder; soluble in alcohol and acetic acid; insoluble in water; the potassium and sodium salts are soluble in water.

Derivation: Bromination of fluorescein.

Uses: Dyeing silk, cotton, and wool; red writing ink; coloring motor fuel.

EP. (1) Abbreviation for extreme pressure, as applied to lubricants. (2) Abbreviation for ethylene-propylene.

EPA. Abbreviation for Environmental Protection Agency (q.v.).

EPC black. Abbreviation for easy processing channel black. See carbon black.

EPDM. Abbreviation for a terpolymer elastomer made from ethylene-propylene diene monomer. See ethylene-propylene terpolymer.

"Epex."²⁶⁷ Trademark for a series of epoxy resin extenders.

Uses: Extension and dilution of epoxy resin systems for all applications.

ephedrine (1-phenyl-2-methylaminopropanol)

$C_6H_5CH(OH)CH(NHCH_3)CH_3$. Optically active (levorotatory) form. See racephedrine for the inactive mixture of isomers.

Properties: White to colorless granules, pieces or crystals; unctuous to touch; hygroscopic; gradually decomposes on exposure to light. Soluble in water, alcohol, ether, chloroform, and oils. M.p. 33–40°C; b.p. 255°C (decomposes).

Derivation: Isolation from stems or leaves of Ephedra, especially Ma huang (China and India).

Grades: Technical; N.F.

Use: Medicine (usually as hydrochloride).

epi. (1) A prefix denoting a bridge or intramolecular connection, e.g., epoxide.

(2) An abbreviation for epichlorohydrin.

"Epiall."¹⁷⁵ Trademark for a series of epoxy molding compounds.

Properties: Excellent electrical resistivity; high physical strength; flame resistance; good dimensional stability; outstanding resistance to high temperature (500°F). Resistant to virtually all solvents and most chemicals; good colorfastness in sunlight and heat; fungus resistance; water absorption, 0.17% in 48 hours.

Available in mineral glass-filled and long glass fiber-filled grades.

epichlorohydrin (chloropropylene oxide; epi) An epoxide. CH_2OCHCH_2Cl .

Properties: Highly volatile, unstable, liquid. Chloroform-like odor; miscible with most organic solvents; slightly soluble in water. Sp. gr. 1.1761 (20/20°C); b.p. 115.2°C; wt/gal 9.78 lb; vapor pressure 12.5 mm (20°C); f.p. –58.1°C; viscosity 1.12 cp (20°C); refractive index (n_D²⁵) 1.4358; flash point 93°F (TOC).

Derivation: By removing hydrogen chloride from dichlorohydrin.

Hazard: Toxic by inhalation, ingestion, and skin absorption. Strong irritant. Tolerance, 5 ppm in air. Flammable, moderate fire risk.

Uses: Major raw material for epoxy and phenoxy resins; mfg. of glycerol; curing propylene-based rubbers; solvent for cellulose esters and ethers; high wet-strength resins for paper industry.

See also "Hydrin," "Herdor."

epichlorohydrin triethanolamine cellulose. See EC-TEOLA-cellulose.

"Epi-Cure."⁴⁷⁴ Trademark for curing agents for epoxy resins.

epimer. An isomer which differs from the compound with which it is being compared only in the relative positions of an attached hydrogen and hydroxyl. The isomerism may be represented as —HCOH— and —HOCH—. It is common in sugars. See also diastereoisomer.

epinephrine (*l*-methylaminoethanolcatechol; "Adrenalin.") $C_6H_3(OH)_2CHOHCH_2NHCH_3$. A hormone of the adrenal glands.

Properties: Light brown or nearly white, odorless crystalline powder; affected by light; m.p. 211–212°C; specific rotation (25°C) –50° to –53.5°; sparingly soluble in water; insoluble in alcohol, chloroform, ether, acetone, oils. Readily soluble in aqueous solutions of mineral acids, sodium hydroxide and potassium hydroxide.

Derivation: From the adrenal glands of sheep and cattle or synthetically from pyrocatechol.

Grade: U.S.P.

Use: Medicine.

"Epiphen."⁶⁵ Trademark for an epoxy resin in liquid form. "Epiphen" ER-823 is used in adhesives for rubber, steel, aluminum or glass. Catalyst is supplied for specific end uses.

epitaxial growth. An oriented crystal growth between two crystalline solid surfaces in which the surface of one crystal offers suitable positions for deposition of a second crystal. This behavior is characteristic of some types of high polymers.

"E P Mudlube."²³⁶ Trademark for a solution of modified higher organic acids which imparts extreme pressure lubricating properties to drilling muds.

EPN (O-ethyl O-para-nitrophenyl phenylphosphonothioate) $C_6H_5P(C_2H_5O)(S)OC_6H_4NO_2$.

Properties: Light-yellow crystals; m.p. 36°C; sp. gr. 1.5978 (30°C). Insoluble in water; soluble in most organic solvents. Decomposes in alkaline solutions.

Grades: Wettable powders and dusts.

Hazard: Toxic; a cholinesterase inhibitor. Tolerance, 0.5 mg per cubic meter of air. Absorbed by skin. Use may be restricted.

Uses: Insecticide; acaricide.

Shipping regulations: (Rail. Air) Organic phosphate, solid, n.o.s. Poison label. Not accepted passenger planes.

"Epocryl" Resins.¹²⁴ Trademark for a group of thermosetting resins, best described as epoxy acrylates, designed to combine the performance properties of epoxy resins and the application features of unsaturated polyesters. Used in reinforced structures.

"Epolene." Trademark for a series of low-molecular-weight polyethylene resins. Available in both emulsifiable and nonemulsifiable types.

"Epon" Curing Agent.¹²⁴ Trademark for curing agents by which "Epon" resins can be hardened to form clear tough polymers with high physical strength, excellent chemical resistance, and good electrical resistance.

"Eponite" 100.¹²⁴ Trademark for a water-dispersible liquid epoxy resin. Used in the textile industry alone or in combination with hydrolyzed or partially hydrolyzed polyvinyl acetate, starches, gums, cellulose ethers, selected resins, or other chemical finishing agents to impart crease resistance, shrinkage control, embossing, stiffness, softness or other fabric properties.

"Eponol" Resins.¹²⁵ Trademark for high molecular weight linear copolymers of bisphenol A and epichlorohydrin; produce outstanding surface coatings by solvent evaporation alone.

"Epon" Resins.¹²⁵ Trademark for a series of condensation products of epichlorohydrin and bisphenol-A having excellent adhesion, strength, chemical resistance and electrical properties when formulated into protective coatings, adhesives and structural plastics.

"Eporal."¹¹⁸ Trademark for sulfonyldianiline.

"Epotuf."¹³⁶ Trademark for epoxy resins (q.v.).

epoxide. An organic compound containing a reactive group resulting from the union of an oxygen atom with two other atoms (usually carbon) that are joined in some other way, as indicated:

This group, commonly called "epoxy," characterizes the epoxy resins (q.v.). Epichlorohydrin and ethylene oxide are well-known epoxides. The compounds are also being used in recently developed types of cellulose derivatives and fluorocarbons.

"Epoxols."¹⁵² Trademark for epoxidized oils and esters.

7-4. High purity epoxidized soybean oil with a minimum of 7% oxirane oxygen.

9-5. A high oxirane (9% minimum) epoxidized triglyceride.

5-2E. An epoxidized, higher alkyl ester.

7-4 and 9-5 approved for use in food packaging materials.

Uses: Vinyl films, sheetings, extrusions and coatings, polyvinylidene chloride, chlorinated rubber, chlorinated paraffins, nitrocellulose, and other compounds.

"Epoxybond."⁴¹ Trademark for an epoxy adhesive putty in stick form.

1,2-epoxybutane. See 1,2-butylene oxide.

3,4-epoxycyclohexane carbonitrile $\text{O}(\text{C}_6\text{H}_9)\text{CN}$.

Properties: Liquid; sp. gr. 1.0929 (20/20°C); b.p. 244.5°C; f.p. -33°C; soluble in water.

Hazard: Toxic by skin absorption; moderately by ingestion and inhalation.

Uses: Intermediate; stabilizer.

epoxyethane. See ethylene oxide.

2,3-epoxy-2-ethylhexanol $\text{C}_3\text{H}_7\text{CHOC}(\text{C}_2\text{H}_5)\text{CH}_2\text{OH}$.

Properties: Liquid; sp. gr. 0.9517 (20/20°C); b.p., decomposes; f.p. -65°C; slightly soluble in water. Low toxicity. Combustible.

Hazard: Moderately irritant to skin.

Uses: Stabilizer; intermediate.

epoxy novolak. Epoxy resin made by the reaction of epichlorohydrin with a novolak resin (phenol-formaldehyde; see novolak). These have a repeating epoxide structure which offers better resistance to high temperatures than epichlorohydrin-bisphenol A type, and are especially useful as adhesives.

2,3-epoxy-1-propanol. See glycidol.

epoxy resin. A thermosetting resin based on the reactivity of the epoxide group (q.v.). One type is made from epichlorohydrin and bisphenol A. Aliphatic polyols such as glycerol may be used instead of the aromatic bisphenol A. Molecules of this type have

glycidyl ether structures, $\text{---OCH}_2\text{CH}(\text{OCH}_2)\text{---}$, in the

terminal positions, have many hydroxyl groups, and cure readily with amines.

Another type is made from polyolefins oxidized with peracetic acid. These have more epoxide groups, within the molecule as well as in terminal positions, and can be cured with anhydrides, but require high temperatures. Many modifications of both types are made commercially. Halogenated bisphenols can be used to add flame-retardant properties. See also epoxy novolak. The reactive epoxies form a tight cross-linked polymer network, and are characterized by toughness, good adhesion, corrosion, chemical resistance, and good dielectric properties.

Hazard: Strong irritant to skin in uncured state.

Uses: Surface coatings, as on household appliances and gas storage vessels; adhesives for composites and for metals, glass, and ceramics; casting metal-forming tools and dies; encapsulation of electrical parts; filament-wound pipe and pressure vessels; floor surfacing and wall panels; neutron-shielding materials; cements and mortars; nonskid road surfacing; rigid foams; oil wells (to solidify sandy formations); matrix for stained glass windows.

EPR. Abbreviation for ethylene propylene rubber; also for electron paramagnetic resonance.

epsilon acid. See 1-naphthylamine-3,8-disulfonic acid.

Epsom salts. See magnesium sulfate.

EPT. Abbreviation for ethylene-propylene terpolymer (q.v.).

"Eptac No. 1."²⁸ Trademark for zinc dimethyldithiocarbamate, an ultra-accelerator for rubber.

"Eptam."¹ Trademark for a selective herbicide containing ethyl-N,N-di-n-propylthiolcarbamate.

EPTC (S-ethyl di-N,N-propylthiocarbamate) $\text{C}_2\text{H}_5\text{SC}(\text{O})\text{N}(\text{C}_3\text{H}_7)_2$. A pre-emergence herbicide. Available in liquid and granular formulations.

eq. Abbreviation for gram equivalent weight, i.e., the equivalent weight in grams. Recommended as an international unit.

equilibrium. (1) Chemical equilibrium is a condition in which a reaction and its opposite or reverse reaction occur at the same rate, resulting in a constant concentration of reactants; for example, ammonia synthesis is at equilibrium when ammonia molecules form and decompose at equal velocities ($\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$).

(2) Physical equilibrium is exhibited when two or more phases of a system are changing at the same rate, so that the net change in the system is zero. An example is the liquid-to-vapor/vapor-to-liquid interchange in an enclosed system, which reaches equilibrium when the number of molecules leaving the liquid is equal to the number entering it.

equilibrium constant. A number that relates the concentrations of starting materials and products of a reversible chemical reaction to one another. For example, for a chemical reaction represented by the equation $a\text{AB} + b\text{CD} \rightleftharpoons c\text{AD} + d\text{BC}$, the equilibrium constant would be $K = \frac{[(\text{AD})^c(\text{BC})^d]}{[(\text{AB})^a(\text{CD})^b]}$ where a, b, c, and d are the numbers of molecules of AB, CD, AD and BC that occur in the balanced equation and (AD), (BC), (AB) and (CD) are the molecular concentrations of AD, BC, AB and CD in any mixture that is at equilibrium. At any one temperature, K is usually at least approximately constant regardless of the relative quantities of the several substances, so that when K is known, it is often possible to predict concentrations of products when those of the

starting materials are known. The constant changes markedly with temperature. The constant can often be calculated from the relations of thermodynamics if the free energy for the chemical reaction is known, or can be calculated by measuring all concentrations in one or more carefully conducted experiments.

equivalent weight (combining weight). The weight of an element that combines chemically with 8 grams of oxygen or its equivalent. Since 8 grams of oxygen combines with 1.008 grams of hydrogen, the latter is considered equivalent to 8 grams of oxygen. When 8 grams is selected for the combining weight of oxygen, no element has a combining weight value of less than 1. The equivalent weight of an acid is the weight that contains one atomic weight of acidic hydrogen, i.e., the hydrogen that reacts during neutralization of acid with base. The equivalent weight of a base or hydroxide is the weight that will react with an equivalent weight of acid. Equivalent weights of other substances are defined in a similar manner.

Er Symbol for erbium.

"Erasol."²³² Trademark for a series of sulfoxylate reducing agents for use in the textile and paper industries.

"Eratrope."²³² Trademark for a series of discharge agents for removing vat dyes from cellulosic material.

erbia. See erbium oxide.

erbium Er Element with atomic number 68; atomic weight 167.26; valence 3. One of the rare earth elements of the yttrium subgroup. See rare earth metals. Properties: Soft, malleable solid with metallic luster; insoluble in water; soluble in acids; salts are pink to red; sp. gr. 9.16 (15°C); m.p. 1522°C; b.p. 2500°C (approx). Toxicity low. High electrical resistivity. Derivation: Reduction of the fluoride with calcium; electrolysis of the fused chloride. Source: Rare earth minerals. Forms: Lumps; ingots of high purity; sponge; powder. Hazard: Flammable in finely divided form. Uses: Nuclear control; special alloys; room-temperature laser.

erbium nitrate $\text{Er}(\text{NO}_3)_3 \cdot 5\text{H}_2\text{O}$.

Properties: Large reddish crystals; soluble in water, alcohol, ether, and acetone; loses $4\text{H}_2\text{O}$ at 130°C.

Derivation: Treatment of oxides, carbonates or hydroxides with nitric acid.

Grade: 99.9%.

Hazard: May explode if shocked or heated.

Shipping regulations: (Rail) Nitrates, n.o.s., Yellow label. (Air) Oxidizer label.

erbium oxalate $\text{Er}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$.

Properties: Reddish microcrystalline powder; decomposes at 575°C; sp. gr. 2.64. Soluble in water and dilute acids.

Hazard: Toxic and corrosive.

Use: Oxalates of the rare earth metals are used to separate the latter from common metals.

erbium oxide (erbia) Er_2O_3 .

Properties: Pink powder which readily absorbs moisture and carbon dioxide from the atmosphere. Sp. gr. 8.64; specific heat 0.065; infusible; insoluble in water; slightly soluble in mineral acids.

Derivation: By heating the oxalate or other oxy-acid salts.

Grades: 98–99%.

Uses: Phosphor activator; infrared-absorbing glass. See also rare earth.

erbium sulfate $\text{Er}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Properties: Pink monoclinic crystals; soluble in water; sp. gr. 3.217; dehydrated at 400°C.

Derivation: Dissolving hydroxides, carbonates, or oxides in dilute sulfuric acid.

Grade: 99.9%.

Use: To determine atomic weight of the rare-earth element.

erbon. Generic name for 2-(2,4,5-trichlorophenoxy)-ethyl 2,2-dichloropropionate

$(\text{Cl})_2\text{C}_6\text{H}_2\text{OC}_2\text{H}_4\text{OC}(\text{O})\text{C}(\text{Cl})_2\text{CH}_3$.

Properties: Solid; m.p. 49–50°C (technical). Insoluble in water; soluble in most organic solvents.

Hazard: Moderately toxic by inhalation and ingestion.

Use: Herbicide.

"Ercusol."⁴⁷⁰ Trademark for an aqueous dispersion of an acrylonitrile-based copolymer and other monomers.

ERDA. Abbreviation for Energy Research and Development Administration (q.v.).

erepsin. A mixture of peptidase enzymes, formerly thought to be a single enzyme, which catalyzes the hydrolysis of peptides in the small intestine.

ergocalciferol (calciferol; vitamin D₂) $\text{C}_{28}\text{H}_{44}\text{O}$.

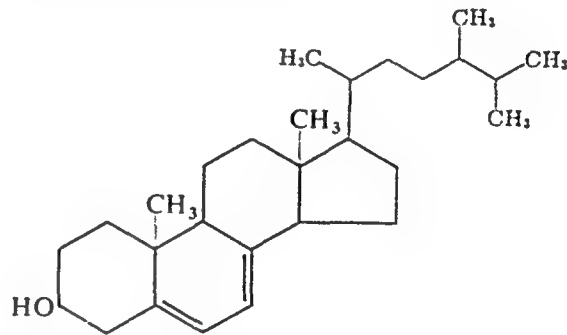

Properties: White, odorless crystals; affected by air and light. Insoluble in water; soluble in alcohol, chloroform, ether and fatty oils; m.p. 115–118°C; specific rotation +103° to +106°.

Derivation: From ergosterol by irradiation with ultraviolet light.

Grades: U.S.P.; F.C.C., as vitamin D₂.

Uses: Medicine; nutrition; dietary supplement.

ergosterol (provitamin D₂) $\text{C}_{28}\text{H}_{44}\text{O}$. A plant sterol widely distributed in nature.

Properties: Colorless crystals; m.p. 166°C (with 1½ H₂O); b.p. 250°C (0.01 mm); sp. gr. 1.04; specific rotation -135° (in chloroform); insoluble in water; soluble in alcohol, benzene, ether.

Derivation: Synthesized by yeast from simple sugars; obtained from fungus ergot.

Hazard: Due to its ability to catalyze calcium deposition in the bony structure (thus preventing rickets), overdosage of vitamin D may be harmful.

Use: Medicine; when irradiated with ultraviolet light, it has vitamin D activity; source of estradiol (q.v.).

ergot (secale cornutum; rye ergot). A fungus growth, *Claviceps purpurea*, on rye.

Habitat: Europe; cultivated in Spain and Russia.
 Grades: Spanish; Russian.
 Containers: Bats of variable size; tin-lined drums.
 Hazard: Toxic by ingestion.
 Uses: Source of many alkaloids; medicine.

erucamide (erucylamide) $C_{21}H_{41}CONH_2$.

Properties: Solid; sp. gr. 0.888; m.p. 75–80°C; iodine value 70–80; soluble in isopropanol; slightly soluble in alcohol and acetone. Combustible.
 Uses: Foam stabilizer; solvent for waxes and resins; emulsions; antiblock agent for polyethylene.

erucic acid (cis-13-docosenoic acid)

$C_{22}H_{41}CH:CH(CH_2)_{11}COOH$. A C_{22} (solid) fatty acid with one double bond. A homolog of oleic acid with four more carbons.

Properties: M.p. 33–34°C; b.p. 264°C (15 mm); iodine value 75; combustible.

Derivation: Fats and oils from mustard seed, rapeseed and crambe seed.

Uses: Preparation of dibasic acids and other chemicals; polyethylene film additive; water-resistant nylon.

erucyl alcohol $C_{22}H_{43}OH$. A C_{22} (solid) fatty alcohol having one double bond. White, soft solid almost odorless. Sp. gr. 0.8486; cloud point 81°F; boiling range 334–376°C; iodine value 82; flash point 395°F; soluble in alcohol and most organic solvents. Combustible.

Derivation: Sodium reduction of erucic acid.

Uses: Lubricants; surfactants; petrochemicals; plastics; textiles; rubber.

"Erusticator."²⁰⁴ Trademark for a rust remover which dissolves rust rapidly from fabrics.

"Erusto."²⁰⁴ Trademark for a series of laundry and dry-cleaning products.

"Ervol."⁴⁵ Trademark for white mineral oil.

erythorbic acid (trivial name adopted officially for *d*-erythro-ascorbic acid, formerly called isoascorbic acid) $C_6H_8O_6$.

Properties: Shiny, granular crystals; decomp. 164–169°C. Soluble in water, alcohol, pyridine; moderately soluble in acetone; slightly soluble in glycerol. Grade: F.C.C.

Uses: Antioxidant (industrial and food) especially in brewing industry; reducing agent in photography.

erythrite.

(1) Synonym for erythritol.

(2) (cobalt bloom) $Co_3(AsO_4)_2 \cdot 8H_2O$. A natural hydrated cobalt arsenate. Crimson, peach, red, pink or pearl gray. Contains 37.5% cobalt oxide. Soluble in hydrochloric acid. Sp. gr. 2.91–2.95; Mohs hardness 1.5–2.5; m.p. decomposes.

Occurrence: United States (California, Colorado, Idaho, Nevada); Ontario.

Hazard: Highly toxic by ingestion and inhalation.

Uses: Coloring glass and ceramics.

Shipping regulations: Arsenical compounds n.o.s., (Rail, Air) Poison label.

erythritol (tetrahydroxybutane; erythrite)

$CH_2OHCHOHCH_2OH$. A tetrahydric alcohol found in *Protococcus vulgaris* and other lichens of *Rocella* species. Can be made synthetically. Combustible.

Properties: White, sweet crystals; m.p. 121–122°C; b.p. 329–331°C; sp. gr. 1.45; soluble in water; slightly soluble in alcohol; insoluble in ether.

Use: Mfg. of erythrityl tetranitrate.

erythrityl tetranitrate (erythrityl tetranitrate)

$CH_2ONO_2(CHONO_2)_3$

Properties: Crystals; m.p. 61°C. Soluble in alcohol, ether, and glycerol; insoluble in water.

Derivation: By nitration of erythritol.

Hazard: Severe explosion risk when shocked or heated.

Use: Medicine (diluted with lactose in non-explosive tablets).

Shipping regulations: (Rail) Consult regulations; (Air) Not acceptable.

erythro-ascorbic acid. See erythorbic acid.

"Erythrocin."³ Trademark for erythromycin (q.v.).

erythrocyte. A red blood cell, containing hemoglobin, the iron-carrying protein of the blood. See also leucocyte.

erythrogenic acid. See isanolic acid.

erythrol tetranitrate. See erythrityl tetranitrate.

erythromycin. $C_{37}H_{67}NO_{13}$. An antibiotic produced by growth of *Streptomyces erythreus* Waksman. It is effective against infections caused by Gram-positive bacteria, including some beta-hemolytic streptococci, pneumococci, and staphylococci.

Properties: White or slightly yellow, odorless, bitter crystalline powder; m.p. 133–138°C. Freely soluble in alcohol, chloroform, and ether; very slightly soluble in water. Slightly hygroscopic. pH (saturated solution) 8–10.5. pH less than 4 is destructive. Alcoholic solution is levorotatory.

Grade: U.S.P.

Use: Medicine (antibiotic); various salts are available.

erythrosine $C_{20}H_6I_4Na_2O_5$. Sodium (or potassium) salt of iodeosin. CI No. 45430.

Properties: Brown powder; forms cherry red solution in water; soluble in alcohol.

Use: Colorant.

Es Symbol for einsteinium.

"Escalol 106."¹⁰ Trademark for glyceryl para-aminobenzoate. $CH_2OHCH(OH)CH_2OOCCH_6H_4NH_2$.

Use: Sun-screening compound.

"Escalol 506."¹⁰ Trademark for amyl para-dimethylaminobenzoate, $C_5H_{11}OOCCH_6H_4N(CH_3)_2$. Used as an ultraviolet screen.

"Escon."²⁹ Trademark for a polypropylene thermoplastic.

eserine. See physostigmine.

"Eskabarb."⁷¹ Trademark for phenobarbital (q.v.).

"Eskaserp."⁷¹ Trademark for reserpine (q.v.).

"Es-min-el."⁹³ Trademark for a granular mixture of compounds of manganese, copper, zinc, iron, magnesium and boron. Used in horticulture to correct trace element deficiencies.

"Espantone."⁵⁰⁵ Trademark for a ketone derived from petrochemical starting materials.

Properties: Colorless to straw oily liquid; sp. gr. 1.069; refractive index (n_{20/D}) 1.513; carbonyl value 340; acid value 1.

Use: Perfumery (for lavender and spike fragrance).

esparto. The leaves of a desert plant (*Stipa tenacissima* and *Lygeum spartum*) of the Mediterranean area. Relatively high content of cellulose and alpha-cellulose make it usable for high-quality paper for intaglio color printing. A wax is also derived from this plant.

essential (1) Containing the characteristic odor or flavor (i.e., the essence) of the original flower or fruit; an essential oil (q.v.), usually obtained by steam dis-

tillation of the flowers or leaves or cold-pressing of the skin.

(2) As applied to certain amino acids, fatty acids, and vitamins, this term is used by biochemists to mean that the compound in question is a necessary nutritional factor that is not synthesized within the body of the animal and thus must be obtained from external sources. Eight amino acids are classified as essential on this basis. See also amino acid.

essential oil. A volatile oil derived from the leaves, stem, flower or twigs of plants, and usually carrying the odor or flavor of the plant. Chemically, they are often principally terpenes (hydrocarbons), but many other types also occur. Essential oils (except for those containing esters) are unsaponifiable. Some are nearly pure single compounds, as oil of wintergreen, which is methyl salicylate. Others are mixtures, as turpentine oil (pinene, dipentene), and oil of bitter almond (benzaldehyde, hydrocyanic acid). Some contain resins in solution and are called oleo-resins or balsams (q.v.).

Properties: Pungent taste, and odor, usually nearly colorless when fresh, but becoming darker and thick on exposure to the air; optically active; sp. gr. 0.850–1.100. Soluble in alcohol, carbon disulfide, carbon tetrachloride, chloroform, petroleum ether and fatty oils; insoluble in water, except for individual constituents of some oils which may be partially water-soluble, resulting in a loss of these constituents during steam distillation.

Derivation: (a) By steam distillation; (b) by pressing (fruit rinds); (c) by solvent-extraction; (d) by maceration of the flowers and leaves in fat and treating the fat with a solvent; (e) by enfleurage (q.v.).

Uses: Perfumery; flavors; thinning precious metal preparations used in decorating ceramic ware.

See also terpeneless oil, and specific entries. Further information can be obtained from the Essential Oil Association of U.S.

Note: Many essential oils are now made synthetically for a wide variety of fragrances and flavoring agents. Use of these synthetics is increasing because of a shortage of natural products.

"Esskol."⁶⁴ Trademark for modified linseed oils used in redwood finishes, varnishes, and enamels.

"Essotane."⁵¹ Trademark for liquefied petroleum gases for domestic and industrial uses.

"Essowax."⁵¹ Trademark for fully refined paraffin wax available in slabs and in liquid form in wide range of melting points and hardness.

"Estan."⁵¹ Trademark for light colored, general purpose, lime-base greases. Available in wide range of consistencies and suitable for all methods of application. Made with an oil having a minimum of internal friction and bearing drag.

"Estane"¹¹⁹ Trademark for thermoplastic polyester and polyether urethane elastomers which provide good physical and chemical properties without curing. Extremely tough and abrasion resistant with high tensile strength at high ultimate elongation; good solvent resistance, particularly to gasoline; low air permeability, and exceptional low-temperature flexibility.

Uses: Wire and cable jacketing, fuel hose and tanks, belting, shoe heels, coated fabrics, free film, adhesives.

"Estar."¹¹⁵ Trademark for polyester film base

ester. An organic compound corresponding in structure to a salt in inorganic chemistry. Esters are considered as derived from acids by the exchange of the replaceable hydrogen of the latter for an organic radical. The usual reaction is that of an acid (organic or inorganic) with an alcohol or other organic compound rich in OH groups. Esters of acetic acid are called acetates and esters of carbonic acid carbonates. See also fatty ester.

ester gum. Hard, semisynthetic resin produced by esterification of natural resins (especially rosin) with polyhydric alcohols (principally glycerol, but also pentaerythritol). Flash point 375°F. Combustible. Grades: By color; also as gum rosin or wood rosin. Containers: 300-lb barrels and drums; multiwall paper sacks.

Uses: Paints, varnishes, and cellulosic lacquers.

"Esteron."²³³ Trademark for a series of weed and brush control products; they are formulated esters of 2,4-D and 2,4,5-T.

Hazard: Moderately toxic.

"Estinyl."³²¹ Trademark for ethinyl estradiol.

"Estonmite."⁸⁸ Trademark for para-chlorophenyl para-chlorobenzene sulfonate; miticide; available as a dust base, wettable powder and emulsifiable solution; used as an ovicide, specific against the eggs of spider mites.

"Estonox."⁸⁸ Trademark for toxaphene in a dust base, wettable powder and in a stabilized emulsifiable carrier; used for control of insects on cotton, seed alfalfa, sugar beets, beans and potatoes.

Hazard: Probably toxic. See toxaphene.

estradiol $C_{18}H_{24}O_2$. A female sex hormone. It occurs in two isomeric forms, alpha and beta. Beta-estradiol has the greatest physiological activity of any naturally occurring estrogen. The alpha form is relatively inactive. Commonly used preparations, are the benzoate, dipropionate, and valerate, as well as ethinyl-estradiol (q.v.).

Properties of beta form: White or slightly yellow; small crystals or crystalline powder; odorless; m.p. 173–179°C; stable in air; almost insoluble in water; soluble in alcohol, acetone, dioxane, and in solutions of alkali hydroxides; sparingly soluble in vegetable oils.

Derivation: Isolation from human and mare pregnancy urine; commercial synthesis from cholesterol or ergosterol.

Grade: N.F. (beta form).

Use: Medicine.

estragole (chavicol methyl ether; methyl chavicol)

$C_8H_8(C_2H_5)(OCH_3)$.

Properties: Colorless liquid; anise odor; sp. gr. 0.965–0.975 (20/4°C); (n) 1.523; b.p. 216°C. Soluble in alcohol and chloroform. Low toxicity.

Occurrence: In estragon oil, basil oils; anise bark oil and others.

Uses: Perfumes; flavors.

estragon oil (tarragon oil)

Properties: Colorless to yellowish-green essential oil; anise-like odor; aromatic but not sweet taste; not well stoppered. Solubility in alcohol: in 6 to 10 parts and more of 80% alcohol in 1 vol and more in 100% alcohol. Sp. gr. 0.974–0.986 (25°C); optical rotation +2° to +9°; refractive index 1.502 to 1.504; density value up to 1; ester value 1 to 9, after saponification. Low toxicity. Combustible.

Derivation: Steam distillation of the flowering herb *artemisia dracunculus* L.

Containers: Glass bottles; copper flasks.

Grades: Technical; F.C.C. (as tarragon oil).

Use: Flavoring; cosmetics; fragrances; medicine.

"Estrex."¹⁵² Trademark for a series of methyl, butyl, and propyl, glyceryl, and polyethylene glycol esters of fatty acids.

Uses: Adhesives, agricultural sprays, aluminum rolling, antioxidants, cosmetics, cutting oils, detergents, leather tanning, lubricants and lubricating additives, plasticizers, rubber and textile finishes.

estriol $C_{18}H_{24}O_3$.

Properties: White, odorless, microcrystalline powder; m.p. 282°C. Exhibits reddish fluorescence under filtered ultraviolet light. Undergoes phase change at 270–275°C. Practically insoluble in water; soluble in alcohol, dioxane, and oils.

Derivation: Isolation from human pregnancy urine; isolation from human placenta; organic synthesis.

Use: Medicine.

estrogen. A general term for female sex hormones.

They are responsible for the development of the female secondary sex characteristics such as the deposition of fat and the development of the breasts. The naturally occurring estrogens, such as estradiol, estrone, and estriol, are steroids. Estrogens are produced by the ovary, and to a lesser degree, by the adrenal cortex and testis. Some synthetic nonsteroid compounds, such as diethylstilbestrol and hexestrol, have estrogenic activity.

Hazard: May be carcinogenic; may have damaging side effects (thromboembolism) as used in oral contraceptives.

Use: Medicine; biochemical research; oral contraceptives.

See also antifertility agent.

"Estron."²⁵⁶ Trademark for synthetic yarn and staple fiber, acetate tow for use in cigarette filter tips, tobacco smoke filters, and tobacco smoke filter tip rods.

estrone $C_{18}H_{22}O_2$. A steroid with some estrogenic activity.

Properties: Small, white crystals or white crystalline powder; m.p. 258–262°C; odorless; stable in air; insoluble in water; soluble in alcohol, acetone, dioxane, and in solutions of fixed alkali hydroxides.

Derivation: Isolation from human pregnancy urine; synthesis from ergosterol.

Grades: N.F.

Use: Medicine.

"Estynox."²⁰² Trademark for epoxidized esters of castor or other fatty acids produced by reacting the double bonds in these oils to produce oxirane or epoxy groups.

Uses: Stabilizing plasticizers for polyvinyl chloride and nitrocellulose resins. Acid scavengers in cutting fluids, lubricants, textile processing, alkyl manufacture; corrosion inhibitors.

Et Informal abbreviation for ethyl. Example: EtOH, ethyl alcohol.

"Etamon."³³⁰ Trademark for tetraethylammonium chloride (q.v.).

"Ethafoam."²³³ Trademark for a lightweight, low-density polyethylene foam.

ethanal. See acetaldehyde.

ethanamide. See acetamide.

ethane (dimethyl; methylmethane) C_2H_6 .

Properties: Colorless, odorless gas; insoluble in water; soluble in alcohol; relatively inactive chemically; b.p. -88.63°C; f.p. -183.23°C (triple point); sp. gr. of liquid 0.446 (0°C); sp. gr. of vapor (air = 1) 1.04 (0°C); critical temperature 32.1°C; critical pressure (absolute) 718 psi; specific heat at constant pressure 0.897; specific heat at constant volume 0.325; ratio of specific heats (cp/cv) 1.224; heat of combustion (approx.) 22,300 Btu/lb or 1800 Btu/cu ft; flash point -211°F; autoignition temp. 959°F. An asphyxiant gas.

Derivation: Fractionation of natural gas.

Grades: 95%; 99%; research, 99.98%.

Containers: Steel cylinders.

Hazard: Severe fire risk if exposed to sparks or open flame. Flammable limits in air, 3 to 12.5%.

Uses: Petrochemicals (source of ethylene, halogenated ethanes); refrigerant fuel.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not accepted on passenger planes.

ethanedioyl chloride. See oxalyl chloride.

ethane hydrate. See gas hydrate.

ethanethiol (ethyl sulfhydrate; ethyl mercaptan). C_2H_5SH .

Properties: Colorless liquid. Has one of the most penetrating and persistent odors known (skunk). Slightly soluble in water; soluble in alcohol, ether, petroleum naphtha. Sp. gr. 0.83907 (20/4°C); b.p. 36°C; f.p. -121°C; refractive index (n_D 20/D) 1.4305; flash point below 80°F (C.C.); autoignition temp. 570°F.

Derivation: By saturating potassium hydroxide solution with hydrogen sulfide, mixing with calcium ethylsulfate solution and distilling on a water bath.

Containers: 55-gal drums; 25-lb cylinders; tank cars.

Hazard: Flammable; dangerous fire risk. Highly toxic by ingestion and inhalation. Tolerance, 0.5 ppm in air.

Uses: LPG odorant; adhesive stabilizer; chemical intermediate.

Shipping regulations: (Rail) Red label (Air) Flammable Liquid label. Legal label name, ethyl mercaptan.

Note: Tomato juice is reported to deodorize materials contaminated with this compound.

ethanethiolic acid. See thioacetic acid.

ethanoic acid. See acetic acid.

ethanol. See ethyl alcohol.

ethanolamine (MEA; monoethanolamine; colamine; 2-aminoethanol; 2-hydroxyethylamine) $HOCH_2CH_2NH_2$.

Properties: Colorless, moderately viscous liquid. Ammoniacal odor. Strong base. Miscible with water; soluble in carbon tetrachloride, alcohol, chloroform. Sp. gr. 1.0179 (20/20°C); b.p. 170.5°C; melting point 10.5°C; vapor pressure 0.48 mm (20°C); flash point (open cup) 200°F; wt/gal 8.5 lb (20°C). Combustible.

Derivation: Reaction of ethylene oxide and ammonia gives a mixture of mono-, di-, and triethanolamines.

Grades: Technical; N.F.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Hazard: Toxic and irritant. Tolerance, 3 ppm in air.

Uses: Scrubbing acid gases (H_2S , CO_2), especially in synthesis of ammonia, from gas streams; nonionic detergents used in drycleaning, wool treatment, emulsion paints, polishes, agricultural sprays; chem-

ical intermediates; pharmaceuticals; corrosion inhibitor; rubber accelerator.

Shipping regulations: (Air) Corrosive label; (Solutions) Flammable Liquid label.

ethanol formamide $\text{HOCH}_2\text{CH}_2\text{NHOCH}_3$.

Properties: Somewhat viscous liquid completely miscible with water, alcohol and glycerol; compatible with polyvinyl alcohol, many cellulosic and natural resins; b.p. 143°C (2.5 mm); freezing point below -72°C ; sp. gr. ($25/4^\circ\text{C}$) 1.170; flash point 347°F ; combustible. Low toxicity.

ethanol hydrazine. See beta-hydroxyethylhydrazine.

ethanolurea $\text{NH}_2\text{CONHCH}_2\text{CH}_2\text{OH}$. Liquid. Solidification point $71\text{--}74^\circ\text{C}$; formaldehyde condensation products are permanently thermoplastic and water-soluble. As increasing amounts of simple urea are mixed with ethanolurea, the condensation products gradually change from pliable film-forming resins into the brittle types. Thus almost any degree of water-solubility and flexibility may be obtained in the final resin. The modified resins formed with ethanolurea are compatible with polyvinyl alcohol, methyl cellulose, cooked starch and other water-dispersible materials.

"Ethasan."⁵⁸ Trademark for zinc diethyldithiocarbamate, a rubber accelerator.

"Ethavan."⁵⁸ Trademark for ethyl vanillin.

"Ethazate."²⁴⁸ Trademark for zinc diethyldithiocarbamate, a rubber accelerator.

ethchlorvynol (1-chloro-3-ethyl-1-penten-4-yn-3-ol; beta-chlorovinyl ethyl ethynyl carbinol)

Properties: Colorless to yellow liquid; pungent aromatic odor; darkens on exposure to light and to air; sp. gr. 1.068–1.071; refractive index, 1.4765–1.4800 (n_{25}^D). Immiscible with water; miscible with most organic solvents.

Grade: N.F.

Use: Medicine (sedative).

ethene. See ethylene.

ethenol. See vinyl alcohol.

ether. A class of organic compounds in which an oxygen atom is interposed between two carbon atoms (organic groups) in the molecular structure, giving the generic formula ROR. They may be derived from alcohols by elimination of water, but the major method is catalytic hydration of olefins. Only the lowest member of the series, methyl ether, is gaseous; most are liquid, and the highest members are solid (cellulose ethers). The term "ether" is often used synonymously with "ethyl ether", and is the legal label name for it.

Hazard: The lower m.w. ethers are dangerous fire and explosion hazards; when containing peroxides, they can detonate on heating.

Uses: See ethyl ether; polymer, water-soluble; ethylene oxide; propylene oxide; diethylene glycol; ethyl cellulose; polyether.

Note: An illogical and archaic use of the term "ether" survives in such names as petroleum ether, referring to its volatility and "ethereal" nature.

ethical drug. A prescription drug. See also drug.

ethinylestradiol (ethynylestradiol) $\text{C}_{20}\text{H}_{24}\text{O}_2$. An estrogen (female sex hormone), 19-nor-17 α -pregna-1,3,5(10)-trien-20-yne-3,17-diol.

Properties: Fine, white to creamy white, odorless, crystalline powder; sensitive to light. M.p. $142\text{--}146^\circ\text{C}$. May also exist in a polymorphic modification, m.p. $180\text{--}186^\circ\text{C}$. Soluble in acetone, alcohol, chloroform, dioxane, ether and vegetable oils; practically insoluble in water; soluble in solutions of sodium or potassium hydroxide. Slightly dextrorotatory in dioxane solution.

Derivation: Preparation from estrone.

Grade: U.S.P.

Use: Medicine.

ethion Generic name for O,O,O',O'-tetraethyl-S,S'-methylene diphosphorodithioate

Properties: Liquid; sp. gr. 1.220 (20°C); f.p. -13°C . Slightly soluble in water; soluble in lactones, xylene, chloroform and methylated naphthalene.

Hazard: Highly toxic; cholinesterase inhibitor. Use may be restricted.

Use: Insecticide and miticide.

Shipping regulations: Organic phosphate, liquid, n.o.s., (Rail, Air) Poison label. Not accepted on passenger planes.

ethisterone (pregneninolone; anhydrohydroxyprogesterone; ethynyltestosterone) $\text{C}_{21}\text{H}_{28}\text{O}_2$. A female sex hormone; a derivative of progesterone with similar activity. Effective when given by mouth.

Properties: White or slightly yellow crystals or as crystalline powder. Odorless; stable in air. Affected by light. M.p. $267\text{--}275^\circ\text{C}$ (dec.). Practically insoluble in water; slightly soluble in alcohol, chloroform, ether, and vegetable oils.

Derivation: From progesterone and other steroids.

Grade: N.F.

Use: Medicine.

"Ethocel."²³¹ Trademark for ethylcellulose resins which are able to withstand shock and maintain toughness over a temperature range of 200° to -40°F . Available in transparent, translucent, and opaque colors. Insoluble in water; soluble in most organic solvents.

Uses: Household articles; automotive parts; tools for aircraft industry.

ethodin (6,9-diamino-2-ethoxyacridine lactate monohydrate) $\text{C}_{15}\text{H}_{15}\text{N}_3\text{O} \cdot \text{C}_4\text{H}_8\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: Pale yellow crystals; darken at 200°C . M.p. 235°C ; slowly soluble in 15 parts water, soluble in 9 parts boiling water; soluble in 110 parts alcohol (22°C). Solutions are yellow, fluorescent and stable to boiling.

Purity: 97% (dry basis).

Containers: 1-oz, $\frac{1}{4}$ lb, 1 lb.

Uses: Bactericide; surgical antisepsis; preparation of pure gamma globulin.

"Ethoduomeen."¹⁴ Trademark for a series of polyethoxylated high-molecular-weight aliphatic diamines.

Containers: 55-gal open head drums; tank cars; tank trucks.

Uses: Cationic emulsifiers; wetting agents.

"Ethofat."¹⁴ Trademark for a series of polyethoxylated fatty acids. Nonionic.

Containers: 55-gal open head or bung-type drums; tank cars; tank trucks.

Uses: Detergents; emulsifiers.

"Ethofil."⁵³⁹ Trademark for glass fiber-reinforced linear polyethylene.

ethoheptazine (ethyl heptazine) $C_{16}H_{23}NO_2$. 1-Methyl-4-carbethoxy-4-phenylhexamethyleimine.

Properties: Liquid; sp. gr. 1.038 (26/4°C); b.p. 133–134°C (1.0 mm); refractive index 1.5210 (26°C).

Use: Medicine.

ethohexadiol. U.S.P. name for 2-ethylhexanediol-1,3.

"Ethomeen."¹⁵ Trademark for a series of polyethoxylated aliphatic amines with alkyl groups ranging from C_3 to C_{18} , also for naturally occurring mixtures of these alkyl groups. Can be obtained with varying degrees of cationic strength from quite strong to almost nonionic.

Containers: 55-gal drums; tank cars; tank trucks.

Uses: Emulsifiers; wetting agents.

"Ethomid."¹⁵ Trademark for polyethoxylated high-molecular-weight amides.

Containers: 55-gal drums; tank cars; tank trucks.

Uses: Emulsifiers; wetting agents.

"Ethone."²²⁷ Trademark for alpha-methylanisalacetone (q.v.).

"Ethoquad."¹⁵ Trademark for a series of polyethoxylated quaternary ammonium chlorides derived from long-chain amines.

Containers: 55-gal drums; tank cars; tank trucks.

Uses: Antistatic agents; dye levelers; electroplating bath additives.

"Ethospense."⁷³ Trademark for a series of surface-active compounds, the reaction products of fatty alcohols, glycols, glycerol, and sorbitol and ethylene oxide.

Uses: Food, cosmetics, pharmaceuticals and industrial applications.

ethosuximide (SAN) (alpha-ethyl-alpha-methylsuccinimide) $C_7H_{11}NO_2$.

Properties: White to off-white waxy powder or solid having a characteristic odor; soluble in water, alcohol and ether.

Grade: N.D.

Use: Medicine.

para-ethoxyacetanilide. See acetophenetidin.

ethoxybenzidine (di-para-aminoethoxydiphenyl)

$C_6H_4NH_2C_6H_3(OC_2H_5)NH_2$.

Properties: Glistening, flat needles. Soluble in alcohol; sparingly soluble in water. M.p. 135°C.

Derivation: By heating ethoxybenzidine sulfonic acid, obtained from benzeneazophenetholesulfonic acid, with water in an autoclave.

Hazard: May be carcinogenic. See benzidine.

Use: Medicine.

2-ethoxy-3,4-dihydro-2H-pyran

$OCH:CHCH_2CH_2CHOC_2H_5$.

Properties: Liquid; sp. gr. 0.970 (20/20°C); b.p. 143°C; f.p. -100°C; sets to glass below this temperature; flash point 111°F (O.C.). Very slightly soluble in water. Combustible.

Hazard: Moderate fire risk. Moderately toxic.

Uses: Stabilizer; intermediate.

6-ethoxy-1,2-dihydro-2,2,4-trimethylquinoline (ethoxyquin) $C_{14}H_{19}NO$.

Properties: Yellow liquid; b.p. 125°C (2 mm); m.p.

below 0°C; refractive index 1.569–1.572 (25°C); sp. gr. 1.029–1.031 (25°C). Discolors and stains badly.

Containers: 55- and 5-gal drums.

Uses: Insecticide; antioxidant; flex-cracking inhibitor; post-harvest preservation of apples (scald inhibitor).

2-ethoxyethyl-para-methoxycinnamate

$CH_3OC_6H_4CH:CHCOOC_2H_4OC_2H_5$.

Properties: Slightly yellow viscous liquid; practically odorless; sp. gr. 1.1000–1.1035 (25/25°C); refractive index (1.5650–1.5675 (20°C); flash point above 212°F (TCC). Miscible with alcohol and isopropyl alcohol; almost insoluble in water. Combustible.

Use: Ultraviolet absorber in suntan preparations.

3-ethoxy-4-hydroxybenzaldehyde. See ethyl vanillin.

1-ethoxy-2-hydroxy-4-propenylbenzene. See propenyl guaethol.

4-ethoxy-3-methoxybenzaldehyde

$C_6H_3(OC_2H_5)(OCH_3)CHO$. White to light brown crystals having a slight vanillin odor; m.p. 62–64°C.

Use: Intermediate. Combustible.

4-ethoxy-3-methoxyphenylacetic acid

$C_6H_3(OC_2H_5)(OCH_3)CH_2COOH$. An off-white powder; m.p. 119–122°C.

Use: Intermediate.

1-ethoxy-2-methoxy-4-propenylbenzene. See isoeugenol ethyl ether.

ethoxymethylenemalononitrile $C_2H_5OCH:C(CN)_2$.

Properties: Colorless liquid. B.p. 160°C; m.p. 64°C; flash point 311°F. Combustible.

Hazard: May be toxic.

Uses: Chemical intermediate.

4-ethoxyphenol. See hydroquinone monoethyl ether.

ethoxyquin. Coined name for 6-ethoxy-1,2-dihydro-2,2,4-trimethylquinoline (q.v.).

ethoxytriglycol $C_2H_5O(C_2H_4O)_3H$.

Properties: Colorless liquid. Sp. gr. 1.0208 (20/20°C); 8.5 lb/gal (20°C); b.p. 255.4°C; vapor pressure less than 0.01 (20°C); freezing point -18.7°C; viscosity 7.80 cp (20°C); completely soluble in water. Flash point 275°F (closed cup); combustible; low toxicity.

Use: Chemical intermediate.

"Ethrel."³⁷⁴ Trademark for a plant-growth regulator that promotes release of ethylene when applied to plants thus hastening ripening and making possible higher product yield. Claimed useful as stimulant for rubber latex formation and pineapple growth.

"Ethron."²³³ Trademark for polyethylene resins.

"Ethycol."²³³ Trademark for pigments dispersed in ethylcellulose and plasticizer.

Uses: Protective coatings and inks in which ethylcellulose is a major ingredient.

ethyl abietate $C_{19}H_{29}COOC_2H_5$.

Properties: Amber-colored, viscous liquid; hardens upon oxidation. Soluble in ether, most varnish solvents; insoluble in water. B.p. 350°C; flash point 352°F; m.p. 45°C; refractive index 1.4980; sp. gr. 1.02. Combustible.

Derivation: (a) By heating together ethyl chloride and an alcoholic solution of rosin and caustic soda. (b) By reacting ethyl iodide with silver abietate.

Hazard: Moderately toxic; irritant.

Uses: Varnishes, lacquers, and coating compositions.

"Ethylac."²⁰⁴ Trademark for 2-benzothiazyl-N,N-diethylthiocarbamylsulfide (q.v.).

N-ethylacetamide $\text{CH}_3\text{CONHC}_2\text{H}_5$.

Properties: Colorless liquid; sp. gr. 0.920 (20/20°C); boiling range 206–208.5°C; flash point 230°F; faint odor. Combustible.

ethyl acetamidocynoacetate (acetamidocynoacetic ester; ethyl N-acetyl- α -cyanoglycine)

$\text{NCCH}(\text{NHCOCH}_3)\text{COOC}_2\text{H}_5$. Solid; m.p. 129°C.

Use: Synthesis of amino acids and related compounds.

N-ethylacetanilide (ethylphenylacetamide)

$\text{C}_6\text{H}_5\text{NC}_2\text{H}_5\text{COCH}_3$.

Properties: White, crystalline solid. Faint odor. Soluble in most organic solvents. Insoluble in water. Sp. gr. 0.994; b.p. 258°C; flash point 126°F; m.p. 54°C. Low toxicity. Combustible.

Grade: Technical.

Hazard: Moderate fire risk.

Use: Substitute for camphor in nitrocellulose.

ethyl acetate (acetic ether; acetic ester; vinegar naphtha) $\text{CH}_3\text{COOC}_2\text{H}_5$.

Properties: Colorless, fragrant liquid. Soluble in chloroform, alcohol and ether; slightly soluble in water. B.p. 77°C; vapor pressure (20°C) 73 mm; f.p. -83.6°C; density 0.8945 g/ml (25°C); flash point 24°F. Autoignition temp. 800°F.

Derivation: By heating acetic acid and ethyl alcohol in presence of sulfuric acid, and distilling.

Grades: Commercial, 85–88%; 95–98%; 99%; N.F. (99%); F.C.C.

Containers: Drums; tank cars.

Hazard: Flammable, dangerous fire and explosion risk. Flammable limits in air, 2.2 to 9%. Moderately toxic by inhalation and skin absorption. Irritating to eyes and skin. Tolerance, 400 ppm in air. Safety data sheet available from Mfg. Chemists Assn., Washington, D.C.

Uses: General solvent in coatings and plastics; organic synthesis; smokeless powders; pharmaceuticals.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

ethyl acetate, anhydrous. Ethyl acetate, grade 99%.

ethylacetic acid. See butyric acid.

ethyl acetoacetate (diacetic ester; acetoacetic ester)

$\text{CH}_3\text{COCH}_2\text{COOC}_2\text{H}_5$ (keto form). This compound is a tautomer, at room temperature consisting of about 93% keto form and 7% enol form,

$\text{CH}_3\text{C}(\text{OH})\text{:CHCOOC}_2\text{H}_5$.

Properties: Colorless liquid; fruity odor. Soluble in alcohol; soluble in water. Sp. gr. 1.0250 (20.4°C); f.p. (enol) -80°C, (keto) -39°C; b.p. 180–181°C; wt/gal 8.5 lb; vapor pressure 0.8 mm (20°C); flash point 185°F (COC); coefficient of expansion 0.00101 °C. Combustible.

Derivation: Action of metallic sodium on ethyl acetate, with subsequent distillation.

Grades: Technical; 98%.

Containers: Drums; tank cars.

Hazard: Moderately toxic by ingestion and inhalation; irritant to skin and eyes.

Uses: Organic synthesis; antipyrine; lacquers; dopes; plastics; manufacture of dyes, pharmaceuticals, anti-malarials, vitamin B; flavoring.

ethyl acetone. See methyl propyl ketone.

ethylacetylene (1-butyne) C_4H_6 ; $\text{C}_2\text{H}_3\text{CH}$.

Properties: Available as liquefied gas; b.p. 8.3°C, sp. gr. 0.669 (0 °C); f.p. -130°C; flash point (TOC)

<20°F; specific volume 7.2 cu ft/lb (70°F); insoluble in water.

Hazard: Flammable, dangerous fire risk.

Uses: Specialty fuel; chemical intermediate.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes.

ethyl N-acetyl- α -cyanoglycine. See ethyl acetamidocynoacetate.

ethyl acetylsalicylate $\text{C}_2\text{H}_5\text{OOC}_6\text{H}_4\text{OOCCH}_3$.

Properties: Colorless liquid. Insoluble in water; soluble in many organic solvents. Sp. gr. 1.153; b.p. 272°C.

Use: Medicine.

ethyl acrylate $\text{CH}_2\text{:CHCOOC}_2\text{H}_5$.

Properties: Colorless liquid; b.p. 99.4°C; f.p. -72.0°C; sp. gr. 0.9230 (20/20°C); refractive index 1.4037 (25/D); wt/gal 7.6 lb (20°C); soluble in water and alcohol; readily polymerized. Flash point 60°F (open cup).

Derivation: (a) Ethylene cyanohydrin, ethyl alcohol, and dilute sulfuric acid; (b) Oxo reaction of acetylene, carbon monoxide, and ethyl alcohol in the presence of nickel or cobalt catalyst.

Grades: Technical (inhibited, usually with hydroquinone or its monomethyl ether); pure uninhibited.

Containers: Drums; tank cars.

Hazard: Toxic by ingestion, inhalation, skin absorption; extremely irritating to skin and eyes. Tolerance, 25 ppm in air. Flammable, dangerous fire and explosion hazard. Safety data sheet available from Mfg. Chemists Assn., Washington, D.C.

Uses: Polymers; acrylic paints; intermediates.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label (Air) (inhibited) Flammable Liquid label; (uninhibited) Not acceptable.

See also acrylate and acrylic resin.

ethyl alcohol (alcohol; grain alcohol; ethanol; EtOH) $\text{C}_2\text{H}_5\text{OH}$. 47th highest-volume chemical produced in U.S. (1975).

Properties of pure 100% absolute alcohol (dehydrated): Colorless, limpid, volatile liquid; b.p. 78.3°C; f.p. -117.3°C; ethereal, vinous odor; pungent taste. Miscible with water, methyl alcohol, ether, chloroform, and acetone.

Properties: (95%) Refractive index 1.3651 (15°C); surface tension 22.3 dynes/cm (20°C); viscosity 0.0141 poise (20°C); vapor pressure 43 mm (20°C); specific heat 0.618 cal/g (23°C); flash point 55°F; sp. gr. 915.56°C) 0.816; b.p. 78°C; f.p. -114°C. Autoignition temp. 793°F.

Derivation: (a) From ethylene by direct catalytic hydration or with ethyl sulfate as intermediate. (b) Fermentation of blackstrap molasses. (c) Fermentation of lactose from whey. (d) Enzymatic hydrolysis of cellulose (see also cellulase). Methods (c) and (d) are experimental but may be expected to move into production before 1980.

Grades: U.S.P. (95% by volume); absolute; pure; completely denatured; specially denatured; industrial; various proofs (one half the proof number is the percent of alcohol by volume).

Containers: Drums, tank trucks, tank cars.

Hazard: Flammable, dangerous fire risk; flammable limits in air, 3.3 to 19%. Tolerance, 1000 ppm in air.

Ethyl alcohol is classified as a depressant drug. Though it is rapidly oxidized in the body and is

therefore noncumulative, ingestion of even moderate amounts causes lowering of inhibitions, often succeeded by dizziness, headache, or nausea. Larger intake causes loss of motor nerve control, shallow respiration, and in extreme cases unconsciousness and even death. Degree of intoxication is determined by concentration of alcohol in the brain. Of primary importance is the fact that intake of even moderate amounts together with barbiturates or similar drugs is extremely dangerous, and may even be fatal.

Uses: Solvent for resins, fats, oils, fatty acids, hydrocarbons, alkali hydroxides; extractive medium; manufacture of intermediates, organic derivatives (especially acetaldehyde), dyes, synthetic drugs, esters, elastomers, detergents, cleaning solutions, surface coatings, cosmetics, pharmaceuticals, explosives, antifreeze; beverages; antiseptics; medicine; gasoline additive; yeast-growth medium.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

See also: alcohol, denatured; industrial alcohol.

ethyl aldehyde. See acetaldehyde.

ethyl alpha-allylacetoacetate

$\text{CH}_3\text{COCH}(\text{CH}_2\text{CH}=\text{CH}_2)\text{COOC}_2\text{H}_5$.

Properties: Water-white liquid; sp. gr. (20°C) 0.989; wt/gal (20°C) 8.24 lb. Combustible. Low toxicity.

Uses: Intermediate for pharmaceuticals, perfumes, fungicides, insecticides, fine chemicals.

ethyl aluminum dichloride (EADC) $\text{C}_2\text{H}_5\text{AlCl}_2$.

Properties: Clear, yellow pyrophoric liquid. B.p. (extrapolated) 194°C; f.p. 32°C; density 1.222 g/ml; weight 10.28 lb/gal (25°C).

Derivation: Reaction of aluminum chloride with ethyl aluminum sesquichloride.

Hazard: Ignites on contact with air; dangerous fire risk; reacts violently with water.

Uses: Catalyst for olefin polymerization, aromatic hydrogenation; intermediate.

Shipping regulations: (Rail) Red label. (Air) Not acceptable.

ethyl aluminum sesquichloride (EASC) $(\text{C}_2\text{H}_5)_3\text{Al}_2\text{Cl}_3$.

Properties: Clear yellow pyrophoric liquid; b.p. 204°C; f.p. -50°C. Density 1.08 g/ml.

Derivation: Reaction of ethyl chloride and aluminum.

Grades: Commercial.

Containers: Tank cars and trucks.

Hazard: Ignites on contact with air; dangerous fire risk; reacts violently with water.

Uses: Catalyst for olefin polymerization, aromatic hydrogenation; intermediate.

Shipping regulations: (Rail) Red label. (Air) Not acceptable.

ethylamine (monoethylamine; aminoethane)
 $\text{CH}_3\text{CH}_2\text{NH}_2$.

Properties: Colorless, volatile liquid (or gas); ammonia odor; strong alkaline reaction. B.p. 16.6°C; freezing point -81.2°C; sp. gr. (liquid, 15/15°C) 0.689; wt/gal (20°C) 5.7 lb; flash point (open cup) below 0°F. Autoignition temp. 723°F. Miscible with water, alcohol, and ether.

Derivation: From ethyl chloride and alcoholic ammonia under heat and pressure.

Grades: Technical (anhydrous and 70% aqueous solution); pure, 98.5% min.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars; tank trucks.

Hazard: Flammable, dangerous fire risk. Toxic; strong irritant. Tolerance, 10 ppm in air. Flammable limits in air 3.5 to 14%.

Use: Dye intermediates; solvent extraction; petroleum refining; stabilizer for rubber latex; detergents; organic synthesis.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Legal label name monoethylamine.

ethylamine hydrobromide $\text{C}_2\text{H}_5\text{NH}_2 \cdot \text{HBr}$.

Properties: White, practically odorless granules; m.p. 158-161°C; very soluble in water.

Hazard: Probably toxic.

Use: Intermediate (where liquid ethylamine or liquid hydrobromic acid cannot be used).

ethyl-ortho-aminobenzoate. See ethyl anthranilate.

ethyl-para-aminobenzoate (benzocaine, anesthesin)
 $\text{C}_6\text{H}_4\text{NH}_2\text{CO}_2\text{C}_2\text{H}_5$.

Properties: White, crystalline, odorless, tasteless powder; stable in air; m.p. 88-92°C. Soluble in dilute acids, less so in chloroform, ether, and alcohol, very slightly soluble in water. Low toxicity.

Derivation: Ethylation of para-nitrobenzoic acid, followed by reduction.

Grades: Technical; pure; N.F. (as benzocaine).

Containers: Glass bottles; drums.

Use: Medicine (local anesthetic); suntan preparations.

ethylaminoethanol. See ethylethanolamine. Mixed ethylaminoethanols (sold in up to tank car lots) may also contain diethylaminoethanol (q.v.).

2-ethylamino-4-isopropylamino-6-methylthio-s-triazine
 $\text{C}_2\text{H}_5\text{HNC}_3\text{N}_3(\text{SCH}_3)\text{NHCH}(\text{CH}_3)_2$.

Properties: White crystalline powder; m.p. 84-85°C; slightly soluble in water; soluble in organic solvents.

Hazard: Toxic by ingestion.

Use: Weed-killing agent in pineapple and sugar cane.

ethyl-1-(para-aminophenyl)-4-phenylisonipecotatate
See anileridine.

ethyl amyl ketone (EAK; 5-methyl-3-heptanone)
 $\text{CH}_3\text{CH}_2\text{CO}(\text{CH}_2)_4\text{CH}_3$.

Properties: Colorless liquid, pungent odor. Insoluble in water. Soluble in 4 vols of 60% alcohol. Sp. gr. 0.819-0.824; refractive index 1.416; flash point 138°F. Combustible.

Containers: Drums; tank cars.

Hazard: Narcotic in high concentrations. Moderate fire risk. Tolerance, 25 ppm in air.

Uses: Perfumery; solvent.

N-ethylaniline $\text{C}_2\text{H}_5\text{NHC}_6\text{H}_5$.

Properties: Colorless liquid, becoming brown on exposure to light. Soluble in alcohol; insoluble in water. Sp. gr. 0.9631; f.p. -63.5°C; b.p. 206°C; refractive index (n_D 20/D) 1.5559. Flash point 185°F (O.C.). Combustible.

Derivation: By heating aniline and ethyl alcohol in presence of sulfuric acid, with subsequent distillation.

Containers: Iron drums; tank cars.

Hazard: Toxic by ingestion, inhalation, skin absorption.

Use: Organic synthesis.

ortho-ethylaniline $\text{C}_6\text{H}_4(\text{NH}_2)\text{C}_2\text{H}_5$.

Properties: Brown liquid; f.p. -44°C; sp. gr. (20°C) 0.982; b.p. 214°C; flash point (open cup) 185°F. Soluble in alcohol and toluene; insoluble in water. Combustible.

Hazard: Toxic by ingestion, inhalation, skin absorption.

Uses: Intermediate for pharmaceuticals, dyestuffs, pesticides, and other products.

ethyl anthranilate (ethyl-ortho-aminobenzoate) $C_6H_4(NH_2)COOCH_2CH_3$.

Properties: Colorless liquid, fruity odor. Sp. gr. 1.117; refractive index 1.564; b.p. 260°C. Soluble in alcohol and propylene glycol. Combustible.

Grades: Technical; F.C.C.

Uses: Perfumery and flavors, similar to methyl anthranilate (q.v.).

-ethylanthraquinone $C_{14}H_8O_2C_2H_5$.

Properties: Buff to light yellow paste. M.p. 108°C.

Use: Synthesis, especially of hydrogen peroxide.

Ethyl™ Antiknock Compounds.³¹³ Trademark for a series of fuel additives containing various percentages of tetraethyl lead, ethylene dibromide, ethylene dichloride, dye, kerosine, and antioxidant. All are used to improve the octane rating of motor fuels.

"Ethyl" Antioxidants.³¹³ Trademark for a series of gasoline antioxidants based on phenols (chiefly di-tert-butyl phenol). They inhibit formation of gum and peroxides in gasoline, and the formation of decomposition products of jet fuels in storage. Also used for steam-turbine and industrial oils, and to retard decomposition of antiknock compounds in gasoline.

ethylarsenious oxide C_2H_5AsO .

Properties: Colorless oil. Garlic-like, nauseating odor. Oxidizes in air and forms colorless crystals. Soluble in acetone, benzene, ether. Sp. gr. 1.802 (11°C); b.p. 158°C (10 mm).

Hazard: Highly toxic.

Use: Organic synthesis.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

"Ethyl" Automate Liquid Dyes.³¹¹ Trademark for single-phase organic dyes in aromatic solvent. Full range of liquid dyes in various concentrations, colors, and combinations.

2-ethylaziridine. See ethylethyleneimine.

ethylbenzene (phenylethane) $C_6H_5C_2H_5$. 20th highest-volume chemical produced in U.S. (1975).

Properties: Colorless liquid; aromatic odor; vapor heavier than air; boiling point 136.187°C; refractive index 1.49594 (20°C); sp. gr. 0.867 (20°C); f.p. -94.-975°C; wt/gal 7.21 lb (25°C); flash point 59°F; autoignition temp. 810°F; specific heat 0.41/cal/gal/°C; viscosity 0.64 centipoise (25°C). Soluble in alcohol, benzene, carbon tetrachloride, and ether; almost insoluble in water.

Derivation: (a) By heating benzene and ethylene in presence of aluminum chloride, with subsequent distillation; (b) by fractionation directly from the mixed xylene stream in petroleum refining.

Grades: Technical; pure; research.

Containers: Drums; tank cars.

Hazard: Flammable, dangerous fire risk. Moderately toxic by ingestion, inhalation, and skin absorption. Irritant to skin and eyes. Tolerance. 100 ppm in air.

Uses: Intermediate in production of styrene; solvent.

Shipping regulations: (Rail) Flammable Liquid, n.o.s., Red label. (Air) Flammable Liquid label.

ethyl benzoate $C_6H_5CO_2C_2H_5$.

Properties: Colorless, aromatic liquid; soluble in alcohol and ether; insoluble in water. Sp. gr. 1.043-1.046; f.p. -32.7°C; b.p. 212.9°C; refractive index 1.505. Flash point 200°F; combustible; low toxicity.

Derivation: By heating ethyl alcohol and benzoic acid in presence of sulfuric acid.

Grade: Technical; F.C.C.

Containers: Drums; glass bottles.

Uses: Flavoring; perfumery; solvent mixtures; lacquers; solvent for many cellulose derivatives and natural and synthetic resins.

ethyl benzoylacetate $C_6H_5COCH_2COOC_2H_5$.

Properties: Light yellow oil; boiling range 144-148°C (10 mm); sp. gr. 1.111-1.117 (20°C); flash point 275°F. Soluble in most organic solvents; insoluble in water. Combustible. Low toxicity.

Derivation: Reaction of ethyl acetate and ethyl benzoate with metallic sodium.

Method of purification: Vacuum distillation.

Grade: 95% pure.

Use: Dye and pharmaceutical intermediate.

ethyl ortho-benzoylbenzoate $C_6H_5COC_6H_4COOC_2H_5$.

Properties: Yellowish white solid; odorless; insoluble in water; soluble in alcohol, acetone, ethyl acetate, and benzene; m.p. 56-58°C; b.p. 325°C. Combustible.

Uses: Plasticizer for nitrocellulose and synthetic resins.

ethylbenzylaniline $C_6H_5N(C_2H_5)CH_2C_6H_5$.

Properties: Colorless oil; soluble in alcohol and ether; insoluble in water. Sp. gr. 1.034; b.p. 286°C. Combustible.

Derivation: By heating ethyl aniline, benzyl chloride, and aqueous caustic soda, with subsequent distillation.

Hazard: May be toxic.

Uses: Dyestuffs; organic synthesis.

ethylbenzyl chloride (1-chloromethylethylbenzene)

$ClCH_2C_6H_5C_2H_5$. Consists of 70% para- and 30% ortho-ethylbenzyl chloride.

Properties: Colorless liquid; sp. gr. 1.0460-1.0475 (25/25°C); refractive index 1.5290-1.5305 (n_D 25/D); soluble in alcohols; insoluble in water.

Hazard: Irritant to eyes; a lachrymator.

Use: Intermediate.

ethyl biscoumaracetate (ethyl bis(4-hydroxycoumarinyl)-acetate) $C_{22}H_{16}O_8$. A synthetic derivative of bishydroxycoumarin.

Properties: White, odorless, bitter, crystalline solid. M.p. 177-182°C. Another form melts 154-157°C.

Soluble in acetone and benzene; slightly soluble in alcohol and ether; insoluble in water.

Grade: N.F.

Use: Medicine.

ethyl bis(4-hydroxycoumarinyl) acetate. See ethyl biscoumaracetate.**ethyl borate.** Legal label name for triethyl borate (q.v.).**ethyl bromide (bromoethane) C_2H_5Br .**

Properties: Colorless liquid; soluble in alcohol and ether; sparingly soluble in water. Sp. gr. 1.431 (20°C); b.p. 38.4°C; wt/gal 12-12.1 lb; vapor pressure 386 mm (20°C); autoignition temp. 952°F; f.p. -119°C; constant minimum boiling mixture of ethyl alcohol 7 mole% and ethyl bromide 93 mole% 37.6°C.

Derivation: From ethyl alcohol or ethylene and hydrogen bromide. One process uses gamma radiation to initiate the combination.

Grade: Technical (98%).

Containers: Drums; tank cars.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Strong irritant. Tolerance, 200 ppm in air; explosion limits in air, 6 to 11%. Flammable, dangerous fire hazard.
Uses: Organic synthesis; medicine (anesthetic); refrigerant; solvent; grain and fruit fumigant.

ethyl bromoacetate $\text{CH}_3\text{BrCOOC}_2\text{H}_5$.

Properties: Clear, colorless liquid. Partially decomposed by water. Soluble in alcohol, benzene, ether; insoluble in water. Sp. gr. 1.53 (4°C); b.p. 168°C; f.p. -13.8°C; vapor density 5.8.
Derivation: Interaction of bromine and acetic acid in the presence of red phosphorus.
Grade: Technical.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Strong irritant.

Shipping regulations: (Air) Not acceptable.

ethyl butanoate. See ethyl butyrate.

2-ethylbutanol. See 2-ethylbutyl alcohol.

2-ethyl-1-butene (uns-diethylethylene)

$\text{CH}_3\text{CH}_2(\text{C}_2\text{H}_5)\text{C}=\text{CH}_2$.
Properties: Colorless liquid; sp. gr. 0.6894 (20/4°C); b.p. 64.95°C; refractive index (n_D 20/D) 1.3969; soluble in alcohol, acetone, ether, petroleum, and coal-tar solvents; insoluble in water. Combustible.
Grade: 95% pure.
Uses: Organic synthesis of flavors, perfumes, medicines, dyes, resins.

3-(2-ethylbutoxy)propionic acid

$\text{CH}_3\text{CH}_2\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{OCH}_2\text{CH}_2\text{COOH}$.
Properties: Water-white liquid; sp. gr. (20/20°C) 0.9600; b.p. (100 mm) 200°C; vapor pressure (20°C) <0.1 mm; f.p., glass below -90°C; insoluble in water. Flash point 280°F. Combustible. Low toxicity.
Uses: Preparation of metallic salts for paint driers and gelling agents.

2-ethylbutyl acetate $\text{C}_2\text{H}_5\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{OOCCH}_3$.

Properties: Colorless liquid; mild odor. Sp. gr. 0.875-0.881 (20/20°C); boiling range, below 155°C none, above 164°C none; purity not less than 90% ethylbutyl acetate; average wt/gal 7.33 lb (20°C). Flash point 130°F (open cup).
Hazard: Moderate fire risk.
Uses: Solvent for nitrocellulose lacquers; flavoring.

2-ethylbutyl alcohol (2-ethylbutanol; hexyl alcohol, pseudo-) $\text{CH}_3\text{CH}_2\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{OH}$.

Properties: Colorless liquid; stable. Miscible with most organic solvents; slightly soluble in water. B.p. 148.9°C; f.p. -114°C; sp. gr. 0.8328 (20/20°C); wt/gal 6.93 lb (20°C); refractive index 1.4229 (20°C); flash point (ASTM open cup) 137°F; low toxicity; vapor pressure 0.9 mm (20°C). Combustible.
Containers: Drums; tank cars.
Hazard: Moderate fire risk.
Use: Solvent for oils, resins, waxes, dyes; diluent; synthesis of perfumes, drugs; flavoring.

N-ethylbutylamine $\text{C}_2\text{H}_5\text{NHCH}_2\text{CH}_2\text{CH}_2\text{CH}_3$.

Properties: Water-white; amine odor; b.p. 108°C; f.p. -78°C; sp. gr. 0.7401 (20/20°C); refractive index 1.407 (20°C); flash point 65°F. Partly soluble in water.
Hazard: Flammable; dangerous fire risk.
Use: Intermediate.

ethylbutyl carbonate $\text{C}_2\text{H}_5\text{CO}_3\text{C}_4\text{H}_9$.

Properties: Colorless liquid used as solvent for many natural and synthetic resins; in mixtures for nitro-

cellulose. Sp. gr. 0.92 to 0.93 (20°C); b.p. 135-175°C; flash point 122°F (closed cup). Combustible.
Hazard: Moderate fire risk.

ethyl n-butyl ether (n-butyl ethyl ether) $\text{C}_2\text{H}_5\text{OC}_4\text{H}_9$.
Properties: Liquid; sp. gr. (20°C) 0.7528; f.p. -103°C; b.p. 92.2°C; flash point 40°F; vapor pressure (20°C) 43 mm; slightly soluble in water.

Containers: Cans; drums.
Hazard: Flammable, dangerous fire risk.
Uses: Extraction solvent; inert reaction medium.
Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

ethyl butyl ketone (3-heptanone)

$\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{COCH}_2\text{CH}_3$.
Properties: Clear liquid; sp. gr. 0.8191 (20/20°C); f.p. -39°C; boiling range 142.8 to 147.8°C; 95% purity; wt/gal 6.8 lb. Flash point 115°F (open cup). Insoluble in water; soluble in alcohol. Combustible.
Containers: Drums; tank cars.
Hazard: Moderate fire risk. Moderately toxic; irritant.
Tolerance: 50 ppm in air.
Uses: Solvent mixtures for air-dried and baked finishes; for polyvinyl and nitrocellulose resins.

2-ethyl-2-butylpropanediol-1,3 (2-butyl-2-ethylpropanediol-1,3) $\text{HOCH}_2\text{C}(\text{C}_2\text{H}_5)(\text{C}_4\text{H}_9)\text{CH}_2\text{OH}$.

Properties: White crystals or liquid; sp. gr. (50/20°C) 0.931; b.p. (50 mm) 178°C; f.p. 41.4°C; solubility in water (20°C) 0.8% by wt. Flash point 280°F; combustible.
Uses: Synthesis of lubricants, emulsifying agents; insect repellents; plastics.

2-ethylbutyl silicate $[\text{CH}_3\text{CH}_2\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{O}]_2\text{Si}$.

Properties: Colorless liquid; b.p. (1 mm) 164°C.
Derivation: Reaction of silicon tetrachloride with 2-ethylbutanol.
Uses: Hydraulic fluid; heat-transfer liquid.

2-ethylbutyraldehyde (diethylacetaldehyde) $(\text{C}_2\text{H}_5)_2\text{CHCHO}$.

Properties: Colorless liquid; insoluble in water. Sp. gr. 0.8164 (20/20°C); b.p. 116.8°C; vapor pressure 13.7 mm (20°C); flash point 70°F (open cup); wt/gal 6.8 lb (20°C); f.p. -89°C.
Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.
Hazard: Flammable, dangerous fire risk. Irritant to eyes and skin.

Uses: Organic synthesis; pharmaceuticals; rubber accelerators; synthetic resins.
Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

ethyl butyrate (ethyl butanoate) $\text{C}_3\text{H}_7\text{CO}_2\text{C}_2\text{H}_5$.

Properties: Colorless liquid; pineapple-like odor. Soluble in alcohol and ether; almost insoluble in water and glycerin. Sp. gr. 0.8788; f.p. -93.3°C; b.p. 120.6°C; refractive index (n_D 20/D) 1.400. Flash point 78°F (closed cup). Autoignition temp. 865°F.
Derivation: Ethyl alcohol and butyric acid heated in presence of sulfuric acid, with subsequent distillation.

Grades: Technical; F.C.C.
Containers: Iron drums; glass bottles.
Hazard: Flammable, dangerous fire risk. Irritating to eyes and mucous membranes; narcotic in high concentrations.

Uses: Flavoring extracts; perfumery; solvent mixture for cellulose esters and ethers; many natural and synthetic resins; lacquers; safety glass.
Shipping regulations: (Air) Flammable Liquid label.

2-ethylbutyric acid (diethyl acetic acid) $(C_2H_5)_2CHCOOH$.

Properties: Water-white liquid. Resembles butyric acid in most properties except that its odor is less pronounced and its water solubility limited. Sp. gr. 0.9225 (20/20°C); b.p. 190°C; vapor pressure 0.08 mm (20°C); flash point 210°F; wt/gal 7.7 lb (20°C); f.p. -15°C. Combustible; low toxicity.

Uses: Ester formation; intermediate for drugs, dye-stuffs, chemicals; flavoring.

ethyl caffeate (ethyl 3,4-dihydroxycinnamate) $C_6H_3(OH)_2CH:CHCOOC_2H_5$.

Properties: Yellow to tan crystals; characteristic, aromatic odor; insoluble in water; very soluble in alcohol.

Grade: C.P.

Containers: Bottles; fiber drums.

Use: Food antioxidant.

ethyl caprate (ethyl decanoate) $C_9H_{19}COOC_2H_5$.

Properties: Colorless liquid; fragrant odor. Soluble in alcohol and ether; insoluble in water; sp. gr. 0.862; b.p. 243°C. Low toxicity. Combustible.

Derivation: By heating capric acid, absolute alcohol and sulfuric acid, with subsequent distillation.

Uses: Organic synthesis; manufacturing wine-bouquet and cognac essence.

ethyl caproate (ethyl hexoate; ethyl hexanoate) $C_5H_{11}COOC_2H_5$.

Properties: Colorless to yellowish liquid; pleasant odor. Soluble in alcohol and ether; insoluble in water and glycerin. Sp. gr. 0.873; b.p. 167°C. Low toxicity. Combustible.

Derivation: Heating absolute alcohol and n-caproic acid in presence of sulfuric acid, with subsequent distillation.

Grades: Technical; F.C.C.

Uses: Organic synthesis; artificial fruit essences.

ethyl caprylate (ethyl octoate; ethyl octanoate) $CH_3(CH_2)_6COOC_2H_5$.

Properties: Colorless liquid; pineapple odor. Soluble in alcohol and ether; insoluble in water and glycerin. Sp. gr. 0.865-0.869 (25°C); f.p. -48°C; b.p. 207-209°C. Low toxicity. Combustible.

Derivation: Heating caprylic acid, alcohol, and sulfuric acid with subsequent distillation.

Grades: Technical; F.C.C.

Uses: Flavoring; fruit essences.

ethyl carbamate. See urethane.**N-ethylcarbazole (9-ethylcarbazole) $(C_8H_4)_2NC_2H_5$ (tricyclic).**

Properties: Leaflets; soluble in ether and hot alcohol. M.p. 69-70°C; b.p. 175°C (5 mm).

Derivation: Action of ethyl chloride on the potassium salt of carbazole.

Uses: Intermediate for dyes, pharmaceuticals; agricultural chemicals.

ethyl carbonate. See diethyl carbonate.**ethylcellulose. An ethyl ether of cellulose.**

Properties: White, granular, thermoplastic solid; low-density of the commercial cellulose plastics; properties vary with extent to which hydroxyl radicals of cellulose have been replaced by ethoxy groups. Standard commercial product has: 47-48% ethoxy content; sp. gr. 1.07-1.18; refractive index 1.47; high dielectric strength; softening point 100-

130°C. Soluble in most organic liquids, and compatible with resins, waxes, oils, and plasticizers; inert to alkalis and dilute acids. Insoluble in water and glycerol. Nontoxic. Combustible.

Derivation: From alkali cellulose and ethyl chloride or sulfate; from cellulose and ethyl alcohol in presence of dehydrating agents.

Grades: Technical; N.F.; F.C.C.

Uses: Hot-melt adhesives and coatings for cables, paper, textiles, etc.; extrusion wire insulation; protective coatings; pigment-grinding bases; toughening agent for plastics; printing inks; molding powders; proximity fuses; vitamin preparations; casing for rocket propellants; food and feed additive.

ethyl centralite. See sym-diethyldiphenylurea.**ethyl chloride (chloroethane) C_2H_5Cl .**

Properties: Gas at room temperature; when compressed, a colorless, volatile liquid. Ether-like odor, burning taste. Stable and noncorrosive when dry but will hydrolyze in the presence of water or alkalis. Miscible with most of the commonly used solvents; slightly soluble in water. Sp. gr. 0.9214; f.p. -140.85°C; b.p. 12.5°C; critical point 187.2°C (52 atm; sp. gr. 0.33); vapor pressure 1000 mm (20°C); flash point (closed cup) -58°F. Autoignition temp. 966°F.

Derivation: (a) From ethylene and hydrogen chloride; (b) by passing hydrogen chloride into a solution of zinc chloride and ethyl alcohol.

Grades: Technical; U.S.P.

Containers: Cylinders; drums; tank cars.

Hazard: Highly flammable; severe fire and explosion risk. Flammable limits in air 3.8-15.4%. Moderately toxic; irritant to eyes. Tolerance, 1000 ppm in air. Safety data sheet available from Mfg. Chemists Assn., Washington, D.C.

Uses: Manufacture of tetraethyl lead and ethylcellulose; anesthetic; organic synthesis, alkylating agent; refrigeration; analytical reagent; solvent for phosphorus, sulfur, fats, oils, resins and waxes; insecticides.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

ethyl chloroacetal $ClCH_2CH(OC_2H_5)_2$.

Properties: Water-white liquid with pleasant odor; sp. gr. 1.022 (20°C); boiling range: 54-61°C (20 mm); 149-153°C; f.p. -32°C; flash point 117°F; refractive index 1.418 (20°C); soluble in alcohol and ethyl ether; insoluble in water. Combustible.

Hazard: Moderate fire risk. May be toxic.

ethyl chloroacetate $CCH_2ClCO_2C_2H_5$.

Properties: Water-white, mobile liquid; pungent, fruity odor. Decomposed by hot water and alkalis. Soluble in alcohol, benzene, and ether; insoluble in water. Sp. gr. 1.1585 (20°C); b.p. 144.2°C; vapor density 4.23-4.46; flash point 179°F; combustible; refractive index (n_D 20) 1.4227.

Derivation: (a) Action of chloroacetyl chloride on alcohol; (b) by treating chloroacetic acid with alcohol and sulfuric acid.

Containers: Bottles; carboys; 55-gal drums.

Hazard: Highly toxic by ingestion and inhalation.

Uses: Solvent; organic synthesis; military poison gas; vat dyestuffs.

Shipping regulations: (Air) Poison label.

ethylchlorocarbonate (ethyl chloroformate) $ClCOOC_2H_5$.

Properties: Water-white liquid with irritating odor; sp. gr. 1.135-1.139 (20/20°C); b.p. 93-95°C; refractive index (n 20/D) 1.3974. Flash point 61°F (closed cup). Decomposes in water and alcohol; soluble in benzene, chloroform, and ether.

Derivation: Reaction of carbon monoxide with gaseous chlorine, producing phosgene (COCl₂) which is then treated with anhydrous ethyl alcohol giving ethyl chlorocarbonate and splitting off hydrochloric acid.

Grades: Technical.

Hazard: Highly toxic; strong irritant to eyes and skin. Flammable, dangerous fire risk.

Use: Organic synthesis; intermediate in making diethyl carbonate, flotation agents, polymers, isocyanates.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

Legal label name: ethyl chloroformate.

ethyl chloroformate. Legal label name for ethyl chlorocarbonate.

ethylchlorosulfonate C₂H₅OCISO₂.

Properties: Colorless, oily liquid. Pungent odor; fumes in moist air. Decomposed by water. Attacks lead and tin, but copper mildly. Iron and steel not affected. Soluble in chloroform and ether, insoluble in water. Sp. gr. 1.379 (0°C); b.p. 153-153°C; vapor density 5 (air = 1); volatility 18,000 mg/cu m (20°C).

Derivation: (a) Action of fuming sulfuric acid on ethylchloroformate; (b) interaction of ethylene and chlorosulfonic acid.

Grades: Technical.

Hazard: Strong irritant to eyes and skin. Evolves phosgene when heated.

Uses: Organic synthesis; military poison gas.

ethyl cinnamate (ethyl phenylacrylate; cinnamyl ether) C₆H₅CH:CHCOOC₂H₅.

Properties: Limpid, oily liquid; strawberry-like odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.045-1.048; refractive index (n 20/D) 1.560; congealing point 7°C (min); b.p. 271°C. Combustible; low toxicity.

Derivation: Heating ethyl alcohol and cinnamic acid in presence of sulfuric acid.

Uses: Perfumery; flavoring extracts.

ethyl citrate. See triethyl citrate.

ethyl crotonate. CH₃CH:CHCOOC₂H₅.

Properties: Water-white solid or liquid. Characteristic pungent persistent odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.9207 (20/20°C); m.p. (solid) 45°C; b.p. (solid) 209°C, liquid 139°C; flash point 36°F; refractive index 1.4242 (20°C); wt/gal 7.65 lb (20°).

Hazard: Flammable, dangerous fire risk. Strong irritant.

Uses: Solvent and softening agent; lacquers; organic synthesis.

Shipping regulations: (liquid): (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

ethyl cyanide (propionitrile; propanenitrile) C₂H₅CN.

Properties: Mobile, colorless liquid; ethereal odor. Soluble in alcohol and water. Sp. gr. 0.7829 (20/20°C); refractive index (n 20/D) 1.3664; b.p. 97.4°C; f.p. -92.9°C; flash point 61°F (open cup).

Derivation: Heating barium ethyl sulfate and potassium cyanide, with subsequent distillation.

Containers: Iron drums; glass bottles.

Hazard: Highly toxic by ingestion and inhalation. Flammable, dangerous fire risk.

Uses: Solvent; dielectric fluid; intermediate.

Shipping regulations: (Rail) Not listed. (Air) Cyanide solutions, n.o.s., Poison label.

ethyl cyanoacetate (malonic ethyl ester nitrile) CNCH₂COOC₂H₅.

Properties: Colorless liquid; b.p. 206-208°C; f.p. -22.5°C; refractive index 1.41751 (20°C/D). Soluble in alcohol and ether; slightly soluble in water and alkaline solutions. Flash point 230°F. Combustible.

Derivation: Esterification of cyanoacetic acid with ethanol; reaction of an alkali cyanide and chloroacetic ethyl ester.

Method of purification: Vacuum distillation.

Grades: Reagent; technical.

Containers: Tin-lined steel drums.

Hazard: Toxic by ingestion and inhalation.

Uses: Organic synthesis; pharmaceuticals; dyes.

5-ethyl-5-cycloheptylbarbituric acid. See heptabarbitol.

ethylcyclohexane C₂H₅C₆H₁₁.

Properties: Colorless liquid; sp. gr. 0.787; boiling point 131.8°C; refractive index (n 20/D) 1.4330. Flash point 95°F; autoignition temp. 504°F.

Hazard: Flammable, moderate fire risk. Flammable limits in air, 0.9 to 6.6%.

Use: Organic synthesis.

ethylcyclopentane C₂H₅C₅H₉.

Properties: Colorless liquid. Sp. gr. 0.766; b.p. 103.5°C; refractive index (n 20/D) 1.4198. Autoignition temp. 504°F.

Hazard: Flammable, moderate fire risk. Flammable limits in air, 1.1 to 6.7%.

ethyl cyclopentanone-2-carboxylate. See 2-carbethoxycyclopentanone.

ethyl decanoate. See ethyl caprate.

ethyldichloroarsine (dichloroethylarsine) C₂H₅AsCl₂.

Properties: Colorless, mobile liquid. Becomes yellowish under the action of light and air. Fruit-like odor (high dilution). Decomposed by water. Attacks brass, but not iron (dry). Soluble in alcohol, benzene, ether, and water. Sp. gr. 1.742 (14°C); b.p. 156°C (decomposes); f.p. -65°C; coefficient of thermal expansion 0.0011; vapor density 6 (air = 1); volatility 20,000 mg/cu m (20°C); vapor pressure 2.29 mm (21.5°C).

Derivation: Chlorination of ethyl arsenious oxide.

Hazard: Highly toxic by ingestion, inhalation, skin absorption. Strong irritant.

Use: Military poison gas.

Shipping regulations: (Rail) Poison gas label. Not accepted by express; (Air) Not acceptable.

ethyl 4,4'-dichlorobenzilate. See chlorobenzilate.

ethyl dichlorophenoxyacetate. See 2,4-D.

ethyldichlorosilane C₂H₅SiHCl₂.

Properties: Colorless liquid; b.p. 75.5°C; sp. gr. 1.088 (25/25°C); flash point (COC) 30°F. Readily hydrolyzed by moisture, with the liberation of hydrogen and hydrochloric acid.

Derivation: By Grignard reaction of trichlorosilane and ethylmagnesium chloride.

Hazard: Flammable, dangerous fire risk. Strong irritant to eyes and skin.

Use: Intermediate for silicones.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

ethyldiethanolamine C₂H₅N(CH₂CH₂OH)₂.

Properties: Water-white liquid; sp. gr. 1.015 (20°C);

boiling range 246–252°C; odor amine. Flash point 255°F. Combustible. Low toxicity.

Uses: Solvent; detergents.

ethyldimethylmethane. See isopentane.

ethyldipropylmethane. See 4-ethylheptane.

S-ethyl di-N,N-propylthiocarbamate. See EPTC.

ethyl enanthate (ethyl oenanthat; ethyl heptanoate; cognac oil) $\text{CH}_3(\text{CH}_2)_5\text{COOC}_2\text{H}_5$.

Properties: Clear, colorless oil with fruity odor and taste; sp. gr. 0.87; b.p. 187°C; soluble in alcohol, chloroform and ether; insoluble in water. Low toxicity. Combustible.

Derivation: By heating oenanthic acid and ethyl alcohol in presence of sulfuric acid, and subsequent recovery by distillation.

Grade: Technical.

Containers: Iron drums; glass bottles.

Uses: Artificial cognac flavor; flavor for liqueurs and fruity-type soft drinks.

ethylene (bicaretted hydrogen, ethene) $\text{H}_2\text{C}=\text{CH}_2$.

5th highest-volume chemical produced in U.S. (1975).

Properties: Colorless gas with sweet odor and taste; freezing point -169°C; boiling point -103.9°C; flash point -213°F; sp. gr. of liquid at 0°C 0.610; vapor density (0°C) (air = 1) 0.975; critical temperature 9.5°C; autoignition temp. 842°F; critical pressure (absolute) 744 psi. Purity not less than 96% ethylene by gas volume, not more than 0.5% acetylene, not more than 4% methane and ethane; 13.4 cu ft/lb (15.6°C), slightly soluble in water, alcohol, and ethyl ether. An asphyxiant gas.

Derivation: Thermal cracking of propane, ethane, butane, naphtha, and refinery off-gases. Occurs naturally in plant organs and tissues.

Hazard: Extremely flammable; dangerous fire and explosion risk. Explosive limits in air: upper, 3% by vol., lower 32% by vol.

Grades: Technical (95% min.); 99.5% min.; 99.9 mole %; N.F.

Containers: Steel cylinders; tube trailers; tank cars (as liquid); pipeline; ocean tankers.

Uses: Polyethylene, polypropylene, ethylene oxide, ethylene dichloride, ethylene glycols, aluminum alkyls, vinyl chloride, vinyl acetate, ethyl chloride, ethylene chlorohydrin, acetaldehyde, linear alcohols, polystyrene, styrene, polyvinyl chloride, SBR, polyester resins, trichloroethylene, etc; refrigerant; welding and cutting of metals; anesthetic; in orchard sprays to accelerate fruit ripening.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not accepted on passenger planes.

ethylenedis(iminodiacetic acid). See ethylenediaminetetraacetic acid.

ethylene bis(oxyethylenenitrilo)tetraacetic acid. See ethylene glycol-bis(beta-aminoethyl ether)-N,N-tetraacetic acid.

ethylene bromide. See ethylene dibromide.

ethylene bromohydrin (glycol bromohydrin; 2-bromoethyl alcohol) $\text{BrCH}_2\text{CH}_2\text{OH}$.

Properties: Hygroscopic liquid; sp. gr. 1.7629 (20°C); b.p. 149–150°C (750 mm); refractive index 1.4915 (20°C). Soluble in most organic solvents and completely miscible with water, alcohol, or ether. Aqueous solutions have a sweet, burning taste. Hydrolysis

of aqueous solutions is accelerated by heat, acids, and alkalis. Combustible.

Derivative: Action of hydrobromic acid on ethylene oxide.

Hazard: Irritant to eyes and mucous membranes.

Use: Organic synthesis.

ethylene carbonate (glycol carbonate; dioxolone-2) $(-\text{CH}_2\text{O})_2\text{CO}$.

Properties: Colorless, odorless solid or liquid. M.p. 36.4°C; b.p. 248°C; sp. gr. (39/4°C) 1.3218; refractive index (n 50/D) 1.4158; flash point 290°F (O.C.). Miscible (40°) with water, alcohol, ethyl acetate, benzene, and chloroform. Soluble in ether, n-butanol, and carbon tetrachloride. Combustible. Low toxicity.

Derivation: Interaction of ethylene glycol and phosphoric acid.

Uses: Solvent for many polymers and resins; solvent extraction; synthesis of pharmaceuticals, rubber chemicals, textile finishing agents.

ethylene chloride. See ethylene dichloride.

ethylene chlorobromide. See sym-bromochloroethane.

ethylene chlorohydrin (2-chloroethyl alcohol; glycol chlorohydrin) $\text{ClCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid; faint ethereal odor. Soluble in most organic liquids and completely miscible with water. Sp. gr. 1.2045 (20/20°C); b.p. 128.7°C; refractive index (n 20/D) 1.4419; vapor pressure 4.9 mm (20°C); flash point 140°F (open cup); wt/gal 10.0 lb (20°C); coefficient of expansion 0.00089 (20°C); f.p. -62.6°C; viscosity 0.0343 poise (20°C). Autoignition temp. 797°F. Combustible.

Derivation: Action of hypochlorous acid on ethylene.

Grades: Anhydrous; 38%.

Containers: (36 to 40% grade) bottles; jugs; carboys; (anhydrous) tank cars.

Hazard: Toxic by ingestion and inhalation; skin absorption may be fatal. Strong irritant. Tolerance, 5 ppm in air. Moderate fire hazard. Penetrates ordinary rubber gloves and protective clothing (MCA).

Uses: Solvent for cellulose acetate, ethylcellulose; introduction of hydroxyethyl group in organic synthesis; to activate sprouting of dormant potatoes; mfg. of ethylene oxide and ethylene glycol.

Shipping regulations: (Air) Poison label.

ethylene cyanide (ethylene dicyanide; succinonitrile) $\text{C}_2\text{H}_2(\text{CN})_2$.

Properties: Colorless, waxy solid; soluble in alcohol, water, and chloroform. M.p. 57–57.5°C; b.p. 265.7°C; flash point 270°F. Combustible.

Derivation: Interaction of ethylene dibromide and potassium cyanide in presence of alcohol.

Hazard: Highly toxic. See cyanide.

Use: Organic synthesis.

Shipping regulations: (Rail, Air) Cyanides, dry. Poison label.

ethylene cyanohydrin (beta-hydroxypropionitrile) $\text{HOCH}_2\text{CH}_2\text{CN}$.

Properties: Straw-colored liquid; f.p. -46°C; b.p. 227–228°C (dec); sp. gr. 1.0404 (25.4°C); vapor pressure 0.08 mm (25°C); 20 mm (117°C). Miscible in all proportions with water, acetone, methyl ethyl ketone, ethanol, chloroform and diethyl ether. Insoluble in benzene, carbon tetrachloride, and naphtha. Combustible.

Derivation: Ethylene oxide and hydrocyanic acid.

Containers: Steel drums; tank cars.

Hazard: Toxic by ingestion.

Uses: Solvent for certain cellulose esters and inorganic salts. Organic intermediate for acrylates.

ethylenediamine (1,2-diaminoethane)

Properties: Colorless, alkaline liquid; ammonia odor. Strong base. Soluble in water, alcohol; slightly soluble in ether; insoluble in benzene. Readily absorbs carbon dioxide from air. Sp. gr. 0.8995 (20/20°C); wt/gal 7.50 lb (20°C); b.p. 116–117°C; vapor pressure 10.7 mm (20°C); m.p. 8.5°C; viscosity 0.0154 poise (25°C); flash point 93°F (closed cup); refractive index 1.4540 (26°C); pH of 25% solution 11.9 (25°C).

Derivation: Heating ethylene dichloride and ammonia, with subsequent distillation.

Method of purification: Redistillation.

Grades: Technical; U.S.P., 97%; solutions of various strengths.

Containers: 55-gal tin-lined drums; tank cars.

Hazard: Strong irritant to skin and eyes; toxic by inhalation and skin absorption. Tolerance 10 ppm in air. Flammable, moderate fire risk.

Uses: Fungicides; manufacture of chelating agents (EDTA); dimethylethylene-urea resins; chemical intermediate.

ethylenediamine carbamate. See "Diak."

ethylenediamine dihydroiodide ($-\text{CH}_2\text{NH}_2)_2 \cdot 2\text{HI}$.

Use: Feed additive.

ethylenediamine di-ortho-hydroxyphenylacetic acid [$-\text{CH}_2\text{NHCH}(\text{COOH})\text{C}_6\text{H}_4\text{OH}$]₂. A phenolic analog of ethylenediaminetetraacetic acid; m.p. 218°C (dec.). Insoluble in water and most organic solvents; soluble in mineral acid; also forms water-soluble alkali metal and ammonium salts. Used for chelating iron in mildly alkaline solutions.

ethylenediamine tartrate. Used to make piezo-electric crystals for control of electric frequencies, etc., as in television.

ethylenediaminetetraacetic acid (EDTA; ethylenebisiminodiacetic acid; ethylenedinitrilotetraacetic acid) ($\text{HOOCCH}_2)_2\text{NCH}_2\text{CH}_2\text{N}(\text{CH}_2\text{COOH})_2$. An organic chelating agent.

Properties: Colorless crystals, decomposing at 240°C. Slightly soluble in water; insoluble in common organic solvents; neutralized by alkali metal hydroxides to form a series of water-soluble salts containing from one to four alkali metal cations. Low toxicity.

Derivation: (a) Addition of sodium cyanide and formaldehyde to a basic solution of ethylenediamine (forms the tetrasodium salt); (b) heating tetrahydroxyethylethylenediamine with sodium or potassium hydroxide with cadmium oxide catalyst.

Uses: Detergents, liquid soaps, shampoos, agricultural chemical sprays; metal cleaning and plating; metal chelating agent; treatment of chlorosis; decontamination of radioactive surfaces; metal deactivator in vegetable oils, oil emulsions, pharmaceutical products, etc.; anticoagulant of blood; eluting agent in ion exchange magnesium soaps; in textiles to improve dyeing, change; to remove insoluble deposits of calcium and scouring, and detergent operations; antioxidant; clarification of liquids; analytical chemistry; spectrophotometric titration; aid in reducing blood cholesterol; in medicine to treat lead poisoning and calcinosis; food additive (preservative).

Note: A number of salts of EDTA are available with uses identical or similar to the acid. The U.S.P. salts are called edetates (calcium disodium, disodium edetates); others are usually abbreviated to EDTA (tetrasodium, trisodium EDTA). Other salts, known chiefly under trademarked names, are the sodium ferric, dihydrogen ferrous, and a range of disodium salts with magnesium, divalent cobalt, manganese, copper, zinc and nickel.

ethylenediaminetetraacetonitrile (EDTAN)

Properties: White crystalline solid; melting range 126–132°C; bulk density 48.4 lb/cu ft. Slightly soluble in water; soluble in acetone.

Hazard: May be toxic.

Uses: Chelating agent and intermediate.

ethylene dibromide (EDB; 1,2-dibromoethane; ethylene bromide) $\text{BrCH}_2\text{CH}_2\text{Br}$.

Properties: Colorless, nonflammable liquid. Sweetish odor. Emulsifiable. Miscible with most solvents and thinners; slightly soluble in water. Sp. gr. 2.17–2.18 (20°C); wt/gal 18.1 lb; b.p. 131°C; vapor pressure 17.4 mm (30°C); f.p. 9.10°C; refractive index 1.5337 (25°C); flash point, none.

Derivation: Action of bromine on ethylene.

Hazard: Toxic by inhalation, ingestion, and skin absorption. May be carcinogenic. Strong irritant to eyes and skin. Tolerance, 20 ppm in air.

Uses: Scavenger for lead in gasoline; grain fumigant; general solvent; waterproofing preparations; organic synthesis; fumigant for tree crops.

Shipping regulations: (Air) Poison label.

Note: May poison platinum catalysts.

ethylene dichloride (sym-dichloroethane; 1,2-dichloroethane; ethylene chloride; Dutch oil). 16th highest-volume chemical produced in U.S. (1975)

Properties: Colorless, oily liquid; chloroform-like odor; sweet taste. Stable to water, alkalis, acids, or active chemicals. Resistant to oxidation. Will not corrode metals. Miscible with most common solvents; slightly soluble in water. B.p. 83.5°C; f.p. –35.5°C; sp. gr. 1.2554 (20/4°C); wt/gal 10.4 lb; refractive index 1.444; flash point 56°F.

Derivation: Action of chlorine on ethylene with subsequent distillation, with metallic catalyst.

Grades: Technical; spectrophotometric.

Containers: Drums; tank cars.

Hazard: Toxic by ingestion, inhalation, skin absorption. Strong irritant to eyes and skin. Tolerance, 50 ppm in air. Flammable, dangerous fire risk; explosive limits in air 6 to 16%. Safety data sheet available from Mfg. Chemists Assn., Washington, D.C.

Uses: Vinyl chloride (Wulff process); solvent; lead scavenger in antiknock gasoline; paint, varnish and finish removers; metal degreasing; soaps and scouring compounds; wetting and penetrating agents; organic synthesis; ore flotation.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

ethylene dicyanide. See ethylene cyanide.

ethylenedinitrilotetraacetic acid. See ethylenediaminetetraacetic acid.

ethylenedinitrilotetra-2-propanol. See N,N,N',N'-tetrakis(2-hydroxypropyl) ethylenediamine.

ethylene diphenyldiamine. See N,N-diphenylethylenediamine.

1,1'-ethylene-2,2'-dipyridinium dibromide. See diquat.

ethylene glycol (ethylene alcohol; glycol; 1,2-ethanediol). $\text{CH}_2\text{OHCH}_2\text{OH}$. The simplest glycol.

Properties: Clear, colorless, syrupy liquid; sweet taste; hygroscopic; lowers freezing point of water. Relatively non-volatile. Odorless. Soluble in water, alcohol, and ether. Sp. gr. 1.1155 (20°C); b.p. 197.2°C; f.p. -13.5°C; wt/gal 9.31 lb (15/15°C); refractive index 1.430 (25°C); flash point 240.8°F; combustible; autoignition temp. 775°F.

Derivation: (1) Air oxidation of ethylene followed by hydration of the ethylene oxide formed; (2) heating ethylene chlorohydrin with a solution of an alkali carbonate or bicarbonate; (3) from formaldehyde, water and carbon monoxide, with hydrogenation of the resulting glycolic acid; (4) acetoxylation (q.v.); (5) from carbon monoxide and hydrogen (synthesis gas) from coal gasification. Methods (2) and (3) are obsolescent; methods (4) and (5) are recent innovations.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Toxic by ingestion and inhalation; lethal dose reported to be 100 cc. Tolerance (vapor), 100 ppm in air.

Uses: Coolant and antifreeze; asphalt-emulsion paints; heat-transfer agent in refrigeration and electron tubes; low-pressure laminates; brake fluids; glycol diacetate; polyester fibers and films; low-freezing dynamite; solvent; extractant for various purposes; solvent mixtures for cellulose esters and ethers, especially cellophane; cosmetics (up to 5%); lacquers; alkyd resins; printing inks; wood stains; adhesives; leather dyeing; textile processing; tobacco; ingredient of deicing fluid for airport runways.

ethylene glycol-bis(beta-aminoethyl ether)-N,N-tetraacetic acid (ethylene bis(oxyethylenenitrilo)tetraacetic acid) $[-\text{CH}_2\text{OC}_2\text{H}_4\text{N}(\text{CH}_2\text{COOH})_2-]_n$. Crystals; m.p. 241° (dec.). Soluble in water.

Use: Chelating agent.

ethylene glycol bis(mercaptopropionate). See glycol dimercaptopropionate.

ethylene glycol bithioglycolate. See glycol dimercaptoacetate.

ethylene glycol diacetate (glycol diacetate)

$\text{CH}_3\text{COOCH}_2\text{CH}_2\text{OOCCH}_3$.

Properties: Colorless liquid; faint odor. Soluble in alcohol, ether, benzene; slightly soluble in water (10%). Sp. gr. 1.1063 (20/20°C); b.p. 190.5°C; vapor pressure 0.3 mm (20°C); flash point 205°F (o.c.); wt/gal 9.2 lb (20°C); f.p. -41.5°C; refractive index (n_D 20) 1.415. Combustible. Low toxicity.

Derivation: (a) Ethylene glycol and acetic acid; (b) ethylene dichloride and sodium acetate.

Uses: Solvent for cellulose esters and ethers; resins; lacquers; printing inks; perfume fixative; non-discoloring plasticizer for ethyl and benzyl cellulose.

ethylene glycol dibutyl ether $\text{C}_4\text{H}_9\text{OC}_2\text{H}_4\text{OC}_4\text{H}_9$.

Properties: Practically colorless liquid; slight odor. Slightly soluble in water; sp. gr. 0.8374 (20/20°C); 7.0 lb/gal (20°C); b.p. 203.1°C; vapor pressure 0.09 mm (20°C); freezing point -69.1°C; flash point 185°F. Combustible.

Containers: 1-gal cans; 5-, 55-gal drums

Uses: High-boiling inert solvent, specialized solvent and extraction applications

ethylene glycol dibutyrate (glycol dibutyrate)

$(-\text{CH}_2\text{OCOC}_4\text{H}_9)_2$.

Properties: Colorless liquid; sp. gr. (0°C) 1.024; refractive index (25°C), 1.424; b.p. 240°C; f.p. less than -80°C; solubility in water, 0.050% by weight. Combustible.

Use: Plasticizer.

ethylene glycol diethyl ether $\text{C}_2\text{H}_5\text{OCH}_2\text{CH}_2\text{OC}_2\text{H}_5$.

Properties: Colorless liquid; slight odor; stable. Sp. gr. 0.8417 (20/20°C); b.p. 121.4°C; vapor pressure 9.4 mm (20°C); flash point 95°F; wt/gal 7 lb (20°C); f.p. -74°C. Immiscible with water.

Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Hazard: Flammable, moderate fire risk.

Uses: Organic synthesis (reaction medium); solvent and diluent for detergents.

ethylene glycol diformate (glycol diformate)

$\text{HCOOCH}_2\text{CH}_2\text{OOCH}$.

Properties: Water-white liquid, soluble in water, alcohol and ether. Sp. gr. 1.2277 (20/20°C); 10.2 lb/gal (20°C); b.p. 177.1°C; flash point 200°F; combustible. Vapor pressure 0.5 mm (20°C); f.p. -10°C. Hydrolyzes slowly, liberating formic acid.

Hazard: Moderately toxic.

Use: Embalming fluids.

ethylene glycol dimethyl ether (GDME; glycol dimethyl ether; glyme; 1,2-dimethoxyethane)

$\text{CH}_3\text{OCH}_2\text{CH}_2\text{OCH}_3$.

Properties: Water-white liquid with a mild odor. Sp. gr. 0.8683 (20°C); b.p. 85.2°C; f.p. -69°C; refractive index 1.3792 (20/D); flash point 34°F (open cup); soluble in water and hydrocarbons; pH 8.2.

Hazard: Flammable, dangerous fire risk.

Use: Solvent.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

ethylene glycol dinitrate. A freezing-point depressant for nitroglycerine, used in low-freezing dynamites.

Hazard: Toxic; can penetrate the skin. Tolerance, 0.2 ppm in air.

ethylene glycol dipropionate (glycol propionate; glycol dipropionate) $(-\text{CH}_2\text{OCOC}_3\text{H}_7)_2$. Liquid; sp. gr.

(15°C) 1.054; refractive index (25°C) 1.419; b.p. 211°C; f.p. less than -80°C; solubility in water, 0.16% by weight. Combustible.

Use: Plasticizer.

ethylene glycol monoacetate (glycol monoacetate)

$\text{HOCH}_2\text{CH}_2\text{OOCCH}_3$.

Properties: Colorless liquid; almost odorless; soluble in alcohol, ether, benzene, and toluene; partially soluble in water. B.p. 181-182°C; sp. gr. 1.108. Flash point 215°F. Combustible. Low toxicity.

Derivation: (a) Heating ethylene glycol with acetic acid (glacial) or acetic anhydride; (b) passing ethylene oxide into hot acetic acid containing sodium acetate or sulfuric acid.

Use: Solvent for nitrocellulose, cellulose acetate, camphor.

ethylene glycol monobenzyl ether (benzyl "Cellosolve"). $\text{C}_6\text{H}_5\text{CH}_2\text{OC}_2\text{H}_4\text{OH}$

Properties: Water-white liquid, faint rose-like odor; sp. gr. 1.070 (20/20°C); b.p. 255.9°C; vapor pressure 0.02 mm (20°C); flash point 265°F; wt 8.9 lb/gal (20°C). Combustible, autoignition temp. 665°F.

Containers: Glass jugs; glass-stoppered carboys.

Hazard: Moderately toxic by ingestion.

Uses: Solvent for cellulose acetate, dyes, inks, resins, perfume fixative; organic synthesis (selective hydroxyethylating agent); coating compositions for leather, paper, and cloth; lacquers.

ethylene glycol monobutyl ether (2-butoxyethanol, butyl "Cellosolve"). $\text{HOCH}_2\text{CH}_2\text{OC}_4\text{H}_9$.

Properties: Colorless liquid; mild odor; high dilution ratio with petroleum hydrocarbons; soluble in alcohol and water. B.p. 171.2°C ; sp. gr. 0.9019 ($20/20^\circ\text{C}$); wt/gal 7.51 lb (20°C); refractive index 1.4190 (25°C); vapor pressure 0.76 mm (20°C); flash point 142°F . Autoignition temp. 472°F . Combustible. Low toxicity.

Grade: Technical.

Containers: 1-gal cans; 5- and 55-gal drums; tank cars and trucks.

Hazard: Moderately toxic. Tolerance, 50 ppm in air.

Uses: Solvent for nitrocellulose resins; spray lacquers; quick-drying lacquers; varnishes; enamels; dry-cleaning compounds; varnish removers; textile (preventing spotting in printing or dyeing); mutual solvent for "soluble" mineral oils to hold soap in solution and to improve the emulsifying properties.

ethylene glycol monobutyl ether acetate (butyl "Cellosolve" acetate). $\text{C}_4\text{H}_9\text{OCH}_2\text{CH}_2\text{OOCCH}_3$.

Properties: Colorless liquid; fruity odor. Soluble in hydrocarbons and organic solvents; insoluble in water. B.p. 192.3°C ; sp. gr. 0.9424 ($20/20^\circ\text{C}$); f.p. -63.5°C ; flash point 190°F . Combustible. Low toxicity.

Grade: Technical.

Containers: 1-, 5-, 55-gal drums; tank cars; tank trucks.

Uses: High-boiling solvent for nitrocellulose lacquers, epoxy resins, multicolor lacquers; film coalescing aid for polyvinyl acetate latex.

ethylene glycol monobutyl ether laurate (butoxyethyl laurate) $\text{C}_{11}\text{H}_{23}\text{COO}(\text{CH}_2)_2\text{OC}_4\text{H}_9$.

Properties: Liquid; sp. gr. (25°C) 0.985; f.p. -10 to -15°C ; insoluble in water. Combustible. Probably low toxicity.

Use: Plasticizer.

ethylene glycol monobutyl ether oleate (butoxyethyl oleate) $\text{C}_{17}\text{H}_{33}\text{COOCH}_2\text{CH}_2\text{OC}_4\text{H}_9$.

Properties: Liquid; sp. gr. (25°C) 0.892; f.p. less than -45°C ; insoluble in water. Combustible. Probably low toxicity.

Use: Plasticizer.

ethylene glycol monobutyl ether stearate (butoxyethyl stearate) $\text{C}_{17}\text{H}_{35}\text{COOC}_2\text{H}_4\text{OC}_4\text{H}_9$.

Properties: Colorless liquid. Sp. gr. 0.882 (20°C); (25°C) 1.446; vapor pressure < 0.01 mm (20°C); b.p. 210 – 233°C (4 mm); m.p. 16.5°C ; insoluble in water. Combustible.

Uses: Plasticizer and solvent.

ethylene glycol monoethyl ether (2-ethoxyethanol; "Cellosolve" solvent). $\text{HOCH}_2\text{CH}_2\text{OC}_2\text{H}_5$.

Properties: Colorless liquid, practically odorless; b.p. 135.6°C ; sp. gr. 0.9311 ($20/20^\circ\text{C}$); wt/gal 7.74 lb (20°C); refractive index 1.4060 (25°C); flash point 120°F ; pour point $< 100^\circ\text{F}$. Autoignition temp. 460°F . Miscible with hydrocarbons and water. Combustible.

Grade: Technical.

Containers: 1-gal cans; 5- and 55-gal drums; tank cars.

Hazard: Moderate fire risk. Moderately toxic; absorbed by skin. Tolerance, 100 ppm in air.

Uses: Solvent for nitrocellulose, natural and synthetic

resins; mutual solvent for formulation of soluble oils; lacquers and lacquer thinners; dyeing and printing textiles; varnish removers; cleaning solutions; leather; anti-icing additive for aviation fuels.

ethylene glycol monoethyl ether acetate ("Cellosolve" acetate). $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{OC}_2\text{H}_5$.

Properties: Colorless liquid; pleasant, ester-like odor; b.p. 156.3°C ; sp. gr. 0.9748 ($20/20^\circ\text{C}$); wt/gal 8.1 lb (20°C); refractive index 1.4030 (25°C); viscosity 1.32 cp. (20°C); flash point 120°F ; f.p. -61.7°C ; vapor pressure 2 mm (20°C). Miscible with aromatic hydrocarbons; slightly miscible with water. Combustible.

Grade: Technical.

Containers: 1-gal cans; 5- and 55-gal drums; tank cars up to 10,000 gals.

Hazard: Moderately toxic by ingestion; moderate fire risk.

Uses: Solvent for nitrocellulose, oils and resins; retards "blushing" in lacquers; varnish removers; wood stains; textiles; leather.

ethylene glycol monoethyl ether laurate

$\text{C}_{11}\text{H}_{23}\text{COO}(\text{CH}_2)_2\text{OC}_2\text{H}_5$.

Properties: Liquid; sp. gr. (25°C) 0.89; f.p. -7 to -11°C ; insoluble in water. Combustible.

Uses: Plasticizer.

ethylene glycol monoethyl ether ricinoleate

$\text{C}_{17}\text{H}_{32}(\text{OH})\text{COO}(\text{CH}_2)_2\text{OC}_2\text{H}_5$.

Properties: Liquid; sp. gr. (25°C) 0.929; f.p. less than -10°C ; insoluble in water. Combustible.

Use: Plasticizer.

ethylene glycol monohexyl ether (n-hexyl "Cellosolve").

$\text{C}_6\text{H}_{13}\text{OCH}_2\text{CH}_2\text{OH}$.

Properties: Water-white liquid; sp. gr. 0.8887 ($20/20^\circ$); 7.4 lb/gal (20°C); b.p. 208.1°C ; vapor pressure 0.05 mm (20°C); f.p. -50.1°C ; flash point 195°F . Combustible. Low toxicity.

Containers: 1-gal can; 5-, 55-gal drums.

Use: High-boiling solvent.

ethylene glycol monomethyl ether (2-methoxyethanol, methyl "Cellosolve"). $\text{CH}_3\text{OCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid; mild, agreeable odor; stable; miscible with hydrocarbons, alcohols, ketones, glycols, water. B.p. 124.5°C ; sp. gr. 0.9663 ($20/20^\circ\text{C}$); wt/gal 8.0 lb (20°C); refractive index 1.4021 (20°C); flash point 110°F ; f.p. -85.1°C . Autoignition temp. 551°F . Combustible.

Derivation: From ethylene oxide.

Grade: Technical.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars; up to 10,000 gal.

Hazard: Moderately toxic by ingestion and inhalation; moderate fire risk. Tolerance, 25 ppm in air.

Uses: Solvent for nitrocellulose, cellulose acetate, alcohol-soluble dyes, natural and synthetic resins; solvent mixtures; lacquers; enamels; varnishes; leather; perfume fixative; wood stains; sealing moisture-proof cellophane; jet fuel deicing additive.

ethylene glycol monomethyl ether acetate (methyl "Cellosolve" acetate). $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{OCH}_3$.

Properties: Colorless liquid; pleasant odor; stable; miscible with common organic solvents; soluble in water. Sp. gr. 1.0067 ($20/20^\circ\text{C}$); b.p. 145°C ; vapor pressure 2 mm (20°C); flash point 120°F ; wt/gal 8.4 lb (20°C); f.p. -65.1°C . Combustible.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Hazard: Moderately toxic by ingestion and inhalation; moderate fire risk. Tolerance, 25 ppm in air.

Uses: Solvent for nitrocellulose, cellulose acetate,

various gums, resins, waxes, oils; textile printing; photographic film; lacquers; dopes.

ethylene glycol monomethyl ether acetyl ricinoleate
 $C_{17}H_{32}(OCOCH_3)COOCH_2CH_2OCH_3$.

Properties: Liquid; sp. gr. 0.966; refractive index 1.460; boiling range 220–260°C; f.p. less than –60°C; flash point 425°F; insoluble in water. Combustible. Low toxicity.

Use: Plasticizer.

ethylene glycol monomethyl ether ricinoleate

$C_{17}H_{32}(OH)COOCH_2CH_2OCH_3$.

Properties: Liquid; sp. gr. (25°C) 0.935; f.p. less than –60°C; insoluble in water. Combustible. Low toxicity.

Use: Plasticizer.

ethylene glycol monomethyl ether stearate

$C_{17}H_{33}COOCH_2CH_2OCH_3$.

Properties: Liquid; sp. gr. 0.890; m.p. 21°C; insoluble in water. Combustible. Low toxicity.

Use: Plasticizer.

ethylene glycol monoethyl ether

$C_4H_9CHC_2H_5CH_2OCH_2CH_2OH$.

Properties: Colorless, odorless liquid; b.p. 228.3°C; sp. gr. 0.8859; flash point 230°F; vapor pressure 0.02 mm (20°C). Combustible. Low toxicity.

Uses: Solvent for cellulose esters; plasticizers.

ethylene glycol monophenyl ether (2-phenoxyethanol, phenyl "Cellosolve"). $C_6H_5OCH_2CH_2OH$.

Properties: Colorless liquid; faint aromatic odor; stable in presence of acids and alkalis; partially soluble in water. Sp. gr. 1.1094 (20/20°C); b.p. 244.9°C; f.p. 14°C; vapor pressure <0.01 mm (20°C); flash point 250°F; phenol 0.3% (max.); 9.2 lb/gal. Combustible; low toxicity.

Grade: Technical.

Containers: 1-, 5-gal cans; 55-gal drums.

Uses: Solvent for cellulose acetate, dyes; inks, resins; perfume and soap fixative; bactericidal agent; organic synthesis of plasticizers, germicides, perfume materials and pharmaceuticals.

ethylene glycol monoricinoleate

$C_{17}H_{32}(OH)COO(CH_2)_2OH$.

Properties: Clear, moderately viscous, pale yellow liquid; mild odor; miscible with most organic solvents. Sp. gr. 0.965 (25/25°C); saponification value 170; hydroxyl value 270; solidifies at –20°C; insoluble in water. Combustible. Low toxicity.

Derivation: Castor oil and ethylene glycol.

Grade: Technical.

Containers: 5-gal cans; 55-gal drums.

Uses: Plasticizer; greases; urethane polymers.

ethylene glycol monostearate (glycol stearate)

$C_{17}H_{33}COO(CH_2)_2OH$.

Properties: Yellow waxy solid; m.p. 57–60°C; sp. gr. 0.96 (25°C); soluble in alcohol, hot ether, and acetone; insoluble in water. Combustible.

ethylene glycol silicate (HOCH₂CH₂)₂SiO₄.

Properties: Colorless liquid; slowly hydrolyzed by acids; miscible with water.

Uses: Nonvolatile bonding agent for pigments; weather-proofing paints for protecting concrete, stone, brick, and plastic surfaces.

ethylene-hexene-1-copolymer. Product developed especially for use in blow-molded items; other possible

uses are coatings for pipe, wire, and cables, sheeting, and monofilament.

ethylene hydrate. See gas hydrate.

ethylenimine (aziridine; ethylenimine) $H_2C\overline{N}HCH_2$.

Properties: Clear, colorless liquid with amine odor; b.p. 57°C; sp. gr. 0.832 (20/4°C); refractive index 1.4123 (25°C); f.p. –78°C; flash point 12°F. Miscible with water and most organic solvents. Autoignition temp. 612°F.

Containers: Steel cylinders; plastic-lined drums.

Derivation: From ethylene dichloride and ammonia by use of an acid acceptor.

Hazard: Highly toxic and corrosive. Absorbed by skin. Tolerance, 0.5 ppm in air. Dangerous fire and explosion hazard. Flammable limits in air 3.6 to 46%. Causes tumors in experimental animals; worker exposure should be minimized. A known carcinogen.

Uses: Intermediate and monomer for fuel oil and lubricant refining, ion exchange, protective coatings, including paper and textiles, pharmaceuticals, adhesives, polymer stabilizers, surfactants. Alkyl substituted forms, called alkyl aziranes, are used as intermediates and for microbial control; aziridiny compounds are also used as polymers and intermediates.

Shipping regulations: (inhibited) (Rail) Red label.

(Air) Flammable Liquid label. Not accepted on passenger planes. (uninhibited) (Rail) Not listed. (Air) Not acceptable.

ethylene-maleic anhydride copolymer.

Properties: Fine, water-soluble powder available as both straight-chain and crosslinked polymers in a variety of molecular weights. May be in form of free acid, sodium or amide-ammonium salts. Reacts readily with alcohols and amines.

Uses: Oil-well drilling muds; stabilizers and thickeners in liquid detergents, cosmetics, paints; textile sizes; printing inks; suspending agents; ceramic binders.

ethylenenaphthalene. See acenaphthene.

ethylene oxide (epoxyethane; oxirane) CH_2CH_2O . 26th highest-volume chemical produced in U.S. (1975).

Properties: Colorless gas at room temperature; soluble in organic solvents; miscible with water in all proportions; f.p. –111.3°C; b.p. 10.73°C; sp. gr. (20/20°C) 0.8711; wt/gal (20°C) 7.25 lb; viscosity (0°C) 0.32 cp; flash point (TOC) below 0°F; autoignition temp. 804°F.

Derivation: (a) oxidation of ethylene in air or oxygen with silver catalyst; (b) action of an alkali on ethylene chlorohydrin.

Grades: Technical; pure (99.7%).

Containers: Cylinders; tank cars.

Hazard: Highly flammable; dangerous fire and explosion risk. Flammable limits in air 3 to 100%. Toxic; irritating to eyes and skin. Tolerance, 50 ppm in air. Safety data sheet available from Mfg. Chemists Assn., Washington, D.C.

Uses: Manufacture of ethylene glycol and higher glycols; surfactants; acrylonitrile; ethanolamines; petroleum demulsifier; fumigant; rocket propellant; industrial sterilant, e.g., medical plastic tubing.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

ethylene-propylene-diene monomer. See ethylene-propylene terpolymer.

ethylene-propylene rubber (EPR). An elastomer made by the stereospecific copolymerization of ethylene and propylene. Has no unsaturation; cannot be vulcanized with sulfur, but can be cured with peroxides.

ethylene-propylene terpolymer (EPT, EPDM). An elastomer based on stereospecific linear terpolymers of ethylene, propylene and small amounts of a non-conjugated diene; e.g., a cyclic or aliphatic diene (hexadiene, dicyclopentadiene, or ethylidene norbornene). The unsaturated part of the polymer molecule is pendant from the main chain, which is completely saturated. Can be vulcanized with sulfur.

Properties of vulcanizate: Light cream to white; excellent resistance to ozone, to high and low temperatures (from -60 to $+300^{\circ}\text{F}$), and to acids and alkalis; good electrical resistance. Susceptible to attack by oils.

Uses: Automotive parts; gaskets; cable coating; mechanical rubber products; cover strips for tire sidewalls; tire tubes; safety bumpers; coated fabrics; footwear; wire and cable coating. See also "Nordel."

ethylene thiourea $\text{NHCH}_2\text{CH}_2\text{NHCS}$. (2-imidazolidinethione).

Properties: White to pale green crystals, faint amine odor; m.p. $199-204^{\circ}\text{C}$; slightly soluble in cold water; very soluble in hot water; slightly soluble at room temperature in methanol, ethanol, acetic acid, naphtha.

Containers: Fiber drums (150 lb).

Uses: Electroplating baths; intermediate for antioxidants, insecticides; fungicides, vulcanization accelerators, dyes, pharmaceuticals, synthetic resins.

ethylene urea (2-imidazolidinone; dihydro-2(3)-imidazolone; 2-imidazolidone) $\text{CH}_2\text{CH}_2\text{NHCONH}$.

Properties: White lumpy powder; odorless; m.p. $125-128^{\circ}\text{C}$; soluble in water.

Use: Drip-dry fabrics and textiles. See dimethylolethylene urea.

ethylene-vinyl acetate copolymer (EVA). An elastomer used to improve adhesion properties of hot-melt and pressure-sensitive adhesives; also for conversion coatings and thermoplastics. See also "Ultrathene."

ethylenimine. See ethyleneimine.

N-ethylethanolamine (ethylaminoethanol)

$\text{C}_2\text{H}_5\text{NHCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid. Sp. gr. 0.914 (20°C); boiling range $167-169^{\circ}\text{C}$; odor amine. Soluble in water, alcohol, and ether. Flash point 160°F (open cup). Combustible. Low toxicity.

Containers: 5-gal cans; 55-gal drums; tank cars.

Uses: Solvent; intermediate.

ethyl ether (ether, diethyl ether; sulfuric ether; ethyl oxide; diethyl oxide) $(\text{C}_2\text{H}_5)_2\text{O}$.

Properties: Colorless, volatile, mobile liquid; hygroscopic; aromatic odor; burning and sweet taste. B.p. 34.5°C ; freezing point -116.2°C ; sp. gr. 0.7147 ($20/20^{\circ}\text{C}$); surface tension 17.0 dynes/cm (20°C); refractive index ($n_{20/D}$) 1.3526; viscosity 0.00233 poise (20°C); vapor pressure 442 mm (20°C); specific heat 0.5476 cal/g (30°C); flash point -49°F ; autoignition temp. 356°F ; latent heat of evaporation 83.96 cal/g at b.p.; electric conductivity 4×10^{-13} recip. ohms (25°C); wt/gal 6 lb (20°C). Soluble in alcohol, chloroform, benzene, solvent naphtha, and oils; slightly soluble in water.

Derivation: By the action of sulfuric acid on ethyl alcohol or ethylene, followed by distillation.

Method of purification: Rectification, dehydration, treatment with alkali and charcoal.

Grades: U.S.P. (for anesthesia); A.C.S. Reagent; A.C.S. Absolute; C.P.; concentrated; U.S.P. 1880; washed; motor; electronic.

Containers: 30-, 100-lb drums; tank trucks.

Hazard: Extremely flammable, severe fire and explosion hazard when exposed to heat or flame. Forms explosive peroxides. Explosive limits in air 1.85 to 48%. CNS depressant by inhalation and skin absorption. Tolerance, 400 ppm in air. Safety data sheet available from Mfg. Chemists Assn., Washington, D.C.

Uses: Manufacture of ethylene and other chemical synthesis; industrial solvent (smokeless powder); analytical chemistry; anesthetic; perfumery; extractant.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

ethyl 3-ethoxypropionate. $\text{C}_2\text{H}_5\text{OOCCH}_2\text{CH}_2\text{OC}_2\text{H}_5$.

Properties: Liquid; sp. gr. (20°C) 0.9496; b.p. 170.1°C ; vapor pressure (20°C) 0.9 mm; sets to glass at -100°C ; slightly soluble in water. Flash point 180°F (O.C.). Combustible.

Uses: Intermediate for vitamin B₁; other chemicals.

ethylethylene. See butene-1.

ethylethyleneimine (2-ethylaziridine) $\text{C}_2\text{H}_5\text{HCNHCH}_2$.

Properties: Water-white liquid; b.p. $87-90^{\circ}\text{C}$; sp. gr. ($25/25^{\circ}\text{C}$) 0.812-0.816.

Hazard: Toxic.

Uses: Organic intermediate whose derivatives are used in the textile, paper, rubber and pharmaceutical industries.

ethyl ferrocenolate (ferrocenecarboxylic acid ethyl ester) $(\text{C}_5\text{H}_4\text{COOC}_2\text{H}_5)_2\text{Fe}$. Orange crystalline solid; m.p. $63-64^{\circ}\text{C}$. Used as an intermediate.

ethylfluoroformate FCOOC_2H_5 .

Properties: Liquid. Sp. gr. 1.11 (33°C); b.p. 57°C .

Derivation: Interaction of ethylchloroformate and a reactive fluoride.

Hazard: Highly toxic; strong irritant.

Shipping regulations: (Rail, Air) Not listed.

ethylfluorosulfonate $\text{C}_2\text{H}_5\text{OFSO}_2$.

Properties: Liquid. Ethereal odor.

Hazard: Highly toxic; strong irritant.

ethyl formate HCOOC_2H_5 .

Properties: Water-white, unstable liquid. Pleasant, aromatic odor. Miscible with benzene, ether, alcohol; slightly soluble in water; gradual decomposition in water. Flash point -4°F (closed cup); explosive limits in air, 2.8-13.5%. Autoignition temp. 851°F . Sp. gr. 0.9236 ($20/20^{\circ}\text{C}$); f.p. -80.5°C ; b.p. 54.3°C ; vapor pressure 200 mm (20.6°C), 300 mm (30.2°C); wt/gal 7.61 lb (68°F); refractive index 1.35975 (20°C).

Derivation: Heating ethyl alcohol with formic acid in presence of sulfuric acid.

Grades: Technical; F.C.C.

Hazard: Highly flammable; dangerous fire and explosion risk. Narcotic and irritating to skin and eyes. Tolerance, 100 ppm in air. Use in foods restricted to 0.0015%.

Uses: Solvent for cellulose nitrate and acetate; acetone substitute; fumigant; larvicide; synthetic flavors; synthetic resins; medicine.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

ethyl 3-formylpropionate $C_7H_5O_3C_2H_4C(O)H$.

Properties: Liquid; sp. gr. 1.0625 (20/20°C); b.p. 190.9°C; f.p. less than -80°C; wt/gal 8.9 lb; flash point 200°F. Somewhat soluble in water. Combustible.

Uses: Solvent for lacquers; antibiotic extraction; acetic acid separation; coalescing acids for emulsion paints.

ethyl furoate $C_4H_3OCO_2C_2H_5$.

Properties: White leaflets or prisms. Insoluble in water; soluble in alcohol and ether. Sp. gr. 1.1174 (20.8/4°C); m.p. 34°C.

4-ethylheptane (ethyldipropylmethane)

$CH_3(CH_2)_2CHC_2H_5(CH_2)_2CH_3$.

Properties: Colorless liquid. Sp. gr. 0.730; b.p. 141.2°C; refractive index (n_D 20) 1.4109. Combustible.

Grade: Technical.

Use: Organic synthesis.

ethyl heptanoate. See ethyl enanthate.

ethyl heptazine. See ethoheptazine.

2-ethylhexaldehyde (butylethylacetaldehyde; octyl aldehyde; 2-ethylhexanal) $C_8H_{17}CH(C_2H_5)CHO$.

Properties: Colorless, high-boiling liquid. Mild odor. Miscible with most organic solvents; slightly soluble in water. Sp. gr. 0.8205 (20°C); b.p. 163.4°C; vapor pressure 1.8 mm (20°C); flash point 125°F (open cup); wt/gal 6.8 lb. Combustible.

Grades: Technical.

Hazard: Moderate fire risk.

Uses: Organic synthesis; perfumes.

2,2'-(2-ethylhexamido)diethyl di(2-ethylhexoate) ("Flexol" 8N8) $(C_7H_{15}OCOC_2H_4)_2NCOC_2H_5$.

Properties: Light-colored liquid; sp. gr. 0.9564 (20/20°C); 8.0 lb/gal (20°C); b.p. 256°C (5 mm); flash point 420°F; vapor pressure 0.60 mm (200°C); insoluble in water; viscosity 139.2 cp (20°C). Combustible.

Use: Plasticizer.

2-ethylhexanal. See 2-ethylhexaldehyde.

2-ethylhexanediol-1,3 (ethohexadiol; 2-ethyl-3-propyl-1,3-propanediol) $C_7H_{17}CH(OH)CH(C_2H_5)CH_2OH$.

Properties: Colorless, slightly viscous, odorless liquid; hygroscopic. Sp. gr. 0.9422 (20/20°C); 7.8 lb/gal (20°C); b.p. 244°C; vapor pressure less than 0.01 mm (20°C); flash point 260°F; freezing point below -40°C; refractive index 1.4465-1.4515; viscosity 323 cp (20°C); soluble in alcohol and ether; partially soluble in water. Low toxicity; combustible.

Grades: U.S.P. (as ethohexadiol); industrial.

Uses: Insect repellent; cosmetics; vehicle and solvent in printing inks; medicine; chelating agent for boric acid.

ethyl hexanoate. See ethyl caproate.

2-ethylhexanol. See 2-ethylhexyl alcohol.

2-ethylhexenal. See 2-ethyl-3-propylacrolein.

2-ethyl-1-hexene $CH_3(CH_2)_3(C_2H_5)C=CH_2$.

Properties: Colorless liquid; sp. gr. 0.7270 (20/4°C); b.p. 120°C; refractive index (n_D 20) 1.4157; soluble in alcohol, acetone, ether, petroleum, coal-tar solvents; insoluble in water. Combustible.

Grade: 95% min purity.

Hazard: Moderately toxic by ingestion and inhalation.

Use: Organic synthesis of flavors, perfumes, medicines, dyes, resins.

ethyl hexoate. See ethyl caproate.

2-ethylhexoic acid (butylethylacetic acid)

$C_8H_{17}CH(C_2H_5)COOH$.

Properties: Mild-odored liquid; slightly soluble in water; sp. gr. 0.9077 (20/20°C); 7.6 lb/gal (20°C); b.p. 226.9°C; vapor pressure 0.03 mm (20°C); freezing point -83°C; viscosity 7.73 cp (20°C); acid number 370; flash point 260°F; combustible.

Grade: 99%.

Containers: Drums; tank cars and trucks.

Uses: Paint and varnish driers (metallic salts). Ethylhexoates of light metals are used to convert some mineral oils to greases. Its esters are used as plasticizers.

2-ethylhexyl. An eight-carbon radical of the formula $CH_3(CH_2)_3CH(C_2H_5)CH_2-$. Many of its compounds were formerly called octyl (q.v.).

2-ethylhexyl acetate

$CH_3COOCH_2CHC_2H_5C_4H_9$.

Properties: Water-white, stable liquid; very slightly soluble in water; miscible with alcohol. Sp. gr. 0.8733 (20°C); b.p. 198.6°C; f.p. -93°C; vapor pressure 0.4 mm (20°C); flash point 180°F; wt/gal 7.3 lb (20°C). Combustible; low toxicity.

Grade: Technical (about 95%).

Containers: 1-, 5-gal cans; 55-gal drums.

Use: Solvent for nitrocellulose, resins, lacquers, baking finishes.

2-ethylhexyl acrylate

$CH_2=CHCOOCH_2CH(C_2H_5)C_4H_9$.

Properties: Liquid, pleasant odor; sp. gr. 0.8869; b.p. 214-218°C; vapor pressure at 20°C 0.1 mm; sets to glass at -90°C; flash point 180°F (O.C.); insoluble in water. Combustible; low toxicity.

Containers: 400-lb drums; tank cars.

Uses: Monomer for plastics, protective coatings, paper treatment; water-based paints.

2-ethylhexyl alcohol (2-ethylhexanol; octyl alcohol)

$CH_3(CH_2)_3CHC_2H_5CH_2OH$.

Properties: Colorless liquid. Miscible with most organic solvents; insoluble in water. Sp. gr. 0.83 (20°C); b.p. 183.5°C; f.p. -76°C; vapor pressure 0.36 mm (20°C); refractive index 1.4300 (20°C); wt/gal 6.9 lb (20°C); flash point 178°F. Combustible; low toxicity.

Derivation: (a) Oxo process, from propylene and synthesis gas. (b) Aldolization of acetaldehyde or butyraldehyde, followed by hydrogenation.

Grade: Technical.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Uses: Plasticizer for PVC resins; defoaming agent; wetting agent; organic synthesis; solvent mixtures for nitrocellulose, paints, lacquers, baking finishes; penetrant for mercerizing cotton; textile finishing compounds; plasticizers; inks; rubber; paper; lubricants; photography; dry cleaning.

2-ethylhexylamine $C_8H_{17}CH(C_2H_5)CH_2NH_2$.

Properties: Colorless liquid; sp. gr. 0.7894 (20/20°C); 6.56 lb/gal (20°C); b.p. 169.2°C; vapor pressure 1.2 (20°C); viscosity 1.11 cp (20°C); flash point 140°F (open cup). Soluble in water; solubility of water in (20°C), 25.3%. Combustible.

Hazard: Moderate fire risk. Moderately toxic.

Uses: Synthesis of detergents, rubber chemicals, oil additives and insecticides.

N-2-ethylhexylaniline $C_6H_5NHCH_2CH(C_2H_5)C_4H_9$.

Properties: Light yellow liquid with mild odor. Sp.

gr. (20/20°C) 0.9119; b.p. (50 mm) 194°C; vapor pressure (20°C) <0.01 mm; freezing point, sets to a glass below -70°C; viscosity (20°C) 7.4 cp; solubility in water (20°C) <0.01%; flash point 325°F (COC). Combustible.

Hazard: Toxic on chronic exposure.

Uses: Solvent; organic synthesis.

2-ethylhexyl bromide $C_4H_9CH(C_2H_5)CH_2Br$.

Properties: Water-white liquid, b.p. 56–58°C (6 mm); insoluble in water.

Uses: Introduction of the 2-ethylhexyl group in organic synthesis. Preparation of disinfectants, pharmaceuticals.

2-ethylhexyl chloride $C_4H_9CH(C_2H_5)CH_2Cl$.

Properties: Colorless liquid. Sp. gr. 0.8833 (20°C); b.p. 172.9°C; refractive index 1.4310; 7.33 lb/gal; flash point 140°F (open cup); freezing point -135°C. Insoluble in water. Combustible.

Hazard: Moderate fire risk. Moderately toxic.

Use: Synthesis of cellulose derivatives, dyestuffs, pharmaceuticals, textile auxiliaries, insecticides, resins.

2-ethylhexyl cyanoacetate

$CNCH_2COOCH_2CH(C_2H_5)C_4H_9$. Liquid; b.p. 150°C; refractive index (n 20/D) 1.4389; insoluble in water; soluble in alcohol, benzene, and ether. Combustible.

Containers: 55-gal steel drums.

Use: Organic intermediate.

2-ethylhexyl isodecyl phthalate

$C_4H_9CH(C_2H_5)CH_2OOC C_6H_4COOC_7H_{14}CH(CH_3)_2$. Properties: Colorless, high-boiling liquid; good dielectric properties. Combustible. Refractive index 1.478–1.488 (25°C); sp. gr. 0.969–0.977 (25/25°C). Miscible with most common solvents, thinners and oils.

Containers: Tank cars and trucks.

Use: Plasticizer.

2-ethylhexylmagnesium chloride

$C_4H_9CH(C_2H_5)CH_2MgCl$. Grignard reagent available commercially in tetrahydrofuran solution. Containers: 55-gal drums.

2-ethylhexyl octylphenyl phosphite

$(C_8H_{17}O)_2(C_8H_{17}C_6H_4C_8H_4O)P$. Properties: Colorless to light-yellow liquid with characteristic odor. Sp. gr. (20/4°C) 0.935–0.950; flash point 385°F; insoluble in water. Combustible. Containers: 5, 55-gal drums.

Uses: Antioxidant; plasticizer; flame retardant; lubricating oil additive.

3,3'-(2-ethylhexyl) thiodipropionate (dioctyl thiopropionate) $(C_8H_{17}OOCCH_2CH_2)_2S$.

Properties: Colorless liquid; sp. gr. (25°C) 0.952. Insoluble in water; soluble in most organic solvents. Combustible.

Uses: Antioxidant; stabilizer and lubricant.

ethyl 2-hydroxy-2,2-bis(4-chlorophenyl) acetate. See chlorobenzilate.

ethyl hydroxyethyl cellulose (EHEC). A cellulose ether.

Properties: White granular solid; available in extra low, and high-viscosity types. Soluble in mixtures of aliphatic hydrocarbons containing alcohol; soluble in water. Combustible.

Uses: Stabilizer; thickener; binder; film former in silk screen and gravure printing inks; protective coatings; aqueous, aqueous-organic, and organic solvent systems.

ethyl alpha-hydroxyisobutyrate $(CH_3)_2COHCOOC_2H_5$. Properties: Water-white liquid; sp. gr. 0.978–0.986 (20°C); b.p. 149–150°C; soluble in water, alcohol, and ether. Combustible.

Uses: Solvent for nitrocellulose and cellulose acetate; solvent mixtures for cellulose ethers; organic synthesis; pharmaceuticals.

ethylidene chloride (1,1-dichloroethane) CH_3CHCl_2 .

Properties: Colorless, neutral, mobile liquid; aromatic ethereal odor; saccharin taste. Soluble in alcohol, ether, fixed and volatile oils; very sparingly in water. Sp. gr. 1.174 (17°C); b.p. 57–59°C; freezing point -98°C; refractive index (n 20/D) 1.4166. Combustible.

Hazard: Moderately toxic. Tolerance, 200 ppm in air.

Use: Medicine; extraction solvent; fumigant.

ethylidenediethyl ether. See acetal.

ethylidenedimethyl ether. See dimethylacetal.

ethylidene fluoride. See 1,1-difluoroethane.

5-ethylidene-2-norbornene (ENB). A diene used as the third monomer in EPDM elastomers.

Hazard: Toxic; tolerance, 0.2 ppm in air.

ethyl iodide (iodoethane) C_2H_5I .

Properties: Colorless liquid; turns brown on exposure to light. Soluble in alcohol and ether; slightly soluble in water. Sp. gr. 1.90–1.93 (25/25°C); f.p. -108°C; b.p. 72°C; refractive index (n 15/D) 1.5168. Combustible.

Derivation: By digesting red phosphorus with absolute ethyl alcohol, after which iodine is added. The mixture is heated under a reflux condenser and finally distilled.

Hazard: Moderately toxic by inhalation and skin absorption. Narcotic in high concentrations.

Uses: Medicine; organic synthesis.

ethyl iodoacetate $CH_3ICOOC_2H_5$.

Properties: Dense, colorless liquid. Decomposed by light and air; also (very slowly) by alkaline solutions and water. Sp. gr. 1.8; b.p. 179°C; vapor density 7.4; vapor pressure 0.54 mm (20°C).

Derivation: Interaction of potassium iodide with ethyl bromo- or chloroacetate.

Hazard: Strong irritant to eyes and skin.

ethyl iodophenylundecylate. See iophendylate.

5-ethyl-5-isoamylbarbituric acid. See amobarbital.

ethylisobutylmethane. See 2-methylhexane.

ethyl isobutyrate $(CH_3)_2CHCOOC_2H_5$.

Properties: Colorless, volatile liquid. Soluble in alcohol and ether; slightly soluble in water. Sp. gr. 0.870; b.p. 110–111°C; f.p. -88°C; refractive index (n 20/D) 1.3903. Combustible.

Derivation: Heating isobutyric acid and ethyl alcohol, with subsequent distillation.

Hazard: Moderately toxic.

Uses: Organic synthesis; flavoring extracts.

ethyl isocyanate C_2H_5NCO . Liquid; sp. gr. 0.898; b.p. 60°C; soluble in chlorinated and aromatic hydrocarbons.

Hazard: Highly toxic.

Use: Pharmaceutical and pesticide intermediate.

Shipping regulations: (Air) Poison label. Not acceptable on passenger planes.

2-ethylisohexanol $(CH_3)_2CHCH_2CH(C_2H_5)CH_2OH$.

Properties: Liquid; sp. gr. 0.825–0.835 (20/20°C); boiling range 173.0–181.0°C; refractive index (n

20/D) 1.4235; density 6.89 lb/gal (20°C); flash point 170°F (COC). Combustible. Low toxicity.

Containers: Tank cars and trucks.

Use: Chemical intermediate.

ethyl isothiocyanate. See ethyl thiocarbimide.

ethyl isovalerate (ethyl valerate; ethyl 2-methylbutyrate) $(\text{CH}_3)_2\text{CHCH}_2\text{COOC}_2\text{H}_5$.

Properties: Colorless oily liquid with fruity odor. B.p. 135°C; f.p. -99°C; sp. gr. 0.864 (20/20°C); refractive index (n 20/D) 1.3950-1.3990. Slightly soluble in water; miscible with alcohol, ether, and benzene. Low toxicity. Combustible.

Derivation: Heating sodium valerate and ethyl alcohol in presence of sulfuric or hydrochloric acid, with subsequent distillation.

Grades: Technical; F.C.C.

Uses: Essential oils; perfumery; artificial fruit essences; flavoring.

ethyl lactate $\text{CH}_3\text{CHOHCOOC}_2\text{H}_5$.

Properties: Colorless liquid. Mild odor. Miscible with water, alcohols, ketones, esters, hydrocarbons, oils. Sp. gr. 1.020-1.036 (20/20°C); b.p. 154°C; flash point 115°F (closed cup); wt/gal 8.55 lb (approx.) (20°C). Autoignition temp. 752°F. Low toxicity. Combustible.

Derivation: (a) By the esterification of lactic acid with ethyl alcohol; (b) by combining acetaldehyde with hydrocyanic acid to form acetaldehyde cyanohydrin, which is converted into ethyl lactate by treatment with ethyl alcohol and an inorganic acid.

Grades: Technical (96%). Combustible.

Containers: 5-, 55-gal steel drums.

Hazard: Moderate fire risk.

Uses: Solvent for nitrocellulose, cellulose acetate, many cellulose ethers, resins; lacquers; paints; enamels; varnishes; stencil sheets; safety glass; flavoring.

ethyl levulinate $\text{CH}_3\text{CO}(\text{CH}_2)_2\text{COOC}_2\text{H}_5$.

Properties: Colorless liquid; sp. gr. 1.012; b.p. 205-206°C; soluble in water; miscible with alcohol; refractive index (n 20/D) 1.4229. Combustible.

Uses: Solvent for cellulose acetate and starch ethers; flavoring.

ethylolithium (lithium ethyl).

Properties: Transparent crystals, decomposed by water. The commercial product is a 2M suspension of $\text{C}_2\text{H}_5\text{Li}$ in benzene.

Hazard: Flammable; reacts with oxidizing materials.

Uses: Grignard-type reactions.

ethylmagnesium bromide $\text{C}_2\text{H}_5\text{MgBr}$, dissolved in ether.

Properties: Liquid; sp. gr. 1.01.

Containers: Glass bottles; 5-, 55-gal drums.

Hazard: Flammable; dangerous fire risk.

Uses: Grignard-type reactions.

ethylmagnesium chloride $\text{C}_2\text{H}_5\text{MgCl}$, dissolved in ether. (Is also offered commercially in tetrahydrofuran).

Properties: Liquid; sp. gr. 0.85.

Containers: Glass bottles; 5-, 55-gal drums.

Hazard: Flammable; dangerous fire risk.

Uses: Grignard-type reactions.

ethyl malonate (malonic ester; diethyl malonate) $\text{CH}_2(\text{COOC}_2\text{H}_5)_2$.

Properties: Colorless liquid; sweet ester odor. Insoluble in water; soluble in alcohol, ether, chloroform,

and benzene. B.p. 198°C; f.p. -50°C; sp. gr. 1.055 (25/25°C); flash point 200°F. Combustible. Low toxicity.

Derivation: By passing hydrogen chloride into cyanoacetic acid dissolved in absolute alcohol, with subsequent distillation.

Containers: Carboys; bottles.

Uses: Intermediate for barbiturates and certain pigments; flavoring.

ethyl mercaptan. Legal label name for ethanethiol, q.v.

ethylmercuric acetate $\text{C}_2\text{H}_5\text{HgOOCCH}_3$.

Properties: White crystalline powder; m.p. 178°C; slightly soluble in water; soluble in many organic solvents; may be steam-distilled.

Hazard: Highly toxic; strong irritant. See mercury.

Use: Seed fungicide as dust or slurry with water.

Shipping regulations: (Rail, Air) Mercury compounds, solid, n.o.s., Poison label.

ethylmercuric chloride $\text{C}_2\text{H}_5\text{HgCl}$.

Properties: Crystals; sp. gr. 3.482; m.p. 193°C. Insoluble in water; slightly soluble in ether; soluble in hot alcohol. Sublimes readily.

Derivation: Reaction of zinc diethyl and mercuric chloride.

Hazard: Highly toxic; strong irritant. See mercury.

Uses: Fungicide for seed or bulb treatment either alone or with other organic mercury compounds.

Shipping regulations: (Rail, Air) Mercury compounds, solid, n.o.s., Poison label.

ethylmercuric phosphate $(\text{C}_2\text{H}_5\text{HgO})_3\text{PO}$.

Properties: White powder, soluble in water; garlic-like odor.

Derivation: Reaction of ethylmercuric acetate with phosphoric acid.

Hazard: Highly toxic; strong irritant. See mercury.

Uses: Seed fungicide; timber preservative.

Shipping regulations: (Rail, Air) Mercury compounds, solid, n.o.s., Poison label.

ethylmercurithiosalicylic acid, sodium salt. See thimerosal.

ethylmercury 2,3-dihydroxypropyl mercaptide

$\text{C}_2\text{H}_5\text{HgSCH}_2\text{CHOHCH}_2\text{OH}$. Organic mercurial compound used as a fungicidal dust or in slurry treatment for control of seedborne diseases and to reduce losses from seed decay and damping-off of wheat, oats, rye, etc.

Hazard: Highly toxic. See mercury.

Shipping regulations: (Rail, Air) Mercury compounds, solid, n.o.s., Poison label.

ethylmercury-para-toluenesulfonanilide (EMTS: "Ceresan" M) $\text{C}_6\text{H}_5\text{N}(\text{HgC}_2\text{H}_5)_2\text{SO}_2\text{C}_6\text{H}_4\text{CH}_3$.

Properties: Crystals; pungent odor; m.p. 154-157°C; nearly insoluble in water; soluble in acetone and chloroform.

Hazard: Highly toxic. See mercury.

Uses: Dust or slurry for control of seed-borne diseases and of fungi by treatment of seeds or bulbs.

Shipping regulations: (Rail, Air) Mercury compounds, solid, n.o.s., Poison label.

"Ethyl" Metal Deactivator.³¹¹ Trademark. Contains 80% N,N'-disalicylidene-1,2-diaminopropane and 20% toluene solvent. Amber liquid; density 1.0672 g/ml at 68°F; flash point (open cup) 84°F. Soluble

in gasoline, insoluble in water. Used to neutralize the catalytic effect of copper in promoting fuel oxidation. Hazard: Flammable; moderate fire risk. Irritant to eyes and skin.

ethyl methacrylate $\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{COOC}_2\text{H}_5$.

Properties: Colorless liquid; b.p. 119°C ; f.p. below -75°C ; sp. gr. 0.911; refractive index (n 25/D) 1.4116; flash point (open cup) 70°F (O.C.); insoluble in water; readily polymerized.

Derivation: Reaction of methacrylic acid or methyl methacrylate with ethyl alcohol.

Grade: Technical (inhibited).

Containers: Drums; tank cars.

Hazard: Moderately toxic and irritant. Flammable; dangerous fire and explosion hazard.

Uses: Polymers; chemical intermediates.

Shipping regulations: (Air) (inhibited) Flammable Liquid label; (uninhibited) Not acceptable.

See also acrylic resin.

N-ethyl-3-methylaniline. See N-ethyl-meta-toluidine.

5-ethyl-5(1-methyl-1-butenyl)barbituric acid. See vinylbarbital.

ethyl 2-methylbutyrate. See ethyl isovalerate.

ethyl methylcellulose. A water-soluble cellulose ether used for thickening, sizing, emulsifying and dispersing. See also polymer, water-soluble.

ethyl methyl ether $\text{C}_2\text{H}_5\text{OCH}_3$.

Properties: Colorless liquid; sp. gr. 0.725; b.p. 10.8°C . Soluble in water, miscible with alcohol and ether; flash point -35°F ; autoignition temp. 374°F . Hazard: Highly flammable; dangerous fire and explosion risk.

Use: Medicine.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

2-ethyl-4-methylimidazole $\text{C}_2\text{H}_5\text{C}_3\text{N}_2\text{H}_2\text{CH}_3$. A supercooled amber liquid which if crystallized is a low-melting solid; m.p. 45°C ; b.p. 154°C (10 mm). Use: Curing epoxy resin systems.

ethyl methyl ketone. Legal label name for methyl ethyl ketone (q.v.).

ethyl methylphenylglycidate (so-called aldehyde C-16; "strawberry aldehyde") $\text{CH}_3(\text{C}_6\text{H}_5)\text{COCHCOOC}_2\text{H}_5$.

Properties: Colorless to yellowish liquid, having a strong odor, suggestive of strawberry. Soluble in 3 vols of 60% alcohol. Sp. gr. 1.104–1.123; refractive index 1.509–1.511. Low toxicity. Combustible.

Grade: Technical; F.C.C. (as aldehyde C-16).

Uses: Perfumery; flavors.

1-ethyl-1-methylpropyl carbamate. See emylcamate.

alpha-ethyl-alpha-methylsuccinimide. See ethosuximide.

7-ethyl-2-methyl-4-undecanol (tetradecanol) $\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{C}_2\text{H}_4\text{CH}(\text{OH})\text{CH}_2\text{CH}(\text{CH}_3)_2$.

Properties: Liquid; sp. gr. 0.8355 (20/20°C); b.p. 264°C ; flash point 285°C ; insoluble in water. Combustible.

Use: Intermediate for synthetic lubricants, defoamers and surfactants.

ethylmorphine hydrochloride $\text{C}_{19}\text{H}_{23}\text{NO}_3 \cdot \text{HCl} \cdot 2\text{H}_2\text{O}$.

Properties: White crystalline powder; odorless; soluble in water and alcohol; slightly soluble in ether and chloroform. M.p., about 123°C (dec). Derivation: Action of hydrochloric acid on ethylmor-

phine which is made by action of ethyl iodide on morphine in alkaline solution.

Grades: Technical; N.F.

Hazard: Highly toxic by ingestion. Habit-forming narcotic.

Use: Medicine.

N-ethylmorpholine $\text{CH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{NCH}_2\text{CH}_3$.

Properties: Colorless liquid; ammoniacal odor. Miscible with water. Sp. gr. 0.916 (20/20°C); f.p. -63°C ; b.p. 138°C ; wt/gal 7.6 lb (20°C); flash point 90°F (O.C.).

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Flammable; moderate fire risk. Toxic; irritant to skin and eyes; absorbed by skin. Tolerance, 20 ppm in air.

Uses: Intermediate for dyestuffs, pharmaceuticals, rubber accelerators and emulsifying agents. Solvent for dyes, resins, oils. Catalyst in making polyurethane forms.

"Ethyl" Multi-Purpose Additive.³¹³ Trademark. Contains 52% mixed substituted oleamides, 37% isopropyl alcohol, 7% aromatic solvent, and 4% water. Clear amber liquid; density 0.888 g/ml at 68°F ; flash point (closed cup) 75°F ; pour point 50°F . Used to remove and prevent deposits on the throat walls of carburetors, to prevent carburetor icing, and as a corrosion preventive.

Hazard: Flammable; dangerous fire risk.

ethyl mustard oil. See ethyl thiocarbimide.

ethyl myristate (ethyl tetradecanoate) $\text{CH}_3(\text{CH}_2)_{12}\text{COOC}_2\text{H}_5$.

Properties: Liquid; sp. gr. 0.856; m.p. 12°C ; b.p. 295°C . Insoluble in water; soluble in alcohol; slightly soluble in ether. Combustible. Low toxicity.

Use: Flavoring.

N-ethyl-alpha-naphthylamine (N-ethyl-1-naphthylamine) $\text{C}_{10}\text{H}_7\text{NCH}_2\text{H}_5$.

Properties: Colorless liquid; refractive index 1.6475; b.p. 305°C . Insoluble in water; soluble in alcohol and ether. Combustible.

Use: Intermediate.

ethyl nitrate $\text{C}_2\text{H}_5\text{NO}_3$.

Properties: Colorless liquid; pleasant odor; sweet taste. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.116; f.p. -112°C ; b.p. 87.6°C ; vapor three times heavier than air. Flash point 50°F (closed cup); lower explosive limit 3.8%.

Derivation: By heating alcohol, urea nitrate and nitric acid, with subsequent distillation.

Hazard: Flammable; dangerous fire and explosion risk.

Uses: Organic synthesis; drugs; perfumes; dyes; rocket propellant.

Shipping regulations: (Rail) Red label. (Air) Not acceptable.

ethyl nitrite $\text{C}_2\text{H}_5\text{NO}_2$.

Properties: Yellowish, volatile liquid. Soluble in alcohol and ether; decomposes in water. Sp. gr. 0.90; b.p. 16.4°C . Flash point -31°F . Decomposes spontaneously at 194°F .

Hazard: Highly flammable; dangerous. Explodes at 194°F . Explosive limits in air 3 to 50%. Narcotic in high conc.

Uses: Organic reactions; medicine; synthetic flavoring.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

ethyl nonanoate. See ethyl pelargonate.

ethyl octanoate. See ethyl caprylate.

ethyl octoate. See ethyl caprylate.

ethyl oenanthat. See ethyl enanthate.

ethyl oleate $C_{17}H_{33}COOC_2H_5$.

Properties: Light-colored, yellowish oleaginous liquid. Insoluble in water; soluble in alcohol and ether. Solubility of water in product 1.0 cc/100 cc (20°C). Wt/gal 7.27 lb (20°C); refractive index 1.45189 (20°C); f.p. -32°C (approx); sp. gr. 0.867; flash point 348°F. Combustible; low toxicity.

Uses: Solvent; plasticizer; lubricant; water-resisting agent; flavoring.

ethyl orthoacetate $CH_3C(OC_2H_5)_3$.

Properties: Colorless liquid. B.p. 144-148°C; refractive index (n 25/D) 1.395; insoluble in water; soluble in alcohol and ether; flash point 131°F. Combustible.

Containers: 55-gal steel drums.

Hazard: Moderate fire risk.

Use: Intermediate.

ethyl orthoformate $CH(OC_2H_5)_3$.

Properties: Colorless liquid. B.p. 145.9°C; f.p. -76°C; refractive index (n 20/D) 1.392; slightly soluble in water; soluble in alcohol and ethers; flash point 85°F.

Containers: 55-gal steel drums.

Hazard: Flammable; fire risk.

Use: Intermediate.

ethyl orthopropionate $CH_3CH_2C(OC_2H_5)_3$.

Properties: Colorless liquid. B.p. 155-160°C; refractive index (n 20/D) 1.401; insoluble in water; soluble in alcohol and ether; flash point 140°F. Combustible.

Containers: 55-gal steel drums.

Hazard: Moderate fire risk.

Use: Intermediate.

ethyl oxalate (diethyl oxalate) $(COOC_2H_5)_2$.

Properties: Colorless, unstable, oily, aromatic liquid. Miscible in all proportions with alcohol, ether, ethyl acetate, and other common organic solvents; slightly soluble in water and gradually decomposed by it. Sp. gr. 1.09 (20/20°C); b.p. 186°C; f.p. -40.6°C; wt/gal 8.96 lb (20°C) (approx); flash point 168°F (closed cup). Combustible.

Derivation: By standard esterification procedure using ethyl alcohol and oxalic acid. The final purification calls for unusual technique and equipment. The last traces of water are most difficult to remove and this is accomplished by a special step in the rectification.

Containers: Drums; tank cars.

Hazard: Strong irritant to skin and mucous membranes, especially by ingestion.

Uses: Solvent for cellulose esters and ethers, many natural and synthetic resins; radio tube cathode fixing lacquers; dye intermediate; pharmaceuticals; perfume preparations; organic synthesis.

ethyl 2-oxocyclopentanecarboxylate. See 2-carbethoxycyclopentanone.

ethyl parathion. See parathion.

ethyl PCT. See O,O-diethylphosphorochloridothioate.

ethyl pelargonate (ethyl nonanoate; wine-ether)

$CH_3(CH_2)_8COOC_2H_5$.

Properties: Colorless liquid; fruity odor; refractive index 1.4220 (20°C); sp. gr. 0.866 (18/4°C); b.p. about

220°C; f.p. -44°C; insoluble in water; soluble in alcohol and ether. Low toxicity. Combustible.

Grades: Technical; F.C.C.

Uses: Flavoring alcoholic beverages; perfumes; chemical intermediate.

3-ethylpentane (triethylmethane) $(C_2H_5)_3CH$.

Properties: Colorless liquid; b.p. 93.5°C; freezing point -118.6°C; sp. gr. 0.69818 (20°C); refractive index (n 20/D) 1.3934; soluble in alcohol; insoluble in water. Combustible.

Grades: Technical.

Use: Organic synthesis.

meta-ethylphenol (3-ethylphenol) $HOC_6H_4C_2H_5$.

Properties: Colorless liquid; f.p. -4°C; b.p. 214°C; sp. gr. 1.001; very slightly soluble in water; miscible with alcohol and ether. Combustible.

Hazard: May be toxic. See phenol.

para-ethylphenol (4-ethylphenol) $HOC_6H_4C_2H_5$.

Properties: Colorless needles; m.p. 46°C; b.p. 219°C; flash point 219°F; soluble in alcohol or ether; slightly soluble in water. Combustible.

Hazard: May be toxic. See phenol.

ethylphenylacetamide. See ethylacetanilide.

ethyl phenylacetate $C_6H_5CH_2COOC_2H_5$.

Properties: Colorless liquid, honey-like odor. Sp. gr. 1.027-1.032; refractive index, 1.498; b.p. 276°C. Soluble in 8 parts of 60% alcohol; insoluble in water. Combustible.

Grades: Technical; F.C.C.

Uses: Perfumery; flavors; intermediate, especially for phenobarbital; herbicide.

ethyl phenylacrylate. See ethyl cinnamate.

5-ethyl-5-phenylbarbituric acid. See phenobarbital.

ethyl phenylcarbamate (phenylurethane; ethyl phenylurethane) $C_6H_5NHCOOC_2H_5$.

Properties: White, crystalline solid; aromatic odor, clove-like taste. M.p. 51°C. Soluble in alcohol, ether and boiling water; insoluble in cold water.

Derivation: Action of ethyl alcohol on phenyl isocyanate.

ethyl phenyl dichlorosilane $C_2H_5(C_6H_5)SiCl_2$.

Properties: Colorless liquid which fumes strongly in moist air.

Hazard: Highly toxic by inhalation and ingestion. Strong irritant to eyes and skin.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

N,N-ethylphenylethanolamine $C_6H_5NC_2H_5CH_2CH_2OH$.

Properties: Liquid; sp. gr. 1.04 (20/20°C); b.p. (740 mm) 268°C; wt/gal 8.7 lb (20°C). Combustible; low toxicity.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Organic synthesis; dyestuffs.

2-ethyl-2-phenylglutarimide (glutethimide) $C_{13}H_{15}NO_2$.

Properties: White, crystalline powder. A saturated solution is slightly acid. Freely soluble in acetone, ethyl acetate, and chloroform; soluble in ethanol and methanol; practically insoluble in water. Melting range: 85-87°C.

Grade: N.F. (as glutethimide).

Hazard: Manufacture and use controlled by law.

Use: Medicine (sedative).

ethyl phenyl ketone. See propiophenone.

ethyl phenylurethane. See ethyl phenylcarbamate.

ethylphosphoric acid $C_2H_5H_2PO_4$.

Properties: Pale straw-colored liquid; sp. gr. 1.33 (25°C); can be neutralized with alkalis or amines to give water-soluble salts. Combustible.

Purity: 97%, remainder being orthophosphoric acid and ethyl alcohol.

Hazard: May be irritant. See phosphoric acid.

Uses: Catalyst; rust remover; soldering flux; intermediate.

ethyl phthalate. See diethyl phthalate.

ethyl phthalyl ethyl glycolate

Properties: Liquid with slight odor. Sp. gr. (25°C) 1.180; refractive index (25°C) 1.498; b.p. (5 mm) 190°C; flash point 193°C; solubility in water, 0.018% by wt. Miscible with most organic solvents. Combustible. Low toxicity.

Use: Plasticizer.

5-ethyl-2-picoline. See 2-methyl-5-ethylpyridine.

1-ethyl-1-propanol. See 3-pentanol.

ethyl propionate $C_2H_5COOC_2H_5$.

Properties: Water-white liquid. Odor resembling pineapples; soluble in alcohol and ether; in water 2.5% at 15°C; sp. gr. 0.888 (25°C); b.p. 99°C; f.p. -73°C; flash point 54°F (closed cup); autoignition temp. 890°F; refractive index (n_D 20/D) 1.3844. Toxicity probably low.

Derivation: Treating ethyl alcohol with propionic acid.

Grades: Commercial, 85–90% ester content; F.C.C.

Containers: 50-, 100-gal drums.

Hazard: Flammable; dangerous fire risk.

Uses: Solvent for cellulose ethers and esters, various natural and synthetic resins; flavoring agent; fruit syrups; cutting agent for pyroxylin.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

ethylpropionyl. See diethyl ketone.

2-ethyl-3-propylacrolein (2-ethylhexenal)

Properties: Yellow liquid. Powerful odor. Sp. gr. 0.8518 (20/20°C); b.p. 175.0°C; vapor pressure 1.0 mm (20°C); flash point 155°F (open cup); wt/gal 7.1 lb (20°C); viscosity 0.113 poise (20°C). Combustible.

Containers: 1-gal cans; 5-, 55-gal drums.

Hazard: Moderately toxic by inhalation and ingestion; strong irritant.

Uses: Insecticide; organic synthesis (intermediate); warning agents and leak detectors.

alpha-ethyl-beta-propylacrylanilide

Use: Rubber accelerator.

2-ethyl-3-propylacrylic acid $C_3H_7CH:C(C_2H_5)COOH$.

Properties: Liquid; sp. gr. (20°C) 0.9484; f.p. -7.8°C; b.p. 232.1°C; vapor pressure (20°C) less than 0.01 mm; flash point 330°F; insoluble in water. Combustible.

Uses: Pharmaceuticals; resins and plastics; lubricants.

2-ethyl-3-propylglycidamide. See oxanamide.

ethyl propyl ketone. See 3-hexanone.

3-ethyl-3-propyl-1,3-propanediol. See 2-ethylhexane-1,3.

2-(5-ethyl-2-pyridyl)ethyl acrylate

Properties: Liquid; sp. gr. 1.0458 (20°C); b.p. 181°C (50 mm); f.p. -75°C; very slightly soluble in water. Combustible.

Hazard: Moderately toxic.

Uses: Manufacture of plastics and fibers; adhesives, textile finishes and sizes.

ethyl pyrophosphate. See tepp.

ethyl salicylate $C_6H_4(OH)COOC_2H_5$.

Properties: Colorless liquid, with a faint odor of methyl salicylate. Soluble in ether and alcohol; insoluble in water. Sp. gr. 1.127–1.130; refractive index 1.523; b.p. 231–234°C. Combustible.

Uses: Perfumery; flavors.

ethyl silicate (tetraethyl orthosilicate) $(C_2H_5)_4SiO_4$.

Properties: Colorless liquid; faint odor; slightly soluble in benzene; hydrolyzed to an adhesive form of silica. Sp. gr. 0.9356 (20/20°C); b.p. 168.1°C; m.p. 110°C (sublimes); vapor pressure 1.0 mm (20°C); flash point 125°F (open cup); wt/gal 7.8 lb (20°C); f.p. -77°C; viscosity 0.0179 poise (20°C). Combustible.

Grades: 29% SiO_2 , 40% SiO_2 .

Containers: 5-, 55-gal (tin-lined) drums; tank cars.

Hazard: Moderate fire risk. Strong irritant to eyes, nose and throat. Tolerance, 100 ppm in air.

Uses: Weatherproof and acidproof mortar and cements; refractory bricks; other molded objects; heat-resistant paints; chemical-resistant paints; protective coatings for industrial buildings and castings; lacquers; bonding agent; intermediate.

ethyl silicate, condensed. Light-yellow liquid with mild odor consisting of 85% by wt tetraethyl orthosilicate and 15% polyethoxysiloxanes. On hydrolysis or ignition, yields high purity, refractory silica. Used as an intermediate for siloxane compounds; for precision casting of high-melting alloys; pigments binder for paints; surface hardener for sandstones.

Hazard: See ethyl silicate.

ethyl sodium oxalacetate

$C_2H_5OOC(ONa):CHCOOC_2H_5$. Light yellow powder; 92% pure.

Derivation: Reaction of pure ethyl acetate and diethyl oxalate with metallic sodium.

Containers: 175-lb fiber drums.

Hazard: May be toxic.

Uses: Dyes; synthesis.

ethyl sulfate. See diethyl sulfate.

ethyl sulfhydrate. See ethanethiol.

ethyl sulfide (diethyl sulfide) $(C_2H_5)_2S$.

Properties: Colorless, oily liquid; garlic-like odor; soluble in alcohol and ether; slightly soluble in water; sp. gr. 0.837; f.p. -102°C; b.p. 92–93°C; refractive index (n_D 20/D) 1.4423. Combustible.

Derivation: Heating potassium ethyl sulfate and potassium sulfide, with subsequent distillation.

Hazard: Probably toxic.

Uses: Organic synthesis; special solvent.

ethylsulfuric acid (acid ethylsulfate) $C_2H_5HSO_4$.

Properties: Colorless, oily liquid; soluble in water, alcohol and ether; sp. gr. 1.316; b.p. 280°C (decomposes). Combustible.

Derivation: Action of sulfuric acid on ethyl alcohol.

Hazard: Strong irritant to eyes and skin.

Uses: Medicine; precipitant for casein; organic synthesis.

4-ethyl-1,4-thiazane $C_4H_9NSC_2H_5$.

Properties: Colorless, mobile liquid; soluble in water;—

- sp. gr. 0.9929 (15°C); b.p. 184°C (763 mm). Combustible.
- Derivation: Interaction of dichlorodiethyl sulfide and an aliphatic amine in the presence of alcohol and sodium carbonate.
- ethyl thiocarbimide** (ethyl mustard oil; ethy isothiocy-anate) C_2H_5NCS .
- Properties: Colorless liquid; pungent odor; soluble in alcohol; insoluble in water. Sp. gr. 1.004 (15/4°C); f.p. -5.9°C; b.p. 131-132°C.
- Hazard: Highly toxic by inhalation; strong irritant to skin and mucous membranes.
- Use: Military poison gas.
- Shipping regulations: (Rail, Air) Not listed. Consult authorities.
- ethyl thioethanol** $C_2H_5SC_2H_5OH$.
- Properties: Pale straw liquid; sp. gr. 1.015-1.025 (20/20°C); distillation range; 180-184°C; refractive index 1.486 (20°C). Combustible.
- Grade: 95% min.
- Containers: 5-, 55-gal drums; tank cars.
- Uses: Synthesis; intermediate.
- ethylthiopyrophosphate**. See sulfoteppe.
- N-ethyl para-toluenesulfonamide**
 $C_2H_5NHOSO_2C_6H_4CH_3$.
- Properties: Colorless crystals; m.p. 64°C. Soluble in alcohol. Flash point 260°F; combustible.
- Grades: A mixture of the ortho- and para-isomers is available commercially.
- Hazard: May be toxic.
- Use: Plasticizer.
- ethyl para-toluenesulfonate** $CH_3C_6H_4SO_3C_2H_5$.
- Properties: Unstable solid; m.p. 33°C; b.p. 221.3°C; sp. gr. 1.17; soluble in many organic solvents; insoluble in water. Flash point 316°F; combustible.
- Hazard: Probably toxic.
- Uses: Plasticizer for cellulose acetate; ethylating agent.
- N-ethyl-meta-toluidine** (N-ethyl-3-methylaniline)
 $CH_3C_6H_4NHC_2H_5$. Light amber liquid; refractive index (n 20/D) 1.5451; b.p. 221°C. Combustible.
- Containers: Drums; tanks.
- Hazard: Probably toxic.
- Use: Chemical intermediate.
- N-ethyl-ortho-toluidine** $CH_3C_6H_4NHC_2H_5$.
- Properties: Colorless to yellowish oil; soluble in alcohol, ether, and hydrochloric acid; insoluble in water. Sp. gr. 0.9534; b.p. 214°C. Combustible.
- Derivation: Heating ethyl alcohol with ortho-toluidine and hydrochloric acid.
- Hazard: Probably toxic.
- ethyl triacetylglactate** $C_2H_5OOCCH_3CH_2(OOCCH_3)_3$.
- Properties: Colorless crystals, or white crystalline powder. Insipid taste; odorless; soluble in warm alcohol and acetone; slightly soluble in ether and alcohol; insoluble in water. M.p. 134-136°C.
- ethyltrichlorosilane** $C_2H_5SiCl_3$.
- Properties: Colorless liquid. B.p. 99.5°C; sp. gr. 1.236 (25/25°C); refractive index (n 25/D) 1.4257; flash point 72°F (open cup). Soluble in benzene, ether, heptane, perchloroethylene. Readily hydrolyzed with liberation of hydrochloric acid.
- Derivation: By reaction of ethylene and trichlorosilane in the presence of a peroxide catalyst.
- Hazard: Highly toxic; strong irritant. Flammable, dangerous fire risk. May form explosive mixtures with air.
- Uses: Intermediate for silicones.
- Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.
- ethyl urethane**. See urethane.
- ethyl valerate**. See ethyl isovalerate.
- ethyl vanillate** $(CH_3O)HOC_6H_3COOC_2H_5$.
- Properties: Solid; m.p. 44°C; b.p. 291-293°C. Insoluble in water; soluble in alcohol and ether.
- Uses: Food preservative; medicine; sunburn preventive.
- ethyl vanillin** (3-ethoxy-4-hydroxybenzaldehyde)
 $OHC_6H_3(OC_2H_5)CHO$.
- Properties: Fine, white crystals; intense odor of vanillin; affected by light; m.p. 76.5°C; soluble in alcohol, chloroform, and ether; slightly soluble in water. Combustible; low toxicity.
- Grades: N.F.; F.C.C.
- Containers: 100-lb fiber drums.
- Uses: Flavors; replacement or fortifier of vanillin.
- ethyl vinyl ether**. See vinyl ethyl ether.
- ethylxanthic acid**. See xanthic acids.
- ethylzinc**. See diethylzinc.
- ethyne**. See acetylene.
- ethynylation**. Condensation of acetylene with a reagent such as an aldehyde to yield an acetylenic derivative. The best example is the union of formaldehyde and acetylene to produce butynediol.
- 1-ethynylcyclohexanol** $HC\equiv CC_6H_{10}OH$.
- Properties: Colorless, low-melting solid with sweet odor. M.p. 30-31°C; b.p. 180°C; sp. gr. (20/20°C) 0.967. Slightly soluble in water. Combustible.
- Containers: Cans; drums.
- Hazard: May be highly toxic and irritant to eyes and skin.
- Uses: Stabilization of chlorinated organic compounds; intermediate; corrosion inhibitor for mineral acids.
- 1-ethynylcyclohexyl carbamate**. See ethinamate.
- ethynylestradiol**. See ethinylestradiol.
- ethythrins**. Ethyl analog of allethrin, used as insecticide with applicatoinis similar to allethrin (q.v.). Moderately toxic. See also barthrin, cyclothrin and furethrin.
- Eu** Symbol for europium.
- eucalyptol** (cineol; cajeputol) $C_{10}H_{18}O$.
- Properties: Colorless essential oil; a terpene ether having a camphor-like odor and pungent, cooling, spicy taste. Slightly soluble in water; miscible with alcohol, chloroform, ether, glacial acetic acid and fixed or volatile oils. Sp. gr. 0.921-0.923 (25°C); b.p. 174-177°C; congealing point not below 0°C; refractive index 1.4550-1.4600 (20°C). Combustible.
- Derivation: By fractionally distilling eucalyptus oil, followed by freezing. The oil is imported from Spain, Portugal, and Australia.
- Grades: Technical; N.F.
- Containers: Drums.
- Uses: Pharmaceuticals (cough syrups, expectorants); flavoring; perfumery.

eucryptite. A lithium silicate mineral (LiAlSiO_4) containing up to 4.8% lithia. Used in glass manufacture and as a source of lithium.

eugenic acid. See eugenol.

eugenol (4-allyl-2-methoxyphenol; caryophyllic acid; eugenic acid) $\text{C}_9\text{H}_8\text{O}_2$ ($\text{CH}_3\text{OCH}_2\text{C}_6\text{H}_3(\text{CH}_2\text{CH=CH}_2)_2$).

Properties: Colorless or yellowish liquid; oily; becomes brown in air; spicy odor and taste. Soluble in alcohol, chloroform, ether, and volatile oils; very slightly soluble in water. Sp. gr. 1.064–0.070; b.p. 253.5°C; refractive index 1.5400–1.5420 (20°C); optically inactive. Low toxicity; combustible.

Derivation: By extraction of clove oil with aqueous potash, liberation with acid and rectification in a stream of carbon dioxide.

Grades: Technical; U.S.P.; F.C.C.

Uses: Perfumes; essential oils; medicine (active germicide); production of isoeugenol for the manufacture of vanillin; flavoring.

eugenyl methyl ether. See methyl eugenol.

"Eulan" CN.³⁰⁷ Trademark for a permanent anionic moth-proofing agent, consisting of sodium pentachlorodihydroxytriphenylmethanesulfonate.

Properties: Fine powder. Compatible with acid or chrome dyes as well as with anionic and non-ionic surfactants. Incompatible with basic dyes, cationic surfactants and leveling agents based on albumin decomposition products.

"Eulysine" A.³⁰⁷ Trademark for an organic amine used as a dyeing assistant.

"Eunaphтол" AS.³⁰⁷ Trademark for a naphthol dyeing assistant, composed of a modified lignin-sulfonate.

"Eureka."²⁸ Trademark for a soldering flux crystal composition based on zinc chloride and ammonium chloride.

"Euresol."⁹ Trademark for resorcinol acetate (q.v.).

europia. See europium oxide.

europium Eu Atomic number 63; one of the lanthanide or rare-earth elements of the cerium subgroup. Atomic weight 151.96. Valences 2,3. Two stable isotopes.

Properties: Steel-gray metal, difficult to prepare. Quite soft and malleable (DPH = 20); m.p. 826°C; b.p. 1489°C (approx); sp. gr. 5.24. Oxidizes rapidly in air; may burn spontaneously. Most reactive of the rare earth metals; liberates hydrogen from water. Toxicity unknown.

Derivation: Reduction of the oxide with lanthanum or misch metal.

Source: See rare-earth minerals.

Grade: High purity (ingots; lumps).

Hazard: Highly reactive; may ignite spontaneously in powder form.

Uses: Neutron absorber in nuclear control; doping agent in plastic lasers. Color TV phosphors to activate yttrium; phosphors in postage stamp glues to permit electronic recognition of first-class mail.

europium chloride $\text{EuCl}_3 \cdot 6\text{H}_2\text{O}$. Yellow needles, soluble in water; sp. gr. 4.89 (20°C); m.p. 850°C. Obtained by treating the oxide with hydrochloric acid.

europium fluoride $\text{EuF}_3 \cdot 3\text{H}_2\text{O}$. Crystals; m.p. 1390°C; b.p. 2280°C. Insoluble in water and dilute acids.

europium nitrate $\text{Eu}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$. Colorless to pale pink crystals; m.p. 85°C (sealed tube); soluble in water. Obtained by treating the oxide with nitric acid.

europium oxalate $\text{Eu}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$. White powder; insoluble in water; slightly soluble in acids. Grades: 25–50% and 99.8% europium salt. Impure grades may be colored.

europium oxide (europia) Eu_2O_3 .

Properties: Pale rose powder; sp. gr. 7.42; insoluble in water, but soluble in acids to give the corresponding salt.

Derivation: Calcination of the oxalate; solvent extraction or liquid ion-exchange processes.

Grades: 25–50%; 99.9%.

Uses: Nuclear-reactor control rods; especially in red- and infrared-sensitive phosphors.

europium sulfate $\text{Eu}_2(\text{SO}_4)_3$, anhydrous and $8\text{H}_2\text{O}$. Colorless to pale pink crystals; sp. gr. (anhydrous) 4.99 (20°C). Hydrate loses $8\text{H}_2\text{O}$ at 375°C, and is slightly soluble in water.

eutectic. The lowest melting point of an alloy or solution of two or more substances (usually metals) that is obtainable by varying the percentage of the components. Eutectic alloys are relatively few; they are the particular alloys that have definite and minimum melting points compared with other combinations of the same metals.

See also alloy, fusible.

eutrophication. The unintentional enrichment or "fertilization" of either fresh or salt water by chemical elements or compounds present in various types of industrial wastes. Phosphates and nitrogenous compounds in detergent and chemical processing wastes are particularly effective eutrophying agents, but they supply nutrients to algae, which proliferate so abundantly that a large proportion die for lack of light; their decomposition depletes the water of its dissolved oxygen and thus causes the death of fish and other marine life. One process for removing phosphates involves addition of a metal ion source to waste effluents to insolubilize dissolved phosphates, after which the particles are agglomerated by anionic polymers.

See also: algae; nitrilotriacetic acid (note).

eV. Abbreviation for electron-volt.

EVA. Abbreviation for ethylene-vinyl acetate copolymer.

"Evanacid 3CS."³¹² Trademark for carboxymethylmercaptosuccinic acid (q.v.).

"Evanohm."¹⁵⁵ Trademark for an alloy of 75% nickel, 20% chromium, 2.5% aluminum and 2.5% copper.

Forms: Wire; insulated wire.

Use: Precision-wound resistors.

Evans blue $\text{C}_{34}\text{H}_{24}\text{N}_6\text{Na}_4\text{O}_{14}\text{S}_4$. A diazo dye used in medicine to measure blood plasma volume.

Properties: Bluish green or brown iridescent powder. Odorless and hygroscopic. Very soluble in water; very slightly soluble in alcohol; practically insoluble in benzene, carbon tetrachloride, chloroform, and ether. pH (0.5% solution) 5.5–7.5.

evaporation. The change of a substance from the solid or liquid phase to the gaseous or vapor phase. Evaporation of solids (ice, snow, dry ice, and a few others) occurs at or below room temperature; the substance does not go through a liquid phase and the phenomenon is called sublimation (q.v.). The rate of evaporation of liquids varies with their chemical nature, and with the temperature; in general, organic liquids

- (benzene, gasoline) evaporate at lower temperatures and higher rates than water. The thermal energy required to vaporize a given volume of a liquid is known as its latent heat of vaporization; it remains in the vapor (steam, in the case of water heated to its boiling point) and is released when the vapor condenses. For water, this latent heat value is 540 cal/g. In chemical processing installations requiring a series of evaporations and condensations, the units are set up in series, and the latent heat of vaporization from one unit is utilized to supply energy for the next. Such units are called "effects" in engineering parlance, as, e.g., a triple-effect evaporator. See also distillation.
- EVE.** Abbreviation for ethyl vinyl ether. See vinyl ethyl ether.
- "Evenglo."**¹¹ Trademark for a durable lightweight polystyrene, varying in its properties of light transmission, degree of diffusion and color. Used in lighting applications.
- "Everdur."**³²⁴ Trademark for a group of five copper-silicon alloys, with compositions adjusted to hot and cold working, hot forging, welding, free machining, and for ingots for remelting and casting.
- "Everflex."**³¹¹ Brand name for polyvinyl acetate copolymer emulsions; used in paints, paper coating, and acoustic tile coatings.
- "Evipal."**¹⁶² Trademark for hexobarbital (q.v.).
- exchange reaction.** A chemical reaction in which atoms of the same element in two different molecules or in two different positions in the same molecule transfer places. Exchange reactions are usually studied with the aid of a tracer or tagged atom.
- excipient.** A natural inert and somewhat tacky material used in the pharmaceutical industry as a binder in tablets, etc. Commonly used materials are gum arabic, honey, and beet pulp.
- excited state.** A higher than normal energy level (vibrational frequency) of the electrons of an atom, radical, or molecule resulting from absorption of photons (quanta) from a radiation source (arc, flame, spark, etc.) in any wavelength of the electromagnetic spectrum. X-ray, ultraviolet, visible, infrared, microwave, and radiofrequencies are used for excitation in various types of spectroscopy. When the energizing source is removed or discontinued the atom or molecule returns to its normal or stable state either by emitting the absorbed photons or by transferring the energy to other atoms or molecules. The increased vibrational activity of the atom or molecule yields line or band spectra characteristic of its structure, thus permitting identification. Photochemical reactions are induced by excited chemical entities, which are also responsible for the phenomena of luminescence (phosphorescence and fluorescence). See also: spectroscopy; photochemistry; absorption (2).
- exhaust emission control.** See air pollution.
- "Exkin 1,2,3"**⁷⁴ Trademark for a series of anti-skinning agents of the volatile oxime type.
Use: Paints.
- exo-.** A prefix used in chemical names to indicate attachment to a side chain rather than to a ring. See also endo-.
- "Exobond."**²⁴⁴ Trademark for a compound of sodium silicate-ferrosilicon. Used as a binder in a self-setting exothermic process, in moldings.
- "Exolvent."**¹⁴¹ Trademark for a solvent made from aliphatic hydrocarbons.
Hazard: Probably flammable.
- "Exon."**³⁵ Trademark for a series of polyvinyl resins, compounds and latexes composed of polymers and copolymers based on vinyl chloride.
Containers: Up to tank cars and trucks.
Uses: Molding, sheeting film, strip coatings, protective coatings, extrusions, paints, ink, adhesives, plastisols, flooring, phonograph records.
- exothermic.** A process or chemical reaction which is accompanied by evolution of heat, for example, combustion reactions.
- exotic.** A term applied to materials of various functional types that have extra power, and that are often derived from unusual sources. Examples are rocket propellants derived from boron hydrides and certain special-purpose solvents.
- expander.** (1) A mixture of lampblack, barium sulfate, and an organic material usually derived from lignin that increases the capacity of storage batteries, presumably by coating the anode and thus preventing the deposit of lead sulfate on the underlying lead metal.
(2) A substance used in medicine as a substitute for blood plasma, e.g., dextran, gelatin, or polyvinylpyrrolidone.
- explosive, high.** A chemical compound, usually containing nitrogen, that detonates as a result of shock or heat (see detonation). Dynamite was the most widely used explosive for blasting and other industrial purposes until 1955, when it was largely replaced by prills-and-oil and slurry types. The former consists of 94% ammonium nitrate prills and 6% fuel oil, (ANFO). Slurry blasting agents (SBA) are based on thickened or gelatinized ammonium nitrate slurries sensitized with TNT, other solid explosives, or aluminum. An unusual type of explosive is represented by acetylides of copper and silver, which are examples of commercially used explosives that contain neither oxygen nor nitrogen.
High explosives vary greatly in their shock sensitivity; most sensitive are mercury fulminate and nitroglycerin, while TNT and ammonium nitrate are comparatively difficult to detonate, requiring the use of blasting caps or similar activating device. For further information, refer to Institute of Makers of Explosives, 420 Lexington Ave., New York.
- explosive, initiating.** An explosive composition used as a component of blasting caps, detonators, and primers. They are highly sensitive to flame, heat, impact, or friction. Examples are lead azide; silver acetylide, mercury fulminate, diazodinitrophenol, nitrosoguanidine, lead styphnate and pentaerythritol tetranitrate.
- explosive limits.** The range of concentration of a flammable gas or vapor (% by volume in air) in which explosion can occur upon ignition in a confined

area. Explosive limits for some common substances are:

	Lower (%)	Upper (%)
carbon disulfide	1	50
benzene	1.5	8
methane	5	15
butadiene	2	11.5
butane	1.9	8.5
propane	2.4	9.5
natural gas	3.8	17
hydrogen	4	75
acetylene	2.5	80

explosive, low. An explosive which deflagrates rather than detonates, such as black powder. See deflagration.

explosive, permissible. Explosives approved for use in coal mines. Usually they are modified dynamites.

expression. Removal of a liquid from a solid by hydraulic pressure, as in manufacture of vegetable oils from seeds, rinds, or meal cake. Worm devices similar to extrusion machines are also used for this purpose; they are called expellers.

extender. A low-gravity material used in paint, ink, plastic and rubber formulations chiefly to reduce cost. Extenders include diatomaceous earth, wood flock, mineral rubber, liquid asphalt, etc. Microscopic droplets of water fixed permanently in a plastic matrix have been introduced as an efficient extender for polyester resins. In the food industry the term refers to certain extruded proteins, especially those derived from soybeans, which are used in meat products to provide equivalent nutrient values at lower cost. Made from defatted soy flour, they are often called textured proteins.

See also diluent (2); filler.

extinguishing agent. See fire extinguishment.

extraction, solvent. See solvent extraction.

extractive distillation. A variety of distillation that always involves the use of a fractionating column, and is characterized by use of a purposely added substance which modifies the vaporization characteris-

tics of the materials undergoing separation, to make them easier to separate. The additive is often called a solvent, and is usually chosen to be much less volatile than any of the substances being separated. It is added to the downflowing liquid reflux stream near the top of the column, and is removed from the still pot or reboiler at the base. The addition of furfural to mixtures of butadiene and butene hydrocarbons to separate the butadiene more easily is an example of extractive distillation.

extractive metallurgy. That portion of metallurgical science devoted to the technology of mining and processing of metals and their ores.

extreme-pressure additive (EP additive)

(1) Material added to cutting fluids to impart high film strength. They are mainly sulfur, chlorine, and occasionally phosphorus compounds. Actual conditions, amounts, etc. are proprietary.

(2) Lubricating oil and grease additives that prevent metal-to-metal contact in highly loaded gears. (See "Aroclor"). Some react with the metal gears to form a protective coating. Saponified lead salts are often used.

extrusion. A fundamental processing operation in many industries, in which a material is forced through a metal forming die, followed by cooling or chemical hardening. The material may be liquid (molten glass or a polymer dispersion); a viscous polymer, as in injection molding; a semisolid mass such as a rubber or plastic mixture; or a hot metal billet. High-viscosity materials are fed into a rotating screw of variable pitch, which forces it through the die with considerable pressure; a ram is used for metals at temperatures from 1000 to 2000°F. Film is made by passing a low-viscosity mixture through a narrow slit. Molten glass and polymer suspensions are forced through a nozzle having a tiny orifice (spinneret); the latter are hardened after extrusion by immersion in a bath of formaldehyde or similar agent. Food items (spaghetti, etc.) are also extruded. Extrusion involves rheological principles of some complexity, critical factors being viscosity, temperature, flow rate, and die design. See also injection molding.

F

F Symbol for fluorine; the molecular formula is F_2 .

"FA."²²⁴ Trademark for furfuryl alcohol (q.v.).

"Fabrez."³⁶ Trademark for cyclic ethylene urea and urea-formaldehyde resins.

fabric. A textile structure composed of mechanically interlocked fibers or filaments; it may be randomly integrated (nonwoven) or closely oriented by warp and filler strands at right angles to each other (woven). While the word usually refers to wool, cotton, or synthetic fibers, fabrics can also be made of glass fiber and other inorganic materials, such as graphite.

fabrication. The molding, forming, machining, assembly and finishing of metals, rubber, and plastics into enduse products. In the paper industry the term "converting" is used in this sense.

"Fabrikoid."²⁸ Trademark for pyroxylin-coated fabrics which are water-resistant, soap- and water-washable.

Uses: Book binding; luggage.

"Fabrilit."²⁸ Trademark for vinyl coated fabrics and selected vinyl compounds without fabric backing.

Uses: Pocketbooks, bags, upholstery, etc.

F acid: See 2-naphthol-7-sulfonic acid and 2-naphthylamine-7-sulfonic acid.

factice (vulcanized oil). A soft mealy material made by reaction of sulfur or sulfur chloride with a vegetable oil.

Uses: Erasers; rubber goods (bath spray tubing, etc.) to give soft "hand."

FAD. Abbreviation for flavin adenine dinucleotide (q.v.).

Fahrenheit. The scale of temperature in which 212° is the boiling point of water at 760 mm Hg, and 32° is the freezing point of water. See centigrade for method of converting from Fahrenheit to centigrade. See absolute temperature for converting Fahrenheit to absolute Rankine.

"Fairprene."²⁸ Trademark for a variety of products including:

Industrial cements made from synthetic rubber compounds for cementing rubber sheets and coated fabrics to leather, fabric, paper, metal and wood.

Synthetic rubber coated fabrics and sheet stock including silicone rubber and "Viton" A fluoroelastomer. Used for industrial applications in the automotive, aviation, gas, chemical, petroleum and marine fields.

fallout. Deposition upon the earth of the radioactive particles resulting from a nuclear explosion. The most dangerous component is strontium-90 (q.v.).

"Falone."²⁴⁸ Trademark for tris(2,4-dichlorophenoxy-ethyl) phosphite.

Properties: Viscous amber liquid; sp. gr. 1.434; m.p. $70-72^\circ\text{C}$; soluble in benzene, xylene and aromatic hydrocarbons; insoluble in water. Available as an emulsifiable concentrate and a granular solid.

Use: A pre-emergence herbicide.

famphur. Generic name for O,O-dimethyl O-[para-(dimethylsulfamoyl)phenyl]phosphorothioate. $(\text{CH}_3\text{O})_2\text{P}(\text{S})\text{OC}_6\text{H}_4\text{SO}_2\text{N}(\text{CH}_3)_2$.

Properties: Crystalline powder; m.p. 55°C ; very soluble in chloroform and carbon tetrachloride; slightly soluble in water.

Hazard: Highly toxic. Cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

Shipping regulations: (Rail, Air) Organic phosphate, solid, n.o.s. Poison label. Not accepted on passenger planes.

"Fanal."³⁰⁷ Trademark for phosphotungstic lakes. Used for printing inks. Characterized by brilliancy of shade and good fastness to light.

"Fanox."⁵¹ Trademark for a line of low-sulfur non-staining cutting fluids for ferrous and nonferrous metals.

Faraday, Michael (1791-1867). A native of England, Faraday did more to advance the science of electrochemistry than any other scientist. A profound thinker and accurate experimentalist and observer, he was the first to propound correct ideas as to the nature of electrical phenomena, not only in chemistry but in other fields. His contributions to chemistry include the basic laws of electrolysis, electrochemical decomposition (the basis of corrosion of metals) as well as of battery science and electrometallurgy. His work in physics led to the invention of the dynamo. Faraday was in many respects the exemplar of a true scientist, combining meticulous effort and interpretive genius.

faraday. The quantity of electricity that can deposit (or dissolve) one gram-equivalent weight of a substance during electrolysis (about 96,500 coulombs).

farnesol. Generic name for 3,7,11-trimethyl-2,6,10-decatrienol, $\text{C}_{15}\text{H}_{25}\text{OH}$.

Properties: Colorless liquid; delicate floral odor. Soluble in 3 vols of 70% alcohol. Sp. gr. 0.885 (15°C); b.p. $145-146^\circ\text{C}$ (3 mm). Combustible. Low toxicity.

Derivation: Found in nature in many flowers and essential oils, such as cassie, neroli, cananga, rose, balsams, ambrette seed.

Uses: Perfumery; flavoring; insect hormone.

fast. (1) Descriptive of a dye or pigment whose color is not impaired by prolonged exposure to light, steam, high temperature or other environmental conditions. Inorganic pigments are normally superior in this respect to organic dyes.

(2) In nuclear technology, the term refers to neu-

trons moving at the speed at which they emerge from a ruptured nucleus, as opposed to "slow" or thermal neutrons whose speed has been reduced by impinging on a neutral substance called a moderator (q.v.).

fat. A glyceryl ester of higher fatty acids such as stearic and palmitic. Such esters and their mixtures are solids at room temperatures and exhibit crystalline structure. Lard and tallow are examples. There is no chemical difference between a fat and an oil, the only distinction being that fats are solid at room temperature and oils are liquid. The term "fat" usually refers to triglycerides specifically, whereas "lipid" is all-inclusive. See also lipid.

fat dyes. Oil-soluble dyes for candles, wax, etc.

fatliquoring agent. An oil-in-water emulsion usually made from raw oils such as neatsfoot, cod, etc., made soluble by dispersing agents such as sulfonated oils. Uses: Leather processing, to replace natural oils removed from hides by tanning operations. See also neatsfoot oil; emulsion.

fat splitting. See hydrolysis.

fatty acid. A carboxylic acid derived from or contained in an animal or vegetable fat or oil. All fatty acids are composed of a chain of alkyl groups containing from 4 to 22 carbon atoms (usually even-numbered) and characterized by a terminal carboxyl radical -COOH . The generic formula for all above acetic is $\text{CH}_3(\text{CH}_2)\text{COOH}$ (the carbon atom count includes the radical). Fatty acids may be saturated or unsaturated (olefinic), and either solid, semisolid, or liquid. They are classed among the lipids (q.v.), together with soap and waxes.

Saturated. The most important of these are butyric (C_4), lauric (C_{12}), palmitic (C_{16}) and stearic (C_{18}). They have a variety of special uses (see specific entry). Stearic acid leads all other fatty acids in industrial use, primarily as a dispersing agent and accelerator activator in rubber products, and in soaps. *Note:* There is still no conclusive proof that increase in body cholesterol as a result of high dietary intake of animal-derived saturated fats or fatty acids is causatively related to atherosclerosis (see also cholesterol).

Unsaturated. These are usually vegetable-derived and consist of alkyl chains containing 18 or 22 carbon atoms with the characteristic end group -COOH . Most vegetable oils are mixtures of several fatty acids or their glycerides; the unsaturation accounts for the broad chemical utility of these substances, especially of drying oils (q.v.). The most common unsaturated acids are oleic, linoleic, and linolenic (all C_{18}). Safflower oil is high in linoleic acid; peanut oil contains 21%. Olive oil is 83% oleic acid. Palmitoleic acid is abundant in fish oils. Aromatic fatty acids are now available (see phenylstearic acid). *Note:* Linoleic, linolenic and arachidonic acids are called essential fatty acids by biochemists, because they are necessary nutrients that are not synthesized in the animal body.

Uses: Special soaps; heavy-metal soaps; lubricants; paints and lacquers (drying oils); candles; salad oil; shortening; synthetic detergents; cosmetics; emulsifiers.

For further details refer to Fatty Acid Producers' Council, 485 Madison Ave., New York.

fatty acid enol ester. A fatty acid reacted with the enolic form of acetone for the purpose of increasing the chemical reactivity of the acid. Stearic acid (18-carbon) combined with acetone (3-carbon) gives isopropenyl stearate (21-carbon). This is effective in

making the fatty stearyl group available for synthesis of polymers, medicinals, and the like. See also fatty ester.

fatty acid pitch. A by-product residue from (a) soap stock and candle stock manufacture; (b) refining of vegetable oils; (c) refining of refuse greases; (d) refining of wool grease.

Properties: Dark brown to black; properties analogous to complex hydrocarbons; contains fixed carbon (5% to 35%). Soluble in naphtha and carbon disulfide.

Uses: Manufacture of black paints and varnishes; tarred papers; printers' rolls; rubber filling agent; impregnating agent; electrical insulations; marine caulking; waterproofing; sealant.

fatty alcohol. A primary alcohol (from C_8 to C_{20}), usually straight-chain. High molecular weight alcohols are produced synthetically, by the Oxo and Ziegler processes. Those from C_8 to C_{11} are oily liquids; above C_{11} they are solids. Other methods of production are (a) reduction of vegetable seed oils and their fatty acids with sodium, (b) catalytic hydrogenation at elevated temperatures and pressures and (c) hydrolysis of spermaceti and sperm oil by saponification and vacuum fractional distillation. The more important commercial saturated alcohols are octyl, decyl, lauryl, myristyl, cetyl and stearyl. The commercially important unsaturated alcohols such as oleyl, linoleyl and linolenyl are also normally included in this group. The odor tends to disappear as the chain length increases.

Uses: Solvent for fats, waxes, gums and resins; pharmaceutical salves and lotions; lube oil additives; detergents and emulsifiers; textile antistatic and finishing agents.

fatty amine. A normal aliphatic amine derived from fats and oils. May be saturated or unsaturated, primary, secondary or tertiary, but the alkyl groups are straight-chain and have an even number of carbons in each. The length varies from 8 to 22 carbon atoms.

Derivation: Fatty acids are treated with ammonia and heated to form fatty acid amides which are converted to nitriles and reduced to the amine.

Uses: Organic bases; soaps; plasticizers; tire cords; fabric softeners; water-resistant asphalt; hair conditioners; cosmetics; medicinals.

fatty ester. A fatty acid with the active hydrogen replaced by the alkyl group of a monohydric alcohol. The esterification of a fatty acid, RCOOH , by an alcohol, R'OH , yields the fatty ester RCOOR' . The most common alcohol used is methanol, yielding the methyl ester, RCOOCH_3 . The methyl esters of fatty acids have higher vapor pressures than the corresponding acids and are distilled more easily.

fatty nitrile (RCN). An organic cyanide derived from a fatty acid.

Derivation: Fatty acids are treated with ammonia and heated to form fatty acid amides, which are converted to nitriles.

Hazard: May be toxic.

Uses: Intermediates for fatty amines; lube oil additives; plasticizers.

"Faxam."⁵¹ Trademark for a series of general-purpose, paraffin-base oils that serve as lubricants, in process applications, and as components in proprietary formulations.

FCC. (I) Abbreviation for Food Chemicals Codex, a publication giving specifications and test methods for chemicals used in foods.

(2) Abbreviation for fluid-cracking catalyst, as used in the petroleum refining industry. Examples are powdered silica-alumina, in which alumina is impregnated with dry synthetic silica gel, and various natural clays impregnated with alumina.

FDA. Abbreviation for Food and Drug Administration (q.v.).

FD&C colors. A series of colorants permitted in food products, marking inks, etc., certified by the FDA. Among the more important are the following:

Blue No. 1: Disodium salt of 4-((4-(N-ethyl-*p*-sulfo-benzylamino)-phenyl)-(2-sulfoniumphenyl)-methylene)-(1-(N-ethyl-N-*p*-sulfo-benzyl)- $\Delta^{2,5}$ -cyclohexadienimine).

Blue No. 2: Disodium salt of 5,5'-indigotindisulfonic acid.

Green No. 3: Disodium salt of 4-((4-(N-ethyl-*p*-sulfo-benzylamino)-phenyl)-(4-hydroxy-2-sulfoniumphenyl)-methylene)-(1-(N-ethyl-N-*p*-sulfo-benzyl)- $\Delta^{2,5}$ -cyclohexadienimine).

Red No. 2: Trisodium salt of 1-(4-sulfo-1-naphthylazo)-2-naphthol-3,6-disulfonic acid. The largest-volume food color in commercial use. A suspected carcinogen. Use prohibited by FDA in 1975. Red No. 40 is permissible substitute.

Red No. 3: Disodium salt of 9-*o*-carboxyphenyl-6-hydroxy-2,4,5,7-tetraiodo-3-isoxanthone.

Red No. 4: Disodium salt of 2-(5-sulfo-2,4-xylylazo)-naphthyl-4-sulfonic acid. Use in foods prohibited by FDA.

Violet No. 1: Monosodium salt of 4-((4-(N-ethyl-*p*-sulfo-benzylamino)-phenyl)-(4-(N-ethyl-*p*-sulfoiumbenzylamino)-phenyl)-methylene)-(N,N-dimethyl- $\Delta^{2,5}$ -cyclohexadienimine). Use prohibited by FDA in 1973 and by USDA in 1976.

Yellow No. 5: Trisodium salt of 3-carboxy-5-hydroxy-1-*p*-sulfophenyl-4-sulfophenylazopyrazole.

Yellow No. 6: Disodium salt of 1-*p*-sulfophenylaze-2-naphthol-6-sulfonic acid.

See also food color; food additive.

Fe Symbol for iron.

Federal Trade Commission (FTC). A consumer protection agency.

feedstock. Gaseous or liquid petroleum-derived hydrocarbons or mixtures of hydrocarbons from which gasoline, fuel oil, and petrochemicals are produced by thermal or catalytic cracking. It is also called charging stock. Feedstocks commonly used include ethane, propane, butane, butene, benzene, toluene, xylene, naphtha and gas oils.

"FE Fatty Esters."⁴⁸⁷ Trademark for a series of esters derived from straight chain (normal) even-carbon alcohols ranging from C_8 (octyl) to C_{18} (stearyl) and straight chain (normal) fatty acids ranging from C_8 to C_{18} and including mixtures of these esters. Example: FE 12:18 is dodecyl octadecanoate.

Uses: Cosmetics, lubricants, softeners, water repellents, paper coatings, protective coatings and wax substitutes.

Fehling's solution. A reagent used as a test for sugars aldehydes, etc. It consists of two solutions, one of copper sulfate, the other of alkaline tartrate, which are mixed just before use. Benedict's modification is a one-solution preparation. For details, see Book of Methods, Association of Official Analytical Chemists.

feldspar (potassium aluminosilicate). General name for a group of sodium, potassium, calcium, and barium

aluminum-silicates. Commercially, feldspar usually refers to the potassium feldspars with the formula $KAlSi_3O_8$, usually with a little sodium. Noncombustible; nontoxic, except as fine-ground powder.

Grades: Usually based on silicon dioxide content, potassium-sodium ratio, iron content, and fineness of grinding.

Occurrence: North Carolina, Colorado, New Hampshire, South Dakota, California, Arizona, Wyoming, Virginia, Texas.

Uses: Pottery, enamel, and ceramic ware; glass; soaps; abrasive; bond for abrasive wheels; cements and concretes; insulating compositions; fertilizer; poultry grit; tarred roofing materials.

"Feltmetal."⁵⁵¹ Trademark for randomly interlocked structure of metal fibers which are sintered together to provide strong, permeable materials with precisely controlled properties.

Uses: Acoustical applications where high noise levels, high velocity gas flows, elevated temperatures, corrosive atmospheres or other situations exist which preclude the use of conventional material.

FEMA. Abbreviation of Flavor Extract Manufacturers Association. It makes recommendations to FDA on safety aspects of flavoring materials.

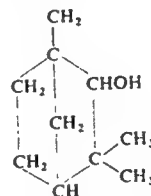

fenchone $C_{10}H_{16}O$.

Properties: Oil with camphor-like odor. Sp. gr. 0.9465 ($19^\circ C$); b.p. $193^\circ C$. Soluble in ether; insoluble in water. Combustible; nontoxic.

Derivation: A ketone found (a) as dextrofenchone in oil of fennel; (b) as levofenchone in oil of thuja.

Use: Flavoring.

fenchyl alcohol (fenchol; 2-fenchanol; 1-hydroxyfenchane) $C_{10}H_{17}OH$; structural formula:

Properties: Colorless, oily liquid (*d* and *l* forms) or solid (*dl* form). Sp. gr. approx. 0.96; b.p. $201^\circ C$; m.p. $39^\circ C$; refractive index 1.473.

Derivation: Pine oil; fennel oil; also made synthetically.

Uses: Solvent; organic intermediate; odorant; flavoring.

fenoprop. See silvex.

fenson. Generic name for para-chlorophenyl benzene-sulfonate, $ClC_6H_4OSO_2C_6H_5$.

Properties: Colorless crystals; m.p. $61-62^\circ C$. Soluble in organic solvents; insoluble in water.

Hazard: May be toxic.

Use: Acaricide.

fenthion. Generic name for O,O-dimethyl O-[4-(methylthio)-meta-tolyl] phosphorothioate $(CH_3O)_2P(S)OC_6H_3(CH_3)SCH_3$.

Properties: Brown liquid; b.p. $105^\circ C$ (0.01 mm); insoluble in water; soluble in most organic solvents.

Hazard: Highly toxic by ingestion, inhalation, skin absorption. Use may be restricted. Cholinesterase inhibitor.

Use: Insecticide; acaricide.

Shipping regulations: Organic phosphate, liquid.

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

n.o.s., (Rail, Air) Poison label. Not acceptable on passenger planes.

fenuron. Generic name for 3-phenyl-1,1-dimethylurea, $C_6H_5NHCON(CH_3)_2$.

Properties: White crystalline solid; almost insoluble in water (3850 ppm at 25°C); sparingly soluble in hydrocarbon solvents. Stable towards oxidation and moisture; m.p. 127–129°C.

Use: Weed and brush killer.

"Feosol."⁷¹ Trademark for medicines containing ferrous sulfate.

FEP resin. Abbreviation for fluorinated ethylene-propylene resin (q.v.).

"Feran."¹⁹⁷ Trademark for a nitrogen fertilizer solution containing ammonium nitrate and water. Used in manufacturing solid fertilizers and for direct application.

ferbam. Generic name for ferric dimethyldithiocarbamate, $[(CH_3)_2NCSS]_3Fe$.

Properties: Black or dark colored, fluffy powder; decomposes above 180°C; usually readily dispersible but very slightly soluble in water; pH of saturated solution 5.0.

Derivation: By addition of carbon disulfide to an alcoholic solution of dimethylamine and precipitation with a ferric salt.

Grades: 76% wettable powder; 87% technical powder.

Hazard: Irritant to eyes and mucous membranes.

Tolerance, 15 mg per cubic meter of air.

Use: Fungicide.

"Ferberk."⁸¹ Trademark for ferbam (q.v.).

"Fergon."⁵⁰⁸ Trademark for ferrous gluconate (q.v.).

"Fermate."²⁸ Trademark for a wettable powder containing 76% ferbam (q.v.).

"Fermentase."¹¹⁴ Trademark for a diastatic malt syrup; used in baking.

fermentation. A chemical change induced by a living organism or enzyme (q.v.), specifically bacteria or the microorganisms occurring in unicellular plants such as yeast, molds, or fungi. The reaction usually involves the decomposition of sugars and starches to ethyl alcohol and carbon dioxide, the acidulation of milk, or the oxidation of nitrogenous organic compounds. The basic reaction is $C_6H_{12}O_6 \xrightarrow[\text{alyst}]{\text{cat.}} 2C_2H_5OH + 2CO_2$. Enzymes are usually involved in such reactions; with yeast, the effective enzyme is zymase. Fermentation is essential in the preparation of breads and other food products, in the manufacture of beer, wine, and other alcoholic beverages, as well as of citric acid, gluconic acid, sodium gluconate, and synthetic biopolymers (q.v.). Much of the industrial alcohol used in the U.S. is made by fermentation of blackstrap molasses, a by-product of sugar manufacture. Antibiotics are produced by various forms of microorganisms active in molds, especially bacteria and Actinomycetes. The activated sludge process for sewage digestion is a form of fermentation. A continuous fermentation process for deriving edible protein from petroleum has been introduced. Fermentation is also used in making synthetic amino acids. Research in this field is being directed toward conversion of agricultural, urban and animal wastes to fuel oil by fermentation processes. See also yeast, sewage sludge, antibiotics, bacteria.

fermentation alcohol. See ethyl alcohol.

"Fermex."¹⁷³ Trademark for a diastatic (protease-amylase) enzyme supplement for baking fermentation used to improve quality and uniformity of bread and other yeast-raised bakery products.

Fermi, Enrico (1901–1954). Italian physicist who later became a U.S. citizen. He developed a statistical approach to fundamental problems of physical chemistry based on Pauli's exclusion principle. He discovered induced or artificial radioactivity resulting from neutron impingement, as well as slow or thermal neutrons. He was Professor of Physics at Columbia (1939) and was awarded the Nobel Prize in Physics in 1938. He was the first to achieve a controlled nuclear chain reaction, directed the construction of the first nuclear reactor at University of Chicago (1942), and worked on the atomic bomb at Los Alamos. He also carried on fundamental research on subatomic particles using sophisticated statistical techniques. Element 100 (fermium) is named after him.

fermium (element 100) Fm atomic weight; 254; valence +3. Half-life 3 hours. A synthetic radioactive element with atomic number 100 discovered in 1952. Fermium has since been prepared in a nuclear reactor by irradiating californium, plutonium, or einsteinium with neutrons, in a cyclotron by bombarding uranium with accelerated oxygen ions, and by other nuclear reactions. The element is named for Enrico Fermi. It has chemical properties similar to those of the rare earth erbium. Isotopes are known with mass numbers 254, 255, and 256. Used in tracer studies. See also actinide element.

ferrate. See ferrite (2).

ferredoxin. An iron-containing protein thought to be involved in photosynthesis as an acceptor of energy-rich electrons from chlorophyll. It occurs in green plants and in bacteria that metabolize elemental hydrogen.

ferric acetate, basic (iron acetate, basic) $Fe(C_2H_3O_2)_2OH$.

Properties: Red powder. Soluble in alcohol and acids; insoluble in water. Combustible.

Derivation: Action of acetic acid on ferric hydroxide with subsequent crystallization.

Uses: Medicine; textile industries.

ferric acetylacetonate $Fe[OC(CH_3)_2CHC(O)CH_3]_3$.

Properties: Crystalline powder; m.p. 179–182°C. Slightly soluble in water, soluble in most organic solvents. Resistant to hydrolysis. A chelating non-ionizing compound. Combustible.

Uses: Moderating and combustion catalyst; solid fuel catalyst; bonding agent; curing accelerator; intermediate.

ferric ammonium alum. See ferric-ammonium sulfate.

ferric ammonium citrate (iron ammonium citrate).

Properties: Thin, transparent, garnet red scales or granules, or as a brownish yellow powder; odorless (or slight ammonia odor); saline, mildly ferruginous taste; deliquescent; affected by light. Soluble in water; insoluble in alcohol. Combustible. Low toxicity.

Derivation: Addition of citric acid to ferric hydroxide, then adding ammonium hydroxide, followed by filtration.

Grade: Technical.

Uses: Medicine; blueprint photography; feed additive.

ferric ammonium oxalate (iron ammonium oxalate; ammonioferric oxalate) $(NH_4)_3Fe(C_2O_4)_3 \cdot 3H_2O$.

Properties: Green crystals. Soluble in water and alcohol; sensitive to light.

Derivation: Interaction of ammonium binoxalate and ferric hydroxide.

Hazard: Moderately toxic and irritant to skin and mucous membranes.

Use: Blueprint photography.

ferric ammonium sulfate (iron ammonium sulfate; ferric ammonium alum; ammonio-ferric sulfate)

$\text{FeNH}_4(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Lilac to violet efflorescent crystals. Sp. gr. 1.71; m.p. 39–41°C; b.p. (-12H₂O) 230°C. Soluble in water; insoluble in alcohol.

Derivation: By mixing solutions of ferric sulfate and ammonium sulfate, followed by evaporation and crystallization.

Uses: Medicine; analytical chemistry; textile dyeing (mordant).

ferric ammonium tartrate (ammonium iron tartrate; iron ammonium tartrate).

Properties: Reddish-brown scales. Transparent. Sweet taste. Soluble in water; insoluble in alcohol.

Use: Medicine.

ferric arsenate $\text{FeAsO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: A green or brown powder; sp. gr. 3.18; decomposes on heating. Insoluble in water; soluble in dilute mineral acids. Nonflammable.

Hazard: Highly toxic by ingestion and inhalation; strong irritant.

Use: Insecticide.

Shipping regulations: (Rail, Air) Poison label.

ferric arsenite. $2\text{FeAsO}_3 \cdot \text{Fe}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$. A basic salt of variable composition.

Properties: Brownish-yellow powder. Soluble in acids; insoluble in water. Nonflammable.

Hazard: Highly toxic by ingestion and inhalation; strong irritant.

Use: Combined with ammonium citrate (ferric ammonium citrate) and used in medicine.

Shipping regulations: (Rail, Air) Poison label.

ferric benzoate (iron benzoate) $\text{Fe}_2(\text{OOCCH}_3)_6$.

Properties: Brown powder. Slightly soluble in water, alcohol, and ether. Combustible.

Derivation: Interaction of ferric hydroxide and benzoic acid.

Use: Medicine.

ferric bromide (ferric tribromide; iron bromide) FeBr_3 .

Properties: Dark-red, deliquescent crystals. Soluble in water, alcohol, and ether. M.p., sublimes. Low toxicity.

Derivation: By the action of bromine on iron filings.

Containers: Boxes; glass bottles. Keep cool, well closed, and protected from light.

Uses: Medicine; analytical chemistry; bromine salts.

ferric cacodylate $\text{Fe}[(\text{CH}_3)_2\text{AsO}_2]_3$.

Properties: Yellowish-brown powder; odorless. Moderately soluble in cold water, more so in hot water, less so in alcohol.

Hazard: Highly toxic.

Use: Medicine.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

ferric chloride, anhydrous (ferric trichloride; ferric perchloride; iron chloride; iron trichloride; iron perchloride) FeCl_3 .

Properties: Black-brown solid; sp. gr. 2.898 (25°C); m.p. 306°C (decomp.) b.p. 319°C; soluble in water, alcohol, glycerol, methanol and ether. Noncombustible.

Derivation: Action of chlorine on ferrous sulfate or chloride.

Grades: Anhydrous 96%; 42° Bé solution, photographic and sewage grades.

Containers: (Solid) barrels; (solution) carboys; tank cars and trucks.

Hazard: Strong irritant to skin and tissue.

Uses: Treatment of sewage and industrial wastes; etching agent for engraving, photography, and printed circuitry; catalyst; mordant; oxidizing, chlorinating and condensing agent, disinfectant, pigment, medicine; feed additive; water purification.

Shipping regulations: (Air) Corrosive label.

ferric chloride hydrate $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Orange-yellow very deliquescent crystals.

M.p. 37°C; b.p. 280°C; decomposes to yield hydrochloric acid if exposed to moist air or light.

Uses: See ferric chloride, anhydrous.

ferric chromate (iron chromate) $\text{Fe}_2(\text{CrO}_4)_3$.

Properties: Yellow powder; soluble in acids; insoluble in water and alcohol; soluble in HCl.

Derivation: By adding sodium chromate to a solution of a ferric salt.

Hazard: Toxic by inhalation. May be carcinogenic. Strong irritant. Moderate fire risk by reaction with reducing agents. Tolerance, 0.1 mg per cubic meter of air.

Uses: Metallurgy; ceramics (color); paint pigment.

ferric citrate (iron citrate) $\text{FeC}_6\text{H}_5\text{O}_7 \cdot 2 \cdot 5\text{H}_2\text{O}$.

Properties: Reddish-brown scales. Keep away from light. Soluble in water; insoluble in alcohol.

Derivation: By the action of citric acid on ferric hydroxide, and crystallization.

Uses: Medicine; blueprint paper.

ferric dichromate (iron dichromate; ferric bichromate) $\text{Fe}_2(\text{Cr}_2\text{O}_7)_3$.

Properties: Reddish-brown granules. Soluble in water and acids.

Derivation: By heating aqueous chromic acid and moist ferric hydroxide.

Hazard: Toxic by inhalation; strong irritant. Moderate fire risk by reaction with reducing agents.

Use: Preparation of pigments.

ferric dimethyldithiocarbamate. See ferbam.

ferric ferrocyanide (iron ferrocyanide; Prussian Blue).

Blue pigment described under iron blue (q.v.). Low toxicity.

ferric fluoride (iron fluoride) FeF_3 .

Properties: Green crystals; sp. gr. 3.52; soluble in acids and in water; insoluble in alcohol and ether.

Hazard: Toxic; strong irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Ceramics (porcelain, pottery).

ferric glycerophosphate (iron glycerophosphate)

$\text{Fe}_2[\text{C}_3\text{H}_5(\text{OH})_2\text{PO}_4]_3 \cdot x\text{H}_2\text{O}$.

Properties: Yellowish scales, odorless and nearly tasteless; soluble in water; insoluble in alcohol.

Use: Pharmaceutical.

ferric hydroxide (ferric hydrate; iron hydroxide; iron hydrate; iron oxide, hydrated; ferric oxide, hydrated) $\text{Fe}(\text{OH})_3$.

Properties: Brown flocculant precipitate which dries to the oxide; sp. gr. 3.4–3.9; m.p., loses water below 500°C; soluble in acids; insoluble in water, alcohol and ether. Noncombustible; low toxicity.

Derivation: Addition of ferrous sulfate solution to ammonia solution.

Uses: Pharmaceutical preparations; water purification; manufacturing pigments; rubber pigment.

ferric hypophosphite (iron hypophosphite) $\text{Fe}(\text{H}_2\text{PO}_2)_3$.
Properties: White or grayish-white powder; odorless; tasteless. Slightly soluble in water; more so in boiling water.

Hazard: Explosion may occur if triturated or heated with nitrates, chlorates or other oxidizing agents.

Use: Medicine.

"Ferriclear."¹ Trademark for a grade of ferric sulfate largely used as a conditioner of alkaline soils.

ferric malate (iron malate) $\text{Fe}_2(\text{C}_4\text{H}_4\text{O}_5)_2$.
Properties: Brown, hygroscopic crystals. Soluble in water and alcohol.

Derivation: By the interaction of ferric hydroxide and malic acid.

Use: Medicine.

ferric naphthenate

Properties: A heavy-metal soap. See also soaps (2). Combustible.

Derivation: Fusion method, by heating naphthenic acids with the metallic oxide.

Containers: Drums.

Uses: Conditioning and waterproofing agent, sludge preventive, fungicide and paint drier.

ferric nitrate (iron nitrate) $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$.

Properties: Violet crystals; sp. gr. 1.684; m.p. 47.2°C; dec. 125°C; soluble in water, and alcohol.

Derivation: Action of concentrated nitric acid on scrap iron or iron oxide, and crystallizing.

Hazard: Dangerous fire risk in contact with organic materials; strong oxidant and irritant.

Uses: Dyeing (mordant for buffs and blacks); medicine; tanning; analytical chemistry.

Shipping regulations: (Rail) Nitrates, n.o.s., Yellow label. (Air) Oxidizer label.

ferric octoate. See soaps (2).

ferric oleate (iron oleate) $\text{Fe}(\text{C}_{18}\text{H}_{33}\text{O}_2)_3$.

Properties: Brownish-red lumps. Soluble in alcohol, ether, and acids; insoluble in water. Combustible. See also soap (2).

ferric oxalate $\text{Fe}_2(\text{C}_2\text{O}_4)_3$.

Properties: Pale-yellow amorphous scale or powder; odorless; decomposes on heating to 100°C. Soluble in water and acids; insoluble in alkali. Combustible.

Hazard: Moderately toxic by ingestion.

Uses: Catalyst in making oxygen; silvertone photographic printing papers.

ferric oxide (ferric oxide, red; iron oxide; red iron trioxide; ferric trioxide) Fe_2O_3 . See also iron oxide reds.

Properties: Dense, dark-red powder or lumps; sp. gr. 5.12–5.24; m.p. 1565°C; soluble in acids; insoluble in water.

Grades: Technical; 99.5% pure; electronic.

Uses: Metallurgy; gas purification; paint and rubber pigment; component of thermite; polishing compounds; mordant; laboratory reagent; catalyst (paramagnetic); medicine; feed additive; electronic pigments for TV; permanent magnets; memory cores for computers; magnetic tapes.

ferric oxide, yellow. Impure ferric oxide (water and calcium sulfate are the usual impurities). See iron

oxide yellows. Natural hydrated yellow iron oxide (limonite) is sometimes referred to as yellow ferric oxide.

ferric perchloride. See ferric chloride.

ferric phosphate (iron phosphate) $\text{FePO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Yellowish-white powder. Insoluble in water; soluble in acids; sp. gr. 2.87. Low toxicity.

Derivation: by adding a solution of sodium phosphate to a solution of ferric chloride. The product is filtered and then dried.

Uses: Medicine; fertilizers; feed and food additive.

ferric potassium citrate (iron potassium citrate).

Properties: Brown scales. Hygroscopic. Odorless. Contains 16% (approx) iron. Soluble in water; insoluble in alcohol.

Use: Medicine.

ferric pyrophosphate (iron pyrophosphate) $\text{Fe}_4(\text{P}_2\text{O}_7)_3 \cdot x\text{H}_2\text{O}$.

Properties: Yellowish-white powder; insoluble in water, soluble in dilute acid. 24% Fe minimum. Not to be confused with ferric pyrophosphate, soluble (q.v.).

Uses: Source of nutritional iron and for enrichment of foods not subject to rancidity.

ferric pyrophosphate, soluble. A combination of ferric pyrophosphate and sodium citrate.

Properties: Apple-green crystals; very soluble in water; insoluble in alcohol. Protect from light. 11% Fe.

Uses: Medicine; feed additive.

ferric resinate (iron resinate).

Properties: Reddish-brown powder; soluble in ligroin, carbon disulfide, ether, oil of turpentine; slightly soluble in alcohol; insoluble in water.

Use: Drier (paints, varnish). See also soap (2).

ferric sodium oxalate (iron-sodium oxalate) $\text{Na}_2\text{Fe}(\text{C}_2\text{O}_4)_2 \cdot 5\frac{1}{2}\text{H}_2\text{O}$.

Properties: Emerald-green crystals; decomposed by heat or light; soluble in water and alcohol. Sp. gr. 1.973 (18°C); dec. 300°C. Protect from light.

Derivation: By the interaction of sodium acid oxalate and ferric hydroxide.

Hazard: Moderately toxic.

Uses: Photography; blueprinting.

ferric stearate (iron stearate) $\text{Fe}(\text{C}_{18}\text{H}_{35}\text{O}_2)_3$.

Properties: Light-brown powder; soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Interaction of solutions of ferric sulfate and sodium stearate.

Use: Varnish driers; photocopying. See also soap (2).

ferric succinate (iron succinate) $(\text{C}_4\text{H}_4\text{O}_4)_2\text{Fe}_2(\text{OH})_2$.

Properties: Reddish-brown powder; insoluble in cold water; partly decomposed by hot water forming a more basic salt; soluble in dilute acids. Protect from light. Combustible.

Derivation: By addition of ferric chloride to a succinate solution.

Use: Medicine.

ferric sulfate (iron sulfate; ferric trisulfate; iron tersulfate; iron persulfate) (a) $\text{Fe}_2(\text{SO}_4)_3$; (b) $\text{Fe}_2(\text{SO}_4)_3 \cdot 9\text{H}_2\text{O}$.

Properties: Yellow crystals or grayish-white powder. Sp. gr. (a) 3.097, (b) 2.0–2.1; m.p., decomposes (480°C). (a) Slightly soluble in water. (b) Very soluble in water. Keep well closed and protected from light. Noncombustible. Low toxicity.

Derivation: By adding sulfuric acid to ferric hydroxide.

Grades: Technical; C.P.; partly hydrated.

Uses: Pigments; medicine; reagent; iron alum manufacture; etching aluminum; disinfectant; textiles

(dyeing and calico printing); flocculant in water purification; soil conditioner.

ferric tallate. See soap (2).

ferric tannate (iron tannate; iron gallotannate)

Properties: Dark-brown or bluish black powder, variable composition. Soluble in alkalies; insoluble in water, alcohol and ether; soluble in dilute acids. Combustible. Low toxicity.

Derivation: Interaction of ferric acetate and tannic acid solutions.

Use: Medicine.

ferric tribromide. See ferric bromide.

ferric trichloride. See ferric chloride.

ferric trioxide. See ferric oxide.

ferric trisulfate. See ferric sulfate.

ferric vanadate (iron metavanadate) $\text{Fe}(\text{VO}_3)_3$.

Properties: Grayish-brown powder; soluble in acids; insoluble in water and alcohol. Noncombustible; low toxicity.

Derivation: By adding a solution of a ferric salt to the liquor obtained by leaching vanadium ores with caustic soda solution or by lixiviating the slags obtained when vanadium ores are fused with soda ash, etc.

Grade: Technical.

Use: Metallurgy.

"Ferri-Floc."⁹³ Trademark for ferric sulfate. Used as a coagulant in water, sewage and industrial waste treatment; in manufacture of fungicides, chelated iron products, chemical intermediate, and in pickling metals.

ferrite.

(1) Iron in the body-centered cubic form; commonly occurs in steels, cast iron and pig iron below 910°C. Alpha and beta iron are the common varieties of ferrite, and the name is also applied to delta iron.

(2) A compound, a multiple oxide, of ferric oxide with another oxide, as sodium ferrite, NaFeO_2 , but more commonly, a multiple oxide crystal.

Ferrites are made by dissolving hydrated ferric oxide in concentrated alkali solution, by fusing ferric oxide with alkali metal chloride, carbonate or hydroxide, or by simply heating metal oxides with ferric oxide. Ceramic ferrites are made by press-forming powdered ingredients (with a binder) into a sheet, then sintering, or firing.

The oxide ferrites are used as rectifiers, on memory and record tapes, for permanent magnets, semiconductors, insulating materials, dielectrics, high frequency components, and various related uses in radio, television, radar, computers, and automatic control systems.

ferro-alloy. An alloy of iron with some element other than carbon used as a vehicle for introducing such an element into steel during its manufacture. The element may alloy with the steel by solution or as the carbide, neutralize the harmful impurities by combining with them and separating from the steel as flux or slag before solidification.

ferroboron. A ferro-alloy used as hardening agent in special steels. It also is an efficient deoxidizer. Boron steel is used in controlling the operating rate of nuclear reactors. Two grades available, 10 and 17% boron.

"Ferrocabo."²⁸⁰ Trademark for briquetted or granular silicon carbide (q.v.).

Uses: Cupola addition in the production of gray iron, or as a ladle addition to steel. It decomposes into its component elements and acts as a powerful deoxidizer and graphitizer. Machinability and strength of the iron or steel are increased with no loss of hardness.

ferrocene (dicyclopentadienyliron) $(\text{C}_5\text{H}_5)_2\text{Fe}$. A coordination compound of ferrous iron and 2 molecules of cyclopentadiene in which the organic portions have typically aromatic chemical properties. Its activity is intermediate between phenol and anisole. The first compound shown to have the "sandwich" structure found in certain types of metallocene molecules.

Properties: Orange, crystalline solid; camphor-like odor; m.p. 173–174°C; resists pyrolysis at 400°C. Insoluble in water, slightly soluble in benzene, ether and petroleum ether. Iron content 29.4–30.6%.

Derivation: From ferrous chloride and cyclopentadiene sodium.

Containers: Bottles; fiber drums.

Hazard: Evolves toxic products on decomposition and heating. Moderate fire risk.

Uses: Additive to fuel oils to improve efficiency of combustion and eliminate smoke; antiknock agent; catalyst; coating for missiles and satellites; high-temperature lubricant; intermediate for high temperature polymers; ultraviolet absorber.

See also metallocene.

ferrocenecarboxylic acid ethyl ester. See ethyl ferrocenoate.

1,1'-ferrocenedicarboxylic acid diethyl ester. See 1,1'-diethyl ferrocenoate.

1,1'-ferrocenedicarboxylic acid dimethyl ester. See dimethyl ferrocenoate.

ferrocenoyl chloride. See chlorocarbonyl ferrocene.

ferrocenoyl dichloride. See 1,1'-dichlorocarbonyl ferrocene.

ferrocenylborane polymer.

Properties: Long-term heat resistance at 600°F; short-term stability about 1500°F. Good resistance to oxidation and hydrolysis. Contains up to 30% iron directly combined.

Uses: Specialty plastics, coatings, fibers; ablative material for space vehicles.

ferrocenyl methyl ketone. See acetylferrocene.

ferrocium. A pyrophoric alloy (q.v.) of iron and misch metal.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable solid label.

ferrocholate (iron choline citrate chelate)

Properties: Greenish-brown to reddish-brown amorphous solid; soluble in water, yielding a stable solution; soluble in acid and alkaline media.

Derivation: Reaction of choline dihydrogen citrate with ferric hydroxide.

Grade: N.D.

Use: Medicine.

ferrochromium (ferrochrome). An alloy composed principally of iron and chromium used as a means of adding chromium to steels (low-, medium-, and high-carbon) and to cast iron. Available in several

classifications and grades, generally containing between 60–70% chromium; in crushed sizes and lumps up to 75 pounds, which readily dissolve in molten steel.

ferroconcrete. See concrete.

ferroelectric. A crystalline material such as barium titanate, monobasic potassium phosphate or potassium-sodium tartrate (Rochelle salts) that over certain limited temperature ranges has a natural or inherent deformation (polarization) of the electrical fields or electrons associated with the atoms and groups in the crystal lattice. This results in the development of positive and negative poles and a consequent "direction" of polarization, which can be reversed when the crystal is exposed to an external electric field. Ferroelectric crystals are internally strained and as a consequence show unusual piezoelectric and elastic properties.

Uses: Capacitors; transducers; computer technology. See also ceramic, ferroelectric.

ferroin chelation group. A functional group characteristic of heterocyclic ring nitrogen compounds:

Among such compounds are 2,2'-bipyridine, 1,10-phenanthroline, and the 2-pyridyl triazines. These provide a large number of terminal (=C–H) groups in which the hydrogen can be replaced by many chemical groupings (carboxyl, hydroxyl, halogen, etc.). Thus synthesis of an almost endless number of substituted ferroin reactants is possible. About 200 such chelation reagents have been synthesized. Ferroin chelation chemicals in general form complex undissociated cations with divalent metal ions, e.g., $[(C_{12}H_8N_2)_3Fe]^{+2}$.

"Ferrolon."²³² Brand name for a series of organic sequestering agents used in textile applications.

ferromagnesite. An iron-bearing variety of magnesite (q.v.) used for refractories owing to its ability to bond under heat.

ferromagnetic oxide. See ferrite (2).

ferromanganese. An alloy consisting of manganese (about 48%), plus iron and carbon; used as a vehicle for adding manganese to steel. Available in standard, low-carbon, and medium carbon grades in ground, crushed and lump sizes ranging from 80 mesh to 75-lb lumps, suitable for ladle or furnace addition.

See also manganese steel.

ferromolybdenum. An alloy composed largely of iron and molybdenum used as a means of adding molybdenum to steel. Engineering steels rarely contain more than 1% molybdenum, stainless steels may contain 3% and tool steels as much as 10%. Ferromolybdenum is available in several grades in which molybdenum ranges from 55% to 75% and the maximum carbon content is either 0.10%, 0.60%, or 2.50%. It is generally added in the furnace, since it does not oxidize under steel-making conditions. M.p. 2965°F (approx). Available in crushed sizes up to one inch.

ferron. See 7-iodo-8-hydroxyquinoline-5-sulfonic acid.

ferrophosphorus. An alloy of iron and phosphorus used in the steel industry for adjustment of phosphorus content of special steels; particularly useful in preventing thin sheets from sticking together when rolled and annealed in bundles. Produced in two grades: (a) 18% phosphorus; (b) 25% phosphorus.

ferrosilicon. An alloy of iron and silicon used to add silicon to steel and iron. Sp. gr. 5.4. Insoluble in water. Small quantities of silicon deoxidize the iron and larger amounts impart special properties. It is also used in Pidgeon process for producing metallic magnesium. Available in six grades containing from 15 to 95% silicon.

Hazard: Ferrosilicon containing from 30–90% silicon is flammable and evolves toxic gases in presence of moisture.

Shipping regulations: (Air) (30 to 90% silicon) Flammable Solid label. (Rail) Not listed.

ferrosoferric oxide. See iron oxide, black.

ferrotitanium. An alloy composed principally of iron and titanium used to add titanium to steel. It is often made from titanium scrap. Three classifications are available: low, high, and medium carbon content. Furnished in various lump, crushed, and ground sizes.

ferrotungsten. An alloy of iron and tungsten used as a means of adding tungsten to steel. See tungsten steels. Contains 70–80% tungsten and no more than 0.6% carbon. Melting range 3000–5000°F; dissolves readily in molten steel. Furnished in ground and crushed sizes up to one inch.

ferrous acetate (iron acetate) $Fe(C_2H_3O_2)_2 \cdot 4H_2O$.

Properties: Greenish crystals when pure and unexposed to air; usually partly brown from action of air; soluble in water and alcohol; oxidizes to basic ferric acetate in air. Combustible.

Derivation: Action of acetic acid or pyroligneous acid on iron, with subsequent crystallization.

Uses: Textile dyeing; medicine; dyeing leather; wood preservative.

ferrous ammonium sulfate (Mohr's salt; iron ammonium sulfate) $Fe(SO_4) \cdot (NH_4)_2SO_4 \cdot 6H_2O$.

Properties: Light-green crystals. Soluble in water; insoluble in alcohol. Sp. gr. 1.865; dec. 100–110°C. Deliquescent; affected by light.

Derivation: By mixing solutions of ferrous sulfate and ammonium sulfate, followed by evaporation and subsequent crystallization.

Uses: Medicine; analytical chemistry; metallurgy.

ferrous arsenate (iron arsenate) $Fe(AsO_4)_2 \cdot 6H_2O$.

Properties: Green, amorphous powder. Insoluble in water; soluble in acids.

Derivation: Interaction of solutions of sodium arsenate and ferrous sulfate.

Uses: Medicine; insecticide.

Hazard: Highly toxic.

Shipping regulations: (Rail, Air) Poison label.

ferrous bromide (iron bromide) $FeBr_2 \cdot 6H_2O$.

Properties: Green crystalline powder; very deliquescent. Affected by light. Soluble in water and alcohol; sp. gr. 4.636; m.p. 27°C. Low toxicity.

Derivation: Action of bromine on iron filings.

Use: Medicine.

ferrous chloride (iron chloride; iron dichloride; iron protochloride). (a) $FeCl_2$; (b) $FeCl_2 \cdot 4H_2O$.

Properties: Greenish-white crystals. Soluble in alcohol and water; sp. gr. (a) 3.16 (25°C); (b) 1.93. M.p. (a) 670–674°C. Deliquescent; affected by light. Low toxicity.

Derivation: Action of hydrochloric acid on an excess of iron, with subsequent crystallization.

Uses: Mordant in dyeing; metallurgy; pharmaceutical preparations; manufacture of ferric chloride; sewage treatment.

ferrous 2-ethylhexoate. A paint drier. See soap (2).

ferrous fluoride (iron fluoride) $\text{FeF}_2 \cdot 8\text{H}_2\text{O}$. (also known: FeF_2 and $\text{FeF}_2 \cdot 4\text{H}_2\text{O}$.)

Properties: Green crystals. Soluble in acids; slightly soluble in water; insoluble in alcohol and ether; sp. gr. 4.09 (anhydrous).

Hazard: Toxic; strong irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Ceramics.

ferrous fumarate $\text{FeC}_4\text{H}_2\text{O}_4$. Anhydrous salt of a combination of ferrous iron and fumaric acid. Stable, odorless, substantially tasteless, reddish-brown anhydrous powder. Contains 33% iron by weight. Does not melt at temperatures up to 280°C . Insoluble in alcohol; very slightly soluble in water. Combustible. Low toxicity.

Grade: U.S.P.

Uses: Medicine; dietary supplement.

ferrous gluconate (iron gluconate) $\text{Fe}(\text{C}_6\text{H}_{11}\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Yellowish gray or pale greenish yellow, fine powder or granules with slight odor. Solution (1 in 20) is acid to litmus. Soluble in water and glycerin; insoluble in alcohol. Combustible. Low toxicity.

Grades: Pharmaceutical; N.F.

Uses: Medicine; feed and food additive; vitamin tablets.

ferrous iodide (iron iodide; iron protoiodide)

$\text{FeI}_2 \cdot 4\text{H}_2\text{O}$.

Properties: Crystalline, grayish-black. Soluble in water and alcohol. Sp. gr. 2.873; dec. $90\text{--}98^\circ\text{C}$; m.p. (anhydrous) 177°C . Deliquescent; affected by light. Low toxicity.

Derivation: By the action of iodine on iron filings.

Uses: Manufacture of alkali metal iodides; pharmaceutical preparations.

ferrous lactate (iron lactate) $\text{Fe}(\text{C}_3\text{H}_5\text{O}_3) \cdot 3\text{H}_2\text{O}$.

Properties: Greenish-white crystals, slight peculiar odor. Moderately soluble in water; slightly soluble in alcohol. Deliquescent; affected by light. Combustible. Nontoxic.

Derivation: By interaction of calcium lactate with ferrous sulfate or direct action of lactic acid on iron filings.

Uses: Food additive and dietary supplement.

ferrous naphthenate. A soap based on mixed naphthenic acids. Available commercially as a liquid containing 6% iron. See soap (2).

ferrous octoate. A paint drier. See soap (2).

ferrous oxalate (iron oxalate) $\text{FeC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Pale yellow, odorless crystalline powder. Soluble in acids; insoluble in water. Sp. gr. 2.28; decomposes 160°C , releasing carbon monoxide.

Derivation: By the interaction of solutions of ferrous sulfate and sodium oxalate.

Hazard: Evolves carbon monoxide on heating.

Uses: Medicine; photographic developer.

ferrous oxide (iron monoxide) FeO .

Properties: Black powder; sp. gr. 5.7; m.p. 1420°C . Insoluble in water; soluble in acid.

Derivation: Prepared from the oxalate by heating but the product contains some ferric oxide.

Hazard: Tolerance (as fume): 10 mg per cubic meter of air.

ferrous phosphide (iron phosphide) Fe_2P . A ferrophosphorus (q.v.).

Properties: Bluish-gray powder. Sp. gr. 6.56; m.p. 1290°C .

Grade: 24–26% phosphorus.

Containers: Barrels; bulk.

Hazard: Evolves toxic and flammable products on exposure to moisture or acids.

Uses: Iron and steel manufacture.

ferrous sulfate (iron sulfate; iron vitriol; copperas; green vitriol; sal chalybis) $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: Greenish or yellow-brown crystals or granules. Odorless; slightly soluble in water, with saline taste; insoluble in alcohol. Sp. gr. 1.89; m.p. 64°C ; loses $7\text{H}_2\text{O}$ by 300°C ; pH (10% solution) 3.7. Low toxicity. Hygroscopic.

Derivation: (a) By-product from the pickling of steel and many chemical operations. (b) By action of dilute sulfuric acid on iron. (c) Oxidation of pyrites in air followed by leaching and treatment with scrap iron.

Method of purification: Recrystallization.

Grades: Technical; anhydrous; C.P.; U.S.P.

Uses: Iron oxide pigment; other iron salts; ferrites; water and sewage treatment; catalyst, especially for synthetic ammonia; fertilizer; feed additive; flour enrichment.

ferrous sulfide (iron sulfide; iron protosulfide) FeS .

Properties: Dark-brown or black metallic pieces, sticks or granules. Soluble in acids; insoluble in water. Sp. gr. 4.75; m.p. 1195°C ; b.p., decomposes.

Derivation: By fusing iron and sulfur.

Uses: Generating hydrogen sulfide; ceramics; other sulfides.

See also pyrite.

ferrovanadium. An iron-vanadium alloy used to add vanadium to steel. Vanadium is used in engineering steels to the extent of 0.1–0.25%, and in high speed steels to the extent of 1–2.5% or higher. Several grades are available containing from 50 to 80% vanadium. Produced by reduction of the oxide with aluminum or silicon in presence of iron in an electric furnace. Melting range $2700\text{--}2770^\circ\text{F}$. Furnished in a variety of lump, crushed, and ground sizes.

Hazard (dust): Tolerance, 1 mg per cubic meter of air. Moderate fire risk.

ferrozirconium. Alloys used in the manufacture of steel. 12 to 15 percent zirconium alloy: Approximate analysis: zirconium 12–15%, silicon 39–43%; iron 40–45%. Application: Steel of high silicon content. 35–40 percent zirconium alloy: Approximate analysis: zirconium 35–40%, silicon 47–52%, iron 8–12%. Application: Steel of low silicon content.

ferrum. Latin name for iron; hence the symbol Fe.

fertile material. In nuclear technology, any substance not capable of sustaining a chain reaction but which can be converted into a fissionable material in a nuclear reactor. Uranium 238 (converted to plutonium 239) and thorium 232 (converted to uranium 233) are the most important fertile materials.

fertilizer. A substance or mixture that contains one or more of the primary plant nutrients and sometimes also secondary and/or trace nutrients. The primary nutrients are nitrogen (supplied as anhydrous ammonia, or solutions containing nitrogen derived from ammonia, ammonium nitrate or urea); phosphorus (as superphosphates derived from phosphate rock); and potassium (in the form of KCl from sylvite ore

or natural brines). Secondary nutrients are calcium, magnesium, and sulfur. Trace elements (iron, copper, boron, manganese, zinc and molybdenum) are also among the twelve elements considered essential for plant growth. Nitrogen solutions and anhydrous ammonia are used both in fertilizer manufacture and for direct application to the soil. Substantial amounts of both separate materials and mixtures are used in liquid form. Controlled-release fertilizers are those whose particles are coated with polymeric sulfur by a proprietary process. Their advantages include more uniform supply of nutrient, lower labor costs, and reduced leaching losses in areas of irrigation and high rainfall. See also superphosphate; nutrient solution. For further information refer to National Fertilizer Solutions Assn., Peoria, Ill.

Shipping regulations: (Rail) Green label. (Air) Fertilizer ammoniating solution containing free ammonia (pressurized): Nonflammable Compressed Gas label. Not acceptable on passenger planes.

F.F.A. Abbreviation for free fatty acid. Used in describing specifications for fatty esters, glycerides, oils, etc.

FFPA. Abbreviation for free from prussic acid.

FGAN. Fertilizer grade ammonium nitrate (q.v.). Used in blasting agents as well as fertilizers, because its coating of kieselguhr and its prilled form make it safer to handle than the usual grades.

fiber. A fundamental form of solid (usually crystalline), characterized by relatively high tenacity and an extremely high-ratio of length to diameter (several hundred to one). Natural fibers are animal, such as wool and silk (proteins); vegetable, such as cotton (cellulose); and mineral (asbestos). Cotton fiber is called staple, and rarely exceeds 2" in length.

Semisynthetic fibers include rayon and inorganic substances extruded in fibrous form, such as glass, boron, boron carbide, boron nitride, carbon (graphite), aluminum silicate, fused silica and some metals (steel). Synthetic fibers are made from high polymers (polyamides, polyesters, acrylics, and polyolefins) by extruding from spinnerets (nylon, "Orlon," etc.). Some are being used in specialty papers, though the primary use is in textile fabrics. For ceramic fibers, see "Fiberfrax."

Metals are used in the form of fibers in several forms: (1) As "whiskers," which are single-crystal fibers up to 2 in. long having extremely high tensile strength; they are made from tungsten, cobalt, tantalum and other metals, and are used largely in composite structures for specialized functions. (2) As metal fibers, which are alloys drawn through diamond dies to diameters as small as 0.002 cm; steel for tire cord and antistatic devices has been developed for such applications. (3) As metallic fibers, which are biconstituent structures composed of a metal and a polymeric material, for example, aluminum filament covered with cellulose acetate butyrate.

Hollow fibers of cellulose acetate and nylon are used as membranes in the reverse osmosis method of water purification. See also filament, denier, whiskers, glass fiber.

fiber, biconstituent. A composite fiber comprising a dispersion of fibrils of one synthetic material within, and parallel to the axis of another; also a fiber made up of a polymeric material and a metal or alloy filament.

fiberfill. A fiber designed specifically for use as a filling material in such products as pillows, comfort-

ers, quilted linings, furniture battings, e.g., sisal, jute.

"Fiberfrax."²⁸⁰ Trademark for ceramic fiber made from alumina and silica. Available in bulk as blown, chopped and washed; long staple; paper; rope; roving; blocks.

Properties: Retains properties to 2300°F and under some conditions used to 3000°F; light weight; inert to most acids and unaffected by hydrogen atmosphere; resilient.

Uses: High-temperature insulation of kilns and furnaces; packing expansion joints; heating elements, burner blocks; rolls for roller hearth furnaces and piping; fine filtration; insulating electrical wire and motors; insulating jet motors; sound deadening.

"Fiberglas."¹⁹¹ Trademark for a variety of products made of or with glass fibers or glass flakes including insulating wools, mats and rovings, coarse fibers, acoustical products, yarns, electrical insulation, and reinforced plastics.

See also glass fiber; reinforced plastics.

fiber, optical. An extremely fine-drawn glass fiber of exceptional purity that will transmit laser light impulses with high fidelity. Such fibers, which are in the experimental stage, are made from high-purity quartz coated with germanium-doped silica by vapor deposition. After drawing to a microscopically small diameter, the strands are assembled into cables containing 144 filaments; these are intended for use in telephone systems as replacements for copper cables. See also glass fiber.

fiber-reactive dye. See dye, fiber-reactive.

"Fibertex."²³⁶ Trademark for a fibrous material used as an additive to rotary drilling mud to prevent or restore lost circulation in gravelly, fractured, or creviced formations.

"Fibra Flo."²⁴⁷ Trademark for a series of filter aids comprised of physical mixtures in different proportions of either asbestos fiber and diatomite, asbestos fiber and cellulose fiber, or asbestos fiber alone.

fibril. Generic name for a fibrous form of synthetic polymeric material, used for example as a binder material in the manufacture of tetryl (q.v.).

fibrinogen. A sterile fraction of normal human blood plasma, dried from the frozen state. In solution it has the property of being converted into insoluble fibrin when thrombin is added. It is an essential factor in blood-clotting mechanism.

Properties: White or grayish amorphous substance.

Grade: U.S.P.

Use: Medicine.

fibrinolysin (plasmin). A proteolytic enzyme which dissolves fibrin and hastens the solution of clots that may form in the bloodstream. It is prepared by activating a fraction of normal human plasma with highly purified streptokinase. Listed in N.D.

fibroin. The fibrous material in silk, a scleroprotein containing glycine and alanine; light yellow silk-like mass. Insoluble in water; soluble in concentrated alkalies and concentrated acids.

fibrolite. See sillimanite.

ficin. A proteolytic enzyme hydrolyzing casein, meat, hide powder, edestin, fibrin, liver, and other protein-like material.

Properties: Buff to cream-colored powder with an acrid odor; very hygroscopic; partially soluble in water; insoluble in the usual organic solvents.

Source: Fig latex or sap. Commercially prepared by filtering and drying the latex.

Use: Brewing, cheese, meat, leather, and textile industries; diagnostic aid in medicine.

"Ficoll."⁴⁸⁵ Trademark for an inert non-ionized synthetic, high polymer made by the crosslinking reaction of epichlorohydrin and sucrose. Contains no ionized groups and its extreme solubility is due to the high content of hydroxyl groups (23%).

Uses: Density gradients for centrifugation, electrophoresis and specific gravity determinations; component in the isotonic solutions for preparation of cells and cell fragments; concentrating solutions of sensitive materials by means of dialysis.

fictile. Descriptive of certain molecules which have no permanent structure but are constantly changing their shapes and arrangements. An example is the metal carbonyl $\text{Fe}_3(\text{CO})_{12}$ in which, according to Dr. F. Albert Cotton, originator of the term, "carbonyl groups readily move from one iron atom to another through the rapid formation and dissolution of carbonyl bridges between iron atoms."

filament. A continuous fiber, usually made by extrusion from a spinneret (nylon, rayon, glass, polyethylene). It also may be a drawn metal (tungsten, gold) or a metal carbide. (See fiber).

filament winding. The process of winding fibers under tension on to a prepared core. Before or during the winding operation, the assembly is impregnated with a thermosetting resin. Structures of considerable size and strength can be made in this way. The fibers used are chiefly glass, boron, or silicon carbide. (See filament).

filler. (1) An inert mineral powder of rather high specific gravity (2.00–4.50) used in plastic products and rubber mixtures to provide a certain degree of stiffness and hardness, and to decrease cost. Examples are calcium carbonate (whiting), barytes, blanc fixe, silicates, glass spheres and bubbles, slate flour, soft clays, etc. Fillers have neither reinforcing nor coloring properties, and the term should not be applied to materials that do, i.e., reinforcing agents or pigments. Fillers are similar to extenders and diluents in their cost-reducing function; exact lines of distinction between these terms are difficult, if not impossible, to draw. Use of fillers and extenders in plastics has increased in recent years due to shortages of basic materials.

(2) The cross or transverse thread in a fabric or other textile structure.

(3) A metal or alloy used in brazing and soldering to effect union of the metals being joined.

See also diluent; extender; reinforcing agent.

film. An extremely thin, continuous sheet of a substance, which may or may not be in contact with a substrate. There is no precise upper limit of thickness, but a reasonable assumption is 0.010 in. The protective value of any film depends on its being 100% continuous, i.e., without holes or cracks, since it must form an efficient barrier to molecules of atmospheric water vapor, oxygen, etc. A long-chain fatty acid or alcohol on water produces a film whose "thickness" is the length of one molecule (about 200 Å.) The fatty acid molecules are oriented with the radical end in the water. Such films are good evaporation barriers, and have been successfully imposed

on glass. Soap bubbles are elastic films about one micron thick, and have considerable strength.

Film-forming agents (drying oils) are essential in paints and lacquers. Oxide films formed automatically on the surface of aluminum protect it from corrosion. Thin metallic oxide films are widely used in electronic and semiconductor devices. Electrodeposited metals (chromium, copper, nickel) are conventionally (and perhaps illogically) called coatings.

The term film is also applied to sheets of cellophane, polyethylene, polyvinylidene chloride, etc., used for wrapping and packaging of food products, meats, and poultry (especially shrink films, which are stretched before application). These function as a moisture vapor barrier. Plastic films are also used as slip surfaces in concrete structures such as air strips, ice rinks, and highways. Photographic film is made from cellulose acetate.

"Filmfast."⁵⁰ Trademark for a spray compound for improving distribution of insecticidal and fungicidal sprays.

"Filmcol."¹²⁵ Trademark for an authorized ethyl alcohol. Specially denatured alcohol. No. 1 (190 proof) 100 parts by volume; isopropyl alcohol, 10 parts by volume; methyl isobutyl ketone, 1 part by volume.

Hazard: Flammable; dangerous fire risk.

Uses: Solvent, purifying and recrystallizing operations in chemical industry; photographic, textile, rubber latex, printing industries.

filter aid. See filtration.

filter alum. See aluminum sulfate.

filter sand. Sand used to separate sediment and suspended matter from water.

"Filtrisorb Carbon."¹⁰⁸ Trademark for specially engineered activated carbon granules having mechanical strength great enough to withstand repeated filter backwashings and regeneration at high temperature. Used in conjunction with polymeric water-treatment chemicals for coagulating solids in raw sewage, with subsequent filtration over the carbon granules.

filtration. The process of separating suspended solids from a liquid by forcing the mixture through a porous barrier. This may be a fabric of heavy weave, a wire screen, or (on micro scale) a thin plastic membrane of high porosity (several million pores per square inch). These retain bacteria and are used in industrial sterilization. Clay suspensions are filtered by forced flow electrophoresis. Many fibrous or particulate materials (often called filter aids) can effect filtration; examples are special papers (Whatman), glass fibers, diatomaceous earth, fly ash, sand, etc.

The construction and operation of the many kinds of filtration equipment are too detailed to permit description. The most widely used types may be classified as follows: (1) gravity filters, used largely for water purification and consisting of thick beds of sand and gravel, which retain the flocculated impurities as the water passes through; (2) pressure filters of plate-and-frame or shell-and-leaf construction, which utilize filter cloths of coarse fabric as a separating medium; (3) vacuum or suction filters of the rotating drum or disk type, used on thick sludges and slurries; (4) edge filters; and (5) clarification filters. Gel filtration (q.v.) is a chromatographic technique involving separation at the molecular level.

fixing agent, chemical.

(1) A substance which aids fixation of mordants upon textiles by uniting chemically with them and holding them on the fiber until the dyes can react with them.

(2) A substance which causes actual precipitation of mordant on the fiber by double decomposition.

fixing agent, mechanical.

(1) A substance (e.g., albumin) capable of holding pigments permanently upon textile fibers.

(2) Certain gums and starches which hold dyes and other substances upon textile fibers long enough to permit a desirable reaction to take place.

fixing agent, perfume (fixative). A substance which prevents too rapid volatilization of the components of a perfume, and tends to equalize their rates of volatilization. It thus increases the odor life of a perfume and keeps the odor unchanged. For many years the chief fixatives were animal products (ambergris, civet, musk, castoreum), but these have been largely replaced by synthetics. See also perfume.

flake lead. See lead carbonate, basic.

"Flamenol."²⁴⁵ Trademark for electrical conductors insulated with a vinyl halide resin such as plasticized polyvinyl chloride.

flame-retarding agent. A material used as a coating on or a component of a combustible product to raise its ignition point. The protection provided is only partial, and most materials so treated will burn when exposed to high temperatures. There are three types: (1) nondurable, consisting of water-soluble inorganic salts, which are easily removed by washing or accidental exposure to water; (2) semi-durable (removed by repeated laundering); and (3) durable (not affected by laundering or dry-cleaning). The latter type includes organic compounds of bromine and chlorine, and insoluble metal salts; antimony trioxide, tricresyl phosphate and other phosphate esters, chlorendic acid, etc. are effective, as well as cellulose-reactive agents. Zinc carbonate in high-volume concentration will render a rubber or plastic compound self-extinguishing.

flammability. The ease with which a material (gas, liquid, or solid) will ignite, either spontaneously (pyrophoric), from exposure to a high-temperature environment (autoignition), or to a spark or open flame. It also involves the rate of spreading of a flame once it has started. The more readily ignition occurs, the more flammable the material; less easily ignited materials are said to be combustible, but the line of demarcation is often indefinite, and depends on the state of subdivision of the material as well as on its chemical nature. The Flammable Fabrics Act (1967) established standards of flammability to which all textile manufacturers must conform. See also flammable material; combustible material.

flammable material. Any solid, liquid, vapor, or gas that will ignite easily and burn rapidly. Flammable solids are of several types: (1) dusts or fine powders (metals or organic substances such as cellulose, flour, etc.); (2) those that ignite spontaneously at low temperatures (white phosphorus); (3) those in which internal heat is built up by microbial or other degradation activity (fish meal, wet cellulosic materials); (4) films, fibers, and fabrics of low-ignition point materials.

Flammable liquids are defined by the National Fire Protection Association as those having a flash point below 100°F (Closed Cup) and a vapor pressure

of not over 40 psia at 100°F. The shipping regulatory authorities use 80°F (Open Cup) and 73°F (Closed Cup), and Manufacturing Chemists Association uses 80°F (Open Cup) as the flash point below which liquids are considered flammable.

Flammable gases are ignited very easily; the flame and heat propagation rate is so great as to resemble an explosion, especially if the gas is confined. The most common flammable gases are hydrogen, carbon monoxide, acetylene and other hydrocarbon gases. Oxygen, through essential for the occurrence of combustion, is not itself either flammable or combustible; neither are the halogen gases, sulfur dioxide or nitrogen. Flammable gases are extremely dangerous fire hazards, and require precisely regulated storage conditions.

Note: The terms "flammable," "nonflammable," and "combustible" are difficult to delimit. Since any material that will burn at any temperature is combustible by definition, it follows that this word covers all such materials, irrespective of their ease of ignition. Thus the term "flammable" actually applies to a special group of combustible materials that ignite easily and burn rapidly. Some materials (usually gases) classified in shipping and safety regulations as nonflammable are actually noncombustible. The distinction between these terms should not be overlooked. For example, sodium chloride, carbon tetrachloride, and carbon dioxide are noncombustible; sugar, cellulose, and ammonia are combustible but nonflammable. See also combustible material.

flash. The overflow of cured rubber or plastic from a mold. Correct design will minimize flash, which is an economic loss.

flash distillation. Distillation in which an appreciable proportion of a liquid is quickly converted to vapor in such a way that the final vapor is in equilibrium with the final liquid. This method is now widely used for desalination of sea water.

flash photolysis. A method of investigating the mechanism of extremely rapid photochemical reactions involving the formation of free radicals (both inorganic and organic) by irradiating a given reaction mixture with a flash of high-intensity light, thus producing the short-lived radicals which activate photochemical reactions. These products are instantaneously analyzed spectroscopically, which permits identification of the radical species from the spectra obtained. The time lapses involved in this technique are about 1/100,000th second. It has also been applied to study of the exceedingly fast reactions occurring in flames and explosions. See also photochemistry; free radical; photolysis.

flash point. The temperature at which a liquid or volatile solid gives off a vapor sufficient to form an ignitable mixture with the air near the surface of the liquid or within the test vessel (NFPA). For the purposes of the official shipping regulations, the flash point is determined by the Tagliabue open-cup method (ASTM D1310-63), usually abbreviated TOC. (IATA also permits the Abel or Abel-Pensky closed-cup tester.) Other methods used, generally for the higher flash points, are the Tag closed cup (TCC) and Cleveland open cup (COC). The open cup method more nearly approximates actual conditions. See also flammable material.

flattening agent. A substance ground into minute particles of irregular shape and used in paints and varnishes to disperse incident light rays, so that a dull

or "flat" effect is produced. Standard flatting agents are heavy-metal soaps, finely divided silica, and diatomaceous earth.

flavanol (3-hydroxyflavone). A derivative of flavanone (q.v.); crystallizes in yellow needles melting at 169°C. Has violet fluorescence in conc. sulfuric acid. It is a flavonoid pigment (q.v.). Dyes cotton a bright yellow when mordanted with aluminum hydroxide. Other hydroxyflavones are chrysin, fisetin and quercetin. Eleven different flavanols are known. Not identical with flavonol.

flavanone (2,3-dihydroflavone). A group of colorless derivatives of flavone (q.v.) distributed in higher plants either in free form or as glucosides. About 25 different types have been isolated. It comprises one of the major groups of flavonoids (q.v.). Examples are hesperidin and naringen.

flavanthrene (indanthrene yellow; chloranthrene yellow) $C_{28}H_{12}O_2N_2$.

Properties: Brownish-yellow needles. Soluble in dilute alkaline solutions.

Derivation: Action of antimony pentachloride on beta-aminoanthraquinone in boiling nitrobenzene.

Use: Vat dye for textiles, etc.

"**Flavaxin**."¹⁶² Trademark for riboflavin (q.v.).

flavianic acid. See 2,4-dinitro-1-naphthol-7-sulfonic acid.

flavin.

(1) Isoalloxazine, $C_{10}H_6N_4O_2$, the nucleus of various natural yellow pigments. See riboflavin and flavin enzymes.

(2) Tetrahydroxyflavanol, $C_{15}H_{10}O_7 \cdot 2H_2O$, a yellow dye derived from oak bark.

flavine. Acriflavine hydrochloride, a bacteriostatic agent.

flavin enzyme (flavoprotein). An enzyme composed of protein linked to coenzymes which are mono- or dinucleotides containing riboflavin. Because of their distinctive color they are also called "yellow enzymes." The flavin enzymes function in tissue respiration as dehydrogenases, the hydrogen atoms being taken up by the riboflavin group.

flavin mononucleotide. See riboflavin phosphate.

flavone (2-phenylchromone). One of a group of flavonoid plant pigments, existing as colorless needles, insoluble in water and melting at 100°C. It fluoresces violet in conc. sulfuric acid. It can be synthesized. Treatment with alcoholic alkali yields flavanone (q.v.). The flavones produce ivory and yellow colors in plants and flowers. See also flavonoid.

flavonoid. A group of aromatic, oxygen-containing heterocyclic pigments widely distributed among higher plants. They constitute most of the yellow, red, and blue colors in flowers and fruits. Exceptions are the carotenoids (q.v.). The flavonoids include the following subgroups: (1) catechins, (2) leucoanthocyanidins and flavonones, (3) flavanols, flavones, and anthocyanins; and (4) flavonols. For details, consult specific entries.

flavonol (flavon-3-ol). A flavonoid plant pigment giving ivory and yellow colors to flowers. Not identical with flavanol (q.v.).

flavoprotein. See flavin enzyme.

flavor. (1) The simultaneous physiological and psychological response obtained from a substance in the mouth that includes the senses of taste (salty, sour, bitter, sweet), smell (fruity, pungent), and feel. The sense of feel as related to flavor encompasses only the effect of chemical action on the mouth membranes, such as heat from pepper, coolness from peppermint, and the like. (Institute of Food Technologists). No reliable correlation of taste with chemical structure has yet been possible. Flavor is a critical factor in the acceptability of foods, medicines, confectionery, and beverages. Flavors are used in insect and animal baits to induce ingestion of the bait; also to prevent rodent attack on organic materials, e.g., tributyl tin in cable covers. Substances that affect flavor often have a synergistic effect (for example, monosodium glutamate and certain nucleotides). Sodium chloride is classed as a seasoning agent. See also potentiator; enhancer.

(2) Any substance or mixture of substances that contributes a positive taste to a food product, such as vanillin, cacao, and fruit extracts among natural products, together with numerous synthetic compounds that imitate or duplicate these tastes. Undesirable or "off-flavors" occur in milk, meat and other food products as a result of improper preparation, oxidation, and incipient rancidity. There are over 1500 flavoring materials listed as food additives under provisions of the Food, Drug and Cosmetics Act. See also odor.

flax. Bast fibers, approximately 20 in. long, obtained from the stems of the linseed plant, *linum usitatissimum*. Stronger and more durable than cotton. Combustible.

Uses: Apparel fabrics (linens); thread; rope; twine; cigarette paper; duplicating papers.

"**Flaxedil**."⁵⁷ Trademark for gallamine triethiodide (q.v.).

flaxseed oil. See linseed oil.

flea seed. See psyllium.

"**Flectol**" H.⁵⁸ Trademark for polymerized 1,2-dihydro-2,2,4-trimethylquinoline.

Use: Rubber antioxidant, especially for belting and tire carcasses.

Fleming, Sir Alexander (1881-1955). A Scottish biochemist and bacteriologist who discovered (1928) the bactericidal properties of molds produced from the plant *Penicillium notatum*. The broad spectrum of antibiotics developed from this discovery. See also antibiotic.

"**Flexalyn**" 80M.²⁶⁶ Trademark for a pale, balsamic resin; the diethylene glycol ester of rosin.

"**Flexamine G**."²⁴⁸ Trademark for a mixture of N,N'-diphenyl-para-phenylenediamine and a complex diarylamine-ketone reaction product.

Properties: Brownish gray granules; sp. gr. 1.20; melting range 75-90°C; soluble in acetone, benzol and ethylene dichloride; insoluble in water and gasoline.

Uses: Antioxidant used in tires, camelback, wire insulation, neoprene belting and soles.

"**Flexane**."⁴⁴⁵ Trademark for room-temperature-curing urethane.

"Flexbond."¹⁴⁴ Trademark for polyvinyl acetate co-polymer emulsions.

Properties: 48% to 57% solids; 60 to 3800 cp; 4.0 to 6.5 pH; 0.14 μ to 1.5 μ average particle size; non-ionic; borax stable except for 803 grade; mechanically stable.

Containers: Bulk, 55-gal. lined steel or fiber drums.

Uses: Adhesive bases for paper, cloth, plastic, and leather; vehicles for house paints or industrial finishes; binders for pigments in paper coatings.

"Flexclad."²⁶⁵ Trademark for polyester resin powders for use in coating applications.

"Flexichem."¹⁵² Trademark for a series of soaps composed of sodium stearate, sodium tallowate, calcium stearate, zinc stearate, potassium stearate, and sodium oleate. Food grade materials available.

Uses: Gelling and thickening agents, lubricant, concrete water absorption reducing agents, plasticizer, and processing aids for rubber and metal products.

"Fleximet."¹⁵² Trademark for a series of soaps used as rod and wire processing lubricants.

"Flexol."²¹⁴ Trademark for a series of plasticizers and stabilizers including phthalates, adipates, polyalkylene glycol derivatives, polymeric epoxies, decanoates, octoates, hexoates, tri(2-ethylhexyl)phosphate and dibutyltin dilaurate.

Uses: Film and sheeting; flooring; coated fabrics; wire and cable and other extrusions; organosols, plastisols, and plastigels; lacquers and rubbers.

"Flexon."⁵¹ Trademark for a series of petroleum process oils mainly used as compounding and extender oils in synthetic rubber and resins.

"Flexo Wax C."⁷³ Trademark for a synthetic, non-crystalline hydrocarbon wax; m.p. 66-74°C; has cold flow of 63-65°C; high adhesive and waterproofing properties.

Uses: Adhesives; coatings for paper; greaseproofing; lacquers and enamels; nickel alloy stamping, plating; water-repellent coatings.

"Flexricin."²⁰² Trademark for a group of castor oil derivatives including (1) alkyl ricinoleates, compatible with cellulosic resins, polyvinyl butyral, polyamide, rosin and shellac and used as plasticizers; (2) acetyl ricinoleates, the alkyl esters of acetylated ricinoleic acid used as plasticizers for nitrocellulose, ethylcellulose, polyvinyl chloride resins and copolymers, and as textile lubricants; and (3) polyol ricinoleates used for synthesis, cosmetics, brake fluids, in waxes and greases, and as anti-foam agents.

"Flexzone."²⁴⁸ Trademark for a series of antiozonants, antioxidants and stabilizers based on para-phenylenediamine.

flint. A crystalline form of native silica or quartz. Properties: Color, smoky gray, brownish, blackish, dull yellowish; luster waxy to greasy; Mohs hardness 6.5-7; sp. gr. 2.60-2.65. More easily soluble in hot caustic alkali than crystallized quartz.

Occurrence: Europe; U.S.
Uses: Abrasive; balls for ball mills; paint extender; filler for fertilizer, insecticides, rubber, plastics and road asphalt; ceramics; chemical tower packing.

"Flintflex."²⁸ Trademark for air- or force-dry organic coating system used for linings in interiors of containers that haul dry bulk loadings of edibles or chemicals. Complies with FDA Regulations. Accepted by the Meat Inspection Division of the U.S.

D.A. for interiors of freight cars, motor trucks and trailers and in federally inspected meat-processing plants.

Containers: Up to 55-gal drums.

flint glass. See glass, optical.

floatation. Purification and/or classification of finely divided solids, e.g. clays, by passing them through an airblast. Do not confuse with flotation (q.v.).

floculant. A substance that induces flocculation (q.v.). Flocculants are used in water purification, liquid waste treatment and other special applications. Inorganic flocculants are lime, alum, and ferric chloride; polyelectrolytes (q.v.) are examples of organic flocculants.

flocculation. The combination or aggregation of suspended solid particles in such a way that they form small clumps or tufts resembling wool. The word is derived from this appearance. Carbon black displays a tendency to flocculate in rubber when improperly dispersed, and some colloidal clays have the same property. Oil-well drilling muds are made alkaline to prevent flocculation of their components. Flocculation can often be reversed by agitation, as the cohesive forces are relatively weak. This is not true of other forms of aggregation (coalescence and coagulation), which are irreversible.

flock. A light powder comprised of ground wood or cotton fibers used as an extender or filler in plastics, low-grade rubber and flooring compositions.

"Floform."³¹⁹ Trademark for carbon black used for various industrial purposes and especially for compounding with rubber.

"Flo-Gard."¹⁷⁷ Trademark for amorphous calcium polysilicate used as an anticaking agent for salt.

"Flogel."²⁶⁶ Trademark for regular, high-density, and aluminized grades of water-resistant, nonnitroglycerin slurry explosives so formulated that a strong booster is required for their detonation.

"Flomet-Z."³²⁹ Trademark for a fine, white, grit-free powder containing 12.5 to 14.0% zinc oxide. Used as a lubricant in powdered iron metallurgy.

"Florco."⁹⁸ Trademark for a granular mineral absorbent processed from attapulgite. Used to absorb liquids from concrete, terrazzo and other surfaces.

"Florex."⁹⁸ Trademark for attapulgite which has been substantially improved in adsorption efficiency by high-pressure extrusion and other special processes. Recommended where good adsorption capacity is essential. Available in various grades.

"Florigel H-Y."⁹⁸ Trademark for a high-yield salt water drilling clay.

"Florisol."⁹⁸ Trademark for a highly selective adsorbent of extremely white, hard granular or powdered magnesite-silica gel (magnesium silicate).

"Florisol" TLC. Special grade for thin layer chromatography.

Uses: Preparative and analytical chromatography.

"Florite" Activated Bauxite.⁹⁸ Trademark for products produced from carefully selected domestic and imported bauxite ores. Used in the refining of petroleum oils, distillates, petrolatums, waxes and many other organic solvents; also as desiccant for gases and liquids.

"Floropryl."¹²³ Trademark for diisopropyl fluorophosphate.

flotation. A process for separating minerals from waste rock, or solids of different kinds from one another by agitating the pulverized mixture of solids with water, oil, and special chemicals which cause preferential wetting of solid particles of certain types by the oil, while other kinds are not wet. The unwetted particles are carried to the surface by the air bubbles and thus separated from the wetted particles. A frothing agent is also used to stabilize the bubbles in the form of a froth which can be easily separated from the body of the liquid (froth flotation). Do not confuse with floatation (q.v.).

"Flotox."²⁵³ Trademark for flotation sulfur products.

"Flotronics."⁵³⁵ Trademark for metal membrane filters of uniformly porous silver, available in distinct porosity grades from 0.2 to 5 micron maximum pore diameter. No bonding agent or fiber is used; the filters are of uniform particles of pure silver only. Used for filtration, clarification, and cold sterilization of all types of solutions.

"Flovis."⁷³ Trademark for a modified polyoxyethylene fatty-acid ester.

Properties: Cream to tan solid; m.p. 39–42°C; sp. gr. 1.02 (25°C); pH 5% aqueous dispersion 3–5 (25°C).

Uses: Textile and adhesive industries for stabilizing starch solutions, fluid or heavy paste, against "setting-up."

"Flowbrite."¹⁴² Trademark for a formulation of oils used at elevated temperature for the bright flowing of electroplated tin.

"Flowco."³²⁹ Trademark for a group of stearates. Used as finishes and additives in paper and pulp.

flow diagram (flow sheet). A chart or line drawing used by chemical engineers to indicate successive steps in the production of a chemical, materials input and output, by-products, waste, and other relevant data.

flowers. A fine powder usually resulting from sublimation of a substance, e.g., flowers of sulfur. The term is now obsolescent.

flou. A mixture of liquid fluorine (30%) and liquid oxygen (70%), designed for use as a space vehicle propellant.

Containers: Stainless steel tanks.

Hazard: Highly flammable.

Shipping regulations: Consult authorities.

"Flozan."²⁴⁴ Trademark for an anhydrous soda ash product. Contains a bicarbonate of soda and a monohydrate of soda ash. White, free-flowing and will absorb approximately 30% of its weight.

Uses: Cleansing and detergent preparations.

"Flozene."⁴⁵ Trademark for a series of lubricant white mineral oils; sp. gr. 0.860–0.870 (60°F).

Use: Industrial lubricants.

fludrocortisone acetate (9alpha-fluorohydrocortisone acetate) $C_{23}H_{31}FO_6$. 9Alpha-17alpha-hydroxycorticosterone-21 acetate.

Properties: White, odorless polymorphic crystals; m.p. 233–234°C. Sparingly soluble in alcohol and very slightly soluble in water.

Uses: Medicine; veterinary medicine.

"Fludrocortone."¹²³ Trademark for fludrocortisone.

fluid. Any material or substance that changes shape or direction uniformly in response to an external

force imposed upon it. The term applies not only to liquids, but to gases and to finely divided solids. Fluids are broadly classified as Newtonian and non-Newtonian depending on their obedience to the laws of classical mechanics. See also liquid, Newtonian; rheology; fluidization; hydraulic fluid.

"Fluid Ball."⁶⁴ Trademark for a propellant casting powder consisting of colloidal nitrocellulose having an average particle diameter of 50 microns or less. Composition can include liquid or solid modifiers. Used as binder constituent of modified double base solid rocket propellants.

Containers: Fiber drums, 100-lb net weight.

Hazard: Highly flammable; dangerous fire risk.

fluidization. A process in which a finely divided solid is caused to behave like a fluid by suspending it in a moving gas or liquid. The solids so treated are frequently catalysts; hence, the term fluid catalysis. The fluidized catalyst, e.g., alumina-silica gel, is brought into intimate contact with the suspending liquid or gas mixture, usually a petroleum fraction. Local overheating of the catalyst is greatly reduced, and portions of catalyst can be easily removed for regeneration without shutting down the unit. There are also non-catalytic applications of fluidization, e.g., reduction of iron ore. Important uses of the fluidized bed process are (1) cracking of petroleum fractions; (2) gasification of coal; and (3) application of organic coatings to metals (fusion bond method).

fluoboric acid (fluoroboric acid) HBF₄.

Properties: Colorless, strongly acid liquid; sp. gr. approx 1.84; b.p. 130° with decomposition. Miscible with water, alcohol.

Derivation: Action of boric and sulfuric acids on fluorspar.

Grades: Technical (about 48%); pure.

Hazard: Highly toxic; a corrosive irritant.

Uses: Production of fluoborates; specially purified solution used for electrolytic brightening of aluminum. Also to form stabilized diazo salts.

Shipping regulations: (Rail) Corrosive liquid, n.o.s., White label. (Air) Corrosive label.

"Fluokarb."¹⁸⁴ Trademark for an activated bonechar used for fluoride removal.

fluor. See phosphor.

fluophosphate alkyl ester. See diisopropyl fluorophosphate.

fluoranthene (idryl) C₁₆H₁₀. A tetracyclic hydrocarbon. Properties: Colored needles; f.p. 107°C; b.p. 250°C (60 mm); insoluble in water; soluble in ether and benzene. Combustible.

Derivation: From coal tar.

Hazard: Moderately toxic.

fluorapatite. See apatite.

fluorbenside. Generic name accepted for para-chlorobenzyl para-fluorophenyl sulfide, $ClC_6H_4CH_2SC_6H_4F$. Crystals; m.p. 36°C. Insoluble in water; soluble in acetone and oils. Used as an acaricide.

"Fluorel"¹⁵⁵ Trademark for a fully-saturated fluorinated polymer containing more than 60 per cent fluorine by weight; non-flammable.

Uses: O-rings, gaskets; hoses; wire and fabric coatings; diaphragms; fuel cells; expellent bladders; seals; insulation; containers.

fluorene (alpha-diphenylenemethane) $\overline{\text{C}_6\text{H}_4\text{CH}_2\text{C}_6\text{H}_4}$.
A tricyclic hydrocarbon.

Properties: Small, white, crystalline plates; fluorescent when impure. Soluble in alcohol, ether, benzene and carbon disulfide; insoluble in water. M.p. 116°C; b.p. 295°C (with decomposition). Combustible.

Derivation: By reduction of diphenylene ketone with zinc; from coal tar.

Grades: Technical; 98% pure.

Uses: Resinous products; insecticides; dyestuffs.

fluorescein (resorcinolphthalein; diresorcinolphthalein; see also uranine) $\text{C}_{20}\text{H}_{12}\text{O}_5$.

Properties: Orange-red, crystalline powder; very dilute alkaline solutions exhibit intense, greenish-yellow fluorescence by reflected light, while the solution is reddish-orange by transmitted light; m.p., decomposes at 290°C; soluble in dilute alkalies, boiling alcohol, ether and dilute acids, glacial acetic acid; insoluble in water, benzene, chloroform. Combustible; low toxicity.

Derivation: By heating phthalic anhydride and resorcinol.

Grades: The sodium salt (uranine) and potassium salt are marketed.

Uses: Dyeing sea water for spotting purposes; tracer to locate impurities in wells; dyeing silk and wool; medicine; indicator and reagent for bromine.

fluorescence. A type of luminescence (q.v.) in which an atom or molecule emits visible radiation in passing from a higher to a lower electronic state. The term is restricted to phenomena in which the time interval between absorption and emission of energy is extremely short (10^{-8} to 10^{-3} second). This distinguishes fluorescence from phosphorescence, in which the time interval may extend to several hours. Fluorescent materials may be liquid or solid, organic or inorganic. Fluorescent crystals such as zinc or cadmium sulfide are used in lamp tubes, television screens, scintillation counters, and similar devices. Fluorescent dyes are used for labeling molecules in biochemical research. See also phosphorescence; phosphor; resonance (2).

fluoridation. Addition to public drinking water supplies of about 1 ppm of a fluorine salt for the purpose of reducing the incidence of dental caries. The chemicals most commonly used for city fluoridation are fluosilicic acid, sodium silicofluoride, and sodium fluoride. The concentration used has been established to be far below the permissible level of toxicity of fluorine-containing compounds in the human body. The program was successfully tested for over twenty years on local populations, and since then has been widely adopted in large cities in the U.S. The protection is especially effective for children, whose teeth are usually more susceptible to caries than those of adults. Fluorine is a bone-seeking element; tooth protection is due to the ability of fluoride ion to replace other ions in hydroxyapatite (q.v.), the chief mineral component of bones and teeth. Fluorides are used in toothpastes and other dentrifices.

fluorinated ethylene-propylene resin (FEP resin). A copolymer of tetrafluoroethylene and hexafluoropropylene with properties similar to polytetrafluoroethylene resin. The repeating structure of the molecule is $[-\text{CF}_2-\text{CF}_2-\text{CF}_2-\text{CF}(\text{CF}_3)-]$. See also "Teflon." **Properties:** Similar to polytetrafluoroethylene (q.v.). Capable of continuous service from -450° to +400°F. Has higher coefficient of friction.

Available as extrusion and molding powder, aqueous dispersion, film, monofilament fiber, and nonsticking finish.

Uses: Wire and cable insulation; pipe linings; lining for processing equipment. Fibers are used for filtration screening and mist separators.

fluorine F Nonmetallic halogen element in group VIIA of the periodic classification. Atomic number 9. Atomic weight 18.9984; valence 1. No stable isotopes. The most electronegative and most reactive element. The molecular formula is F_2 .

Properties: Pale yellow diatomic gas or liquid; pungent odor; b.p. -188°C; f.p. -219.6°C; density of gas 1.695 (air = 1); sp. gr. of liquid (-188°C) 1.108; sp. vol. 10.2 cu ft/lb (70°F). Reacts vigorously with most oxidizable substances at room temperature, frequently with ignition. Forms fluorides with all elements except helium, neon, and argon.

Occurrence: Widely distributed to the extent of 0.03% of the earth's crust. The chief minerals are fluorapatite, cryolite, and fluorspar.

Derivation: Electrolysis of molten anhydrous hydrofluoric acid—potassium fluoride melts with special copper-bearing carbon anodes, steel cathodes, containers and monel screens.

Containers: Special steel cylinders; tank trailers (as liquid). Available as a liquid and a compressed gas.

Hazard: Highly toxic; strong corrosive irritant. Flammable, dangerous fire risk. Tolerance 1 ppm in air. Powerful oxidizing agent.

Uses: Oxidizer in rocket fuels; production of metallic and other fluorides; production of fluorocarbons (q.v.).

Shipping regulations: (Rail) Red gas label. (Air) Not acceptable.

fluorine cyanide. See cyanogen fluoride.

fluorite. See fluorspar.

fluoroacetic acid CH_2FCOOH .

Properties: Colorless crystals; m.p. 33°C; b.p. 165°C; soluble in water, alcohol. Nonflammable.

Hazard: Toxic and irritant.

fluoroacetone $\text{CH}_3\text{FCOCH}_3$.

Properties: Yellow liquid. Pungent odor; sp. gr. 0.967 (20°C); b.p. 72.5°C. Nonflammable.

fluoroacetophenone (phenacyl fluoride; phenyl fluoromethylketone) $\text{C}_6\text{H}_5\text{COCH}_2\text{F}$.

Properties: Brown liquid. Pungent odor. B.p. 98°C (8 mm). Nonflammable.

Derivation: By Friedel-Crafts synthesis.

Hazard: Toxic and irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

para-fluoroaniline $\text{FC}_6\text{H}_4\text{NH}_2$.

Properties: Liquid; sp. gr. (25°C) 1.1524; b.p. 187.4°C; m.p. 0.82°C; refractive index (n 20/D) 1.5395. Nonflammable.

Hazard: Probably toxic. See aniline.

Uses: Dye intermediate; preparation of para-fluorophenol.

fluorobenzene (phenyl fluoride) $\text{C}_6\text{H}_5\text{F}$.

Properties: Colorless liquid with benzene odor; sp. gr. (20°C) 1.0252; refractive index (n 25/D) 1.4636; b.p. 84.9°C; freezing point 41.9°C. Insoluble in water; miscible with alcohol, ether. Nonflammable.

Hazard: Toxic and irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Insecticide and larvicide intermediate; identification reagent for plastic or resin polymers.

fluoroboric acid. See fluoboric acid.

fluorocarbon. Any of a number of organic compounds analogous to hydrocarbons, in which the hydrogen atoms have been replaced by fluorine. The term is loosely used to include fluorocarbons that contain chlorine; these should properly be called chloro-fluorocarbons or fluorocarbon chlorides, since it is these which are thought to deplete the ozone layer of the upper atmosphere. Studies of this possibility are in progress; meanwhile the use of chlorofluorocarbons as aerosol propellants has been reduced.

Properties: Fluorocarbons are chemically inert, non-flammable, and stable to heat up to 500–600°F. They are denser and more volatile than the corresponding hydrocarbons, and have low refractive indices, low dielectric constants, low solubilities, low surface tensions, and viscosities comparable to hydrocarbons. Some are compressed gases; others are liquids.

Hazard: React violently with reactive substances, e.g., barium, sodium, and potassium.

Uses: Aerosol propellants, refrigerants, solvents, blowing agents, fire extinguishment; lubricants and hydraulic fluids; flotation and damping fluids; dielectrics; plastics; electrical insulation; wax coatings for alkali cleaning tanks; air conditioning.

Note: The rather considerable number of these compounds is designated by a number system, preceded by the word "refrigerant," "propellant," "fluorocarbon" or by a trademark ("Freon," "Ucon," "Genetron.") They are cross-referenced in this book as follows:

11. See trichlorofluoromethane.
12. See dichlorodifluoromethane.
13. See chlorotrifluoromethane.
14. See tetrafluoromethane.
21. See dichlorofluoromethane.
22. See chlorofluoromethane.
23. See fluoroform.
113. See 1,1,2-trichloro-1,2,2-trifluoroethane.
114. See 1,2-dichloro-1,1,2,2-tetrafluoroethane.
115. See chloropentafluoroethane.
116. See hexafluoroethane.

fluorocarbon polymer. This term includes polytetrafluoroethylene, polymers of chlorotrifluoroethylene, fluorinated ethylene-propylene polymers, polyvinylidene fluoride, hexafluoropropylene, etc.

Properties: Thermoplastic; resistant to chemicals and oxidation; noncombustible; broad useful temperature range (up to 550°F); high dielectric constant; resistant to moisture, weathering, ozone, and ultraviolet radiation. Their structure comprises a straight backbone of carbon atoms symmetrically surrounded by fluorine atoms.

Forms: Powders, dispersions, film, sheet, tubes, rods, tapes, and fibers.

Uses: High-temperature wire and cable insulation; electrical equipment; food, drug and chemical equipment; coating of cooking utensils; piping; gaskets; continuous sheet.

See also fluoroelastomer.

fluorochemical. Organic compounds, not necessarily hydrocarbons, in which a large percentage of the hydrogen directly attached to carbon has been replaced by fluorine. The presence of two or more fluorine atoms on a carbon atom usually imparts stability and inertness to the compound and fluorine usually increases the acidity of organic acids.

Derivation: (a) Electrolysis of solutions in hydrogen

fluoride (Simons process); (b) replacement of chlorine or bromine by fluorine with hydrogen fluoride in the presence of a catalyst (antimony trifluoride or pentafluoride); (c) addition of hydrogen fluoride to olefins or acetylene.

Uses: Dielectric and heat-transfer liquids; pump sealants; surfactants; metering devices; special solvents.

See also fluorocarbon; fluoroelastomer.

fluorodichloromethane. See dichlorofluoromethane.

fluoroelastomer. Any elastomeric high polymer containing fluorine; they may be homopolymers or copolymers. Fluorocarbon polymers (q.v.) include a large group of fluoroelastomers. Besides these, a relatively recent development is a copolymer in which the molecular skeleton is a $-P=N-$ chain containing approximately equal numbers of tri- and heptafluoroethoxy side groups. Such polymers are amorphous, thermally stable, noncombustible, have low glass transition temperature (-77°C), and are generally resistant to attack by solvents and chemicals.

fluoroethylene. See vinyl fluoride.

fluoroform (trifluoromethane; propellant 23; refrigerant 23) CHF_3 .

Properties: Colorless, nonflammable gas; b.p. -84°C (1 atm); f.p. -160°C (1 atm); sp. vol. 5.5 cu ft/lb (70°F , 1 atm).

Grade: 98% min. purity.

Containers: Up to 70 lb steel cylinders.

Hazard: Moderately toxic and irritant. Narcotic in high concentrations.

Uses: Refrigerant; intermediate in organic synthesis; direct coolant for infrared detector cells; blowing agent for urethane foams.

Shipping regulations: (Air) Nonflammable Gas label.

fluoroformyl fluoride. See carbonyl fluoride.

"Fluoroinert."¹⁵⁸ Trademark for a series of perfluorinated liquids used for cleaning electronic components after testing. B.p. range 88 – 345°F ; high dielectric strength; colorless; nonflammable.

"Fluorolubes."⁶² Trademark for polymers of trifluorovinyl chloride ($-\text{CF}_2-\text{CFCI}-$), containing 49% fluorine and 31% chlorine. Products are light oils, heavy oils, and grease-like materials.

Uses: Lubricant and sealant for plug cocks, valves, and vacuum pumps; impregnant for gaskets and packings; fluid for hydraulic equipment, heat exchange and instrument damping.

fluoromethane (methyl fluoride) CH_3F .

Properties: Colorless gas; b.p. -78.2°C ; f.p. -142°C ; density 0.877.

Hazard: Toxic and flammable. Tolerance (as F), 2.5 mg per cubic meter of air.

Shipping regulations: (Rail) Not listed. (Air) Flammable Gas label. Not accepted on passenger planes.

Legal label name methyl fluoride.

fluorometholone. A synthetic derivative of prednisolone, 21-desoxy-9 α -fluoro-6-methylprednisolone. Listed in N.D. Used in medicine.

para-fluorophenol $\text{FC}_6\text{H}_4\text{OH}$.

Properties: White crystalline solid; sp. gr. (56°C) 1.1889; m.p. 48.2°C (stable form), 28.5°C (unstable form); b.p. 185.6°C (760 mm), 78°C (15 mm). Soluble in water.

Hazard: Toxic and irritant.

Use: Fungicide; intermediate for pharmaceuticals and fungicides.

fluorophosphoric acid $\text{H}_2\text{PO}_3\text{F}$.

Properties: Colorless viscous liquid; sp. gr. 1.1818 (25°C); miscible with water.

Hazard: Highly toxic. Strong irritant to tissue.

Uses: Metal cleaners; electrolytic or chemical polishing agents, formation of protective coatings for metal surfaces; catalyst.

Shipping regulations: (anhydrous) (Rail) Corrosive liquids, n.o.s., White label. (Air) Corrosive label. Not acceptable on passenger planes.

See also difluorophosphoric acid and hexafluorophosphoric acid.

fluosilicic acid. Legal label name (Air) for fluosilicic acid.

fluorosulfonic acid. Legal label name (Air) for fluosulfonic acid (q.v.).

fluorosulfuric acid. See fluosulfonic acid.

fluorothene. See chlorotrifluoroethylene polymer.

fluorotrichloromethane. See trichlorofluoromethane.

fluorspar (fluorite, fluorspar) CaF_2 . Natural calcium fluoride. Color yellow, green, or purple crystals;

Mohs hardness 4; sp. gr. 3.2; m.p. 1350°C.

Grades: Metallurgical, ceramic, and acid, containing more than 85, and 98% CaF_2 , respectively.

Occurrence: U.S.; Canada; Europe; Mexico.

Containers: Bulk in railroad cars or barges; 125-lb bags; 500-lb barrels.

Use: Principal source of fluorine and its compounds, by way of hydrogen fluoride; flux in open hearth steel furnaces and in metal smelting; in ceramics; for synthetic cryolite; in carbon electrodes; emery wheels; electric arc welders; certain cements; dentifrices; phosphor; paint pigment; catalyst in wood preservatives; optical equipment.

fluosilicate. A salt of fluosilicic acid H_2SiF_6 . For possible synonyms, see fluosilicic acid.

fluosilicic acid (hydrofluosilicic acid; fluorosilicic acid; hexafluorosilicic acid; hydrogen hexafluorosilicate; hydrosilicofluoric acid; hydrofluorosilicic acid; sand acid) H_2SiF_6 .

Properties: Colorless, fuming liquid. Attacks glass and stoneware. Soluble in water.

Derivation: By-product of the action of sulfuric acid on phosphate rock containing fluorides and silica or silicates. The hydrofluoric acid acts on the silica to produce silicon tetrafluoride, SiF_4 , which reacts with water to form fluosilicic acid, H_2SiF_6 .

Grades: Technical; C.P.

Containers: Special plastic bottles; 50-gal barrels; tank cars.

Hazard: Highly toxic; extremely corrosive by skin contact and inhalation.

Uses: Water fluoridation; ceramics (to increase hardness); disinfecting copper and brass vessels; hardening cement, etc.; technical paints; wood preservative and impregnating compounds; electroplating; manufacture of aluminum fluoride, synthetic cryolite (q.v.), and hydrogen fluoride.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Legal label name (Rail) hydrofluosilicic acid, (Air) fluorosilicic acid.

fluosulfonic acid (fluorosulfuric acid; fluorosulfonic acid) HSO_3F .

Properties: Colorless, fuming liquid; sp. gr. 1.745 (15°C); f.p. -87°C; b.p. 165°C; soluble in nitro-

benzene, soluble in water with partial decomposition.

Derivation: Reaction of anhydrous hydrogen fluoride with sulfuric acid or sulfuric acid anhydride.

Hazard: Highly toxic. Extremely irritating to eyes and tissue.

Uses: Catalyst in organic synthesis; electropolishing.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not accepted on passenger planes. Legal label name (Air) fluorosulfonic acid.

flushed color. A pigment dispersed in oil, varnish, etc., the transfer from the water phase to the oil phase having been effected without the usual drying and subsequent grinding of the dry pigment. It is claimed that flushed colors are ready for use without grinding.

flux.

(1) A substance that promotes the fusing of minerals or metals or prevents the formation of oxides. For example, in metal refining lime is added to the furnace charge to absorb mineral impurities in the metal. A slag (q.v.) is formed which floats on the bath and is run off.

(2) A substance applied to metals that are to be united. On application of heat, it aids the flow of solder and prevents formation of oxides.

(3) Any readily fusible glass or enamel used as a base or ground in ceramic processing.

(4) The rate of flow or transfer of electricity, magnetism, water, heat, energy, etc., the term being used to denote the quantity that crosses a unit area of a given surface in a unit of time.

(5) The intensity of neutron radiation, expressed as the number of neutrons passing through 1 square centimeter in 1 second.

(6) A mixture of sodium nitrate and sodium nitrite; oxidizing agent used as a low explosive.

fluxing lime. See calcium oxide.

fly ash. The very fine ash produced by combustion of powdered coal with forced draft, and often carried off with the flue gases from such processes. Special equipment is necessary for effective recovery, e.g., electrostatic precipitators. Considerable percentages of CaO , MgO , silica and alumina are present. Fly ash is used as a cement additive for oil-field well casings; as an absorbent for oil spills (silicone-coated); as a filler in plastics; and (in England) as a source of germanium. Experimental work has been carried out on its use for separation of oil-sand tailings; it may also be useful in removal of heavy metals from industrial waste waters.

Note: A new cement, utilizing from 50 to 70% fly ash and said to be superior to portland cement in several respects, has been developed in Belgium.

Fm Symbol for fermium.

FMN. Abbreviation for flavin mononucleotide. See riboflavin phosphate.

foam. A dispersion of a gas in a liquid or solid. The gas globules may be of any size, from colloidal to macroscopic, as in soap bubbles. Bakers' bread and sponge rubber are examples of solid foams. Typical liquid foams are those used in fire-fighting, shaving creams, etc. In such foams the liquid must have sufficient cohesion to form an elastic film, e.g., soap, oil, protein, fatty acids, etc. Surfactant-induced foams have been developed to increase the efficiency of fuel cells.

Foams made by mechanical incorporation of air are widely used in the food industry, e.g., whipped

cream, eggwhite, ice cream, etc. Useful foams for auto seats, mattresses and similar uses are made from natural and synthetic latexes, e.g., polystyrene, polyurethane.

A glass foam is based on sodium silicate and rock wool, and vitreous ceramic foams are also available. Metals can be caused to foam. Concrete foams are also in general use. See also foam, metal; foam, fire-extinguishing; foam, plastic.

foam, fire-extinguishing. An agglomeration of small bubbles of gas, produced by two methods: (1) by chemical reaction between aluminum sulfate and sodium bicarbonate to generate carbon dioxide (chemical foams), and (2) by mixing or agitation of air with water containing the foaming ingredients (mechanical foams). The two types are equally efficient in extinguishing ability.

Besides the foaming ingredients, the foams contain stabilizing agents to assure permanence; there are many of these, for example, soaps, proteins, extract of licorice root, fatty acids and sulfite liquors. The ingredients of chemical foams are assembled in two separate units, which generate the foam on blending.

Fire foams are used primarily on fires in hydrocarbon liquids (Class B fires). There are many special types tailored for specific uses. Recently developed fire protection systems for aircraft include an instant-generating foam for cabin interiors, using a 2.5% aqueous solution of alkyl sulfonate, and rigid polyurethane foams for use in fuel tanks. See also fire extinguishment.

"Foam-Cel."¹⁶⁰ Trademark for a foam-polyethylene insulation used on solid copper conductor with impervious aluminum sheath.

Uses: Signal transmission in all high-frequency applications including community antennae, closed circuit TV, electronic circuits of all types.

"Foamex."⁷³ Trademark for a mixture of aliphatic esters.

Properties: Very pale yellow liquid. Insoluble in water; sp. gr. 0.96–0.97.

Uses: Foam retardation and prevention in water solutions of glue, casein, shellac, gelatin, etc.

foam, metal. A cellular metallic structure, usually of aluminum or zinc alloys, made by incorporating titanium or zirconium hydride in the base metal. This subsequently evolves hydrogen to produce a uniform, foam-like material. Its specific gravity is about that of sea-water, so that it is weightless when submerged. The principal use of foamed metals is in absorption of shock impact without elastic rebound. Fiber-reinforced light-metal foams have potential application in reducing weight of automobile bodies.

foam, plastic. A cellular plastic (q.v.) which may be either flexible or rigid. Flexible foams may be polyurethane, rubber latex, polyethylene or vinyl polymers; rigid foams are chiefly polystyrene, polyurethane, epoxy, and polyvinyl chloride. The blowing agents used are sodium bicarbonate, halocarbons such as CCl_3F , and hydrazine. Flexible polystyrene foam is available in extruded sheets and also in the form of "beads" made by treating a polystyrene suspension with pentane; these expand from 30 to 50 times on heating, and are used as automobile radiator sealants. Rigid foams are widely used for building insulation,

boat construction, filtration, fillers in packing cases, absorption of oil spills, etc.

Hazard: The most widely used types of organic foam plastics (polystyrene, polyurethane, polyisocyanurate) are combustible; even when fire-retardant agents are incorporated, such foams will burn. The extent of burning or fire severity will vary with surface treatment, end-use location, recipe, and degree of protection. Thin coatings of fire-retardant paint, metal, or automatic sprinkler systems may not adequately protect against rapid fire spread. Organic foamed plastic surfaces should not be left exposed. Multiple adjacent surfaces like walls and ceiling create a most severe hazard because of the chemical kinetics associated with radiative, conductive and convective currents developed during a building fire.

New methods of making such plastic foams as polyurethane that are reported to reduce their combustibility have been developed, for example, use of trichlorobutylene oxide instead of propylene oxide.

f.o.b. Abbreviation for "freight on board," a designation used in shipping a material to indicate that freight charges are to be paid by the purchaser. This is in contrast to "freight prepaid and allowed," indicating that freight charges are paid by the manufacturer.

fog. A suspension of liquid droplets in air; an aerosol.

The size of the droplets ranges from colloidal to macroscopic. "Synthetic" fogs can be produced on a laboratory scale by ultrasonic vibrations, and natural fogs can be precipitated by the same means. Mists of fogs comprised of atomized particles of oil are used as military concealment screens and for insecticidal purposes in orchards and truck gardens. See also smog; chemical smoke; aerosol.

folacin. See folic acid.

"Folex."⁴⁰ Trademark for a 75% emulsifiable concentrate of tributylphosphorotriithioite for use as a cotton defoliant. See also "Merphos."

"Foliafume."³⁴² Trademark for pyrethrin-rotenone plant spray concentrates.

folic acid (pteroylglutamic acid; folacin; PGA)

$\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$. Considered a member of the vitamin B complex. At least three substances with folic acid activity (see also folinic acid) occur in nature, one of which, pteroylglutamic acid, is made synthetically.

Properties (pteroylglutamic acid): Orange-yellow needles or platelets; tasteless; odorless; slightly soluble in water; insoluble in lipid solvents; soluble in dilute alkali hydroxide and carbonate solutions; stable to heat in neutral and alkaline solution; destroyed by heating with acid; inactivated by light.

Sources: Green plant tissue, fresh fruit, liver, and yeast. Synthetic pteroylglutamic acid made by the reaction of 2,3-di-bromopropanol, 2,4,5-triamino-6-hydroxypyrimidine and para-aminobenzoyl glutamic acid.

Grade: 10% feed grade; U.S.P.

Containers: Fiber drums.

Uses: Medicine; nutrition; feed additive.

folinic acid (5-formyl-5,6,7,8-tetrahydropteroyl-L-glutamic acid; citrovorum factor; leucovorin)

$\text{C}_{20}\text{H}_{21}\text{N}_7\text{O}_7$. A member of the folic acid group of vitamins and a growth factor for the bacterium *Leuconostoc citrovorum*. Folinic acid is an important

metabolite of folic acid and may be the active form in cellular metabolism. It is an effective hematopoietic factor. Ascorbic acid and vitamin B₁₂ are essential for the conversion of folic acid to folinic acid. Properties: *dl*-L-form; Crystals; decompose 240–250°C; sparingly soluble in water. Derivation: (a) Prepared by catalytic reduction of folic acid; (b) produced microbially. Uses: Medicine; nutrition; biochemical research.

folpet. Generic name for N-(trichloromethylthio)-phthalimide, C₈H₄(CO)₂NSCCl₃. Properties: Light colored powder; insoluble in water; slightly soluble in organic solvents. Hazard: May be toxic. Uses: Fungicide-bactericide for vinyls, paints and enamels.

"Folvite."³¹⁵ Trademark for folic acid (q.v.).

"Fomade."⁶⁹ Trademark for a combination of foam former, foam stabilizer and vinyl stabilizer. Properties: Light tan, semi-fluid paste; sp. gr. 1.02. Uses: Foaming agent for polyvinyl chloride.

"Fomrez."¹⁰⁴ Trademark for a series of polyester and polyether resins, stannous octoate catalysts, and coupling agents used in the manufacture of urethane foams.

"Fonoline."⁴⁵ Trademark for petrolatum, of soft consistency and low melting point, with color range of white to yellow and meeting U.S.P. or N.F. purity requirements for petrolatum.

food. Any substance or mixture which, when ingested by man or animals, contributes to the maintenance of vital processes. With the exception of sodium chloride and water, all foods are derived from plants, either by direct consumption or by ingestion of animal tissue or such animal products as eggs, milk, etc., which are derived metabolically from vegetable sources. Basic foods are composed of proteins, fats (lipids), and carbohydrates, together with vitamins and minerals. Ancillary items that are associated with foods, though with little or no nutritive value, are collectively called food additives, e.g., flavorings, spices, preservatives and colorants. Many of these are also plant-derived, though some are now made synthetically. See also plant (1); nutrient; and following entries.

food additive.

(a) Intentional: The Food Protection Committee of the National Research Council states that a food additive is "a substance or mixture other than a basic foodstuff that is present in food as a result of any aspect of production, processing, storage, or packaging." See also additive (note).

(b) Unintentional: Substances that may become part of a food product as a result of chance contamination, such as insecticide residues, fertilizers, and the like. The permissible content of insecticide residues has been established by the FDA.

The Food Additives Amendment to the Food, Drug, and Cosmetic Act empowers the FDA to disapprove or discontinue any food additive that it determines to be unsafe at the level of intended use, based on data supplied by the manufacturer.

food color (certified color). A colorant which may be either a dye (soluble) or a lake (insoluble) permissible for use in foods, drugs, or cosmetics by FDA. The dyes color by solution and the lakes by dispersion. All must satisfy strict regulations as to toxicity. See also FD&C colors.

Food and Drug Administration (FDA). The Federal agency responsible for administering and enforcing the Food, Drug, and Cosmetic Act, including the Food Additives Amendment which went into effect in March, 1960. It has the authority to require proof of the efficacy and safety of drugs, foods, and pharmaceuticals, to conduct and evaluate screening tests, and to compel withdrawal from the market of any such product that it finds ineffective or hazardous. It establishes tolerances on food and animal feed additives of all types, including pesticides, as well as on cosmetic products, flammable fabrics, and packaging and labeling materials. It can also require specific statement on labels of the components or ingredients of a product, as well as precautionary warnings. See also Environmental Protection Agency; food additive.

food engineering. Application of engineering principles to the design of equipment for large-scale food processing, e.g., automatic harvesting devices; dryers of various types; crystallizers; ovens and heat-exchangers; comminuting and mixing equipment; distillation units; packaging machines. Food engineering requires an understanding of thermodynamics, conditions of state and equilibrium, rate processes, and transport phenomena. The unit operations of chemical engineering and basic physics and mechanics are also involved.

food technology. Practice of the techniques used in the preparation of foods for large-scale human use. Among others, these include harvesting; post-harvest treatment; all forms of cooking; tenderizing; preservation by chemicals, heating, dehydration, drying, and freezing; distillation and solvent extraction; milling; refining; hydrogenation; emulsification; packaging materials; and storage, labeling and transportation. Other aspects of food technology are bacteriology, sanitation, quality control, and formulation of ingredients for a wide variety of end products. A recent development of importance is the growth of convenience and quick-service foods.

foots (soapstock). The mixture of soap, oil, and impurities that precipitates when natural fatty oils are refined by treatment with caustic soda or soda ash. Usually contains 30 to 50% of free and combined fatty acids. Used for manufacture of relatively low-grade soaps; as a source of free fatty acids. A related meaning is the suspended solid matter in crude oils.

"Foramine."³⁶ Trademark for urea-formaldehyde adhesives.

"Forasite."³⁶ Trademark for a phenolic water-soluble adhesive used in bonding comminuted wood products, applicable to both wet and dry processes.

"Foray."⁵⁴⁸ Trademark for a monoammonium phosphate-based formulation used to extinguish fires in flammable liquids (Class B fires) and in combustible materials such as wood and paper (Class A fires).

"Foremul."³⁰⁹ Trademark for a series of polyethylene esters of fatty acids and polyglycol fatty acid condensate.

Uses: Emulsifier in the fatliquoring of leather; formulation of insecticides and agricultural sprays; emulsifier for vegetable, animal and mineral oils, waxes, chlorinated hydrocarbons.

forensic chemistry. See legal chemistry.

formal. See methylal.

"Formaldafil."⁵³⁹ Trademark for glass fiber reinforced acetal.

formaldehyde (oxymethylene; formic aldehyde; methanal) HCHO . A readily polymerizable gas. It is commercially offered as a 37 to 50% aqueous solution, which may contain up to 15% methanol to inhibit polymerization. These commercial grades are called formalin. It is one of the few organic compounds known to exist in outer space. 22nd highest-volume chemical produced in U.S. (1975)

Properties (gas): Strong, pungent odor. Sp. gr. 0.82; vapor density. 1.08; b.p. -19°C ; f.p. -118°C ; auto-ignition point 806°F ; soluble in water and alcohol. (Aqueous 37% solution with 15% methanol): B.p. 101°C ; flash point 122°F ; (methanol-free): b.p. 101°C ; flash point 185°F . Sp. gr. 0.82.

Derivation: Oxidation of synthetic methanol or low-boiling petroleum gases such as propane and butane. Silver, copper, or an iron-molybdenum oxide are the most common catalysts.

Grades: Aqueous solutions: 37%, 44%, 50% inhibited (with varying percentages of methanol) or stabilized or unstabilized (methanol-free); also available in solution in n-butanol, methanol, or urea; U.S.P. (37% aqueous solution containing methanol). See also paraformaldehyde, the polymerized, solid form.

Containers: Drums, bottles, carboys, tank cars, tank trucks.

Hazard (gas): Highly toxic by inhalation; strong irritant. Moderate fire risk. Tolerance, 2 ppm in air. Explosive limits in air 7 to 73%. (Solution): Avoid breathing vapor and skin contact. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Urea and melamine resins; polyacetal resins; phenolic resins; ethylene glycol; pentaerythritol; hexamethylenetetramine; fertilizer; dyes, medicine (disinfectant, germicide); embalming fluids; preservative; hardening agent; reducing agent, as in recovery of gold and silver; corrosion inhibitor in oil wells; durable-press treatment of textile fabrics; possible condensation to sugars and other carbohydrates for food use (experimental); industrial sterilant; treatment of grain smut.

formaldehyde aniline (formaniline) $\text{C}_6\text{H}_5\text{NCH}_2$.

Properties: Colorless to yellowish crystals; initial m.p. 133°C ; b.p. 271°C ; sp. gr. 1.14, but these vary somewhat from sample to sample. Soluble in water, ether, alcohol.

Derivation: Condensation of formaldehyde and aniline.

Hazard: Toxic by ingestion.

Uses: Rubber accelerator; intermediate.

formaldehyde cyanohydrin. See glycolonitrile.

formaldehyde-para-toluidine (methylene-para-toluidine) $(\text{CH}_3\text{C}_6\text{H}_4\text{NCH}_2)_n$.

Properties: White powder with grayish-yellow cast. Aromatic odor. Not toxic to skin; soluble in acetone; sp. gr. 1.11.

Derivation: Reaction between formaldehyde and para-toluidine.

Uses: Rubber accelerator; dyes.

formalin. An aqueous 37 to 50% solution of formaldehyde which may contain 15% methyl alcohol. See formaldehyde.

formamide (methanamide) HCONH_2 .

Properties: Colorless, hygroscopic oily liquid; sp. gr. 1.146; b.p. $200-212^{\circ}\text{C}$ with partial decomposition beginning about 180°C ; m.p. 2.5°C . Soluble in water and alcohol. Flash point 310°F ; combustible.

Derivation: Interaction of ethyl formate and ammonia, with subsequent distillation.

Containers: Drums, tank cars.

Hazard: Moderately toxic.

Uses: Solvent; softener; intermediate in organic synthesis.

formanilide (phenylformamide) $\text{C}_6\text{H}_5\text{NHCHO}$.

Properties: Colorless to yellowish crystals; soluble in alcohol and water; m.p. $48-50^{\circ}\text{C}$; b.p. 271°C .

Derivation: Reaction of aniline and formic acid.

Use: Medicine.

formaniline. See formaldehyde aniline.

"Formaset" LC-1.⁴² Trademark for a syrup type urea formaldehyde resin. Used as a stabilizing and bodying agent for textiles.

"Formal."³⁵² Trademark for a series of water-free formaldehyde solutions in alcohols.

Uses: Alcoholated urea and melamine resins, coatings, laminating and textile-treating resins; embalming fluids.

"Formica."¹³ Trademark for high-pressure laminated sheets of melamine and phenolic plastics for decorative applications as surfacing; insulating material; adhesives for bonding laminated plastic to other surfaces; flakeboard for use as corestock with laminated plastic; industrial plastics using various thermosetting resins, combined with various base materials for electrical, mechanical and chemical applications.

formic acid (hydrogen carboxylic acid; methanoic acid) HCOOH .

Properties: Colorless, fuming liquid; pungent penetrating odor. Soluble in water, alcohol and ether; sp. gr. 1.2201 ($20/4^{\circ}\text{C}$); m.p. 8.3°C ; b.p. 100.8°C ; flash point 156°F (open cup); lb/gal (20°C) 10.16; refractive index 1.3719 (20°C). Combustible. Auto-ignition temp. 1114°F . Strong reducing agent.

Derivation: (a) By treatment of sodium formate and sodium acid formate with sulfuric acid at low temperatures, and distilling in vacuo; (b) by acid hydrolysis of methyl formate; (c) as a by-product in the manufacture of acetaldehyde and formaldehyde.

Method of purification: Rectification.

Grades: Technical; 85%; 90%; C.P.; F.C.C.

Containers: Carboys; stainless steel tanks and drums.

Hazard: Corrosive to skin and tissue. Tolerance, 5 ppm in air. Avoid skin contact!

Uses: Dyeing and finishing of textiles and paper, leather treatment; chemicals (formates, oxalic acid, organic esters); manufacture of fumigants, insecticides, refrigerants, solvents for perfumes, lacquers; electroplating; medicine; brewing (antiseptic); silvering glass; cellulose formate; natural latex coagulant; ore flotation; vinyl resin plasticizers; animal feed additive.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

formic aldehyde. See formaldehyde.

formonitrile. See hydrocyanic acid.

"Formopon."²³ Trademark for sodium formaldehyde hydrosulfite. "Formopon" Extra is the basic zinc salt.

"Formrez."¹⁰⁴ Trademark for a series of resins and prepolymers used to produce urethane elastomers (solid cast urethanes).

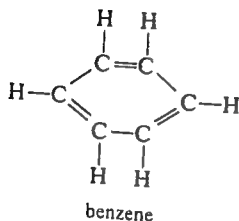

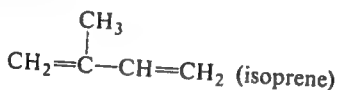

"Formula 40."²³³ Trademark for alkanolamine salts of 2,4-D weed killers.

formula, chemical. A written representation, using symbols, of a chemical entity or relationship. There are several kinds of formulas, as follows:

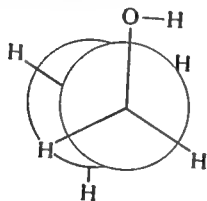

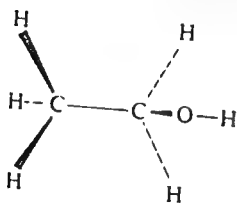

(1) Empirical: Expresses in simplest form the *relative* number and the kind of atoms in a molecule of one or more compounds; it indicates composition only, not structure. Example: CH is the empirical formula for both acetylene and benzene.

(2) Molecular: shows the actual number and kind of atoms in a chemical entity (i.e., a molecule, group, or ion). Examples: H₂ (1 molecule of hydrogen), 2(H₂SO₄) (2 molecules of sulfuric acid); CH₃ (a methyl group); Co(NH₃)₆⁺⁺ (an ion).

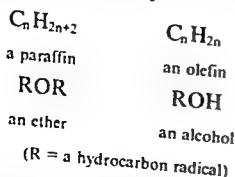

(3) Structural: Indicates the location of the atoms, groups, or ions relative to one another in a molecule, as well as the number and location of chemical bonds: Examples:

Since all molecules are 3-dimensional they cannot properly be shown in the plane of the paper. This is sometimes indicated by extra-heavy lines or 3-dimensional artwork (configurational formula) as in this representation of an ethanol molecule:

(4) Generic: Expresses a generalized type of organic compound, where the variables stand for the number of atoms or for the kind of radical in a homologous series (q.v.). Examples:

(5) Electronic: A structural formula in which the bonds are replaced by dots indicating electron pairs, a single bond being equivalent to one pair of electrons shared by two atoms. Example: the electronic

formula for methane is:

formula, product. A list of the ingredients and their amounts or percentages required in an industrial product. Such formulas (or recipes) are mixtures, not compounds; they are generally used in such industries as adhesives, food, paint, rubber and plastics. See also formulation.

formulation. Selection of components of a product formula or mixture to provide optimum specific properties for the end use desired. Formulation by experienced technologists is essential for products intended to meet specifications or special service conditions.

formula weight. The sum of the atomic weights represented in a chemical formula. Thus, since the atomic weight of hydrogen is 1, and oxygen is 16, the formula weight of water (H₂O) is 18. (Approximate atomic weights used).

"Formvar."⁵⁸ Trademark for polyvinyl formal resins. Uses: Wire enamels; electrical insulation; coatings; adhesives; films and molded materials; electron microscopy.

2-formyl-3,4-dihydro-2H-pyran. See acrolein dimer.

formyl fluoride HCOF.

Properties: Colorless, mobile liquid. Decomposes slowly with formation of hydrofluoric acid and carbon monoxide. Soluble in water (dec). B.p. -26°C. Derivation: Interaction of benzoyl chloride and a formic acid solution of potassium fluoride. Grades: Technical.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Organic synthesis.

1-formylpiperidine $\text{C}_5\text{H}_9\text{NCH=O}$.

Properties: Colorless liquid; liquid from -30 to 222°C; aprotic; low-volatility. Miscible with alcohols, esters, ketones, amines, amides, inorganic acids, organometallics. Soluble in water and hexane.

Uses: Solvent for polar and nonpolar compounds, as well as many high polymers; gas absorption; plastics modifiers.

See also N,N-dimethylformamide.

"Forthane."¹⁰⁰ Trademark for methylhexaneamine (q.v.).

"Forticel."³⁵² Trademark for a cellulosic thermoplastic for use in injection molding, extrusion, rotational casting, and blow molding.

Properties: Pellets (crystals, translucent, metallic and opaque colors). Sp. gr. 1.20. Highest use temp. 175°F. Combustible. Soluble in organic solvents such as ketones and esters. Insoluble in mineral oils. Containers: Fiber drums.

Uses: Pen and pencil barrels, telephone bases, spectacle frames, tool handles, sheeting, steering wheels, etc.

fortification. In food technology, addition to a food ingredient or product of nutrients that are not normally present, for example, addition of vitamin D to milk or of vitamin C to cake-fillings. Nutritionists apply this term to foods especially designed for school children and elderly persons. See also nutrification; enrichment.

"Fortiflex."³⁵² Trademark for a high-density polyethylene consisting mainly of long molecules with occasional short side branches. Thermoplastic. Properties: Milk-white translucent pellets. Colors are also available. Density 0.95; melt index 0.2-8; tensile strength 3,100 to 3,700 psi; highest use temperature 225°F; combustible. Uses: See polyethylene.

"Fortisan"³⁵² Trademark for a cellulosic fiber manufactured by partial saponification of stretched cellulose acetate. A semisynthetic product (q.v.). It resembles cellulose (cotton) in many respects. The high-tensacity product has a dry strength of 5 to 7 pounds per denier (100,000 to 130,000 psi); wet strength is 85% of dry strength. It has relatively low elongation under stress; elastic recovery is about 70% after extension to break; immediate elastic recovery is 46%, delayed recovery 30%, at 5% strain. Young's modulus 1650. Can be dyed in the same way as cotton. The monofilament can be produced to a fineness of 1 denier. Specific gravity 1.50. Resists stretching both dry and wet. Combustible.

"Fortracin."³⁴² Trademark for animal feed supplements of bacitracin methylene disalicylate.

"Fortrel."^{206,352} Trademark for a polyester type synthetic fiber.

"Fosbond."²⁰⁴ Trademark for a group of chemicals used to provide a corrosion-resistant bond between zinc or ferrous metals and a paint film.

"Foscoat."²⁰⁴ Trademark for a class of chemicals designed to provide a phosphate coating prior to cold working.

"Fosfodril."⁵⁵ Trademark for a glassy phosphate of high molecular weight (sodium hexametaphosphate). Uses: Thickener for drilling muds; water treatment in oil-well flooding operations.

"Fosfo" Rosin.⁷⁹ Trademark for limed FF wood rosin. Uses: Box toes; matches; printing ink; smoking molds; pipe bending.

"Foslube."²⁰⁴ Trademark for a class of lubricants used to impregnate a phosphate coating prior to cold working.

"Fosrinse."²⁰⁴ Trademark for a class of chemicals used to render insoluble the acid salts remaining after phosphate treatment of ferrous metals.

fossil. Any material that results from an animal or vegetable source in past geologic ages and has been buried (compressed) in the earth. Examples are fossil fuels (petroleum, natural gas, coal, lignite), fossil waxes (ozocerite, montan), fossil resins (amber) and fossil woods partially preserved (petrified) by the action of silica.

"Fostalite."⁵⁶⁸ Trademark for light-stable polystyrenes, specially formulated for fluorescent light fixtures.

"Fostarene."⁵⁶⁸ Trademark for molding and extrusion grade polystyrenes.

"Fosterite."³⁰⁸ Trademark for a family of resins. Largest application is as "solventless" varnishes for electric insulation, also as a photoelastic resin and as a bond for impregnating and laminating asbestos sheets. Rods made of this plastic will carry a beam

of light without the dispersion which occurs in air, making it possible to bend the beam.

"Fotoceram."²⁰ Trademark for a photosensitive, crystalline ceramic; used in electronics and industrial arts.

"Fotocol."³¹⁹ Trademark for special industrial alcohol solvents. Available in regular and anhydrous formulations.

Containers: Up to 55-gal drums.

Uses: Printing, photography, and rubber industries.

"Fotoform."²⁰ Trademark for photosensitive glass; used in electronics.

"Foundrez."³⁶ Trademark for a group of water-soluble phenol-formaldehyde and urea-formaldehyde resins for foundry applications.

foundry sand (greensand; molding sand). Sand mixed with suitable binders used in making molds for casting metals. The sand/binder mixture is either rammed into place around the mold or baked into a core at 400-500°F (dry-sand molding). The binders used are resins of various types, casein, etc.

Fourdrinier. The machine most widely used for paper-making, named for its English inventors, who introduced it in the mid-19th century. It produces a wide range of papers from heavy board to light tissue, and is of impressive size and complexity. Its unique feature is the traveling wire mesh belt onto which the slurry of fiber and water is run from the headbox. The sheet is formed on this wire almost instantaneously, most of the water draining through the interstices of the wire. After leaving the wire the web passes through the press section of the machine, where a number of rollers express enough of the remaining water to enable the sheet to hold together. It then moves into the multi-roller drying section (described under drying). The dried sheet (4 to 6% moisture content) is then fed to a high-speed calender for compaction and finishing. The entire process is continuous and rapid, the machine often operating for several days without shutdown. See also calendering; drying (2); paper.

"FP" Acids.⁴⁸⁴ Trademark for a series of fluorophosphoric acids.

FPC. (1) Abbreviation for fish protein concentrate (q.v.).

(2) Abbreviation for Federal Power Commission.

Fr Symbol for francium.

fraction. Any portion of a mixture characterized by closely similar properties. The most important fractions of petroleum are naphtha, gasoline, fuel oil, kerosene, and tarry or waxy residues. These are obtained by fractional distillation (q.v.). See also separation.

fractional distillation. Distillation in which rectification is used to obtain product as nearly pure as possible. A part of the vapor is condensed and the resulting liquid contacted with more vapor, usually in a column with plates or packing. The term is also applied to any distillation in which the product is collected in a series of separate components of similar boiling range. See also reflux.

fractionation. In general, the separation or isolation of components of a mixture or a micromolecular

complex. In distillation this is done by means of a tower or column in which rising vapor and descending liquid are brought into contact (counter-current flow). Macromolecular components (proteins and other high polymers) can be separated by a number of methods, including electrophoresis, gel filtration, chromatography, centrifugation, foam fractionation, and partition. See also reflux.

fracturing, hydraulic. A method of inducing flow in oil wells by injecting water or brine under pressure into the oil-bearing strata. The viscosity of the water is often increased by adding gelling agents such as guar gum, cellulose derivatives, or polyacrylamides.

francium Fr Element of atomic number 87, group IA of the periodic system. Atomic weight 223; valence +1. It appears to exist only as radioactive isotopes. One isotope is actinium K (Fr^{223}). Other isotopes have been made artificially. Francium 223 is the longest-lived isotope, having a half-life of 21 minutes and is the only natural isotope. Francium is the heaviest of the alkali-metal family.

fragrance. An odorant used to impart a pleasant smell to shaving lotions, toothpastes, men's accessories, etc. Balsamic and piny odors are typical.

franklinite ($\text{Fe}, \text{Mn}, \text{Zn}$)(FeMn) $_2\text{O}_4$. Black mineral resembling magnetite (q.v.).

Frary metal. A lead-base bearing metal containing 97-98% lead alloyed with 1-2% each of barium and calcium. Excellent for low-pressure bearings at moderate temperatures.

Frasch process. A process by which much of the world's sulfur is obtained. Developed about 1900 by Herman Frasch, the process involves melting sulfur underground by introducing superheated water through a pipe under pressure and forcing the molten sulfur to the surface by compressed air.

Fraunhofer lines. See spectroscopy.

free energy. An exact thermodynamic quantity used to predict the maximum work obtainable from the spontaneous transformation of a given system. It also provides a criterion for the spontaneity of a transformation or reaction, and predicts the greatest extent to which the reaction can occur, i.e., its maximum yield. Transformation of a system can be brought about by either heat or mechanical work. Free energy is derived from the internal energy and entropy of a system in accordance with the laws of thermodynamics.

free radical. A molecular fragment having one or more unpaired electrons, usually short-lived and highly reactive. In formulas a free radical is conventionally indicated by a dot, as $\text{Cl}\cdot$, $(\text{C}_2\text{H}_5)\cdot$. In spite of their transitory existence, they are capable of initiating many kinds of chemical reactions by means of a chain mechanism. Free radicals are formed only by the splitting of a molecular bond. A chain can result only if (1) radicals attack the substrate, and (2) the radicals lost by this reaction are regenerated. Chain mechanisms for the thermal decomposition of many substances have been established. Free radicals are known to be formed by ionizing radiation, and thus play a part in the deleterious degradation effects that occur in irradiated tissue. They also act as initiators or intermediates in such basic phenomena as oxidation, combustion, photolysis, and polymerization. See also carbonium ion.

free sulfur. Sulfur which is left chemically uncombined after vulcanization of a rubber compound.

When this exceeds 1%, the upper limit of solubility of sulfur in rubber, blooming will occur. Most rubber products are vulcanized with as low a sulfur content as possible, so that the free sulfur content of the product is seldom over 0.5%. See also bloom; vulcanization.

freeze-drying (lyophilization). A type of dehydration for separating water from biological materials. The material is first frozen and then placed in a high vacuum so that the water (ice) vaporizes in the vacuum (sublimes) without melting, and the non-water components are left behind in an undamaged state. Used for blood plasma, certain antibiotics, vaccines, hormone preparations, food products such as coffee and vegetables. One technique prepares freeze-dried ceramic pellets from water solutions of metal salts.

"Freezene."⁴⁵ Trademark for a series of refrigeration white mineral oils.
Use: Low-temperature lubrication.

freezing point. See melting point.

"Freon."²⁸ Trademark for a series of fluorocarbon products used in refrigeration and air-conditioning equipment, as aerosol propellants, blowing agents, fire extinguishing agents, and cleaning fluids and solvents.

Properties: Clear, water-white liquids. Vapors have a mild, somewhat ethereal odor and are not irritating; low toxicity; nonflammable, nonexplosive; noncorrosive and essentially stable and inert. For listing of specific types, see fluorocarbon.

Note: Many types contain chlorine as well as fluorine, and should be called chlorofluorocarbons.

"Freon" E.²⁸ Trademark for a series of hydrogen end-capped tetrafluoroethylene epoxide polymers having a D.P. up to 10. Boiling range 39-490°C. High dielectric constant. Used as coolants in electronic devices.

"Freon" C-51-12. See perfluorodimethylcyclobutane.

"Frianite."¹¹⁸ Trademark for a processed anhydrous potassium aluminum silicate. Typical chemical analysis: Silicon dioxide, 74.7%; aluminum oxide, 13.7%; potassium oxide, 5.6%; other oxides, 4.3%.

Properties: Fine, pinkish, inert powder containing no soluble salts. Sp. gr. 2.37; pH 5.4 to 6.5; density 47 lb/cu ft. Free flowing liquid holding capacity is about 1½% max.

Use: Diluent for dry blending or formulating dusting pesticides.

Friedel-Crafts reaction. Originally defined as the condensation of alkyl or aryl halides with benzene and its homologs in the presence of anhydrous aluminum chloride. This definition has been widened to include analogous processes.

Uses: Alkylation and acylation in general. Some examples are the production of high-octane gasoline; production of cumene, ethylbenzene, detergent alkylate, various plastics and elastomers.

frit. A ground glass used in making glazes and enamels and also for making so-called frit seals. Finely powdered glass may be called a frit. The term is also used for finely ground inorganic minerals, mixed with fluxes and coloring agents, which turn into a glass or enamel on heating.

"FR-N."²⁷⁸ Trademark for a series of butadiene-acrylonitrile elastomeric polymers and latices. Properties: Oil and solvent resistance combined with good flexibility and resistance to low temperatures, water absorption and permanent set.

Uses: Oil-resistant seals, shoe soles, gasoline hose, belt conveyors, plasticizers, paper saturation, adhesives, leather finishes and carpet backing.

froth flotation. See flotation.

FRP. Abbreviation for glass fiber-reinforced plastic. See reinforced plastic.

"FR-S."²⁷⁸ Trademark for general-purpose rubbers and latexes, composed of copolymers of butadiene and styrene.

Uses: Rubber: Tires, hose, belting and packing; molded and extruded automotive and industrial products; soles and heels; hard rubber. Latex: Adhesives; foamed rubber; textile and rug backing; paper coating and impregnation; modification of plastics to produce high impact strength; asphalt additive.

"FRTP."⁵³⁹ Trademark for glass fiber-reinforced thermoplastic.

fructose (fruit sugar; D(-)-fructose; levulose) $C_6H_{12}O_6$. A sugar occurring naturally in a large number of fruits and in honey. It is the sweetest of the common sugars.

Properties: White crystals; soluble in water, alcohol and ether; m.p. 103–105°C (dec); specific rotation –89 to –91°. Combustible; nontoxic.

Derivation: Hydrolysis of inulin; hydrolysis of beet sugar followed by lime separation; from cornstarch by enzymic or microbial action.

Grades: Technical; N.F.; food; parenteral.

Containers: Wooden barrels; tins; fiber drums.

Uses: Foodstuffs; medicine; preservative.

fructose-1,6-diphosphate (FDP; fructosediphosphoric acid; Harden-Young ester) $H_2PO_4(C_6H_{10}O_4)H_2PO_4$. Can be prepared from fructose and certain other sugars by the use of yeasts. It is known to take part in cell metabolism; an intermediate in carbohydrate metabolism. Usually handled in the form of its barium or calcium salts, white amorphous powders, soluble in ice water and dilute acid solutions; insoluble in hot water and alcohol.

Uses: Organic synthesis; research in cell metabolism.

fruit sugar. See fructose.

F salt. The sodium salt of F acid; a dye intermediate. See 2-naphthol-7-sulfonic acid.

FT black. Abbreviation for fine thermal black. See thermal black.

FTC. Abbreviation for Federal Trade Commission (q.v.).

"Fuadin."¹⁶² Trademark for stibophen (q.v.).

fuchsin (basic fuchsin; magenta). A synthetic rosaniline dyestuff, a mixture of rosaniline and pararosaniline hydrochlorides.

Properties: Dark green powder or greenish crystals with a bronze luster; faint odor. Soluble in water and alcohol.

Grades: N.F.

Uses: Textile and leather industries; as a red dye; pharmaceutical.

fuel. Any substance that evolves energy in a controlled chemical or nuclear reaction. The most common type of chemical reaction is combustion, the type of oxidation occurring with petroleum products, natural gas, coal, and wood; more rapid oxidation takes place in rocket fuels (hydrogen, hydrogen peroxide, hy-

drazine) which approaches the rate of an explosion. The nuclear fuels used for power generation release their energy by fission of the atomic nucleus (uranium, plutonium, thorium). See also combustion; fission.

fuel cell. (1) An electrochemical device for continuously converting chemicals—a fuel and an oxidant—into direct-current electricity. It consists of two electronic-conductor electrodes separated by an ionic-conducting electrolyte with provision for the continuous movement of fuel, oxidant and reaction product into and out of the cell. The fuel can be gaseous, liquid or solid, the electrolyte liquid or solid, the oxidant gaseous or liquid. The electrodes are solid, but may be porous and may contain a catalyst. Fuel cells differ from batteries in that electricity is produced from chemical fuels fed to them as needed, so that their operating life is theoretically unlimited. The cell products can be regenerated externally into fuel for return to the cell, e.g., CO_2 from the cell can be reacted with coal to form CO for feed to the cell. Fuel is oxidized at the anode (negative electrode) giving electrons to an external circuit; the oxidant accepts electrons from the anode and is reduced at the cathode. Simultaneously with the electron transfer, an ionic current in the electrolyte completes the circuit. One type of electrolyte is a solid polymer of perfluorinated sulfonic acid. The fuels range from hydrogen, carbon monoxide, and carbonaceous materials to redox compounds, alkali metals, and biochemical materials. Fuel cells based on hydrogen and oxygen have a significant future as a primary energy source. Large-scale development of fuel cells for on-site power generation for housing units is well advanced, and research is under way for construction of a 26-megawatt cell capable of serving the needs of a small community. C. A. Hampel

(2) An aircraft fuel tank or container made of or lined with an oil-resistant synthetic rubber.

fuel element. A fabricated rod, form, or other shape which consists of or contains the fissionable fuel for a nuclear reactor. The term does not refer to a chemical element, but rather to a device from which power is derived.

fuel oil. Any liquid petroleum product that is burned in a furnace for the generation of heat, or used in an engine for the generation of power, except oils having a flash point below 100°F and oils burned in cotton or woolwick burners. The oil may be a distilled fraction of petroleum, a residuum from refinery operations, a crude petroleum, or a blend of two or more of these.

Because fuel oils are used with burners of various types and capacities, different grades are required. A.S.T.M. has developed specifications for six grades of fuel oil. No. 1 is a straight-run distillate, a little heavier than kerosene, used almost exclusively for domestic heating. No. 2 (diesel oil) is a straight-run or cracked distillate used as a general purpose domestic or commercial fuel in atomizing-type burners. No. 4 is made up of heavier straight-run or cracked distillates and is used in commercial or industrial burner installations not equipped with preheating facilities. The viscous residuum fuel oils, Nos. 5 and 6, sometimes referred to as bunker fuels, usually must be preheated before being burned. A.S.T.M. specifications list two grades of No. 5 oil, one of which is lighter and under some climatic conditions may be

handled and burned without preheating. These fuels are used in furnaces and boilers of utility power plants, ships, locomotives, metallurgical operations, and industrial power plants. See also diesel oil; fuel oil, synthetic.

Containers: Tank cars and trucks; barges; pipelines.

Uses: Domestic and industrial heating; power for heavy units (ships, trucks, trains); source of synthesis gas.

fuel oil, synthetic. Any type of oil that can be used for fuel energy that is derived from sources other than petroleum. The most promising raw materials are organic wastes of various kinds, including urban, agricultural, and animal wastes. The two methods best adapted for this purpose are flash pyrolysis and fermentation, the latter involving use of carbon monoxide as a reactant. Small-scale production is already under way by pyrolysis, and the fermentation processes are approaching pilot-plant scale.

fuller's earth. A porous colloidal aluminum silicate (clay) which has high natural adsorptive power. Gray to yellow color. Nontoxic; noncombustible. See also bentonite; diatomite.

Occurrence: Florida; England; Canada.

Containers: Bulk; burlap bags; paper bags.

Uses: Decolorizing of oils and other liquids; oil-well drilling muds; insecticide carrier; floor-sweeping compounds; cosmetics; rubber filler; carrier for catalysts; filtering medium.

fulminate of mercury. Legal label name for mercury fulminate (q.v.).

"Fulvicin."³²¹ Trademark for a brand of griseofulvin (q.v.).

fumagillin $C_{27}H_{36}O_7$. An antibiotic substance produced by *Aspergillus fumigatus*.

Properties: Light yellow crystals from dilute methanol; m.p. 189–194°C. Insoluble in water, dilute acids, saturated hydrocarbons. Soluble in most other organic solvents.

Use: Medicine.

fumaric acid (boletic acid; lichenic acid; allomaleic acid; trans-butenedioic acid) $HOOCCH:CHCOOH$. The trans-isomer of maleic acid.

Properties: Colorless, odorless crystals; fruit acid taste; stable in air; sp. gr. 1.635; sublimes at 290°C; m.p. 287°C (sealed tube); solubility in water (25°C) 0.63 g/100 g; solubility in alcohol (30°C) 5.76 g/100 g; insoluble in chloroform and benzene. Low toxicity. Combustible.

Derivation: (a) isomerization of maleic acid; (b) catalytic oxidation of benzene.

Grades: Technical; crystals; F.C.C.

Containers: 250-lb drums; bags.

Uses: Modifier for polyester, alkyd, and phenolic resins; paper-size resins; plasticizers; rosin esters and adducts; alkyd resin coatings; upgrading natural drying oils (especially tall oil) to improve drying characteristics; in foods, to replace citric and tartaric acids and acidulant and flavoring agent (FDA approved); mordant; organic synthesis; printing inks.

fumaryl chloride $ClCOCH:CHCOCl$.

Properties: Clear, straw-colored liquid; b.p. 158–160°C (760 mm), 62–64°C (13 mm); sp. gr. (20°C) 1.408.

Hazard: Toxic. Corrosive to eyes and skin.

Uses: Chemical intermediate for pharmaceuticals, dyestuffs, and insecticides.

Shipping regulations: (Rail) Corrosive liquid, n.o.s., White label. (Air) Corrosive label.

"Fumazone."²³³ Trademark for fumigants and nematocides containing 1,2-dibromo-3-chloropropane and related halogenated C_3 hydrocarbons.

fume. The particulate, smoke-like emanation from the surface of heated metals. Also, the vapor evolved from concentrated acids (sulfuric, nitric); from evaporating solvents; or as a result of combustion or other decomposition reactions (exhaust fume). Many of these fumes are toxic.

fumigant. A toxic agent in vapor form that destroys rodents, insects, and infectious organisms; a type of pesticide. The most effective temperature for their use is about 70°F. They are used chiefly in enclosed or limited areas (barns, greenhouses, ships' holds, and the like); also are applied locally to soils, grains, fruits and garments. Some commonly used fumigants are formaldehyde, sulfur dioxide and other sulfur compounds, hydrogen cyanide, methyl bromide, carbon tetrachloride, p-dichlorobenzene, and ethylene oxide. Care must be used when handling and applying fumigants in view of their toxicity. See also repellent; pesticide.

fuming. A characteristic of some highly active liquids which evolve visible smoke-like emanations on contact with air. Most familiar are the forms of nitric and sulfuric acids designated as "fuming." These are not pure, concentrated acids; low percentages of nitrogen dioxide and water are present in fuming nitric acid, and fuming sulfuric acid contains sulfur trioxide. Hydrofluoric acid (a mixture of hydrogen fluoride and water) also fumes. Pure compounds in which fuming occurs are fluosilicic acid and hydrazine.

fundamental particle (elementary particle). One of the many constituents of atoms in either the normal or the excited state. Since only a few such particles are involved in strictly chemical reactions, the definitions in this dictionary are limited to these, i.e., protons, neutrons, electrons. Other subatomic species are mesons, positrons, neutrinos, hyperons, etc. Photons are light quanta, i.e., "particles" of energy, which have no rest mass. See also particle.

fundamental research (basic research). Scientific investigations undertaken primarily to increase knowledge of a given field on a long-range basis. It is free from the time factor usually present in applied research (q.v.), and is comparatively unlimited by economic restrictions. In general, it seeks basic causes for phenomena rather than immediate results. It has no predetermined goal or purpose. None the less, tremendous achievements in chemistry and other sciences have resulted, and it will always remain the essential cornerstone of science. An example is the fundamental research of Carothers (q.v.) on polymerization that led to the discovery of nylon. More recent examples are the study of rocks and soil samples obtained from the moon and of the surface of the planet Mars made by direct contact of space vehicles.

fungal protease enzyme. See acid fungal protease.

fungicide. Any substance which kills or inhibits the growth of fungi. Older types include mixtures of lime and sulfur, copper oxychloride, and Bordeaux mixture. Copper naphthenate has been used to impregnate textile fabrics such as tenting and military clothing. Dithiocarbamate and quinone types were introduced about 1940. Mercury compounds are also effective, but were discontinued in 1971 because of their toxicity to humans. Ferbam, zineb and 8-hydroxyquinoline are now in wide agricultural use.

as well as hypochlorite solutions in swimming pools and water-cooled heat exchangers. Some types of fungi that infect the human body are extremely hard to eradicate and require highly specific medical treatment.

fungus. Any of a plant-like group of organisms that does not produce chlorophyll; they derive their food either by decomposing organic matter from dead plants and animals or by parasitic attachment to living organisms, thus often causing infections and disease. Examples of fungi are molds, mildews, mushrooms, and the rusts and smuts that infect grain and other plants. They grow best in a moist environment at temperatures of about 25°C, little or no light being required.

Funk, Casimir (1884–1948). Born in Poland and later becoming an American citizen, Funk in 1911 isolated a food factor extracted from rice hulls which he found to be a cure for a disease due to malnutrition (beriberi). Believing this to be an amine compound essential to life, he coined the name "vitamine," from which the final "e" was later dropped. The various types and functions of vitamins were not differentiated till some years later as a result of the work of McCollum, Szent-Gyorgi, R. J. Williams, and others.

furacrylic acid. See furylacrylic acid.

"Furadan" (2,3-dihydro-2,2-dimethyl-7-benzofuranyl-methylcarbamate). Trademark for a pesticide designed to combat corn rootworm and rice water weevil. Approved by USDA. Also effective on alfalfa, sugar cane, rice, peanuts and potatoes.

"Furafil."²²⁴ Trademark for lignocellulose produced by the pressure digestion of the acidified residue remaining after extraction of furfural from agricultural raw materials.

Uses: Additive for bulk, absorbency or conditioning action; extender for phenolic glues for plywood; foundry facings; oil well drilling muds; fertilizer.

"Fur-Ag."²²⁴ Trademark for a sterilized grade of "Furafil" lignocellulose. Used as an anti-caking agent and organic conditioner in mixed fertilizers.

furamide. See furoamide.

furan (furfuran; tetrol) HC:CHCH:CHO . A heterocyclic compound. Its basic structure is:

Properties: Colorless liquid turning brown on standing. This color change is retarded if a small amount of water is added. Sp. gr. 0.938 (20/4°C); f.p. -86°C; b.p. 31.4°C; flash point less than 32°F (TOC); refractive index 1.4216 (n_D 20/D); insoluble in water; soluble in alcohol and ether.

Derivation: Dry distillation of furoic acid from furfural.

Containers: Drums; tank cars.

Hazard: Toxic; absorbed by skin. Flammable, dangerous fire risk; flammable limits 2 to 14%. Forms peroxides on exposure to air.

Uses: Organic synthesis, especially for pyrrole, tetrahydrofuran, thiophene.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label. See also furan polymer.

furancarboxylic acid. See furoic acid.

2,5-furandione. See maleic anhydride.

2-furanmethanethiol. $\text{OCH:CHCH:CCH}_2\text{SH}$.

Properties: Liquid; sp. gr. 1.1319 (20/4°C); b.p. 155°C; refractive index 1.5324 (20°C). Insoluble in water. Low toxicity.

Uses: Ingredient for synthetic coffee compositions and fortifier for natural coffee blends and flavor adjunct. Also inhibits the corrosive power of nitric acid.

furan polymer. A plastic derived (1) from furfuryl alcohol or (2) from furfural or reaction products of furfural and a ketone. The materials are dark-colored and are resistant to solvents, most non-oxidizing acids and alkalies and to specific corrosives such as dinitrogen pentoxide. Physical properties of a typical asbestos-reinforced furan polymer are specific gravity 1.7, tensile strength 5,000 psi, flexural strength 7,500 psi, impact strength 0.5 ft lb/in. notch, water absorption 0.2 percent and coefficient of thermal expansion 3.0×10^{-5} in/in/°F. Furan polymers are used for coating asphaltic pavements, foundry sand cores, shell molding and for corrosion resistant materials of construction. Since furfural is readily obtainable by heating pentosan-containing products such as corn cobs with mineral acid, these resins are inexpensive and have great potential use where products with their characteristics are required.

furazolidone $\text{C}_8\text{H}_7\text{N}_3\text{O}_5$ (N-(5-nitro-2-furfurylidene-3-amino)-2-oxazolidinone).

Properties: Yellow powder; odorless; m.p. 255°C. Slightly soluble in polyethylene glycol; insoluble in water, alcohol; and peanut oil.

Derivation: Synthetically from furfural, hydroxyethylhydrazine, and diethyl carbonate.

Grade: N.F.

Hazard: A suspected carcinogen; use suspended by FDA. See also nitrofurans.

Uses: Veterinary medicine; ingredient of poultry feeds.

furcellaran.

Properties: Seaweed gum (a natural phycocolloid) available as an odorless white powder; soluble in warm water. Form gels at low concentrations reputed to be more stable to heat and acids than those of other vegetable gums. Nontoxic. Available in the form of salts.

Derivation: From the sea-weed *Furcellaria fastigiata*.

Use: Gelling agent; viscosity control agent; puddings, jams, tooth pastes; bacterial cultural media.

furethrin. Generic name for 3-furfuryl-2-methyl-4-oxo-2-cyclopenten-1-yl chrysanthemumate, $\text{C}_{21}\text{H}_{27}\text{O}_4$. A synthetic analog of allethrin substituting the 2-furfuryl for allyl in the side chain. Low toxicity.

Properties: Yellow liquid; b.p. 187–188°C (0.4 mm). Insoluble in water; soluble in light oils.

Use: Insecticide, use like allethrin.

furfural (ant oil, artificial; pyromucic aldehyde; furfur-aldehyde; bran oil) $\text{C}_4\text{H}_3\text{OCHO}$ or OCH:CHCH:CCHO .

Properties: Colorless liquid when very pure; becomes reddish brown upon exposure to light and air. Odor

somewhat similar to benzaldehyde. Forms condensation products with many types of compounds, phenol, amines, urea, etc. Soluble in alcohol, ether, and benzene; 8.3% soluble in water at 20°C. Sp. gr. 1.1598 (20/4°C); f.p. -36.5°C; b.p. 161.7°C; heat of vaporization 107.5 cal; refractive index 1.5260 (n_D 20/D); flash point 140°F (closed cup). Combustible; autoignition temp. 600°F.

Derivation: From oat hulls, rice hulls, corn cobs, bagasse and other cellulosic waste materials by steam-acid digestion.

Grades: Technical; refined.

Containers: Drums; tank cars.

Hazard: Toxic; absorbed by skin. Tolerance, 5 ppm in air. Irritant to eyes, skin, and mucous membranes.

Uses: Solvent refining of lubricating oils, butadiene, rosin and other organic materials; solvent for nitrocellulose, cellulose acetate, shoe dyes; intermediate for tetrahydrofuran and furfuryl alcohol; phenolic and furan polymers; wetting agent in manufacture of abrasive wheels and brake linings; weed killer; fungicide; adipic acid and adiponitrile; road construction; production of lysine; refining of rare earths and metals; flavoring.

furfuralacetic acid. See furylacrylic acid.

furfuraldehyde. See furfural.

furfuramide. See hydrofurfuramide.

furfuran. See furan.

furfuryl acetate $C_4H_3OCH_2OOCCH_3$.

Properties: Colorless liquid turning brown upon exposure to light and air; pungent odor. Insoluble in water; soluble in alcohol and ether. Sp. gr. 1.1175 (20/4°C); b.p. 175-177°C; refractive index 1.4627 (D). Nontoxic. Combustible.

Derivation: By treatment of furfuryl alcohol with acetic anhydride.

Grade: Refined.

Use: Flavor.

furfuryl alcohol (furyl carbinol) $C_4H_3OCH_2OH$ or $OCH:CHCH:CCH_2OH$.

Properties: Colorless, mobile liquid becoming brown to dark-red upon exposure to light and air. With acid catalysts it autopolymerizes, often with explosive violence, to form a thermosetting resin that cures to an insoluble, infusible solid, highly resistant to chemical attack. Soluble in alcohol, chloroform, benzene, and water; insoluble in paraffin hydrocarbons. See also furan polymer. Sp. gr. 1.1285 (20/4°C); b.p. 170°C; refractive index 1.4850 (25°C/D); flash point (open cup) 167°F. Combustible. Autoignition temp. 915°F.

Derivation: Continuous vapor-phase hydrogenation of furfural.

Grades: Technical; refined.

Containers: Drums; tank cars.

Hazard: Approved for food products, but toxic by inhalation. May react explosively with mineral and some organic acids. Tolerance, 5 ppm in air.

Uses: Wetting agent; furan polymers; corrosion-resistant sealants and cements, foundry cores; modified urea-formaldehyde polymers; penetrant; solvent for dyes and resins; flavoring.

alpha-furfuryl amine $C_4H_3OCH_2NH_2$.

Properties: Colorless liquid; soluble in water, alcohol, and ether. Sp. gr. 1.0550 (17°C); b.p. 145°C (757 mm); refractive index 1.4900 (17°C); flash point 99°F (open cup).

Derivation: Furfural and ammonia.

Hazard: Flammable, moderate fire risk. Moderately toxic.

Uses: Corrosion inhibitor; component of soldering flux; chemical intermediate.

6-furfurylaminopurine. Kinetin. See kinins.

furfuryl mercaptan. See 2-furanmethanethiol.

furnace black. A carbon black made by burning natural gas or vaporized aromatic hydrocarbon oil in a closed furnace with about 50% of the air required for complete combustion. The combustion products are cooled by a water spray and finely divided carbon is separated from the gases. Furnace black produced from oil can be made in a wide range of closely controlled particle sizes.

Grades: Conducting furnace black (CF); fine (FF); high modulus (HMF); high elongation (HEF); reinforcing (RF); semi-reinforcing (SRF); high abrasion (HAF); super abrasion (SAF); fast extruding (FEF); general purpose (GPF); intermediate super abrasion (ISAF); channel replacement (CRF); easy processing furnace black (EPF).

Uses: Rubber reinforcing agent; plastics.

See also thermal black, carbon black.

furnace oil. Usually No. 1 fuel oil. See fuel oil.

furnace sand (fire sand). Sand used to line furnace bottoms or walls, particularly in open hearth steel furnaces.

"Furnex."¹³³ Trademark for a series of semi-reinforcing furnace carbon black (SRF).

furnish. Term used by paper makers for mixtures containing the constituents of paper as supplied to the fourdrinier wire on which the sheet is formed.

furoamide (pyromucamide; furamide) C_4H_3OCON .

Properties: Crystals; sublimes partly at 100°C. M.p. 142°C.

Derivation: Treatment of furoyl chloride with ammonia.

furoic acid (pyromucic acid; furancarboxylic acid) C_4H_3OCOOH or $OCH:CHCH:CCOOH$.

Properties: Colorless crystals; m.p. 133-134°C; sublimes at 130°C (50-60 mm). Slightly soluble in cold water; very soluble in hot water, alcohol and ether; insoluble in paraffin hydrocarbons. Combustible; low toxicity.

Derivation: Cannizzaro reaction from furfural; oxidation of furfural.

Purification: Sublimation; fractional crystallization from hot water.

Grade: Technical.

Uses: Preservative; bactericide; furoates for perfume and flavoring; fumigant; textile processing; chemical intermediate.

Furol viscosity. The efflux time in seconds (SFS) of 60 ml of sample flowing through a calibrated Furol orifice in a Saybolt viscometer under specified conditions. Furol viscosity is about one-tenth of Saybolt Universal viscosity (q.v.) and is used for fuel oil and residual materials of relatively high viscosity. Furol is derived from the words "fuel and road oils."

furoyl chloride C_4H_3OCOCI .

Properties: Colorless liquid; powerful lachrymator. Soluble in ether; decomposes in water. M.p. -2°C; b.p. 176°C. Combustible.

Derivation: Treatment of furoic acid with phosphorus pentachloride.

Hazard: Strong irritant to eyes and skin.

Use: Substitute for chloropicrin in disinfecting grain elevators.

furylacrylic acid (furfural acetic acid; furacrylic acid)
 $C_4H_3OCH:CHCOOH$.

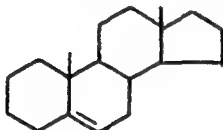

Properties: White powder; slightly soluble in cold water; easily soluble in hot water; soluble in alcohol, ether, and glacial acetic acid. M.p. $141^{\circ}C$; b.p. $117^{\circ}C$ (8 mm), $286^{\circ}C$.

Derivation: From furfural.

Uses: Derivatives used in perfumes.

furyl carbinol. See **furfuryl alcohol**.

fused ring. A ring having one or more of its sides in common with another ring, as shown:

fused salt. A salt (i.e., ionic compound) in the molten state. Halides and nitrates are the salts most commonly used. High temperatures, (500 – $1000^{\circ}C$) for the alkali halides, are usually required. Most fused salts are liquids with viscosities, diffusion coefficients, thermal conductivities, and surface tensions in the same range as water. They conduct electricity exceptionally well.

Uses: Production of sodium by electrolysis; heat-transfer agents; reaction medium in chemical synthesis; heat-treatment of metals (from 350 – $2400^{\circ}F$); solvents for the metals corresponding to their cations; nuclear power reactors.

See also salt bath.

fused silica. See **silica**.

fusel oil (amyl alcohol, fermentation; grain oil; potato oil). A volatile, oily mixture consisting largely of amyl alcohols. Isoamyl alcohol (isobutyl carbinol) and active amyl alcohol (2-methyl-1-butanol) are chief constituents. Ethyl, propyl, butyl, hexyl and heptyl alcohols as well as other alcohols have been separated. Acids, esters, and aldehydes are also present. Normal primary amyl alcohol (1-pentanol) is not found in fusel oil. Combustible.

Containers: 10-gal cans; drums; tank cars.

Hazard: Moderate fire risk. Toxic by ingestion and inhalation.

Uses: Chemicals (amyl ether, amyl acetate, pure amyl alcohols, nitrous ether, various esters); explosives

(gelatinizing agent); solvent for fats and oils; intermediate; pharmaceuticals; nitrocellulose plastics; synthetic rubber; varnishes; lacquers; solvent for resins and waxes; perfumery.

fusible alloy. See **alloy**, **fusible**.

fusion. (1) A synonym for melting of a crystalline substance. Since melted substances tend to mix readily, the word has assumed the meaning of "melt and blend." See also fused salt; melting point.

(2) A nuclear reaction in which the nuclei of light atoms unite at temperatures of 10 to 15 million degrees Kelvin to form heavier nuclei, thus releasing vast amounts of energy. Such reactions occur in the sun by the union of hydrogen nuclei to form helium.

Uncontrolled release of fusion energy has been achieved in the hydrogen bomb, in which a fission reaction supplies the necessary high temperature, which endures only for a time span measured in nanoseconds. A fusion reaction has been induced on a micro scale with a laser beam impinging on deuterium, causing emission of high-energy neutrons.

Controlled fusion reactions are the ultimate means of solving the energy problem. Maintenance of the high temperatures necessary for continuous energy yield at controlled rates is one of the central problems, as is also the selection of suitable materials. Use of lasers will undoubtedly be an important feature of future development of thermonuclear power. At least 20 years of basic research will be necessary. See also thermonuclear reaction.

"Fybrene."⁴⁵ Trademark for petrolatum, U.S.P., of medium melting point and medium consistency. Used in paper industry.

"Fyrol."⁴⁹⁸ Trademark for a series of wool lubricants based on petroleum sulfonates, fatty esters and mineral oil.

"Fyrel"¹²⁴ Trademark for a flexible multifilament fiber made of a nickel-chromium alloy. Withstands heat up to $4000^{\circ}F$. Used for reentry parachute yarns and other space applications.

"Fyrex."¹ Trademark for a substantially neutral ammonium phosphate; fine crystals; soluble in water. Uses: Flameproofing textiles, wood, and fibers; manufacture of matches to prevent afterglow.

"Fyrol."¹ Trademark for a series of phosphate flame-retardant plasticizers.

Used in polyesters, rigid urethane foam; polyurethane, phenolic, epoxy, PVC, PVA, nitrocellulose, cellulose acetate, and ethyl cellulose resins.

g (1) Abbreviation of gram. (2) Acceleration due to gravity.

μ g Abbreviation of microgram (q.v.).

"G-4."¹² Trademark for a brand of dichlorophene (q.v.).

"G-942."²⁸ Trademark for an aqueous solution of the partial sodium salt of a polymeric carboxylic acid, used as a tanning agent.
Containers: 500-lb drums.

Ga Symbol for gallium.

G acid. 2-Naphthol-6,8-disulfonic acid.

gadolinium Gd A rare-earth element of the lanthanide series; atomic number 64; group III B of the periodic table; atomic weight 157.25; valence 3. Seven natural isotopes.

Properties: Lustrous metal; sp. gr. 7.87; m.p. 1312°C; b.p. 3000°C. Reacts slowly with water; soluble in dilute acid; insoluble in water. Exhibits a high degree of magnetism, especially at low temperatures. Salts are colorless. Has highest neutron absorption cross-section of any known element; has superconductive properties. Combustible; burns in air to form the oxide.

Derivation: (a) Reduction of the fluoride with calcium; (b) electrolysis of the chloride with NaCl or KCl in iron pot, which serves as anode, and graphite cathode.
Grades: Ingots, lumps, turnings, powder, up to 99.9+%

Uses: Neutron shielding; garnets in microwave filters; phosphor activator; catalyst; scavenger for oxygen in titanium production.

gadolinium chloride $\text{GdCl}_3 \cdot x\text{H}_2\text{O}$. Colorless crystals, soluble in water. Purities up to 99.9%.

Containers: Glass bottles, fiber drums.
Uses: Gadolinium sponge metal, by contact with a reducing metal vapor.

gadolinium fluoride $\text{GdF}_3 \cdot 2\text{H}_2\text{O}$. Available up to 99.9% purity.

Containers: Glass bottles, fiber drums.
Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

gadolinium nitrate $\text{Gd}(\text{NO}_3)_3 \cdot x\text{H}_2\text{O}$. Colorless crystals, soluble in water; decomposes 110°C. Purities up to 99.9% gadolinium salt.

Containers: Glass bottles, fiber drums.
Hazard: Fire risk in contact with organic materials.
Shipping regulations: Nitrates, n.o.s. (Rail) Yellow label. (Air) Oxidizer label.

gadolinium oxalate $\text{Gd}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$. White powder, insoluble in water, slightly soluble in acids. Loses $6\text{H}_2\text{O}$ at 110°C. Purities up to 99.9% gadolinium salt.
Containers: Glass bottles, fiber drums.

gadolinium oxide Gd_2O_3 . White to cream-colored powder; sp. gr. 7.41 m.p. 2330°C; insoluble in water soluble in acids to form the corresponding salts. Hygroscopic; absorbs carbon dioxide from the air. Purities up to 99.8% gadolinium oxide.
Derivation: Calcination of gadolinium salts; liquid/-liquid ion-exchange separation.

Containers: Glass bottles, fiber drums.

Uses: Neutron shields; catalysts; dielectric ceramics; filament coatings; special glasses; TV phosphor activator; lasers, masers, and telecommunication; laboratory reagent.

gadolinium sulfate $\text{Gd}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$. Colorless crystals, slightly soluble in hot water, more soluble in cold; sp. gr. 3.01 (15°C). Purities up to 99.9% gadolinium salt.

Uses: Cryogenic research; the selenide is used in thermoelectric generating devices.

"Gafac."³⁰⁷ Trademark for a series of anionic, complex organic phosphate esters with good emulsifying and detergent properties.

Uses: Surfactants in emulsion polymerization (FDA approved).

"Gafamide."³⁰⁷ Trademark for a series of fatty acid ethanalamides used as foam boosters, stabilizers, thickeners, detergents, and emulsifiers.

"Gafanol."³⁰⁷ Trademark for a series of polyethylene glycol polymers ranging from free-flowing liquids to waxes. Used for surfactant intermediates, solvents for pharmaceuticals, plasticizers, etc.

"GAF" Carbonyl Iron Powders.³⁰⁷ Trademark for microscopic spheres of extremely pure iron. Produced in eleven carefully controlled grades, ranging in particle size from 3 to 20 microns in diameter. The iron content of some types is as high as 99.5%.

Uses: High-frequency cores for radio, telephone, television, short wave transmitters, radar receivers, direction finders; alloying agents, catalysts; powder metallurgy; magnetic fluids.

"Gafcol."³⁰⁷ Trademark for a series of mild-odored glycol ethers used as solvents for nitrocellulose lacquers, dyes, insecticides, and intermediates in the manufacture of plasticizers. Miscible with most liquids.

"Gafstat"³⁰⁷ Trademark for a series of free acids of complex phosphate esters. Antistatic agents for plastic packaging films (FDA approved).

Gal Abbreviation for galactose.

galactose $\text{C}_6\text{H}_{12}\text{O}_6$. A monosaccharide commonly occurring in milk sugar or lactose.

Properties: White crystals; soluble in water and alcohol; slightly soluble in glycerol; m.p. 165–168°C.

Derivation: By acid hydrolysis of lactose.

Uses: Organic synthesis; medicine.

D(+)-galacturonic acid $\text{COOH}(\text{CHOH})_4\text{CHO}$. A major constituent of plant pectins (q.v.). It exhibits mutarotation, having both an alpha and a beta form.

Properties: The alpha form melts with decomposition at 159–160°C. Soluble in water; slightly soluble in hot alcohol; insoluble in ether.

Derivation: Hydrolysis of pectins.

Use: Biochemical research.

"Galecron."²¹⁹ Trademark for chlordinform (q.v.).

galena (galenite; lead glance) PbS . Natural lead sulfide. Properties: Color lead gray; streak lead gray; luster

metallic; good cubic cleavage; sp. gr. 7.4-7.6; Mohs hardness 2.5. Soluble in strong nitric acid; also in excess of hot hydrochloric acid.

Occurrence: Western U.S.; Canada; Africa; South America.

Use: Chief ore of lead. Frequently recovered for the silver it sometimes contains.

"Galex."^{122,235} Trademark for a stable non-oxidizing rosin, principally dehydroabietic acid.

Properties: Light amber to red brown solid. Sp. gr. 1.05; B & R softening point 65-70°C. Nontoxic.

Grades: W-100, W-100-D, NXD, G-75.

Uses: Tackifier.

gallic acid (3,4,5-trihydroxybenzoic acid)

$C_6H_2(OH)_3CO_2H \cdot H_2O$.

Properties: Colorless or slightly yellow, crystalline needles or prisms. Soluble in alcohol and glycerol; sparingly soluble in water and ether. Sp. gr. 1.694; m.p. 222-240°C.

Derivation: Action of mold on solutions of tannin or by boiling the latter with strong acid or caustic soda.

Uses: Photography; writing ink; dyeing; manufacture of pyrogallol; tanning agent and manufacture of tannins; paper manufacture; pharmaceuticals; engraving and lithography; analytical reagent.

gallimycin 36. A liquid form of erythromycin used for veterinary treatment of mastitis. FDA approved.

gallium Ga. Metallic element of atomic number 31, of group III A of the periodic system. Atomic weight 69.72; valences 2, 3. Two stable isotopes.

Properties: Silvery-white liquid at room temperature; m.p. 29.7°C; b.p. 2403°C; may be under-cooled to almost 0°C without solidifying; sp. gr. 5.9 (25°C), more dense as a liquid than as a solid; soluble in acid, alkali and slightly soluble in mercury. Reacts with most metals at high temperatures. Nontoxic. Grades up to 99.9999% purity are available.

Occurrence: Prepared commercially from zinc ores and bauxite.

Derivation: Extraction of gallium as gallium chloride by ethyl ether or isopropyl ether and subsequent electrodeposition from an alkaline gallium oxide solution.

Uses: The metal has no significant commercial uses. Its compounds are used as semiconductors.

gallium antimonide GaSb. Available in an electronic grade.

Uses: Semiconducting devices.

gallium arsenide GaAs.

Properties: Crystals; m.p. 1238°C. Electroluminescent in infrared light.

Grades: Ingots; polycrystalline form in high purity electronic grade; single crystals. Often alloyed with gallium phosphide or indium arsenide.

Hazard: Highly toxic. See arsenic.

Uses: Semiconductor in light-emitting diodes for telephone dials; injection lasers; solar cells, magnetoresistance devices; thermistors, microwave generation.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

gallium oxides. The sesquioxide, Ga_2O_3 , and suboxide, Ga_2O , are known. Both are stable at ordinary temperatures. See gallium sesquioxide.

gallium phosphide GaP.

Properties: Pale orange, transparent crystals or whiskers

up to 2 cm long, made by vapor phase reaction, at relatively low temperatures, between phosphorus and

gallium suboxide. These crystals are intermediate between normal semiconductors and insulators or phosphors. They operate over a temperature range of -55 to 500°C. Gallium phosphide is electroluminescent in visible light.

Grades: Polycrystalline form in high-purity electronic grade; single crystals; whiskers.

Uses: Semiconducting devices.

gallium sesquioxide Ga_2O_3 .

Properties: (alpha and beta forms) Alpha form: White crystals; sp. gr. 6.44; m.p. 1900°C. Changes to beta form at 600°C. Beta form: White crystals; sp. gr. 5.88. Both forms insoluble in hot acid.

Grade: High-purity electronic.

Uses: Spectroscopic analysis.

galloeyanine, $C_{15}H_{12}N_2O_5$. A dye made from gallic acid. Used as a biological stain.

gallotannic acid. See tannic acid.

galls (nutgalls). Excrescences on various kinds of oak trees resulting from the deposition of insect eggs.

Grades: The best grades (55-60% tannic acid) come from Iran, Syria, Turkey, and Tripoli.

Uses: Source of gallic and gallotannic acids; leather tanning; writing inks; medicine; textile printing; pharmaceuticals.

"Galvan."²⁷⁵ Trademark for battery and electrically conductive carbon black.

galvanizing. Coating of a ferrous metal by passing it through a bath of molten zinc or by electrodeposition of zinc. In the former process, the iron and zinc combine to form an intermetallic compound at the interface, the outer surface being relatively pure zinc, which crystallizes as it cools, to form the characteristic "spangle." The electrodeposition method gives a uniform surface which may be either dull or bright. Duration of corrosion protection is directly related to the thickness of the zinc coating. See also sacrificial protection.

"Galvaseal."⁴⁴ Trademark for a light chromate-type conversion coating for all types of zinc or galvanized steel surfaces, producing salt spray resistance and white rust prevention as well as base for paint. Application by spray, immersion or roller coat.

"Galvoline."²¹¹ Trademark for a cored magnesium ribbon used as a continuous anode for the cathodic protection of buried pipe lines and other metal structures. Combustible.

"Galvomag."²¹¹ Trademark for magnesium alloy composition used in anodes in cathodic protection.

"Galhopak."²¹¹ Trademark for a product consisting of a magnesium anode packed with back-fill material. Used in the cathodic protection of buried pipe lines and other metal structures. Combustible.

"Galvoro."²¹¹ Trademark for a cored magnesium rod used as an anode in the cathodic protection of water-heater tanks. Combustible.

gametocide. A substance which can control pollination of plants by selectively killing plant sex cells (gametes). Some suggested gametocides are maleic hydrazide and sodium alpha, beta-dichloroacrylate.

gamma (γ). A prefix having meanings and uses different from those of alpha (α), namely, to designate a derivative of

substituents in a compound or a particular form or modification of an organic substance (gamma-globulin) or a metal crystal. It also identifies the most intense form of short-wave radiation. See gamma ray.

gamma acid. See 7-amino-1-naphthol-3-sulfonic acid.

"Gammacorten."³⁰⁵ Trademark for dexamethasone (q.v.).

"Gamma-Dent."¹ Trademark for a phosphate cleaning agent used in dentifrices.

gamma-globulin. See globulin.

gamma ray. Electromagnetic radiation of extremely short wavelength and intensely high energy. Gamma rays originate in the atomic nucleus; they usually accompany alpha and beta emission, as in the decay of radium, and always accompany fission. Gamma rays are extremely penetrating and are best absorbed by dense materials like lead and depleted uranium.

Hazard: Exposure to gamma radiation may be lethal; complete protection is essential.

Uses: To initiate chemical syntheses (ethyl bromide) and crosslinking of polyethylene and other polymers; biochemical research; food preservation. See also xray; radiation.

"Gamtox."²⁵³ Trademark for a pesticide formulation containing benzene hexachloride.

Hazard: See benzene hexachloride.

"Ganex."³⁰⁷ Trademark for a series of modified polyvinylpyrrolidone-based products. Available in a wide range of physical forms from liquid to waxy solid to granular solid. Used as emollients and lubricity additives, dispersing and suspending agents, pour point depressants, sizing additives.

gangue. The minerals and rock mined with a metallic ore but valueless in themselves or used only as a by-product. They are separated from the ore in the milling and extraction processes, often as slag. Common gangue materials are quartz, calcite, limonite, feldspar, pyrite, etc.

"Gantrez" AN.³⁰⁷ Trademark for an interpolymer of methyl vinyl ether and maleic anhydride. Properties: Soluble in water and many organic solvents. Compatible with a wide range of gums, resins, and plasticizers, and with most metallic salts. Stable in acid and alkaline solutions. Available in a range of molecular weights.

Uses: Ammonium nitrate slurry explosives, for its suspending action and crosslinking ability; rust-preventive films; antistatic and finishing agent in natural and synthetic textiles and glass fibers; adhesives and coatings; thickening agent and protective colloid; flocculant and foam stabilizer in papermaking; reproduction, pharmaceutical preparations; cosmetics, etc.

"Gantrez" M.³⁰⁷ Trademark for polyvinyl methyl ether (q.v.).

"Gardenol."²²⁷ Trademark for methyl phenyl carbonyl acetate.

"Garlon."²³³ Trademark for herbicides containing diethylene glycol bis(2,2-dichloropropionate) and esters of 2-(2,4,5-trichlorophenoxy)propionic acid.

garnet, natural. A group of silicate minerals. Garnets in nature are usually composed of mixtures of various garnet subspecies.

Uses: Abrasive; blast cleaning of buildings.

garnet, synthetic. Single-crystal garnets designed, by the introduction of bismuth, calcium, and vanadium, for

microwave devices such as low-frequency ferromagnetic resonators. Special yttrium, iron and aluminum garnets are used in lasers and electronic devices.

garnierite (Ni,Mg)₆(OH)₆Si₄O₁₁ · H₂O. A natural nickel-magnesium silicate, occurring as a natural alteration of magnesium silicate rocks. A nickel ore.

gas. One of the three states of matter, characterized by very low density and viscosity (relative to liquids and solids); comparatively great expansion and contraction with changes in pressure and temperature; ability to diffuse readily into other gases; and ability to occupy with almost complete uniformity the whole of any container. Gases may be either elements (argon) or compounds (carbon dioxide); elemental gases may be monatomic (helium), diatomic (chlorine) or triatomic (ozone). All exist in the gaseous state at standard temperature and pressure, but can be liquefied by pressure. The most abundant gases are oxygen, hydrogen, nitrogen (diatomic), and carbon dioxide. Gases are used for fundamental research on the behavior of matter largely because the low concentration permits isolation of the phenomena far better than is possible in liquids or solids.

A "perfect" or ideal gas is one which closely conforms to the simple gas laws for expansion and contraction (Boyle's Law, Charles' Law).

Note: Use of the word "gas" for gasoline, natural gas, or the anesthetic nitrous oxide, is acceptable only in informal communication.

See also kinetic theory; compressed gas; noxious gas; noble gas; vapor.

gas, asphyxiant. See asphyxiant gas.

gas black. See carbon black.

"Gas-Chrom."⁴²⁵ Trademark for a series of diatomaceous earths designed for use as supports in gas chromatography. They have been treated in various ways, such as flux-calcined and screened, washed with acids and bases, and/or silanized for inertness. "Gas-Chrom" Q, which has been treated with dichlorodimethylsilane, is specially recommended for the analytical separation of steroids, pesticides, and other high molecular weight materials.

gas chromatography (GC; gas-liquid chromatography; GLC; vapor-phase chromatography; VPC). The process in which the components of a mixture are separated from one another by volatilizing the sample into a carrier gas stream which is passing through and over a bed of packing consisting of a 20 to 200 mesh solid support. The surface of the latter is usually coated with a relatively nonvolatile liquid (the stationary phase). This gives rise to the term gas-liquid chromatography. If the liquid is not present, the process is gas-solid chromatography, which is also widely useful for analysis. Different components move through the bed of packing at different rates, and so appear one after another at the effluent end, where they are detected and measured by thermal conductivity changes, density differences, or ionization detectors.

Gas chromatography is advantageous as a means of analysis of minute quantities of complex mixtures from industrial, biological, and chemical sources, and is also of potential value in actually preparing moderate quantities of highly purified compounds otherwise difficult to separate from the mixtures in which they occur.

gas, compressed. See compressed gas; liquefied petroleum gas.

gaseous diffusion. See diffusion, gaseous.

gas hydrate. A clathrate compound (q.v.) formed by a gas (both noble and reactive) and water. The compounds are crystalline solids, and are insoluble in water. They usually form (only at relatively low temperatures and high pressures) directly by contact of gas and liquid water. From 6 to 18 molecules of water may combine with each molecule of gas, depending upon the nature of the gas.

The best known gas hydrates are those of ethane, ethylene, propane and isobutane. Others include: methane and 1-butene, most of the fluorocarbon refrigerant gases, nitrous oxide, acetylene, vinyl chloride, carbon dioxide, methyl and ethyl chloride, methyl and ethyl bromide, cyclopropane, hydrogen sulfide, methyl mercaptan and sulfur dioxide.

Interest in the gas hydrates originated mainly because of the nuisance of such compound formation in gas pipelines. In recent years, propane has been successfully used to precipitate water from salt solution (or sea water), thus yielding potable water.

gasification. Production of gaseous or liquid fuels from coal. The term may mean either (1) catalytic addition of hydrogen from an external source to coal, or (2) production of a synthesis gas mixture of hydrogen, carbon monoxide, carbon dioxide and some methane from coal by reaction with steam in the presence of air. In the latter case catalytic methanation is required to increase the methane content and Btu value. An example of the first method is the Hydrane process developed by the Bureau of Mines; an instance of the second method is the Lurgi process, originally developed in Scotland. High temperatures and pressures are required. A number of related processes are under active research, some of which are as follows:

Process	Developer
Hygas	Institute of Gas Technology
Bi-Gas	Bituminous Coal Research
Koppers-Totzek	Heinrich Koppers
Synthane	Bureau of Mines
Atgas	Applied Technology, Inc.
Coalcon	Union Carbide Corp.
Co ₂ Acceptor	Consolidated Coal Co.
Coed	FMC Corp.
Cogas	Consortium
Fischer-Tropsch	M. W. Kellogg Co.
H-Coal	Hydrocarbon Research, Inc.
Winkler	Davy Powergas, Inc.
Synthoil	Bureau of Mines

Also under experimentation is an underground gasification process in which air is pumped down to strata of unmined coal that has been ignited and the product gases collected. Substantial contribution of coal gasification to the energy needs of the U.S. before 1985 is unlikely. See also coal; hydrogenation; synthetic natural gas.

gas, inert. See noble gas; inert.

gas laws. See Boyle's law; Charles' law.

gas, liquefied petroleum. See liquefied petroleum gas.

gas liquid. See light hydrocarbon.

gas, natural. See natural gas.

gas, noble. See noble.

gas oil. A liquid petroleum distillate with viscosity and boiling range between kerosine and lubricating oil.

Boiling range between 450 and 800°F. Flash point 150°F. Autoignition temp. 640°F. Combustible.

Uses: Absorption oil; manufacture of ethylene.

gasoline (gasolene). A mixture of volatile hydrocarbons suitable for use in a spark-ignited internal combustion engine and having an octane number of at least 60. The major components are branched-chain paraffins, cycloparaffins, and aromatics. There are several methods of production: distillation or fractionation, which yields straight-run product of relatively low octane number, used primarily for blending; thermal and catalytic cracking; reforming; polymerization; isomerization; and dehydrocyclodimerization. All but the first are various means of converting hydrocarbon gases into motor fuels by modifications of chemical structure, usually involving catalysis. The present source of gasoline is petroleum, but it may also be produced from shale oil and Athabasca tar sands, as well as by hydrogenation or gasification of coal.

antiknock gasoline. A gasoline to which a low percentage of tetraethyllead or similar compound, has been added to increase octane number and eliminate knocking. Such gasolines have an octane number of 100 or more and are now used chiefly as aviation fuel. Since 1972 gasolines having a research octane number of about 90 have been in general automotive use; the percentage of lead compound added has been gradually reduced. The maximum permitted by EPA is now (1976) 1.4 grams per gallon, but this will gradually be lowered to 0.5 gram per gallon in 1979. See also antiknock agent; octane number.

casinghead gasoline. See natural gasoline (below).

cracked gasoline. Gasolines produced by the catalytic decomposition of high-boiling components of petroleum. In general such gasolines have higher octane ratings (from 80 to 100) than gasoline produced by fractional distillation. The difference is due to the prevalence of unsaturated, aromatic and branched-chain hydrocarbons in the cracked gasoline. The actual properties vary widely with the nature of the starting material, and the temperature, time, pressure and catalyst used in cracking (q.v.).

high-octane gasoline. A gasoline with an octane number of about 100. See antiknock gasoline; octane number.

lead-free gasoline. An automotive fuel containing no more than 0.05 gram of lead per gallon, designed for use in engines equipped with catalytic converters.

natural gasoline. A gasoline obtained by recovering the butane, pentane, and hexane hydrocarbons present in small proportion in certain natural gases. Used in blending to produce a finished gasoline with adjusted volatility, but low octane number. Do not confuse with natural gas (q.v.).

polymer gasoline. A gasoline produced by polymerization of low molecular weight hydrocarbons such as ethylene, propene, and butenes. Used in small amounts for blending with other gasolines to improve their octane number.

pyrolysis gasoline. Gasoline produced by thermal cracking as a by-product of ethylene manufacture. It is used as a source of benzene by the hydrodealkylation process.

reformed gasoline. A high octane gasoline obtained from low octane gasoline by heating the vapors to a high temperature or by passing the vapors through a suitable catalyst.

straight-run gasoline. Gasoline produced from petroleum by distillation, without use of cracking or

other chemical conversion processes. Its octane number is low.

white gasoline. An unleaded gasoline especially designed for use in motorboats; it is uncracked and strongly inhibited against oxidation to avoid gum formation, and is usually not colored to distinguish it from other grades. It also serves as a fuel for camp lanterns and portable stoves.

Containers: Tank cars and tank trucks; barges; pipeline.
Hazard: Highly flammable; dangerous fire and explosion risk.

Shipping regulations: (Rail) Red label (Air) Flammable Liquid label.

gas, perfect. See ideal gas.

"Gastex."²⁷⁵ Trademark for semi-reinforcing gas furnace carbon black for rubber.

gastric juice. A mixture of hydrochloric acid and pepsin secreted by glands in the stomach in response to a conditioned nerve reflex. Its pH is about 2.0. Its action in the metabolic breakdown of food components is essential to the digestive process, though carbohydrate decomposition is initiated by the saliva. See also digestion (1).

Gay-Lussac's law. A modification of Charles' Law to state the following: At constant pressure, the volume of a confined gas is proportional to its absolute temperature. The volumes of gases involved in a chemical change can always be represented by the ratio of small whole numbers.

GC. Abbreviation for gas chromatography.

Gd Symbol for gadolinium.

GDCH. Abbreviation for glycerol dichlorohydrin. See alpha-dichlorohydrin.

GDME. Abbreviation for glycol dimethyl ether. See ethylene glycol dimethyl ether.

GDP. Abbreviation for guanosine diphosphate. See guanosine phosphates.

Ge Symbol for germanium.

gel. A colloid in which the disperse phase has combined with the continuous phase to produce a viscous, jelly-like product. Only 2% gelatin in water forms a stiff gel. A gel is made by cooling a solution, whereupon certain kinds of solutes (gelatin) form submicroscopic crystalline particle groups which retain much solvent in the interstices (so-called "brush-heap" structure). Gels are usually transparent but may become opalescent. See also pectin.

gelatin. A mixture of proteins obtained by hydrolysis of collagen by boiling skin, ligaments, tendons, etc. Its production differs from that of animal glue in that the raw materials are selected, cleaned and treated with special care so that the product is cleaner and purer than glue. Type A gelatin is obtained from acid-treated raw materials, and Type B from alkali-treated raw materials. Gelatin is strongly hydrophilic, absorbing up to ten times its weight of water and forming reversible gels of high strength and viscosity. It can be chemically modified to make it insoluble in water for such special applications as microencapsulation of fish nutrients for fish culture.

Grades: Edible; photographic; technical; U.S.P.
Containers: Cans; fiber drums.

Uses: Photographic film; lithography; sizing; plastic compounds; textile and paper adhesives; cements; capsules for medicinals; matches; light filters; clarifying agent; desserts, jellies, etc.; culture medium for

bacteria; blood plasma volume expander; microencapsulation.

gelatin dynamite. A high explosive which contains about 1% of nitrocellulose in addition to nitroglycerin. The product is a gelatinized mass, less sensitive to shock and friction than straight dynamite.

"Gelcarin."¹²⁴ Trademark for carrageenan extractives from Irish moss. Dry, free-flowing powder packed in fiber drums.

Grade: Food grade, meeting FDA requirements.

Uses: Gelling, suspending, binding and viscosity-building.

gel filtration. A type of fractionation procedure in which molecules are separated from each other according to differences in size and shape; the action is similar to that of molecular sieves. Dextran gels (three-dimensional networks of polysaccharide chains) are usually used in this method, known as gel filtration chromatography. See also fractionation; molecular sieve.

"Gelgard."²¹¹ Trademark for a synthetic polymeric water gelling material; used in fire control.

"Gel-Kote."⁴⁴⁸ Trademark for pigmented polyester resin coatings for polyester products.

"Gelloid."¹⁰⁹ Trademark for a series of purified extracts of various types of Irish moss seaweed, rich in mucilaginous content. Manufactured into dry, odorless, edible powders used in food and pharmaceutical applications.

gel paint (thixotropic paint). A paint formulation which has a semi-solid or gel consistency when undisturbed but which flows readily under the brush or when stirred or shaken. After removal of the stress, it becomes stiff again and has little tendency to spill, drip, or run. The thixotropic quality is obtained by the carefully controlled reaction of a relatively small proportion of a polyamide resin with an alkyd resin vehicle. See thixotropy.

"Geltone."²¹⁶ Trademark for a synthetic organophilic colloid that imparts gel to any oil/mud system.

"Gelva."⁵⁸ Trademark for vinyl acetate polymers. Uses: Adhesives; binders; chewing gum bases; coatings; hot melt adhesives; paints; paper treatment; permanent starches; slush molding; textile sizes and finishes; and thickeners.

"Gelvatex."⁵⁸ Trademark for aqueous emulsions of vinyl acetate polymers and compounded compositions thereof.

"Gelvatol."⁵⁸ Trademark for polyvinyl alcohol resins (q.v.). Uses: Adhesive; emulsifier; hydraulic cement additive; textile sizes; paper coating.

"Gelwhite."⁴⁷¹ Trademark for a series of white grades of water-refined montmorillonite clays. Grades: GP and L, high sodium content in exchange position and low sodium content.

gem-. Prefix; abbreviation of geminate, meaning two identical groups attached to the same carbon atom.

"Gemon-3010."²⁴⁵ Trademark for a glass-reinforced thermosetting polyimide molding compound with excellent high-temperature properties, mechanical performance and processing ease. Used for space applications, electric and electronic industries.

"Genacron."³⁰⁷ Trademark for a series of disperse dyes for polyester fibers.

"Genacryl."³⁰⁷ Trademark for a series of basic dyes for acrylic fibers.

"Genamid."²⁵⁹ Trademark for resinous amine-based coreactants for epoxy resins.

Uses: Coatings, castings, potting adhesives, laminates, tooling.

gene. A complex of nucleoproteins (chiefly DNA) that is the active transmitter of genetic information. Genes occur on the chromosomes of every living cell, where they are arranged in a linear order. Genetic mechanism is the same in all organisms, ranging from the lowest forms of life, both plant and animal, to man. Every organism has a large number of different genes; there are over 10,000 in each cell of the human body. These control the intricate and well-balanced system of biochemical reactions in the cell. The first synthesis of a gene was reported in 1970. In 1976 it was announced that a synthetic gene was successfully introduced into a microorganism in which it functioned in the same manner as would a normal gene.

Because of the ability of DNA to store and transfer "coded" genetic instructions, genes determine the sequence of amino acids in specific polypeptides (see proteins); thus they prescribe the structure of the proteins synthesized. In viruses the genes consist of ribonucleic acid (RNA). Mutation of genes is a change in the basic sequence of amino acids in DNA, and may be induced by ionizing radiation. Mutations can occur in any living cell. See also genetic code; radiation, ionizing; recombinant DNA.

"GenEpoxy."²⁵⁹ Trademark for liquid and solid resins having terminal epoxide groups.

Uses: Coatings, structural adhesives, laminates, casting, encapsulation, sealants, concrete topping.

"Genesolv."⁵⁰ Trademark for ultrapure solvents of the halogenated hydrocarbons of the methane and ethane series.

Properties: Nonflammable, nonexplosive, thermally stable, and relatively nonhydrolyzable. Have high densities and low viscosities. Combined residue (soluble plus insoluble matter) is less than 1 part per million.

Grades: standard and electronic; Genesolv A, B, C, D. Uses: Removal of greases and oils from metals, plastic, elastomer and paint or varnish surfaces. Used with all cleaning techniques on assembled motors and parts, electronic devices, precision components, motion picture film, refrigeration systems, etc. Also used for isolation of viruses, for fire-extinguishing, and as dielectric coolants.

genetic code. Information stored in the genes (q.v.) which "program" the linear sequence of amino acids within the protein polypeptide chain synthesized during cell development. The agencies involved are DNA (deoxyribonucleic acid, q.v.) and RNA (ribonucleic acid, q.v.). It is this information code (analogous to a computer language) that determines (1) the nature and type of an organism, i.e., its heredity, and (2) the kind of cell structure to be formed (muscle, bone, organ, etc.). See also protein; amino acid; nucleotide.

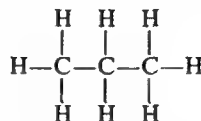

"Genetron."⁵⁰ Trademark for a group of fluorinated hydrocarbons.

Properties: Low moisture content, noncorrosive, nonflammable, stable, low power requirement per unit

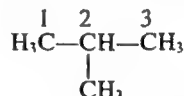

of refrigeration, high dielectric strength. For specific identification, see fluorocarbon.

Geneva System*. A system of nomenclature for organic compounds recommended in 1892. It is based on compounds derived from hydrocarbons as a starting point, the names corresponding to the longest straight carbon chain present. The position is indicated by numbers applied to the carbons of the straight chain, beginning with the end carbon nearest the substituent element or group.

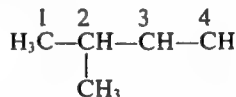

Normal compounds, in which the carbons are linked in a straight chain, are named ethane, propane, pentane, etc. Normal propane is:

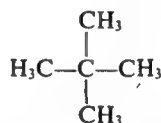

Branched compounds are so named as to show the proper deviation, e.g., 2-methyl propane

is a derivation of propane, not of methane. Similarly, isopentane

is named 2-methyl butane. The four carbons in a straight line give the name butane, and the side group is attached to the second carbon. Another pentane has the structure:

and was once called tetramethyl pentane. Under the Geneva system it is named in terms of two methyl groups joined to carbon number 2 in a propane chain—2,2-dimethyl propane.

Some special recommendations of the Geneva system define the use of certain suffixes: open-chain hydrocarbons with one double bond end in -ene; those with two double bonds end in -diene (alkenes and alkadienes rather than olefins and diolefins). Triple-bonded compounds end in -yne.

Alcohols are named by use of the hydrocarbon name with -ol as the characteristic suffix, i.e., methanol, ethanol, etc. In order to extend this plan to polyhydric alcohols, a syllable such as *di*, *tri*, and *tetra* is inserted between the name of the parent hydrocarbon and the suffix *ol*.

1,2-ethanediol

1,2,3-propanetriol

Sulfides, disulfides, sulfoxides and sulfones are named like ethers, the oxy- term being replaced with thio-, dithio-, sulfinyl and sulfonyl. The acids

are also named in accordance with the Geneva System.

*Based on article "Chemical Nomenclature" by F. A. Griffiths in "Encyclopedia of Chemistry", (Hampel and Hawley, 3rd Ed., Van Nostrand Reinhold, New York, 1973).

See also chemical nomenclature.

"Gen-Flo Latices."¹⁷⁹ Trademark for styrene-butadiene emulsion polymers with varying amounts of styrene and butadiene.

Uses: Latex paints, paper coatings, adhesives, textile printing inks, sizes.

"Genicop."⁸⁰ Trademark for a DDT-copper formulation which acts as an insecticide and fungicide.

genin. The steroid portion linked to a sugar residue in certain glycosides. Important genins are found in the digitalis glycosides, used as heart stimulants.

"Genite" 923.⁵⁰ Trademark for 2,4-dichlorophenyl ester benzenesulfonic acid; available as 50% emulsifiable or 50% wettable powder. Miticide specific for European red mite and clover mite.

"Gensol No. 6."⁷⁹ Brand name for terpene solvent. Uses: Odorant for masking other odors; solvent and softener in rubber reclaiming; solvent in printing ink manufacture.

"Gen-Tac Latex."¹⁷⁹ Trademark for a latex containing vinyl pyridine, butadiene, and styrene. Uses: Adhesive for rubber-to-fabric constructions, as in tires and mechanical products.

"Genthane-S."¹⁷⁹ Trademark for a polyurethane elastomer. Uses: Mechanical goods, grommets, packings, and extrusions.

gentian violet. U.S.P. name for methyl violet.

gentisic acid (2,5-dihydroxybenzoic acid)
 $C_6H_3(OH)_2COOH$.

Properties: Crystals; m.p. 199–200°C; soluble in water, alcohol, and ether; insoluble in carbon disulfide, chloroform, and benzene.

Use: Medicine, as sodium gentisate.

"Gentro."¹⁷⁹ Trademark for a series of vulcanizable polymers containing butadiene and styrene manufactured by the cold process.

Properties: Contains approximately 23.5% styrene and 76.5% butadiene. Polymers mixed with reinforcing pigments give a variety of properties, abrasion resistance, flexibility, color, etc.

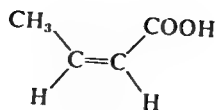

Uses: Tires, mechanical goods, proofed goods, extruded goods, shoe soles, heels, sponge, etc.

"Gentro-Jet."¹⁷⁹ Trademark for a series of carbon blacks co-precipitated with SBR polymer.

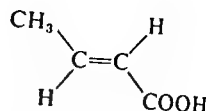

Uses: Tires, tread rubber, mechanical goods, conveyor belts, V-belts, etc.

geochemistry. The study of the chemical composition of the earth in terms of the physicochemical and geological processes and principles that produce and modify minerals and rocks. Of practical importance in discovering and establishing the limits of ore deposits, petroleum, tar sands, salt, sulfur, and other valuable resources.

geometric isomer. A type of stereoisomer in which a chemical group or atom occupies different spatial positions in relation to the double bond. If the double bond is between two carbon atoms the isomers are called *cis* and *trans*, as in crotonic acid, where the H and COOH reverse locations:

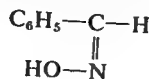

cis

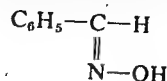

trans

If the double bond is between a nitrogen and a carbon atom the isomers are named *anti* and *syn*, as in benzaldoxime, where the OH group shifts location:

anti

syn

This phenomenon also occurs in saturated ring compounds having three or more members in the ring, as well as in certain coordination compounds. See also stereochemistry.

"Geon"¹¹⁹ Trademark for a group of polyvinyl chloride polymers, available as general-purpose, rigid, insulation, compounded, latex, paste, polyblend, or solution types. Also a high-temperature type (polyvinyl dichloride) that will withstand temperatures 60°F higher than other vinyls, and can be processed in standard equipment. See also polyvinyl chloride.

geothermal energy. Superheated steam at high pressure and temperatures ranging from 120 to 350°C, either trapped in rock strata or emanating from vents called fumaroles, located in areas characterized by volcanic activity or by geologic intrusions of igneous rock (magma). The former is the cause of such "wells" in New Zealand, Iceland, and southern Italy, whereas the latter is responsible for the geysers, hot springs and fumaroles in the Yellowstone area. The presence of subterranean steam pockets is indicated by a steeply rising geothermal gradient. This energy source was utilized for power production in Italy as long ago as 1935, and is now being used for this purpose in New Zealand, as well as for interior heating, papermaking, etc. It is also in limited use in Iceland and in western U.S. Studies have shown that geothermal steam plants are much less efficient than those fired by coal or oil, and that they emit a high level of atmospheric contaminants. These adverse effects can undoubtedly be mitigated by further engineering study.

geranial. See citral.

geranialdehyde. See citral.

geraniol (trans-3,7-dimethyl-2,6-octadien-1-ol)
 $(\text{CH}_3)_2\text{C}:\text{CH}(\text{CH}_2)_2\text{C}(\text{CH}_3):\text{CHCH}_2\text{OH}$. A terpene alcohol.

Properties: Colorless to pale yellow, liquid oil; pleasant geranium-like odor; sp. gr. 0.870–0.890 (15°C); f.p. –15°C; b.p. 230°C; refractive index (n_D²⁰) 1.4710–1.4780; optical rotation –2° to +2°; soluble in alcohol and ether, mineral oil, fixed oils; insoluble in water, and glycerol. Combustible. Nontoxic.

Derivation: From citronella oil (Java); citronellol-free grades from palmerosa oil and (synthetically) from pinene. These are of higher quality.

Grades: Standard; soap; synthetic; FCC; EOA. Uses: Perfumery; flavoring; source of linalool.

geranium oil.

Properties: Pale yellow or greenish liquid; rose-like odor. Slightly soluble in water; soluble in alcohol and ether and most oils; sp. gr. 0.886–0.898; optical rotation –7° to –12°; refractive index (n_D²⁰) 1.4650–1.4700. Combustible; nontoxic.

Chief known constituents: Geraniol; citronellol.
Derivation: Distilled from the herb of several species of *Pelargonium*.

Grades: Algerian; Bourbon; F.C.C. (Algerian).

Uses: Perfumery; flavoring agent.

See also palmerosa oil.

geranyl acetate (geraniol acetate) $\text{CH}_3\text{COOC}_{10}\text{H}_{17}$.

Properties: Clear, colorless liquid; odor of lavender; sp. gr. 0.907–0.918 (15°C); b.p. 128–129°C (16 mm); optical rotation -2° to $+2^\circ$; refractive index ($n_{20/D}$) 1.4580–1.4640; soluble in alcohol and ether; insoluble in water and glycerol. Combustible; non-toxic.

Derivation: (a) Constituent of several essential oils.

(b) By heating geraniol and sodium acetate with acetic anhydride.

Grade: Technical; F.C.C.

Use: Perfumery; flavoring.

geranyl butyrate (geraniol butyrate) $\text{C}_3\text{H}_7\text{COOC}_{10}\text{H}_{17}$.

Properties: Colorless liquid; b.p. 151°C (18 mm); rose-like odor; sp. gr. 0.9008 (17/4°C); insoluble in water and glycerol; soluble in alcohol and ether. Occurs in several essential oils. Combustible. Nontoxic.

Grade: F.C.C.

Uses: Perfumes and soaps; flavoring.

geranyl formate (geraniol formate) $\text{HCOOC}_{10}\text{H}_{17}$.

Properties: Colorless liquid; b.p. 113°C (15 mm); sp. gr. 0.927 (20/4°C); rose-like odor; insoluble in water and glycerol; soluble in alcohol and ether. Occurs in several essential oils. Combustible; nontoxic.

Grade: F.C.C.

Uses: Perfumes and soaps; flavoring.

geranyl propionate (geraniol propionate)

$\text{C}_2\text{H}_5\text{COOC}_{10}\text{H}_{17}$.

Properties: Colorless liquid; rose-like odor; sp. gr. 0.896–0.913 (25°C); refractive index 1.4570–1.4650 (20°C); soluble in most oils; insoluble in glycerol. Combustible; nontoxic.

Grades: Technical; F.C.C.

Uses: Perfumery; flavoring.

germane. A germanium hydride of the general formula $\text{Ge}_n\text{H}_{2n+2}$. See germanium tetrahydride.

germanium Ge. Nonmetallic element of atomic number 32, atomic weight 72.59; valences 2, 4; group IVA of the periodic system.

Properties: Grayish-white metal; a p-type semiconductor; conductivity depends largely on added impurities. Sp. gr. 5.323; m.p. 937.4°C; b.p. 2830°C; oxidizes readily at 600–700°C; does not volatilize below 1350°C; hardness 6 on Mohs scale. Attacked by nitric acid and aqua regia; stable to water, acids, and alkalis in absence of dissolved oxygen. Nontoxic.

Derivation: Recovered from residues from refining of zinc and other sources, by heating in the presence of air and chlorine. It is also present in some coals and can be recovered from their combustion.

Occurrence: Missouri, Kansas, Oklahoma.

Method of purification: The chloride is distilled, and then hydrolyzed to the oxide, which is reduced by hydrogen to the metal. Zone-melting is used for final purification; single crystals are made by vaporization of germanium diiodide. The impurities in germanium are of controlling importance in its use in transistors. These are added to high-purity ger-

manium in trace amounts during growth of single crystals.

Grades: Transistor, i.e., impurities 1 part in 10^{10} .

Forms: Ingots; single crystals, pure or doped; powder.

Uses: Solid state electronic devices (transistors, diodes); semiconducting applications; brazing alloys; phosphors; gold and beryllium alloys.

germanium dichloride GeCl_2 . White powder; m.p. decomposes; decomposes in water; soluble in germanium tetrachloride; insoluble in alcohol, chloroform. Low toxicity.

germanium dioxide (germanium oxide) GeO_2 .

Properties: White powder; hexagonal, tetragonal, and amorphous.

Grades: Technical; semiconductor 99.999% pure.

Uses: Special glass mixtures; phosphors; transistors and diodes.

germanium monoxide GeO . Black solid; m.p. 710°C (sublimes); insoluble in water; soluble in oxidizing agents. Available commercially 99.999% pure. Low toxicity.

germanium potassium fluoride (potassium germanium fluoride) K_2GeF_6 .

Properties: White crystals; soluble in water (hot); insoluble in alcohol.

Grade: Technical.

Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

germanium telluride GeTe . M.p. 725°C. An efficient semiconductor.

Hazard: May be toxic.

germanium tetrachloride GeCl_4 .

Properties: Colorless liquid; sp. gr. 1.874 (25/25°C); f.p. -49.5°C (1 atm); b.p. 83.1°C; refractive index 1.464. Decomposes in water; insoluble in conc. HCl; soluble in carbon disulfide, chloroform, benzene, alcohol, and ether.

Derivation: Reaction of chlorine with elemental Ge.

Containers: Ampoules of Pyrex or quartz.

Use: Research.

germanium tetrahydride GeH_4 . Colorless gas; sp. gr. 3.43 g/l; f.p. -165°C ; b.p. -88°C ; decomp. at 350°C; insoluble in water; soluble in liquid ammonia; slightly soluble in hot hydrochloric acid.

Hazard: Highly toxic. Tolerance, 0.2 ppm in air.

germicide. See bactericide.

"Germ-I-Tol."TM Trademark for higher alkyl dimethyl benzyl ammonium chloride. Meets the requirements for benzalkonium chloride, U.S.P.

getter. See scavenger.

ghatti gum. Exudation from the stem of *Anogeissus latifolia*.

Properties: Colorless to pale yellow tears, rounded or vermiform. Almost tasteless and odorless; partially soluble in water. Can be solubilized by autoclaving. Nontoxic.

Uses: Thickener and protective colloid.

gibberellic acid $\text{C}_{19}\text{H}_{32}\text{O}_6$. A plant-growth-promoting hormone. It is a tetracyclic dihydroxylactonic acid. Properties: Crystals; m.p. 233–235°C; slightly soluble in water; soluble in methanol, ethanol, acetone. Soluble in aqueous solutions of sodium bicarbonate and sodium acetate.

Uses: Agriculture and horticulture; malting of barley with improved enzymatic characteristics.

gibberellin. A group of hormones, widely distributed in flowering plants, which promotes elongation of shoots and coleoptiles. They differ from auxins (q.v.) in not stimulating the growth of roots, and in various other properties. However, the presence of auxin appears to be necessary for gibberellins to function. All gibberellins have closely related structures, being weak acids and having a ring system containing double bonds.

See also gibberellic acid; plant growth regulator.

Gibbs, Josiah Willard (1839-1903). The father of modern thermodynamics. During his lifelong post as professor of mathematical physics at Yale, he stated the fundamental concepts embraced by the three laws of thermodynamics, especially the nature of entropy. A theorist rather than an experimenter, Gibbs was the first to expound with mathematical rigor the "relation between chemical, electrical and thermal energy and capacity for work." It has been said that through out his adult life, Gibbs did nothing but think. The results have established him as one of the foremost creative scientists in history. See also thermodynamics.

Gibbs-Duhem equation (GDE). An exact thermodynamic relation that permits computation of the changes of chemical potential for one component of a uniform mixture over a range of compositions, provided the changes of potential for each of the other components have been measured over the same range. For binary systems, a useful form of the equation in terms of mole fraction is

$$\left(\frac{\partial \mu_1}{\partial x_1} \right)_{P,T} = - \frac{x_2}{x_1} \left(\frac{\partial \mu_2}{\partial x_1} \right)_{P,T}$$

"Gibrel."¹²³ Trademark for compound for promoting plant growth; the potassium salt of gibberellic acid.

"Gib-Sol."⁵³⁰ Trademark for gibberellic acid.

"Gib-TAbs."⁵³⁰ Trademark for gibberellic acid.

giga-. Prefix meaning 10^9 units (symbol = G). 1 Gg = 1 gigagram = 10^9 grams.

gilsonite An asphaltic material, or solidified hydrocarbon, found only in Utah and Colorado. One of the purest (9.9%) natural bitumens (q.v.). Said to be the first solid hydrocarbon to be converted to gasoline.

Hazard: Moderately toxic; irritant; skin sensitizer.

Uses: Acid, alkali and waterproof coatings; black varnishes, lacquers, baking enamels and japans; wire-insulation compounds; linoleum and floor tile; paving; insulation; diluent in low-grade rubber compounds; a possible source of gasoline, fuel oil, and metallurgical coke.

See also asphalt; bitumen.

gin. An alcoholic beverage made by distilling alcohol through a mixture of herbs and berries (juniper, coriander, etc.) and adjusting to 85 to 100 proof. Flash point 90°F.

Hazard: Flammable; moderate fire risk. Slight irritant; intoxicant.

Girard's reagent.

"P." Carboxymethylpyridinium chloride hydrazide; acethydrazidepyridinium chloride.

$C_5H_5NCICH_2CONHNH_2$.

"T." Carboxymethyltrimethyl ammonium chloride

hydrazide; trimethylacethydrazide ammonium chloride. $(CH_3)_3NCICH_2CONHNH_2$.

Properties: White to faintly pinkish crystals with little or no odor; m.p. 190-200°C; soluble in water; insoluble in oils. "T" is hygroscopic.

Uses: Separation of aldehydes and ketones from natural oily or fatty materials; extraction of hormones.

Girbotol absorption (amine absorption). A process for the removal of hydrogen sulfide or carbon dioxide from a gaseous mixture. An organic amine (ethanolamine or diethanolamine, which are basic) is allowed to flow down a tortuous path through a tower where it is contacted by and absorbs (acidic) hydrogen sulfide or carbon dioxide from the gas to be purified as it moves up the tower. The amine, contaminated with these products, is then sent from the bottom of the tower to a steam stripper, where it flows countercurrent to steam, which strips the hydrogen sulfide or carbon dioxide from it. The amine is then returned to the top of the tower. The process is widely used in the petroleum industry for purifying refinery and natural gases and for recovery of hydrogen sulfide for sulfur manufacture. Removal of carbon dioxide from gases is usually done with monoethanolamine.

"Giv-Tan F."¹² Trademark for 2-ethoxyethyl para-methoxycinnamate.

glacial. A term applied to a number of acids, e.g., acetic and phosphoric, which have a freezing point slightly below room temperature when in a highly pure state. For example, glacial acetic acid is 99.8% pure and crystallizes at 62°F.

glance. A mineralogical term meaning brilliant or lustrous, used to describe hard, brittle materials that exhibit a bright, reflecting surface when fractured. Examples of such materials are hard asphalts (glance pitch) and ores of certain metals such as lead glance (galena).

glass. A ceramic material consisting of a uniformly dispersed mixture of silica (sand) (75%), soda ash (20%), and lime (5%), often combined with such metallic oxides as those of calcium, lead, lithium, cerium, etc., depending on the specific properties desired. The blend (or "melt") is heated to fusion temperature (about 2000°F) and then gradually cooled (annealed) to a rigid, friable state, often referred to as vitreous. Technically, glass is an amorphous, undercooled liquid of extremely high viscosity which has all the appearances of a solid. It has almost 100% elastic recovery. See also glass, optical. Properties: (soda-lime glass) Lowest electrical conductivity of any common material (less than 10^{-10} mho/cm). Low thermal conductivity. High tensile and structural strength. Relatively impermeable to gases. Inert to all chemicals except hydrofluoric, fluosilicic, and phosphoric acids and hot, strong alkaline solutions. Continuous upper use temperature about 250°F, but may be higher, depending on composition. Noncombustible and nontoxic. Good thermal insulator in fibrous form. Molten glass is extrudable into extremely fine filaments. Glass is almost opaque to ultraviolet radiation; in the absence of added colorant it transmits 95 to 98% of light to which it is exposed.

Occurrence: Natural glass is rare, but exists in the form of obsidian (q.v.) in areas of volcanic activity and meteor strikes. Excellent sand for glass-making occurs in Virginia (James River), Pennsylvania, Massachusetts, New Jersey, West Virginia, Illinois

and Maryland; also in southern Germany and Czechoslovakia.

Forms available: Plate; sheet; fiber; filament; fabric; rods; tubing; pipe; powder; beads; flakes; hollow spheres. See also sodium silicate.

Uses: Windows, structural building blocks, chemical reaction equipment, pumps and piping, vacuum tubes, light bulbs, glass fibers (q.v.), yarns and fabrics, containers, optical equipment. Minute glass spheres with partial vacuum interior and treated exterior are available for compounding with resins for use in deep-sea floats, potting compounds and other composites. See also following entries.

glass, borosilicate. See glass, heat-resistant.

glass-ceramic. A devitrified or crystallized form of glass whose properties can be made to vary over a wide range.

Properties: Sp. gr. 2.5; rupture modulus up to 50,000 psi; thermal shock resistance 900°C; upper continuous use temperature 700°C. Glass-ceramics lie between borosilicate glasses and fused silica in high-temperature capability.

Derivation: A standard glass formula, to which a nucleating agent such as titania has been added, is melted, rolled into sheet, and cooled. It is then heated to a temperature at which nucleation occurs, causing formation of crystals. See also nucleation.

Uses: Range and stove tops; laboratory bench tops; architectural panels; restaurant heating and warming equipment; telescope mirrors.

See also "Pyroceram"; "Cer-vit."

glass electrode. See electrode, glass.

glass enamel. A finely ground flux, basically lead borosilicate, intimately blended with colored ceramic pigments. Different grades give characteristics of acid resistance, alkali resistance, sulfide resistance, or low lead release to meet requirements for various uses. Firing range 1000–1400°F (540–760°C).

Uses: For fired-on labels and decorations on glassware, tumblers, milk bottles, beverage bottles, glass containers, illuminating ware, architectural glass, and signs.

See also porcelain enamel.

glass fiber. Generic name for a manufactured fiber in which the fiber-forming substance is glass (Federal Trade Commission).

Properties: Tensile strength 15 g per denier; elongation 3 to 4%; sp. gr. 2.54; moisture regain, none; loses strength above 600°F, softens about 1500°F. Non-combustible. See also under glass.

Derivation: Molten glass is extruded at high speed through extremely small orifices.

Uses: Thermal, acoustic, and electrical insulation (coarse fibers in bats or sheets); decorative and utility fabrics such as drapes, curtains, table linen, carpet backing, tenting, etc.; tire cord, as belt between tread and carcass; filter medium; reinforced plastics (q.v.); light transmission for communication signals; reinforcement of cement products for construction use.

glass, heat-resistant. (1) A soda-lime glass containing about 5% boric oxide, which lowers the viscosity of the silica without increasing its thermal expansion. Such glasses (known as borosilicates) have a very low expansion coefficient and high softening point (about 1100°F). Tensile strength is about 10,000 psi.

Continuous use temperature 900°F. Transmits ultraviolet light in higher wavelengths, and is used in "sunlight" lamps and similar equipment for this reason. See also "Pyrex."

(2) A pure silica glass trademarked "Vycor" (q.v.) which softens at about 2700°F. See also silica, fused.

glassine. A thin, transparent, and very flexible paper obtained by excessive beating of the pulp; it may contain an admixture of urea-formaldehyde to improve strength. Use is for packaging, dust covers for books, general household purposes.

glass, optical. Glasses intended for vision-correcting and such applications as lenses for cameras, microscopes, and other instruments; must be of extremely high quality and uniformity to meet requirements for refractive index and light dispersion. Optical glass may be either crown (lime) or flint (lead). Lead oxide is a major ingredient of flint glass, imparting high refractive index and dispersion, as well as surface brilliance. Flint glasses are also used in vacuum tubes and electrical equipment. Many special ingredients are used in both crown and flint glasses for specific refractivity and dispersion properties.

glass, photochromic. A glass that changes color on exposure to light and returns to its original color when the light has been removed. One type is a silicate glass containing dispersed crystals of colloidal silver halide which is precipitated within the melt during cooling. Alkali borosilicates are the most suitable types of glasses for this purpose. Photochromic glasses are used in variable-tint prescription lenses, which darken in sunlight and return to original clearness indoors (85% light transmission when clear; 45% in sunlight).

glass, photosensitive. A glass containing a small amount of a photosensitive substance, such as a gold, silver, or copper compound. When ultraviolet light is passed through a photographic negative onto the surface of this glass, a latent image is formed within the glass, which is converted to a visible image made up of tiny metal particles when the glass is heated. In a special type of photosensitive glass (photosensitive opal), the metal particles of the photographic image within the glass serve as nuclei for the growth of nonmetallic crystals; crystal growth is confined to the area of the image. These crystalline areas are dissolved much more rapidly than the adjacent glass by hydrofluoric acid. Thus the glass can be formed into intricate shapes without the use of mechanical tools.

glass, plate. Plate glass has the same composition as window glass (soda-lime-silica), differing from it only in method of manufacture. These differences are primarily (1) the longer time of annealing (q.v.), (three or four days) which eliminates the distortion and strain effects of rapid cooling, and (2) intensive grinding and polishing, which removes local imperfections and produces a bright, highly reflecting finish.

glass, ruby. A deep-red glass made by incorporating colloidal gold in the silicate mixture. It is used chiefly in the decorative arts.

glass, safety. See safety glass.

glass transition temperature (T_g). The temperature at which an amorphous material (such as glass or a

high polymer) changes from a brittle, vitreous state to a plastic state. Many high polymers, such as acrylics and their derivatives, have this transition point, which is related to the number of carbon atoms in the ester group. The T_g of glass depends on its composition and extent of annealing.

glass, water. See sodium silicate.

"GlaSteel."⁵²² Trademark for an engineering laminate formed by spraying a slurry of powdered glass onto a base of mild steel, followed by high-temperature firing. A chemical reaction takes place during the firing between the glass and steel, forming a chemical bond which locks the pieces firmly together.

Uses: Corrosion-resistant process equipment; piping; heat exchangers; pumps and valves.

Glauber's salt. See sodium sulfate decahydrate.

glaucaurubin $C_{25}H_{36}O_{10}$. Crystals; decomposing at 250–255°C; slightly soluble in water. Obtained from the meal from *Simaruba glauca* seeds. Listed in N.D. Used in medicine.

glauconite $K_2(Mg, Fe)_2Al_6(Si_4O_{10})_3(OH)_{12}$. A natural silicate of potassium, aluminum, iron, and magnesium, found in greensands, and other sedimentary rocks. Color green, luster earthy; sp. gr. 2.3.

Occurrence: New Jersey, Virginia.

Uses: Water softener; foundry molds; fertilizer.

glaze. A mixture similar to porcelain enamel, applied to a ceramic substrate. It may refer to (1) a vitreous coating on pottery or enamelware; (2) the mixed dry powders of the batch to be used for the coating; or (3) a water suspension of these materials (wet glaze). Glazes must be low in sodium, and are usually mixtures of silicates and flint, lead compounds, boric acid, calcium carbonate, etc. See also frit; porcelain enamel.

glaze stain. Finely ground calcined oxide of cobalt, copper, iron and manganese used for coloring ceramic glazes.

GLC. Abbreviation for gas-liquid chromatography. See gas chromatography.

gliadin (prolamin). A group of simple vegetable proteins or globulins found in gluten, the protein of wheat, rye and other grains. Wheat gliadin has the composition: 52.7% C, 17.7% N, 21.7% O, 6.9% H, 1.0% S. It is composed of 18 amino acids, 40% being glutamic acid. Insoluble in water, soluble in 70–90% alcohol, soluble in dilute acid and in alkali.

Uses: Chemical synthesis of spinal anesthetics; pharmaceutical preparations.

"Glidco" Cordage Tars.²⁹⁶ Trademark for a series of tars derived from the distillation and decomposition of oleoresinous southern pine.

Use: Coating and impregnation of paper, twine, fibers, oakum, rope and nets.

"Glidco" Dipentene-300.²⁹⁶ Trademark for commercial cut of terpene hydrocarbons with range similar to that of *d*-limonene.

Uses: Paints; rubber reclaiming agent; resin manufacturing.

"Glidco" Terpene-S.²⁹⁶ Trademark for a terpene cut similar to pine oil containing terpineol, plus other monocyclic terpene alcohols and terpene hydrocarbons. Typical purity of 66% as terpene alcohols.

"Glidco" Terpineol-350.²⁹⁶ Trademark for a water-white viscous liquid with a characteristic woody lilac odor. Contains a minimum alcohol content as

terpineol of 97% consisting principally of the alpha isomer. Used in the preparation of essential oils; industrial and soap perfumes.

"Globar."²⁸⁰ Trademark for silicon carbide heating elements and resistors and accessories.

Properties: Elements have a working temperature up to 2750°F which can be extended to 3000°F for short periods; low coefficient of expansion; structure not affected by rapid heating and quick cooling; resistance remains practically constant above 900°F.

Uses: Electric resistors and heating elements; terminals and other accessories for electric heating elements; electric heating appliances; electric furnaces.

globulin. (1) Any of a group of proteins synthesized by the body when invaded by infective organisms. They are coagulated by heat, insoluble in water, soluble in dilute solutions of salts, strong acids and strong alkalis. Enzymes and acids cause hydrolysis to amino acids as the only products. Examples are immune serum or gamma globulins in blood, myosin in muscle. The blood globulins are used in immunizing against specific diseases and in medical research. The Gamma globulin molecule is reported to consist of 19,996 atoms associated in 1320 amino acid units.

(2) A protein occurring naturally in wheat and other cereal grains.

"Gloria."⁴⁵ Trademark for white mineral oil, U.S.P. Sp. gr. 0.875–0.885 (60°F).

Uses: Pharmaceutical and cosmetic formulations; plastics; tobacco; paper; animal husbandry.

"Gloval."³⁰⁹ Trademark for a sperm and mineral oil blend; used in tanning industry.

Glu Abbreviation for glutamic acid.

glucagon (hyperglycemic-glycogenolytic factor; HG-factor; HGF). Produced by the alpha cells of the islands of Langerhans and also by the gastric mucosa. It is opposite in effect to insulin. It appears to be a straight-chain polypeptide with a molecular weight of about 3500. Small amounts have been detected in commercial insulin preparations.

Grade: U.S.P.

Uses: Medicine; biochemical research.

"Glucarine B."⁷³ Trademark for glycol carbohydrate complex.

Properties: Water-white, syrupy, clear fluid. Soluble in water, alcohols, glycols and glycerol.

Uses: Replaces glycerin where a cheaper, colorless product is desired, especially for cosmetic and technical purposes.

glucose. See maltase.

gluconic acid (glyconic acid; glycogenic acid)

$CH_2OH(CHOH)_4COOH$.

Properties: Light brown syrupy liquid with mild taste. Soluble in water and alcohol. Nontoxic.

Derivation: Bacterial, chemical, or electrochemical oxidation of dextrose. It is the chief acid in honey.

Grades: Technical, 50% solution.

Containers: Barrels, kegs, carboys, tank cars.

Uses: Pharmaceutical and food products; cleaning and pickling metals; sequestrant; cleansers for bottle washing; paint strippers; alkaline derusters.

glucono-delta-lactone $CH_2OH\overline{CH(CHOH)_4}C(O)O$.

Properties: White crystals. M.p. 155°C; b.p. (decomposes); readily soluble in water, slightly soluble in alcohol. Nontoxic.

Derivation: From gluconic acid.

Grade: F.C.C.

Uses: Acid; leavening agent; sequestrant.

D(+)-glucosamine $\text{CH}_2\text{OH}(\text{CHOH})_3\text{CHNH}_2\text{CHO}$.

Properties: Colorless needles; m.p. 110°C (dec); very soluble in water; slightly soluble in methanol and ethanol; insoluble in ether and chloroform.

Use: Biochemical research.

glucose (dextrose; grape sugar; corn sugar) $\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals or white granular powder; odorless; sweet taste. Sp. gr. 1.544; m.p. 146°C ; soluble in water; slightly soluble in alcohol. It has the D (right-handed) configuration and is dextrorotatory. Combustible. Nontoxic.

Occurrence: Formed in plants by photosynthesis; also in the blood.

Derivation: Hydrolysis of corn starch with acids or enzymes; a component of invert sugar and glucose syrup. In a recently (1974) discovered process, glucose has been obtained from cellulose by enzyme hydrolysis.

Grades: Technical; U.S.P.; anhydrous; hydrated.

Uses: Confectionery; infant foods; medicine; brewing and wine-making; intermediate; caramel coloring; baking and canning.

See also glucose syrup; invert sugar.

glucose oxidase. An enzyme commercially available in different grades for the removal of excess glucose or oxygen.

Uses: Food preservative; analytical reagent for glucose.

glucose 1-phosphate (glucose 1-phosphoric acid; Cori ester) $\text{C}_6\text{H}_{11}\text{O}_5 \cdot \text{H}_2\text{PO}_4$. An intermediate in carbohydrate metabolism.

glucose 6-phosphate (glucose 6-phosphoric acid; Robison ester) $\text{C}_6\text{H}_{11}\text{O}_5 \cdot \text{H}_2\text{PO}_4$. An intermediate in carbohydrate metabolism, usually as the barium or dipotassium salt, which are water-soluble.

glucose 1-phosphoric acid. See glucose 1-phosphate.

glucose syrup (corn syrup). A mixture of D-glucose, maltose and maltodextrins made by hydrolysis of cornstarch by the action of acids or enzymes. The degree of conversion of the starch varies, with consequent effect on the dextrose equivalent (D.E.) or reducing power of the syrup. Its primary uses are in the food industry as a sweetener (high D.E.) or as thickeners or bodying agents in soft drinks (low D.E.). See also glucose.

alpha-glucosidase. See maltase.

beta-glucosidase. See emulsin.

glucosides. See glycosides.

glucosulfone sodium $\text{C}_{24}\text{H}_{34}\text{N}_2\text{O}_{18}\text{S}_3\text{Na}_2$. para, para'-Diaminodiphenylsulfone-N,N'-di(dextrose sodium sulfonate). Available only in a mixture containing 11.5% of dextrose.

Properties: White to faintly yellow, odorless, sweet, amorphous solid. Freely soluble in water.

Use: Medicine.

D(+)-glucuronic acid $\text{COOH}(\text{CHOH})_4\text{CHO}$. A widely distributed substance in both plants and animals; usually occurs as part of a larger molecule as in various gums, or combined with phenols or alcohols.

Properties: Exhibits mutarotation. The beta form has m.p. 165°C . Soluble in water and alcohol. Nontoxic.

Derivation: From gum acacia.

Uses: Biochemical research; medicine.

glucuronolactone $\text{C}_6\text{H}_8\text{O}_6$. The gamma lactone of glucuronic acid. Found in plant gums and animal connective tissues.

Properties: Colorless, odorless, white powder. Sp. gr. 1.76 ($30/4^\circ\text{C}$); m.p. $172\text{--}178^\circ\text{C}$; soluble in water. Nontoxic.

Derivation: From glucuronic acid.

Uses: Growth factor; medicine; pharmaceutical intermediate.

glue. A colloidal suspension of various proteinaceous materials in water. Most familiar are those derived by boiling animal hides, tendons, or bones which are high in collagen. Chief sources are slaughterhouse wastes and fish scraps. Other animal-derived glues are made from casein (milk) and blood. The most important vegetable glue is made from soybean protein. Combustible in solid form. Nontoxic, but inedible. See also adhesive, fish glue, collagen, gelatin.

Containers: Bags (40–500 jelly grams); carlots.

"Gluflex."¹⁵⁷ Trademark for a clear, noncrystallizing product consisting of sucrose, levulose, dextrose, sodium bisulfite and water, and having a solids content of 181.5%.

Uses: Animal glues; gummed tapes.

"Glueglis." Trademark for a composition containing chiefly glue and glycerol, used in printing press rollers. Has soft, rubbery consistency but is easily decomposed by heat.

gluside. See saccharin.

glutamic acid (alpha-aminoglutaric acid; 2-amino pentanedioic acid) $\text{COOH}(\text{CH}_2)_2\text{CH}(\text{NH}_2)\text{COOH}$. A nonessential amino acid. The naturally occurring form is L(+)-glutamic acid. Nontoxic.

Properties:

DL-glutamic acid; (synthetic racemic mixture) crystals; m.p. $225\text{--}227^\circ\text{C}$ (dec); slightly soluble in ether, alcohol, and petroleum ether; sp. gr. 1.4601 ($20/4^\circ\text{C}$). D(–)-glutamic acid: leaflets from water; m.p. $247\text{--}249^\circ\text{C}$ (dec); sp. gr. 1.538 ($20/4^\circ\text{C}$).

L(+)-glutamic acid: crystals; sublimes at 200°C ; decomposes at $247\text{--}249^\circ\text{C}$; nearly soluble in ether, acetone, cold glacial acetic acid; insoluble in ethyl alcohol and methanol; sp. gr. 1.538 ($20/4^\circ\text{C}$). Specific rotation (25°C) $+37$ to $+38.9^\circ$. Available commercially.

Derivation: Hydrolysis of vegetable protein (e.g., beet sugar waste, wheat gluten); organic synthesis based on acrylonitrile. It comprises 40% of the gliadin in wheat gluten.

Grade: F.C.C. (L-form).

Containers: Fiber drums.

Uses: Medicine; biochemical research; salt substitute; flavor enhancer; synthetic leather.

See also sodium glutamate.

glutamic acid hydrochloride

$\text{COOH}(\text{CH}_2)_2\text{CH}(\text{NH}_2)\text{COOH} \cdot \text{HCl}$.

Properties: White crystalline powder; sp. gr. 1.525; m.p. $202\text{--}213^\circ\text{C}$ (dec); specific rotation (25°C) $+23.5^\circ$ to $+25.5^\circ$. Very soluble in water, liberating hydrochloric acid; almost insoluble in alcohol and ether.

Derivation: Hydrolysis of gluten; organic synthesis.

Grades: N.F.; F.C.C.

Use: Medicine; salt substitute; flavor enhancer.

glutamine $\text{H}_2\text{NC}(\text{O})(\text{CH}_2)_2\text{CH}(\text{NH}_2)\text{COOH}$. (2-Amino-4-carbamoylbutanoic acid). A nonessential amino acid. Both the L- and DL- forms are available.

Properties: White, crystalline powder; soluble in water; insoluble in most organic solvents. Should be kept dry and refrigerated. M.p. (L-form) 184–185°C (dec); (DL-form) 176°C. Nontoxic. Its presence in wheat gluten contributes to the elastic properties of flour by hydrogen bonding and disulfide cross-linking.

Derivation: Action of enzymes on gluten; from beet roots; constituent of many proteins.

Uses: Medicine; culture media; biochemical research; feed additive.

gamma-glutamylcysteinylglycine. See glutathione.

"Glutan H-C-L."³¹⁵ Trademark for glutamic acid hydrochloride (q.v.).

glutaraldehyde $\text{OHC}(\text{CH}_2)_3\text{CHO}$.

Properties: Liquid; sp. gr. 0.72; b.p. 188°C (decomposes); f.p. -14°C; vapor pressure 17 mm (20°C); soluble in water and alcohol. No flash point. Non-flammable.

Grades: 99%; 50% biological solution; 25% solution.

Hazard: Moderately toxic and irritant.

Uses: Intermediate; fixative for tissues; for cross-linking protein and polyhydroxy materials; tanning of soft leathers.

glutaric acid (n-pyrotartaric acid; pentanedioic acid) $\text{COOH}(\text{CH}_2)_3\text{COOH}$.

Properties: Colorless crystals; m.p. 97°C; refractive index (n 106/D) 1.419; b.p. 302–304°C; soluble in water, alcohol, and ether. Nontoxic.

Derivation: From cyclopentanone.

Use: Organic synthesis.

glutaric anhydride (pentanedioic acid anhydride) $\text{CH}_2(\text{CH}_2\text{CO})_2\text{O}$.

Properties: Solid. M.p. 56.5°C; b.p. 303°C. Soluble in benzene and toluene; soluble in water on complete hydrolysis.

Hazard: Moderately toxic and irritant.

Uses: Plasticizers; resin; lubricant; adhesive synthesis; dyes and pharmaceuticals.

glutaronitrile (trimethylenedicyanide; pentanedinitrile) $\text{NC}(\text{CH}_2)_3\text{CN}$.

Properties: Colorless to straw-colored viscous liquid; b.p. 144–146°C (13 mm); sp. gr. 0.989; soluble in water and alcohol, insoluble in ether and carbon disulfide. Combustible.

Hazard: Moderately toxic.

Use: Chemical intermediate.

glutathione (gamma-glutamylcysteinylglycine) $\text{C}_{10}\text{H}_{17}\text{O}_6\text{N}_3\text{S}$. A universal component of the living cell. Contains glutamic acid, cysteine, and glycine.

These are chemically bound but can be obtained by hydrolysis.

Properties: White crystalline powder; odorless; m.p. 190–192°C; mild sour taste; soluble in water; insoluble in alcohol. Nontoxic.

Use: Nutritional and metabolic research.

gluten. A mixture of many proteins in which gliadin, glutenin, globulin and albumin predominate; it occurs in highest percentage in wheat (Manitoba wheat contains about 12%) and also to some extent in other cereal grains, usually associated with starch. It comprises 18 amino acids. Gluten is insoluble in water and is hydrophilic. Its specific adaptability to bread making is due to its elastic, cohesive nature that enables it to retain the bubbles of carbon dioxide

evolved by leavening agents; this also imparts to doughs their characteristic dilatant properties. This behavior is due to disulfide crosslinks and hydrogen bonding between the proteins or their constituent amino acids.

Containers: Drums and cans.

Uses: Special breakfast foods and other cereals and foods; cattle food; adhesives; production of certain amino acids.

glutenin. One of the proteins present in wheat flour in substantial percentages. It is composed of 18 amino acids.

glutithimide. N.F. name for 2-ethyl-2-phenylglutarimide.

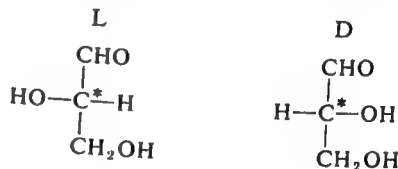

Gly Abbreviation for glycine.

"Glycamide."¹²³ Trademark for glycarbylamide (q.v.).

glycarbylamide (4,5-imidazoledicarboxamide) $\text{C}_3\text{H}_2\text{N}_2(\text{CONH}_2)_2$. White powder, melting above 360°C; insoluble in water. A coccidiostat for chickens.

glyceraldehyde (glyceric aldehyde)

$\text{HOCH}_2\text{CHOHCHO}$. Isomeric with dihydroxyacetone. It is produced by the oxidation of sugars in the body. As the simplest aldose, the conformation of D and L-glyceraldehydes has been designated the reference standard for D- and L- carbohydrates and derivatives.

In these isomers the central carbon atom (C*) is asymmetric.

Properties: (DL-glyceraldehyde) Tasteless crystals from alcohol-ether mixture; m.p. 145°C; insoluble in benzene, petroleum ether, pentane. Nontoxic.

Grades: 40% aqueous solution.

Uses: Biochemical research; intermediate; nutrition; preparation of polyesters, adhesives; cellulose modifier; leather tanning.

See also asymmetry; optical isomer.

glyceride. An ester of glycerol and fatty acids in which one or more of the hydroxyl groups of the glycerol have been replaced by acid radicals. The latter may be identical or different, so that the glyceride may contain up to three different acid groups. Glycerides can be made synthetically. The most common are based on fatty acids which occur naturally in oils and fats. See also mono-, di-, and triglyceride.

glycerin. See glycerol.

glycerin carbonate (hydroxymethylethylene carbonate)

Properties: Pale yellow, odorless, hygroscopic liquid. Boiling range 125–130°C (0.1–0.2 mm); freezing point, supercools to a glass; sp. gr. 1.4000 (20/4°C); refractive index (n 20/D) 1.4580; flashpoint 415°F. Miscible with water, alcohol, ether; soluble in ethylene dichloride; insoluble in carbon tetrachloride, benzene, and aliphatic hydrocarbons. Combustible; nontoxic.

Grades: Technical.

Uses: Solvent; intermediate.

glycerol (glycerin; glycol alcohol; 1, 2, 3-propanetriol) $\text{C}_3\text{H}_8(\text{OH})_3$. A trihydric (polyhydric) alcohol.

Properties: Clear, colorless, odorless, syrupy liquid; sweet taste; hygroscopic; sp. gr. (anhydrous 1.2653; (U. S. P.) greater than 1.249 (25/25°C); (dynamite) 1.2620; m.p. 18°C; b.p. 290°C; soluble in water and alcohol (aqueous solutions are neutral); insoluble in ether; benzene and chloroform and in fixed and volatile oils. Flash point 320°F. Combustible; low toxicity. Autoignition temp. 739°F.

Derivation: (1) By-product of soap manufacture; (2) from propylene and chlorine to form allyl chloride, which is converted to the dichlorohydrin with hypochlorous acid; this is then saponified to glycerol with caustic solution; (3) isomerization of propylene oxide to allyl alcohol, which is reacted with peracetic acid; the resulting glycidol is hydrolyzed to glycerol; (4) hydrogenation of carbohydrates with nickel catalyst; (5) from acrolein and hydrogen peroxide.

Method of purification: Redistillation; ion-exchange techniques.

Grades: U.S.P., C. P. (pharmaceutical and commercial, where highest grade is required); saponification, soap lye, crude yellow distilled (for commercial purposes where color and extreme purity are not factors); high gravity or dynamite (dehydrated to 99.8–99.9% purity); natural; synthetic; F.C.C.

Containers: Drums, tank cars.

Uses: Alkyd resins; explosives; ester gums; pharmaceuticals; perfumery; plasticizer for regenerated cellulose; cosmetics; foodstuffs, conditioning tobacco; liqueurs; solvent; printer's ink rolls; polyurethane polyols; emulsifying agent; rubber stamp and copying inks; binder for cements and mixes; paper coatings and finishes; special soaps; lubricant and softener; bacteriostat; penetrant; hydraulic fluid; humectant.

glycerol boriborate. Pale yellow liquid obtained by heating glycerin, sodium borate and boric acid. Composition varies. Soluble in cold water, absolute alcohol, other alcohols, glycerin. Used as adhesive, binder, fabric softener, fire retardant on fabrics.

glycerol dichlorohydrin. See alpha-dichlorohydrin.

glycerol 1,3-distearate (glyceryl 1,3-distearate)
 $\text{CH}_3(\text{CH}_2)_{16}\text{COOCH}_2\text{CH}(\text{OH})\text{CH}_2\text{OOC}(\text{CH}_2)_{16}\text{CH}_3$.
 Properties: Solid; m.p. 29.1°C. Very slightly soluble in cold alcohol and ether; soluble in hot organic solvents.

glycerol monolaurate (glyceryl monolaurate)
 $\text{C}_{11}\text{H}_{23}\text{COOCH}_2\text{CHOHCH}_2\text{OH}$.

Properties: Cream-colored paste; faint odor. Dispersible in water; soluble in methyl and ethyl alcohols, toluene, naphtha, mineral oil, cottonseed oil, ethyl acetate. M.p. 23–27°C; sp. gr. 0.98; F. F. A. less than 2.5%; iodine value 6–8; pH 8.0–8.6 (25°C) (5% aqueous dispersion). Combustible; nontoxic.

Derivation: See monoglyceride.

Grades: Edible; technical.

Uses: Emulsifying and dispersing agent for food products, oils, waxes and solvents; antifoaming agent; dry-cleaning soap base.

glycerol monooleate (glyceryl monooleate)
 $\text{C}_{17}\text{H}_{33}\text{COOCH}_2\text{CHOHCH}_2\text{OH}$.

Properties: Yellow oil or soft solid; sp. gr. 0.95; m.p. 14–19°C, depending on purity; iodine value 65–80; insoluble in water; somewhat soluble in alcohol and most organic solvents. Combustible; nontoxic.

Derivation: See monoglyceride.

Grades: Edible; technical.

Uses: Foods, pharmaceuticals and cosmetics; preventive oils, textile finishing; vinyl light stabilizers; odorless base paints; flavoring.

glycerol monoricinoleate (glyceryl monoricinoleate)
 $\text{C}_6\text{H}_{13}\text{CHOHC}_{10}\text{H}_{18}\text{COOCH}_2\text{CHOHCH}_2\text{OH}$.

Properties: Yellow liquid; sp. gr. 1.01; m.p. <–5°C; iodine value 65–70; dispersible in water; soluble in most organic solvents. Combustible.

Derivation: See monoglyceride.

Uses: Non-drying emulsifying agent; solvent plasticizer; in polishes, in cosmetics, in textile, paper and leather processing; low-temperature lubricant. Stabilizes latex paints against breakdown due to repeated freeze-thaws.

glycerol monostearate (GMS; glyceryl monostearate; monostearin) $(\text{C}_{17}\text{H}_{35})\text{COOCH}_2\text{CHOHCH}_2\text{OH}$.

Properties: Pure white or cream-colored, wax-like solid with faint odor, and faint, agreeable taste. Affected by light. M.p. 58–59°C (capillary tube); sp. gr. 0.97; F.F.A. less than 5%; iodine value 3–4; dispersible in hot water. Soluble (hot) in alcohol, oils and hydrocarbons. Combustible; nontoxic.

Derivation: See monoglyceride.

Grades: Edible; cosmetic; N. F.

Uses: Thickening and emulsifying agent for margarine, shortenings and other food products; flavoring; emulsifying agent for oils, waxes and solvents; protective coating for hygroscopic powders; cosmetics; opacifier; detackifier; resin lubricant.

glycerol phthalate. See glyceryl phthalate.

glycerol tributurate. See glyceryl tributurate.

glycerol tripropionate. See glyceryl tripropionate.

glycerol tristearate. See stearin.

glycerophosphoric acid $\text{C}_3\text{H}_5(\text{OH})_2\text{H}_2\text{PO}_4$.

Properties: Colorless, odorless liquid. Soluble in water and alcohol. Sp. gr. 1.60; f.p. –20°C. Combustible.

Derivation: Interaction of glycerol and phosphoric acid.

Uses: Medicine; manufacture of glycerophosphates.

glyceryl abietate. An ester gum used as additive in citrus-flavored beverages.

glyceryl para-aminobenzoate. See "Escalol 106."

glyceryl alpha-chlorohydrin. See chlorohydrin.

glyceryl diacetate. See diacetin.

glyceryl 1,3-distearate. See glycerol 1,3-distearate.

glyceryl ditolyl ether. See dicresyl glyceryl ether.

glyceryl monoacetate. See acetin.

glyceryl monolaurate. See glycerol monolaurate.

glyceryl monooleate. See glycerol monooleate.

glyceryl monoricinoleate. See glycerol monoricinoleate.

glyceryl monostearate. See glycerol monostearate.

glyceryl phthalate (glycerol phthalate).

Properties: Water-white, solid resin. Insoluble in water. Soluble (hot) in methyl and ethyl alcohols, acetone, ethyl acetate. Partly soluble in toluene, naphtha. Sp. gr. 1.29; saponification value 605–615; acid value 300–315; softening point about 67°C.

Grade: Technical.

Uses: Varnishes, lacquers, etc. See also alkyd resin.

glyceryl ricinoleate. See glyceryl triricinoleate.

glyceryl triacetate. See triacetin.

glyceryl tri-(12-acetoxystearate) (castor oil, acetylated and hydrogenated) $C_3H_5(OOCC_{17}H_{33}OCOCH_3)_3$.

Properties: Clear, pale yellow, oily liquid; mild odor; soluble in most organic solvents; insoluble in water. Sp. gr. 0.955 (25/25°C); saponification value 298; iodine value 3; solidifies at 4°C. Combustible; low toxicity.

Derivation: Hydrogenation of acetylated castor oil.

Grade: Technical.

Containers: 5-gal cans; 55-gal drums; tank cars.

Uses: Plasticizer for nitrocellulose, ethylcellulose and polyvinyl chloride; lubricants; protective coatings.

glyceryl tri-(12-acetylricinoleate) (castor oil, acetylated) $C_3H_5(OOCC_{17}H_{33}OCOCH_3)_3$.

Properties: Clear, pale yellow, oily liquid; mild odor; soluble in most organic liquids; insoluble in water. Sp. gr. 0.967 (25/25°C); saponification value 300; iodine value 76; solidifies at -40°C. Combustible; low toxicity.

Grade: Technical.

Derivation: Acetylation of castor oil.

Containers: 5-gal cans; 55-gal drums; tank cars.

Uses: Plasticizer for nitrocellulose, ethylcellulose and polyvinyl chloride; lubricants; protective coatings.

glyceryl tributyrate (tributyrin; butyrin; glycerol tributyrate) $C_3H_5(OCOC_3H_7)_3$.

Properties: Colorless, oily liquid; sp. gr. 1.035 (20°C); refractive index (20°C) 1.4359; b.p. 315°C; solubility in water 0.010%; soluble in alcohol and ether. Combustible; low toxicity.

Containers: Drums.

Grades: Technical; F.C.C.

Uses: Plasticizer; flavoring.

glyceryl tri(12-hydroxystearate) (castor oil, hydrogenated) $C_3H_5(OOCC_{17}H_{33}OH)_3$. Glyceryl triricinoleate in which hydrogen has saturated the ricinoleic groups.

Properties: Hard, brittle wax-like solid, yellowish to milk-white in color. M.p. 86-88°C; sp. gr. (100/25°C) 0.899.

Uses: Lubricants; heavy-metal soaps; waxes; plasticizers, cosmetics; chemical intermediate. The lithium compound is used in high-temperature greases.

glyceryl trinitrate. See nitroglycerin.

glyceryl trioleate. See olein.

glyceryl tripalmitate. See tripalmitin.

glyceryl tripropionate (glycerol tripropionate; tripropionin) $C_3H_5(OCOC_2H_5)_3$.

Properties: Solid; sp. gr. (20°C) 1.078; refractive index (20°C) 1.431; b.p. (20 mm) 177-182°C; f.p. less than -50°C; solubility in water, 0.313% of weight; soluble in alcohol.

Use: Plasticizer.

glyceryl triricinoleate (glyceryl ricinoleate)

$C_3H_5(OOCC_{17}H_{33}OH)_3$. The triglyceride of ricinoleic acid. It constitutes about 80% of castor oil.

Properties: Light amber oily liquid.

Use: Emulsifying agent.

glyceryl tristearate. See stearin.

glycidol (2,3-epoxy-1-propanol)  $CH_2OHCHCH_2$. An epoxide.

Properties: Colorless liquid; b.p. 162°C; soluble in water, alcohol and ether. Combustible. Sp. gr. 1.12.

Derivation: Treatment of monochlorohydrin with

bases; reaction product of allyl alcohol and peracetic acid.

Hazard: Moderately toxic. Tolerance, 50 ppm in air.

Uses: Stabilizer for natural oils; demulsifier; dye-leveling agent; stabilizer for vinyl polymers.

gamma-glycidoxypolytrimethoxysilane $OCH_2CHCH_2O(CH_2)_3Si(OCH_3)_3$.

Properties: Liquid; sp. gr. 1.070 (25°C); b.p. approx. 120°C (2 mm); refractive index 1.4280 (25°C). Soluble in acetone, benzene, ether. Reacts with water.

Derivation: Addition of hypochlorite to allyl alcohol and reaction with soda lime.

Containers: Up to 55-gal drums.

Uses: Coupling agent for glass- and mineral-filled plastics.

glycidyl acrylate $H_2C:CHCOOCH_2CHCH_2O$.

Properties: Liquid; sp. gr. 1.1074 (20/20°C); b.p. 57°C (2 mm) with polymerization; f.p. -41.5°C; flash point 141°F (TOC). Insoluble in water. Combustible.

Containers: 55-gal drums.

Hazard: May be irritant to skin and eyes.

Use: See acrylate.

glycidyl ether OCH_2CHOCH_2 . Liquid. Appears as the terminal group of epoxy resin structures resulting from reaction of epichlorohydrin and bisphenol A with alkaline catalyst. Also reacts with novolac resins (q.v.). Combustible.

glycine (1) Aminoacetic acid. A nonessential amino acid. NH_2CH_2COOH .

Properties: White, sweet odorless crystals; m.p. 232-236°C with decomposition; sp. gr. 1.1607; combines with hydrochloric acid to form the hydrochloric; soluble in water; insoluble in alcohol and ether.

Derivation: Action of ammonia on chloroacetic acid; occurs in many proteins, and is especially abundant in silk fibroin, gelatin, and sugar cane.

Grades: Technical; N.F.; F.C.C.

Containers: Drums; carlots.

Hazard: Use in food products restricted to 0.01%.

Uses: Organic synthesis; medicine; biochemical research; buffering agent; chicken-feed additive; reduces bitter taste of saccharin; retards rancidity in animal and vegetable fats.

(2) The extreme dilution of methylacetophenone gives a perfume resembling the odor of the climbing plant glycine (*Wistaria sinensis*), native to China and cultivated elsewhere. The name is also given to bouquets made from violet, lilac and jasmine ottos.

(3) Para-hydroxyphenylglycine (q.v.). A photographic developer.

glycocholic acid (cholyglycine) $C_{26}H_{43}NO_6$. The sodium salt occurs in bile, where it is formed by the combination of glycine with cholic acid (q.v.). It aids in the digestion and absorption of fats.

Properties: Crystallizes from water with 1.5 moles H_2O . Becomes anhydrous at 100°C. Anhydrous form decomposes at 154-155°C. Practically insoluble in water. The sodium salt is soluble in water and alcohol. Nontoxic.

Derivation: Precipitation from bile.

Uses: Biochemical research; food emulsifying agent (up to 0.1%).

glycocoll. See glycine (1).

glycocoll-para-phenetidine hydrochloride. See phenocoll hydrochloride.

glycogen (animal starch; liver starch) ($C_6H_{10}O_5$)_n. A glucose polysaccharide; the storage carbohydrate of the animal organism, found especially in the liver and rested muscle.

Properties: White powder; forms a dextrorotatory colloidal solution; partially soluble in water; sweet taste; nontoxic.

Derivation: Isolated from liver by treatment with 30% sodium hydroxide solution.

Use: Biochemical research.

glycogenic acid. See gluconic acid.

glycol. See ethylene glycol; it is also a general term for dihydric alcohols, which are physically and chemically similar to glycerol (q.v.).

glycol bromohydrin. See ethylene bromohydrin.

glycol carbonate. See ethylene carbonate.

glycol chlorohydrin. See ethylene chlorohydrin.

glycol diacetate. See ethylene glycol diacetate.

glycol dibutylate. See ethylene glycol dibutylate.

glycol diformate. See ethylene glycol diformate.

glycol dimercaptoacetate (ethylene glycol bithioglycolate) $HSCH_2COOCH_2CH_2OOCCH_2SH$.

Properties: Liquid; sp. gr. 1.313; b.p. 137–139°C (2 mm); refractive index 1.519 (25/D); insoluble in water; soluble in alcohol, acetone, and benzene. Combustible.

Uses: Crosslinking agent for rubbers; accelerator in curing epoxy resins.

glycol dimercaptopropionate [ethylene glycol bis(mercaptopropionate)] ($HSCH_2CH_2COOCH_2$)₂.

Properties: Liquid; sp. gr. 1.219 (25°C); b.p. 175–195°C; refractive index 1.5150 (25/D); insoluble in water and hexane; soluble in alcohol, acetone and benzene. Combustible.

Uses: Crosslinking agent for polymers, especially epoxy resins; chemical intermediate.

glycol dimethyl ether. See ethylene glycol dimethyl ether.

glycol dipropionate. See ethylene glycol dipropionate.

glycolic acid. See hydroxyacetic acid.

glycol monoacetate. See ethylene glycol monoacetate.

glycolonitrile (glyconitrile; formaldehyde cyanohydrin) $HOCH_2CN$.

Properties: Mobile, colorless, odorless oil. Supplied commercially as a 70% aqueous solution stabilized with phosphoric acid. B.p. 183°C (slight decomposition); m.p., does not solidify when cooled to –72°C. Sp. gr. 1.1039 (19°C); refractive index (n_D 25) 1.4090; electrolytic dissociation constant $K = 0.843 \times 10^{-4}$ (25°C).

Derivation: Formaldehyde and hydrocyanic acid.

Containers: (70% solution) Drums; tank cars.

Hazard: Toxic by skin absorption.

Uses: Solvent and organic intermediates.

glycol propionate. See ethylene glycol dipropionate.

glycol stearate. See ethylene glycol monostearate.

glycothiourea. See 2-thiohydantoin.

glycolylurea. See hydantoin.

glycolysis. Enzymatic (anaerobic) decomposition of sugars, starches and other carbohydrates, with release

of energy, a type of reaction occurring in yeast fermentation and in certain metabolic processes. Lactic acid is one of the products formed.

"Glycomuls."⁷³ Trademark for a series of sorbitol fatty acid esters, ranging from liquids to relatively high-melting wax-like solids and with varying surface-active characteristics. Used in foods, cosmetics, pharmaceuticals, chemical specialties.

glyconic acid. See gluconic acid.

glyconitrile. See glycolonitrile.

glycoside. One of a group of organic compounds, of abundant occurrence in plants, which can be resolved by hydrolysis into sugars and other organic substances, known as aglycones. Specifically glycosides are acetals which are derived from a combination of various hydroxy compounds with various sugars. They are designated individually as glucosides, mannosides, galactosides, etc. Glycosides were formerly called glucosides, but the latter term now refers to any glycoside having glucose as its sugar constituent.

glycyl alcohol. See glycerol.

glycyrrhizin. A glycoside of the triterpene group, the active principle of licorice root, from which it is extracted. It has an intensely sweet taste and is used as a humectant in tobacco and a flavoring in confectionery and pharmaceutical products. The ammoniated derivative, which is 50 times as sweet as sucrose, is used as a foaming agent in root beer and mouthwashes, as a sweetener in chocolate, cocoa, and chewing gum, and as a taste-masking agent in pharmaceuticals such as aspirin. Its ability to exert strong synergistic action with sucrose makes it useful in low-calorie foods (from 30 to 100 ppm are effective). See also sweetener, nonnutritive.

"Glydag" B.⁴⁶ Trademark for a dispersion of colloidal graphite in 1,3-butylene glycol. Used as a rubber lubricant and soluble-oil additive.

"Glycine" A.¹⁷ Trademark for a dyeing assistant, comprising thiodiethylene glycol; 100% active. **Uses:** Hygroscopic agent in textile printing; solvent for basic colors.

glyme. Abbreviation for glycol dimethyl ether. See ethylene glycol dimethyl ether.

glyodin. Generic name for 2-heptadecyl-2-imidazoline acetate (2-heptadecylglyoxalidine acetate)

$C_{17}H_{35}C_2H_4N_2 \cdot CH_3COOH$.

Properties: Light orange crystals; m.p. 94°C; insoluble in water. Toxicity probably low; high concentrations are irritating to skin and eyes.

Uses: Fungicide (fruits).

glyoxal OHCHO.

Properties: Yellow crystals or light yellow liquid; mild odor; m.p. 15°C; b.p. 51°C; sp. gr. 1.26 (20/20°C); 10.0 lb/gal (20°C). Vapor has a green color and burns with a violet flame; refractive index (n_D 20) 1.3826; polymerizes on standing or in presence of a trace of water. An aqueous solution contains monomolecular glyoxal, and reacts weakly to acid. Undergoes many addition and condensation reactions with amines, amides, aldehydes, and hydroxyl-containing materials. Glyoxal VP resists discoloration.

Derivation: Oxidation of acetaldehyde

Grades: 40% solution; pure, solid; VP.

Containers: (solid) Tins or fiber drums; (liquid) drums; tank cars.

Hazard: Moderately toxic by ingestion and inhalation; irritant.

Uses: Permanent-press fabrics; dimensional stabilization of rayon and other fibers. Insolubilizing agent for compounds containing polyhydroxyl groups (polyvinyl alcohol, starch, and celulosic materials); insolubilizing of proteins (casein, gelatin and animal glue); embalming fluids; leather tanning; paper coatings with hydroxyethylcellulose; reducing agent in dyeing textiles.

glyoxaline. See imidazole.

glyoxyldiureide. See allantoin.

glyoxylic acid HC(O)COOH . Supplied as a 50% solution, sp. gr. 1.42 (20/4°C); miscible with water and alcohol; insoluble in ether and hydrocarbons.

Uses: Intermediate for flavorings, perfumes, pharmaceuticals, dyes, plastics, agricultural chemicals.

"Glyptal."²⁴⁵ Trademark for a group of alkyd-type polymers and plasticizers.

"G-M-F."²⁴⁸ Trademark for para-quinonedioxime, $\text{HONC}_6\text{H}_4\text{NOH}$, a rubber accelerator.

GMP. Abbreviation for guanosine monophosphate. See guanosine phosphates; guanylic acid; sodium guanylate.

GMS. Abbreviation for glycerol monostearate.

"G.N.S. No. 5."⁷⁹ Trademark for a pine oil. Used in ore flotation.

goa powder. Araroba. See chrysarobin.

gold Au Metallic element of atomic number 79, Group IB of the Periodic Table. Atomic weight 196.9665; valence+1, 3. No stable isotopes.

Properties: Yellow, ductile metal; relatively soft. Does not corrode in air, but is tarnished by sulfur. Chemically nonreactive and nontoxic; attacked by chlorine and cyanide solutions in presence of oxygen. Soluble in aqua regia; insoluble in acids. Sp. gr. 19.3; m.p. 1063°C; b.p. 2808°C. Excellent reflector or infrared and heat; electrical resistivity (0°C) 2.06 microhm-cm. Extremely high light reflectivity. Nontoxic.

Occurrence: South Africa, USSR, Northwest Canada, U.S. (South Dakota, Nevada, Utah, Alaska, California) Australia. Oceans are estimated to contain 70 million tons in solution, with ten billion additional tons on the ocean floor. There is no present method of exploiting these resources.

Derivation: Ore is treated with cyanide solution; the dissolved gold cyanate is recovered by precipitation with zinc dust, aluminum, or by hydrolysis. Placer methods are also used.

Forms available: Ingots, sheet, wire, tubing, powder, leaf; alloys with copper or other metals, the gold content being expressed in carats (the number of parts of gold in 24 parts of alloy). Single crystals and aqueous colloidal suspensions. Leaf may be made in near-colloidal thickness; 1 troy ounce covers 68 sq ft (0.0001 inch).

Uses: Infrared reflectors; electrical contact alloys; brazing alloys; polarographic electrodes; spinnerets; laboratory ware; decorative arts (ceramics); in electronics, for bonding transistors and diodes to wires, for metallizing ceramic and mica capacitors, and for printed circuits; space vehicle instruments; dental alloys; jewelry. Colloidal dispersions are used in color-

ing glass, as nucleating agent in photosensitive glasses, and for specialized medical treatments; gold leaf is used in surgery.

gold 198. Radioactive gold of mass number 198.

Properties: Half-life, 2.7 days.

Derivation: Neutron irradiation of the element.

Forms available: Gold metal, colloidal gold (see radiogold) and gold sodium thiosulfate. The N.F. solution is colloidal Au-198.

Hazard: Moderate, from beta and gamma radiation.

Uses: Internal radiation therapy; to detect leaks in bacterial filters; to locate solidification boundary in continuously cast aluminum; to determine metallic silver in photographic materials.

Shipping regulations: Consult regulations.

gold, artificial. See stannic sulfide.

gold bromide (aurous bromide) AuBr .

Properties: Yellowish-gray mass. Decomposes at 165°C (approx). Insoluble in water.

Grades: Technical.

See also gold tribromide.

gold bronze powder. See aluminum bronze powder.

gold chloride. See gold trichloride.

gold-cobalt alloys. See cobalt-gold alloys.

gold cyanide (auric cyanide; cyanoauric acid)

$\text{Au(CN)}_3 \cdot 3\text{H}_2\text{O}$ or $\text{HAu(CN)}_2 \cdot 3\text{H}_2\text{O}$.

Properties: Colorless, hygroscopic crystals. M.p. 50°C (dec); very soluble in water; soluble in alcohol and ether.

Hazard: Highly toxic.

Use: Electrolyte in the electroplating industry.

Shipping regulations: (Rail, Air) Cyanides, dry, Poison label.

gold, filled. A thin gold alloy bonded to a base-metal; also called clad stock. Used in inexpensive jewelry.

gold hydroxide (auric hydroxide; gold hydrate)

Au(OH)_3 .

Properties: Brown powder. Sensitive to light. Keep in amber bottle! Probably a hydrated gold oxide (Au_2O_3), and loses water easily. Soluble in hydrochloric acid, solutions of sodium cyanide and alkali hydroxides; insoluble in water.

Uses: Gilding liquids; medicine; porcelain; gold plating.

gold, liquid bright. See "Liquid Bright Gold."

gold oxide (auric oxide; auric trioxide; gold trioxide)

Au_2O_3 .

Properties: Brownish-black powder; decomposed by heat. Keep in dark bottle. Soluble in hydrochloric acid; insoluble in water.

Uses: Gilding liquids; medicine; porcelain; gold plating.

gold potassium chloride. See potassium gold chloride.

gold potassium cyanide. See potassium gold cyanide.

gold potassium iodide. See potassium gold iodide.

gold salts. See sodium gold chloride.

Goldschmidt, Hans. See thermite.

gold-silicon alloy (silicon-gold alloy). Formed in amorphous foils 10 microns thick by cooling molten gold and silicon almost instantaneously by spreading on a moving wheel. The atoms are "frozen" before crystals can form. Used in electronics.

gold sodium chloride. See sodium gold chloride.

gold sodium cyanide. See sodium gold cyanide.

gold sodium thiomalate

$\text{NaOOCCH(SAu)CH}_2\text{COONa} \cdot \text{H}_2\text{O}$.

Properties: White to yellowish-white, odorless powder with metallic taste; affected by light. Very soluble in water; practically insoluble in alcohol and ether. Aqueous solutions are colorless to pale yellow; pH (5% solution) 5.8–6.5.

Derivation: Reaction of sodium thiomalate with a gold halide.

Grade: U.S.P.

Use: Medicine.

gold sodium thiosulfate. See sodium gold thiosulfate.

gold solder. A solder usually composed of gold, silver, copper, zinc, or brass; used principally by jewelers.

gold thioglucose. See aurothioglucose.

gold tin precipitate. See gold tin purple.

gold tin purple (purple of Cassius; gold tin precipitate). Properties: Brown powder. Insoluble in water; soluble in ammonia.

Derivation: By the reaction of a neutral solution of gold trichloride with stannous and stannic chlorides, yielding a mixture of colloidal gold and tin oxide in varying proportions.

Grade: Technical.

Containers: Tins; glass bottles.

Uses: Manufacture of ruby glass; coloring enamels; painting porcelain.

gold tribromide (auric bromide; gold bromide) AuBr_3 .

Properties: Brownish-black powder; m.p. 160°C , with decomposition. Soluble in alcohol, ether; slightly soluble in water.

Uses: Analysis (testing for alkaloids, spermatid fluid); medicine.

gold tribromide, acid. See bromoauric acid.

gold trichloride (a) AuCl_3 (auric chloride; gold chloride); (b) $\text{AuCl}_3 \cdot 2\text{H}_2\text{O}$; (c) $\text{AuCl}_3 \cdot \text{HCl} \cdot 4\text{H}_2\text{O}$ or $\text{HAuCl}_4 \cdot 4\text{H}_2\text{O}$ (chlorauric acid; chloroauric acid; gold trichloride, acid).

Properties: Yellow to red crystals; decomposed by heat; soluble in water, alcohol and ether.

Derivation: Action of aqua regia on gold.

Grades: Technical; C.P., usually as chlorauric acid.

Uses: Photography; gold plating; special inks; medicine; ceramics (enamels, gilding and painting porcelain); glass (gilding, ruby glass); manufacture of finely divided gold and purple of Cassius.

gold trioxide. See gold oxide.

gold, white. A jeweler's alloy consisting of about 58% gold, 17% nickel, 7% zinc and 17% copper.

Goodyear, Charles (1800–1860). Born in Woburn, Mass., Goodyear was the first to realize the potentialities of natural rubber. Frustrated by its lack of stability to temperature and other weaknesses in the uncurd state, he experimented with additives such as magnesium and sulfur. The discovery of vulcanization was not accidental, as is often stated, but the result of intelligent trial and correct evaluation of their results. Though Goodyear's patents were contested by Hancock in England, he well merits the credit for making rubber usable in countless ways, and helping to make the automobile possible.

gossypol. $\text{C}_{30}\text{H}_{30}\text{O}_7$. A natural polyphenol.

Properties: Yellow, crystalline pigment, having three modifications. Insoluble in water; soluble in alcohol.

Occurrence: Cottonseed kernels.

Hazard: Toxic by ingestion; but is inactivated by heat; 0.04% max. allowed in foods.

Uses: Stabilizer for vinyl polymers; has possibilities as a biodegradable insecticide.

GPF black. Abbreviation for general purpose furnace black. See carbon black.

grade. Any of a number of purity standards for chemicals and chemical products established by various specifications. Some of these grades are as follows:

ACS (American Chemical Society specifications)
reagent (analytical reagent quality)

C.P. (chemically pure)

USP (conforms to U.S. Pharmacopeia specifications)

N.F. (conforms to National Formulary specifications)

purified

FCC (Food Chemicals Codex specifications)
technical (industrial chemicals)

food	spectro
feed	commercial
semiconductor	chemical
radio	injectable
research	nitration

"Grafoil."⁵²¹ Trademark for pure flexible graphite tape with highly directional properties similar to pyrolytic graphite. Thermal insulating properties up to 6600°F .

grafting. A deposition technique whereby organic polymers can be bonded to a wide variety of other materials, both organic and inorganic, in the form of fibers, films, chips, particles, or other shapes. Grafting occurs at specific catalyst sites on the "host" materials, which must have some capacity for ion exchange, methathesis, or complex formation. Ionizable groups may be added artificially.

One proprietary application is polymerization of acrylonitrile with wood pulp fibers to make synthetic soil blocks; the polymer imparts high water-holding capacity to the pulp. Plant nutrient materials are added, and the mixture pressed into blocks to be used for starting seedlings.

graft polymer. A copolymer molecule comprised of a main backbone chain, to which side chains containing different atomic constituents are attached at various points. The main chain may be either a homopolymer or a copolymer. This process may be applied to the union of cellulosic molecules (cotton, rayon) with synthetic polymers (except polyesters, acrylics, and polypropylene) to form modified fibers having improved flame resistance, dimensional stability, resilience, and bacterial resistance. An intermediate called cellulose thiocarbonate (q.v.) is formed in this proprietary process.

See also polyorganosulfate graft polymer.

Graham, Thomas (1805-1869). Born in Scotland, Graham is famous for his basic studies in diffusion which led to the development of colloid chemistry. He was the first to observe a marked difference in the rate of passage of certain types of substances through a parchment membrane. Those which readily crystallize, like sugar, pass rapidly through the membrane, but gelatinous types are "slow in the extreme." The latter, which comprise albumin, starch, gums, etc., he designated as colloids, and their solutions as colloidal solutions. The former, which he called crystalloids, form "true" or molecularly dispersed solutions. See also colloid chemistry.

Graham's salt. See sodium metaphosphate.

grain (1) The smallest unit of weight in the avoirdupois system; one ounce contains 437.5 grains.

(2) Any cereal plant, as wheat, corn, barley, etc.

grain alcohol. See ethyl alcohol.

grain oil. See fusel oil.

gram. One one-thousandth kilogram (q.v.). It is the weight of one milliliter of water at 4°C. One pound contains 453.5 grams, or 15.4 grains.

gram atomic weight. The atomic weight of an element in grams, i.e., the gram atomic weight of carbon is 12.01115 grams. See mole.

gramicidin. An antibiotic produced by the metabolic processes of the bacteria *Bacillus brevis*. It is a polypeptide which is active against most Gram-positive pathogenic bacteria. It is one of the two antibiotic components of tyrothricin (q.v.) but has been isolated and used alone.

Properties: White crystalline platelets; m.p. 229-230°C; soluble in lower alcohols, acetic acid and pyridine; moderately soluble in dry acetone and dioxane; almost insoluble in water, ether, and hydrocarbons. Depresses surface tension; forms a fairly stable colloidal emulsion in distilled water.

Derivation: From tyrothricin by extraction with a mixture of equal volumes of acetone and ether, followed by concentration in vacuo and dissolving in hot acetone.

Grade: N.F.

Use: Medicine.

gram molecular weight. The molecular weight of a compound in grams, i.e., the gram molecular weight of carbon dioxide is 44.01 grams. See mole.

Gram-positive, -negative. A characteristic property of bacteria in reacting to a staining method developed by Gram about 1880. The bacteria are stained with crystal violet, treated with Gram's solution, and again stained with safranin. If the dye is retained the bacteria are called Gram-positive; and vice versa. See also bacteria.

grapefruit oil. See citrus peel oil.

grape sugar. See glucose.

"Graphallast."⁸² Trademark for a group of graphite and hydrocarbon oilless materials. Used for low friction bushings, bearings, and seals in submerged applications in many corrosive chemicals at normal temperatures below 150°F. Resistant to scuffing or abrasion.

"Graphalloy."⁸² Trademark for a series of oilless, self-lubricating, long life, low-friction materials consisting of graphite and a metal or alloy such as Babbitt, bronze, cadmium, copper, gold, iron, nickel, or silver. Widely used for bearings, bushings, seals,

electric brushes, brush assemblies, and non-freezing electric contacts. Many grades are available to meet most chemical applications. Cryogenic applications to -450°F, or to +750°F in air.

"Graphic Red."¹⁴¹ Trademark for lithol red pigments composed of sodium, barium, or calcium salts of diazotized Tobias acid coupled with beta-naphthol. Uses: Printing inks, paints, rubber, floor coverings, crayons.

"Graphilm."⁸² Trademark for a superior liquid lubricant containing graphite and a carrying agent which dries to a film approximately 0.001" thick. The resulting film is insoluble in water and adheres tenaciously to the surface upon which it has been baked. Suitable for high temperature applications to 1000°F and may be applied by brushing, dipping, or spraying. Uses: Provides lubrication for hard vacuum, high temperatures, and cryogenic applications.

graphite (black lead, plumbago). The crystalline allotropic form of carbon. Occurs naturally in Madagascar, Ceylon, Mexico, Korea, Austria, USSR, and China. Also produced synthetically by heating petroleum coke to about 3000°C in an electric resistance furnace. About 70% used in U.S. is synthetic. **Properties:** Relatively soft greasy feel; steel gray to black color with a metallic sheen; sp. gr. 2.0-2.25 depending upon origin; apparent specific gravity artificial graphite 1.5-1.8. High electrical and thermal conductivity. Specific heat 0.17 at room temperature. 0.48 at 1500°C; tensile strength 400 to 2000 psi; compressive strength usually about 2000-8000 psi. Coefficient of friction 0.1μ. Resistant to oxidation and thermal shock. Sublimes at 6600°F. Low toxicity.

Grades: Powdered; flake; crystals; rods; plates; fibers (q.v.).

Containers: Bags; fiber drums.

Hazard: (powder, natural) Fire risk. Tolerance, 15 million particles per cubic foot of air.

Uses: Granular or flake forms: pencils; crucibles, retorts, foundry facings, molds, lubricants, paints and coatings, boiler compounds, powder glazing, electrotyping; monochromator in x-ray diffraction analysis

Fabricated forms: Molds, crucibles, electrodes, bricks, chemical equipment, motor and generator brushes, seal rings, rocket nozzles, moderator in nuclear reactors; cathodes in electrolytic cells.

See also carbon; graphite fiber; carbon, industrial.

graphite fiber. High-tensile fibers or whiskers (q.v.) made from (1) rayon or (2) polyacrylonitrile.

Properties: (1) Amorphous structure; oxidizes readily, requiring silicon carbide coating. Resistant to acids and bases, including hydrofluoric acid. Tensile strength 50,000 to 150,000 psi; elastic modulus 4 to 9 million psi. Upper temperature limit in oxidizing atmosphere 500°C. Self-lubricating. Resistant to electricity. Lightweight. (2) Polycrystalline structure. Tensile strength up to 350,000 psi; elastic modulus up to 70 million psi. Smooth surface. Lightweight.

Derivation: (1) Heating rayon in air at 1400-1700°C. (2) Heating polyacrylonitrile in air at 220°C (20 hrs) to oxygenate, then in hydrogen to 1000°C (24 hrs) to carbonize, finally in argon at 2500°C (2 hrs). (3) Heating pitch materials (petroleum residues, asphalt, etc.) to carbonization temperature.

Forms: Filament, yarn, fabric, whiskers. Fibers may be 7 to 8 microns in diameter.

Uses: (1) Heating pads (combined with glass fiber); protective clothing for electrical workers. (2) Polyes-

ter and epoxy composites for jet engine components, space craft, compressor blades, airframe structures; electrodes for spark-hardening metals.

See also fiber; whiskers; composite; carbon, industrial.

graphite, pyrolytic (pyrographite). A dense, nonporous graphite, stronger and more resistant to heat and corrosion than ordinary graphite, intended for rocket nozzles, missiles in general, and nuclear reactors; exhibits tensile strengths 5-10 times higher than commercial graphite and maintains its strength above 6000°F. It is ultrapure, impermeable to all fluids, and is an anisotropic thermal and electrical conductor.

graphitic oxide (GO). $C_7O_2(H)_2$.

Properties: Light-yellow flakes or plates which deposit in layers to form a membrane, usually supported on a cellulose ester.

Derivation: Slow oxidation of graphite with potassium nitrate in nitric and sulfuric acids.

Uses: Reverse-osmosis membrane for desalination of sea water.

"Graphlon."⁸² Trademark for a group of graphite and resin materials that exhibit extremely high chemical inertness for submerged applications. "Graphlon" bearings, bushings, and seals withstand highly corrosive chemicals. Operating range from -450° to +450°F in air.

"Graphmetex."⁸² Trademark for a group of special insulating resins employed as insulating spacers and holders for electrical components.

GRAS. Abbreviation for "Generally recognized as safe," applied to food additives approved by FDA.

gravimetric analysis. A type of quantitative analysis involving precipitation of a compound which can be weighed and analyzed after drying. It is also used in determining specific gravity.

"Gredag."⁴⁶ Trademark for specialized dispersions based on graphite, aluminum, and molybdenum disulfide. Used in die casting compounds, release agents, plunger lubricants, die pretreatments, toggle assembly and machine and ejector pin lubricants.

green. Used in the chemical industries to mean uncured or untreated material, e.g., greensand.

greenhouse effect. Absorption or trapping by the carbon dioxide and water vapor in the atmosphere of radiation wavelengths above the infrared as they are radiated away from the earth. This effect is important in controlling the earth's surface temperature.

Greenland spar. See cryolite, natural.

green liquor. See liquor.

greenockite CdS. A native cadmium sulfide containing 77.7% cadmium. Ore of cadmium.

greensalt. A wood preservative containing chromated copper arsenate.

Hazard: Highly toxic.

greensand. See foundry sand.

green soap. A liquid soap made with potassium hydroxide and a vegetable oil (except coconut and palm kernel oil). See also soap.

green verditer. A paint pigment consisting of the hydroxycarbonate of copper. See copper carbonate; malachite.

"Greenz."⁴³ Trademark for an ammonium lignin sulfonate containing 4.5% iron, for use as an agricultural spray or soil additive in the treatment of iron chlorosis.

grex. See denier.

"Grifco."³⁰⁹ Trademark for a polyvinyl acetate emulsion useful as a base for adhesives and paint.

Grignard reagent. An important class of reagents used in synthetic organic chemistry, made by union of metallic magnesium with an organic chloride, bromide, or iodide, usually in the presence of an ether, and in the complete absence of water. General formula $RMgX$, where R is an alkyl or aryl or other organic group, and X a halogen. The value of the reagents lies in their ease of reaction with water, carbon dioxide, alcohols, aldehydes, ketones, amines, etc., to produce a great variety of organic compounds, usually with good yields. Examples are ethyl magnesium chloride (C_2H_5MgCl), methyl magnesium bromide (CH_3MgBr), etc.

Hazard: Since all Grignard reagents react rapidly with both water and oxygen, contact must be avoided. Ordinary materials of construction are satisfactory for use with Grignard reagents. Because the heat of decomposition of Grignard reagents with water is great and the ether they are dissolved in is highly volatile and flammable, they must be handled with extreme care. Some, especially the solution of $MeMgBr$ in ethyl ether, may ignite spontaneously on contact with water or even damp floors; nearly all will ignite on a wet rag or similar material.

griseofulvin $C_{17}H_{17}ClO_6$.

Properties: White to creamy white, odorless powder. Very slightly soluble in water; soluble in acetone, and chloroform; sparingly soluble in alcohol.

Derivation: By growth of *Penicillium griseofulvum* or other means.

Grade: U.S.P.

Use: Medicine (antifungal); feed additive.

"Groco."⁴¹⁰ Trademark for a series of fatty acids which include stearic acid, tallow and hydrogenated tallow, oleic acid, white oleine, coconut, soya bean, corn, cottonseed and palm oils.

grog. Crushed refractory materials added to ceramic mixes to reduce lamination in plastic clays and also to reduce shrinkage on drying. Materials crushed for this purpose are pottery, fire brick, quartz, quartzite, burned ware, saggers.

ground-nut oil. See peanut oil.

groundwood. A type of wood pulp produced by direct friction of a rotating stone on the end of a log. In the paper trade this is called mechanical pulp. It is used largely in newsprint and other low-grade papers. See also pulp, paper.

group. (1) One of the major classes or divisions into which elements are arranged in the Periodic Table (vertical columns). The classification is made according to the properties of the elements, those whose properties are similar occupying one group. Groups I through VII are divided into subgroups (A and B), but Group VIII is not so divided. The noble gas group has no number, though it was formerly referred to as Group 0. See also Periodic Table.

Note: Though often loosely so used, the word "group" should not be applied to a number of elements of similar properties that are not actual groups in the

Periodic Table; the proper term for these is "series," i.e., lanthanide series, rare-earth series, etc.

(2) A combination of two or more closely associated elements which tend to remain together in reactions, usually behaving chemically as if they were individual entities, i.e., in respect to valence, ionization, and related properties. Among the more familiar are OH (hydroxyl), COOH (carboxyl), CO₃ (carbonate), NH₄ (ammonium), SO₄ (sulfate), CH₃ and homologs (methyl, etc.), SH (sulfhydryl), and CO (carbonyl). When a group acquires an electric charge it is called a radical.

(3) Any combination of elements that has a specific functional property, for example, a chromophore group in dyes.

growth. (1) In biochemistry, the continuous process of cell division and reproduction characteristic of all living organisms. The basic phenomenon is considered to be osmosis, by which nutrients are transferred through cell walls and tissue structures; it is thus essential to the metabolic functioning of the organism.

(2) In crystallography, the process of crystal formation and development by nucleation and accretion. Crystals of many kinds are artificially produced for a variety of uses (e.g., lasers) by vapor condensation, electrodeposition, or rapid cooling of a saturated solution.

growth hormone. See somatotrophic hormone.

growth regulator. See plant growth regulator.

G salt. The sodium or potassium salt of 2-naphthol-6,8-disulfonic acid (G acid). Used as a dye intermediate.

GTP. Abbreviation for guanosine triphosphate. See guanosine phosphates.

guaiac (guaiac gum; guaiac resin). A resin from certain Mexican and West Indian trees, especially *Guaiacum santum* and *G. officinale*. Soluble in alcohol, ether, acetone, chloroform and caustic soda.

Uses: Flavoring agent in foods.

guaiacol (methylcatechol; pyrocatechol methyl ether, pyrocatechol methyl ester; ortho-methoxyphenol; ortho-hydroxyanisole) Oc1ccccc1OC.

Properties: Faintly yellowish, limpid, oily liquid or yellow crystals; aromatic odor. Guaiacol constitutes 60–90% of beechwood creosote. Soluble in alcohol, ether, chloroform and glacial acetic acid; moderately soluble in water. Sp. gr. 1.1395; m.p. 27.9°C; b.p. 205°C. Flash point 180°F (open cup); combustible.

Derivation: (a) By extracting beechwood creosote with alcoholic potash, washing with ether, crystallizing the potash compound from alcohol and decomposing it with dilute sulfuric acid. (b) Also from ortho-anisidine by diazotization and subsequent action of dilute sulfuric acid.

Hazard: Moderately toxic by ingestion and skin absorption.

Containers: (Crystals). Drums and tins; (liquid) drums and carboys.

Use: Food flavoring agent.

guaiacol benzoate C6H5COOC6H4OCH3.

Properties: White odorless, almost tasteless powder; m.p. 57–58°C; slightly soluble in water, soluble in hot alcohol, ether and chloroform.

Use: Medicine.

guaiacol carbonate (neutral guaiacol carbonate) (C6H7O)2CO3.

Properties: Small colorless crystals or white crystalline powder. Either slight aromatic odor and taste or odorless and tasteless. Soluble in chloroform, ether; less soluble in alcohol; insoluble in water; m.p. 86–88°C.

Derivation: (a) Reaction between sodium guaiacolate and carbonyl chloride. (b) Reaction between guaiacol and methyl chloroformate.

Use: Medicine.

guaiacwood oil.

Properties: Yellow to amber semisolid mass with floral odor. Soluble in alcohol, ether, and chloroform; insoluble in water. Sp. gr. 0.965–0.975; optical rotation –6 to –7°.

Derivation: Steam distillation of guaiacwood (Paraguay).

Chief constituent: Guaiol.

Containers: Cans.

Uses: Perfume fixative and modifier; soap odorant; fragrances; production of guaiacwood acetate.

"Guai-A-Phene."²⁹⁶ Trademark for a phenolic type antiskinning agent used for the prevention of gelling, skinning, and oxidation in paint, varnishes, printing inks, linoleum, etc.

guaiol C15H26O. A bicyclic sesquiterpene alcohol found in guaiac wood oil. Crystalline solid; m.p. 91°C. Insoluble in water; soluble in alcohol.

guanethidine sulfate (C10H22N4)2 · H2SO4. [2-(Hexahydro-1(2H)-azocinyl)ethyl]guanidine sulfate.

Properties: White, crystalline powder; strong odor. Very soluble in water; slightly soluble in alcohol; practically insoluble in chloroform.

Grade: U.S.P.

Use: Medicine (antihypertensive agent).

guanidine. See di-para-anisyl-para-phenylguanidine hydrochloride.

guanidine (carbamidine; iminourea) NHC(NH2)2.

Properties: Colorless crystals; m.p. 50°C; decomposes at 160°C. Soluble in water and alcohol.

Derivation: (a) By heating calcium cyanamide with ammonium iodide. (b) By treating urea with ammonia under pressure. (c) From guanidine carbonate.

Combustible; low toxicity.

Use: Organic synthesis.

guanidine-aminovaleic acid. See arginine.

guanidine carbonate (H2NCNHNH2)2 · H2CO3.

Properties: White granules. Soluble in water, slightly soluble in alcohol and acetone. Decomposes at 197–199°C without melting; sp. gr. 1.25. Combustible; low toxicity.

Derivation: From dicyandiamide.

Grade: Technical, over 95% pure.

Hazard: Moderately toxic by ingestion.

Containers: Fiber drums.

Uses: As a strong organic alkali; organic intermediate; soap and cosmetic products.

guanidine hydrochloride NHC(NH2)2 · HCl.

Properties: White powder; m.p. about 183°C. Soluble in water and alcohol; pH of aqueous solution 6.2 for 10% solution.

Grades: 88% and 95% pure.

Containers: Paper bags or fiber drums.

Hazard: Moderately toxic by ingestion; evolves hydrochloric acid fumes on heating.

Uses: Exceptionally water-soluble source of guanidine for organic syntheses.

guanidine nitrate H2NC(NH)NH2 · HNO3.

Properties: White granules. Soluble in water and al-

cohol; slightly soluble in acetone. Melting range 206–212°C.

Derivation: From cyanamide or dicyandiamide.

Grade: Technical, over 95% pure.

Containers: Fiber drums, multiwall paper sacks.

Hazard: Strong oxidant; may ignite organic materials on contact; may explode by shock or heat.

Uses: Manufacture of explosives; disinfectants; photographic chemicals.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

guanine $C_5H_5N_5O$ (2-amino-6-oxypurine). A purine constituent of ribonucleic acid and deoxyribonucleic acid. Usual sources are guano, sugar beets, yeast, clover seed, and fish scales.

Properties: Colorless rhombic crystals. M.p. 360°C (dec). Insoluble in water; sparingly soluble in alcohol and ether; freely soluble in ammonium hydroxide, alkali hydroxides, and dilute acids. Available as hydrochloride or hemisulfate.

Derivation: Isolation following hydrolysis of nucleic acids (usually from yeast); organic synthesis.

Uses: Biochemical research; cosmetics.

See also pearl essence.

guanosine (guanine riboside) $C_{10}H_{13}N_5O_5$. The nucleoside containing guanine and D-ribose.

Properties: White, crystalline, odorless powder with mild, saline taste. M.p. 237–240°C (dec). Very slightly soluble in cold water; soluble in boiling water, dilute mineral acids, hot acetic acid, and dilute bases; insoluble in alcohol, ether, chloroform and benzene.

Derivation: Found in pancreas, clover, coffee plant, and pollen of pines; prepared from yeast nucleic acid.

Use: Biochemical research.

guanosine monophosphate. See guanylic acid.

guanosine phosphates. Nucleotides used by the body in growth processes; important in biochemical and physiological research. Those isolated are the monophosphate (GMP), the diphosphate (GDP) and the triphosphate (GTP).

guanosine phosphoric acid. See guanylic acid.

"Guantal."⁵⁸ Trademark for diphenylguanidine phthalate (q.v.), a rubber accelerator.

guanylic acid (GMP; guanosine monophosphate; guanosine phosphoric acid) $C_{10}H_{14}N_5O_8P$. The monophosphoric ester of guanine; i.e., the nucleotide containing guanine, D-ribose and phosphoric acid. The phosphate may be esterified to either the 2,3, or 5 carbon of ribose yielding guanosine 2'-phosphate, guanosine-3'-phosphate, and guanosine-5'-phosphate, respectively. It is important in growth processes of the body.

Derivation of commercial product: Isolation from nucleic acid of yeast or pancreas; also made synthetically.

Use: Biochemical research.

guanyl nitrosaminoguanilydene hydrazine. A high explosive.

Shipping regulations: (Rail) Not accepted by express.

Consult regulations: (Air) Not acceptable.

guanyl nitrosaminoguananyl tetrazene. See tetrazene.

guanylurea sulfate. (carbamylguanidine sulfate) $(C_2H_6ON_4)_2 \cdot H_2SO_4 \cdot 2H_2O$.

Properties: White powder, over 97% pure. Soluble in water and alcohol.

Derivation: From cyanamide or dicyandiamide.

Uses: Analytical reagent for nickel; manufacture of dyes; organic synthesis.

"Guardkote."¹²⁵ Trademark for fast-setting two-component liquid systems based on "Epon" resins and designed specifically for highway resurfacing and repair. They are used in combination with sharp aggregates to waterproof and deslick portland cement or bituminous concrete pavements.

guar gum. A water-soluble plant mucilage obtained from the ground endosperms of *Cyanopsis tetragoloba*, cultivated in Pakistan as livestock feed. The water-soluble portion of the flour (85%) is called guaran, and consists of 35% galactose, 63% mannose, probably combined in a polysaccharide; 5–7% protein.

Properties: Yellowish-white powder. Dispersible in hot or cold water. has 5–8 times the thickening power of starch; reduces friction drag of water on metals.

Grades: Industrial; technical; F.C.C.

Uses: Paper manufacture; cosmetics; pharmaceuticals; interior coating of fire-hose nozzles; fracturing aid in oil wells; textiles; printing; polishing; thickener and emulsifier in food products, e.g., cheese spreads, ice cream and frozen desserts.

Guggenheim process. A process for the manufacture of sodium nitrate from the Chilean nitrate ore, caliche, in which heat is efficiently utilized and handling costs are kept to a minimum.

"Guidon."⁴⁴⁶ Trademark for a magnesia-chrome refractory made from electrically fused grains. Has high temperature strength about 10 times that of conventional magnesia-chrome refractories which makes it well suited to abrasive environments.

Uses: Electric furnace sidewalls; copper converter tuyere lines; open hearth front walls and roof.

Guignet's green. A chrome green pigment made by fusing potassium chromate and boric acid.

gum arabic. See arabic, gum.

gum camphor. See camphor.

gum, gasoline. A viscous oxidation product occurring after long standing in gasoline that is not stabilized with an antioxidant.

gum, natural. A carbohydrate high polymer that is insoluble in alcohol and other organic solvents, but generally soluble or dispersible in water. Natural gums are hydrophilic polysaccharides composed of monosaccharide units joined by glycosidic bonds. They occur as exudations from various trees and shrubs in tropical areas or as phycocolloids (algae), and differ from natural resins in both chemical composition and solubility properties. Some contain acidic components and others are neutral. Their chief use is as protective colloids and emulsifying agents in food products and pharmaceuticals; as sizing for textiles; and in electrolytic deposition of metals. For details, see arabic, tragacanth, guar, karaya.

Note: The terminology of natural gums and resins is inconsistent and often confusing. The word "gum," often used as an adjective, seems to acquire a different meaning from the noun. For example, the resinous products obtained from pine pitch (pro-

duced by the parenchyma cells of softwoods) are conventionally called "gum turpentine" and "gum rosin." There are also such "gum resins" as gum benzoin, gum camphor, and others. The so-called ester gum is a semisynthetic reaction product of rosin and a polyhydric alcohol. All these are actually resinous products having properties quite different from those of natural gums. Furthermore, resins are complex *mixtures*, whereas gums are chemical *compounds* that can be represented by a formula. Still further complicating the matter is the common application of the word "gum" to such plant latices as chicle and natural rubber, which are different from both carbohydrate gums and resins. It is probable that the confusion originated in the casual use of "gum" to refer to any soft, sticky product derived from trees. In view of this situation, any specific definition of these terms is likely to be controversial. See also resin, natural; polymer, water-soluble.

gum rosin. See rosin; gum, natural (note).

gum sugar. See arabinose.

gum, synthetic. See ester gum.

gum turpentine. See turpentine; gum, natural (note).

guncotton. See nitrocellulose.

gun metal. An alloy of copper with 10% tin.

gunpowder. See black powder.

"Guthion."¹⁸¹ Trademark for O,O-dimethyl S-4-oxo-1,2,3-benzotriazin-3(4H)-ylmethyl phosphorodithioate (q.v.). See methyl azinphos.

Hazard: A cholinesterase inhibitor.

gutta percha. See rubber, natural (note).

glyocardia oil. See chaulmoogra oil.

gyplure. Generic name for cis-9-octadecen-1, 12-diol-12-acetate. It is a synthetic product, used as a sex attractant for the male gypsy moth. The natural product, found in female moths, is said to be *d*-10-acetoxy-1-hydroxy-cis-7-hexadecene.

gypsum $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. Natural hydrated calcium sulfate. See calcium sulfate.

gypsum cement (plaster of Paris; Keene's cement; Parian cement; Martin's cement; Mack's cement). A group of cements which consist essentially of calcium sulfate and are produced by the partial dehydration of gypsum to the hemihydrate, $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$. They usually contain additions of various sorts. For example, Keene's cement contains alum or aluminum sulfate, Mack's cement contains sodium or potassium sulfate, Martin's cement contains potassium carbonate and Parian cement contains borax.

H

H Symbol for hydrogen; the molecular formula is H_2 .

Ha Symbol for hafnium.

Haber, Fritz (1868–1934). Born in Breslau, Germany, Haber's great contribution to chemistry, for which he was given the Nobel prize in 1918, was his development (with Bosch) of a workable method of synthesizing ammonia from nitrogen and hydrogen. It was the first successful attempt to "fix" atmospheric nitrogen in an industrial process. This discovery was developed to production scale about 1912; it enabled Germany to manufacture an independent supply of explosives for World War I. Haber left Germany to escape persecution in 1933. See also ammonia; explosives.

habit. The type of geometric structure that a given crystalline material invariably forms, e.g., cubic, orthorhombic, monoclinic, tetragonal, hexagonal, etc. Each of these types has several subclasses. Thus crystals may have the form of thin sheets or plates, cubes, rhomboids, and even more complicated geometric structures. For example, the crystal habit of mica is monoclinic, with formation of extremely thin sheets. See also crystal.

H acid. See 1-amino-8-naphthol-3,6-disulfonic acid.

hafnia. See hafnium oxide.

hafnium Hf Metallic element of atomic number 72, Group IVB of the Periodic Table. Atomic weight 178.49; valences 2, 3, 4. There are 6 stable isotopes. Properties: Generally similar to zirconium. Gray crystals; sp. gr. 13.1; m.p. about 2150°C; b.p. over 5400°C; high thermal neutron cross-section (115 barns). Good corrosion resistance and high strength. Nontoxic. See also zirconium.

Occurrence: Present in most zirconium ores.

Derivation: Extremely difficult to separate from zirconium. Most important methods are: (1) solvent extraction of the thiocyanates by hexone; (2) solvent extraction of the nitrates by tributyl phosphate; (3) fractional crystallization of the double fluorides.

Forms available: Powder; rods; single crystals.

Hazard: Explosive in powder form, either dry or wet with less than 25% water. Tolerance, 0.5 mg per cubic meter of air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Control rods in water-cooled nuclear reactors; light-bulb filaments; electrodes; special glasses; getter in vacuum tubes.

Shipping regulations: Powder or sponge form, wet or dry: (Rail) Yellow label. (Air) Flammable Solid label. Not accepted on passenger planes. Consult rail and air regulations for details.

hafnium boride HfB_2 . Crystalline solid; m.p. 3100°C. Use: Refractory metal.

hafnium carbide HfC .

Properties: High thermal neutron absorption cross

section; very high melting point, 3890°C (7030°F).

Most refractory binary substance known.

Use: Control rods in nuclear reactors.

hafnium disulfide HfS_2 . Available in a particle size of 40 microns as a solid lubricant. The diselenide and ditelluride are also available.

hafnium nitride HfN . Yellow-brown crystals; m.p. 3305°C. The most refractory of known metal nitrides.

hafnium oxide (hafnia) HfO_2 .

Properties: White solid; sp. gr. 9.68 (20°C); m.p. 2812°C; b.p. about 5400°C. Insoluble in water.

Use: Refractory metal oxide.

hahnium. Ha Artificial element of atomic number 105 and atomic weight 260; discovered at Lawrence Radiation Laboratory and named for the German physicist Otto Hahn.

"Halane."²⁰³ Trademark for a dry chlorine-liberating compound, dichlorodimethylhydantoin (q.v.).

halazone (para-N,N-dichloro-sulfamylbenzoic acid; para-sulfondichloraminobenzoic acid)
 $HOOC_6H_4SO_2NCl_2$.

Properties: White crystalline powder; strong chlorine odor; affected by light. Soluble in glacial acetic acid, benzene; slightly soluble in water, chloroform; insoluble in petroleum ether. M.p. 195° with decomposition.

Grade: N.F.

Use: Water disinfectant.

half-life. The time required for an unstable element or nuclide to lose one-half of its radioactive intensity in the form of alpha beta and gamma radiation; it is a constant for each unstable element or nuclide. Half-lives vary from fractions of a second for some artificially produced radioactive elements to millions of years.

halibut liver oil (haliver oil).

Properties: Pale yellow to dark red liquid; fishy odor and taste; soluble in alcohol, ether, chloroform, and carbon disulfide; insoluble in water. Sp. gr. 0.920–0.930; saponification number 160–180; iodine number 120–136; refractive index about 1.47. Nontoxic.

Derivation: By expressing and boiling halibut livers.

Grades: Crude, refined.

Uses: Medicine; source of vitamins A and D; leather dressing.

halides. Binary compounds of the halogens (q.v.).

halite. See sodium chloride.

Hall, Charles Martin (1863–1914). A native of Ohio, Hall invented a method of reducing aluminum oxide in molten cryolite by electrochemical means. This discovery made possible the large-scale production of metallic aluminum and resulted in formation of the Aluminum Co. of America. The process requires high electric power input. Hall is generally consid-

ered as the founder of the aluminum industry. See also Hall process.

"Hallcomid."⁹⁴ Trademark for a series of N,N'-dimethyl amides of fatty acids.

halloysite $\text{Al}_2\text{O}_3 \cdot 3\text{SiO}_2 \cdot 2\text{H}_2\text{O}$. A clay used to some extent in refractories and as a cracking catalyst.

Hall process. The electrolytic recovery of aluminum from bauxite or more specifically, from the alumina extracted from it (see Bayer process). A typical cell for this process consists of a rectangular steel shell, lined with insulating brick and block carbon. The cell holds a molten cryolite-alumina electrolyte, commonly called the "bath." The carbon bottom is covered by a pad of molten aluminum, and serves as the cathode. The anodes are prefabricated carbon blocks, suspended in the electrolyte. The cathodic current is collected from the carbon bottom by imbedded steel bars that protrude through the shell to connect with the cathode bus. During electrolysis, aluminum is deposited on the metal pad and the oxygen, liberated at the anode, reacts with the carbon to CO_2 , some of which is reduced to CO by secondary reactions. At 24-48 hour intervals, aluminum is tapped from the cell by a siphon. The process requires large amounts of electric power (from 4 to 5% of total U.S. production). Disposition of the toxic fluoride waste is a problem.

hallucinogen. Any of a number of drugs acting on the central nervous system in such a way as to cause mental disturbance, imaginary experiences, coma, and even death. Many of these are narcotics (q.v.) and/or alkaloids; some are derived from plants and others made synthetically. They differ in degree of addiction and hallucinatory effect. Their sale and possession (other than by physicians) is illegal in the U.S. Most common hallucinogens are cannabis (marijuana; hashish), lysergic acid (LSD), amphetamine, and numerous morphine derivatives.

halocarbon. A compound containing carbon, one or more halogens, and sometimes hydrogen. The lower members of the various homologous series are used as refrigerants, propellant gases, fire-extinguishing agents, and blowing agents for urethane foams. When polymerized they yield plastics characterized by extreme chemical resistance, high electrical resistivity, and good heat resistance. See also fluorocarbon.

halogenation. Incorporation of one of the halogen elements, usually chlorine or bromine, into a chemical compound. Thus benzene (C_6H_6) is treated with chlorine to form chlorobenzene ($\text{C}_6\text{H}_5\text{Cl}$), and ethylene (C_2H_4) is treated with bromine to form ethylene dibromide ($\text{C}_2\text{H}_4\text{Br}_2$). Compounds of chlorine and bromine are sometimes used as the source of the halogen, phosphorus pentachloride.

halogen. One of the electronegative elements of Group VII A of the Periodic Table (fluorine, chlorine, bromine, iodine, and astatine). Listed in order of their activity, fluorine being the most active of all chemical elements.

"Halon."¹⁷⁵ Trademark for tetrafluoroethylene polymer.

Properties: Inertness to almost all chemicals; resistance to high and low temperatures; zero moisture absorption; high impact strength; excellent dielectric properties; nonstick surface with low coefficient of friction; self-extinguishing (ASTM D-635).

Grades: Vary with particle size as, 600, 300, 20 micron average size.

See also polytetrafluoroethylene; fluorocarbon polymer.

"Halopont."²⁸ Trademark for pigments used for tinting white paper.

"Halotestin."³²⁷ Trademark for fluoxymesterone; used in medicine.

halothane (2-bromo-2-chloro-1, 1, 1-trifluoroethane) CF_3CHBrCl .

Properties: Noncombustible, colorless, volatile liquid; sweetish odor. Sp. gr. (20/4°C) 1.872-1.877; b.p. 50.2°C, 20°C (243 mm). Light-sensitive; may be stabilized with 0.01% thymol. Slightly soluble in water; miscible with many organic solvents.

Grade: U.S.P.

Use: Medicine (anesthetic).

"Halowax."¹¹ Trademark for chlorinated hydrocarbons of varying chlorine content, including chlorinated naphthalenes, ranging from a low viscosity oil to a hard microcrystalline wax.

Hazard: May be toxic by ingestion.

Uses: Electrical insulating and fire-resisting materials; impregnants; sealing compounds; crankcase additive; ingredient in penetrating oils; plasticizer; protective coatings.

"Hamp-ene."⁵¹⁷ Trademark for a series of chelating agents including ethylenediaminetetraacetic acid; the disodium salt, dihydrate; the trisodium salt, monohydrate; the tetrasodium salt, monohydrate; the tetrasodium salt; and the tetrasodium salt, dihydrate.

"Hamp-ex."⁵¹⁷ Trademark for diethylenetriaminepentaaetic acid pentasodium salt. (40.2% as DETPA Na_5). Used when slightly higher metal chelate stability is required at a sacrifice in stoichiometric chelating activity.

"Hamp-ol" 120⁵¹⁷ Trademark for N-hydroxyethylethylenediaminetriacetic trisodium salt (41.3% as HEEDTA Na_3). Used as a general purpose chelating agent for the control of iron in the pH range from 6.5 to 9.5 as well as calcium and magnesium.

"Hamposyl."⁵¹⁷ Trademark for a series of fatty acid sarcosinates.

"Han."⁵¹ Trademark for a high-aromatic solvent, boiling range 355-535°F, used as a vehicle for chemical insecticides and herbicides. Combustible.

hand (handle). A term used chiefly in the textile industry to describe a fabric in a qualitative manner, as determined by the sensory perception of its feeling. It is also used to some extent in the leather industry. Such pragmatic physical-perception tests are of great practical value, although the properties being ascertained are often not objectively definable.

handedness. See asymmetry; enantiomer; chiral.

"Hansa."³⁰⁷ Trademark for a group of yellow to orange insoluble azo pigments based on toluidine and betanaphthol. Have good lightfastness in deep shades but tend to fade in pastels. Notably poor resistance to bleeding; good weather resistance and are relatively unaffected by acids and alkalis. Nontoxic. Used chiefly in emulsion paints, toy enamels, and other applications.

"Harbide."⁴⁴⁶ Trademark for a silicon carbide brick, formed by impact pressing; low permeability, dense impervious surfaces, high resistance to oxidation. Uses: Refractory for ceramic kilns, furnace linings,

recuperator tubes, radiant tubes, retorts, and in applications subject to mechanical abrasion.

"Harchemex."¹⁸⁹ Trademark for a compound of mainly C₁₄ and C₁₆ straight-chain primary alcohols in the approximate ratio of 2 to 1.

Uses: Wetting agents; germicidal quaternary ammonium compounds; lubricating oil additive.

"Harchem 2-SL."¹⁸⁹ Trademark for inorganic ester of sebacic acid suitable for use as a base for synthetic lubricants.

Harden-Young ester. See fructose 1,6-diphosphate.

hardness. (1) The resistance of a material to deformation of an indenter of specific size and shape under a known load. This definition applies to all types of hardness scales except the Mohs scale (q.v.), which is based on the concept of scratch hardness and is used chiefly for minerals. The most generally used hardness scales are Brinell (for cast iron), Rockwell (for sheet metal and heat-treated steel), diamond pyramid, Knoop and scleroscope (for metals). Durometer hardness is used for softer materials like rubber and plastics.

(2) The proportion of calcium carbonate or calcium sulfate contained in a given sample of water.

(3) The resistance of a pesticide or detergent to decomposition or biodegradation; also called persistence.

(4) Extremely short-wave radiation, e.g., hard x-rays.

(5) Loosely, having the potential for affecting the nervous system, as hard liquor or hard drugs.

"Hardnox Alkali."²⁴⁴ Trademark for a fused, flake combination of caustic soda and phosphates.

hard rubber. See rubber, hard.

hardwood. In papermaking terminology, the wood from deciduous trees (maple, oak, birch), regardless of whether it is actually hard or soft. Hardwoods are used as components of paper pulp, but in much less volume than softwoods (q.v.).

"Harflex."¹⁸⁹ Trademark for a series of polymeric plasticizers for vinyl resins, synthetic rubbers and cellulose esters. Characterized by permanence and resistance to extraction.

Hargreaves process. The manufacture of sodium sulfate (salt cake) from sodium chloride and sulfur dioxide. A mixture of sulfur dioxide and air is passed over briquettes of sodium chloride in a counter-current manner to produce sodium sulfate and hydrochloric acid. This process accounts for only a small amount of the salt cake produced in the U.S.

hartshorn. See ammonium carbonate.

hartshorn oil. See bone oil.

HAS. Abbreviation for hydroxylamine acid sulfate.

hashish. Extract of cannabis (marijuana), more concentrated and thus more powerful than the base drug. See also cannabis.

"Hastelloy."²¹⁴ Trademark for a series of high-strength, nickel-base, corrosion-resistant alloys. With the exception of "Hastelloy alloy D," which is cast only, all are produced in the forms of sheet, plate, bars, rods, welding electrodes, and wire and can be fabricated into all types of process equipment.

"Haveg."³⁴⁹ Trademark for a series of corrosion-resistant mixtures fabricated into chemical process equipment. They are composites of various synthetic polymers with asbestos, graphite, glass fibers, etc. Especially useful for drums and containers for shipment of chemicals.

"Havelast."³⁴⁹ Trademark for an elastomeric binder or impregnant for various reinforcing materials such as "Sil-Temp," as fabric or rovings, asbestos, glass or graphite. Used in the rocket and missile industry when resiliency is desired.

"Haystellite."²¹⁴ Trademark for tungsten carbide products, principally in the form of hard-surfacing rods for protecting parts from severe abrasion.

hazardous material. Any material or substance which, if improperly handled, can be damaging to the health and well-being of man. Such materials cover a broad range of types which may be classified as follows:

(1) Poisons or toxic agents (see poison; toxicity), including drugs, chemicals, and natural or synthetic products that are in any way harmful, ranging from those that cause death to skin irritants and allergens.

(2) Corrosive chemicals, such as sodium hydroxide or sulfuric acid, that burn or otherwise damage the skin and mucous membranes on external contact or inhalation.

(3) Flammable materials (q.v.) including (a) organic solvents, (b) finely divided metals or powders, (c) some classes of fibers, textiles, or plastics, and (d) chemicals that either evolve or absorb oxygen during storage, thus constituting a fire risk in contact with organic materials.

(4) Explosives (q.v.) and strong oxidizing agents such as peroxides and nitrates.

(5) Materials in which dangerous heat build-up occurs on storage, either by oxidation or microbiological action. Examples are fish meal, wet cellulose and other organic waste materials.

(6) Radioactive chemicals that emit ionizing radiation (q.v.).

Packaging, labeling, and shipping of hazardous materials by rail and truck is regulated by the Hazardous Materials Regulation Board of the Dept. of Transportation (DOT) (1920 L St. N.W., Washington, D.C.); by the Coast Guard (a division of DOT) for shipment by coastwise boats and inland waterway barges; and by the Federal Aviation Administration for air shipment. The latter regulations follow those established by the International Air Transportation Authority (IATA) whose central office is in Geneva, Switzerland.

The Manufacturing Chemists Association (1825 Connecticut Ave., Washington, D.C.) issues a series of authoritative data sheets on the properties of a number of hazardous materials, as well as instructions for preparation of warning labels. The American Conference of Governmental Industrial Hygienists (Box 1937, Cincinnati, Ohio) issues a periodically revised list of Threshold Limit Values for substances in workroom air. The *Journal of Hazardous Materials* (Elsevier) began publication in 1975.

An approach is being made to the problem of formulating an international code of regulations for hazardous materials; legislation pertaining to toxic materials testing and control is imminent.

See also flammable material; toxic material; poison (1).

Hb Symbol for hemoglobin.

"HB."⁵⁸ Trademark for a series of plasticizers for vinyl compounds.

"HBPA."⁵⁸ Trademark for hydrogenated bisphenol A.

Use: Unsaturated polyester raw material.

"HCA."⁵⁰ Trademark for a highly potent herbicide whose active ingredient is hexachloroacetone. Used in the control of all weeds in non-crop areas. It increases the initial and residual effectiveness of oil sprays. Available in mixtures or concentrate.

Hazard: Moderately toxic and irritant.

HCCH. Abbreviation for hexachlorocyclohexane (q.v.).

HCG. Abbreviation for human chorionic gonadotropin.

HCH. Abbreviation for hexachlorocyclohexane (q.v.).

"HCR."¹⁸² Trademark applied to ion exchange resin used in water treating and chemical process applications; strong acid cation exchange resin, 8% divinylbenzene crosslinked.

He Symbol for helium.

HEA. Abbreviation for 2-hydroxyethyl acrylate (q.v.).

heat. A mode of energy associated with and proportional to molecular motion. It can be transferred from one body to another by radiation, conduction or convection; sensible heat is accompanied by a change in temperature, but latent heat is not.

—*of combustion:* The heat evolved when a definite quantity of a substance is completely oxidized (burned).

—*of crystallization:* The heat evolved or absorbed when a crystal forms from a saturated solution of a substance.

—*of dilution:* The heat evolved per mole of solute when a solution is diluted from one specific concentration to another.

—*of formation:* The heat evolved or absorbed when a compound is formed in its standard state from elements in their standard states at a specified temperature and pressure.

—*of fusion:* The heat required to convert a substance from the solid to the liquid state with no temperature change (also called latent heat of fusion or melting).

—*of hydration:* The heat associated with the hydration or solvation of ions in solution; also the heat evolved or absorbed when a hydrate of a compound is formed.

—*of reaction:* The heat evolved or absorbed when a chemical reaction occurs, in which the final state of the system is brought to the same temperature and pressure as that of the initial state of the reacting system.

—*of solution:* The heat evolved or absorbed when a substance is dissolved in a solvent.

—*of sublimation:* The heat required to convert a unit mass of a substance from the solid to the vapor state (sublimation) at a specified temperature and pressure without the appearance of the liquid state.

—*of transition:* The heat evolved or absorbed when a unit mass of a given substance is converted from one crystalline form to another.

—*of vaporization:* The heat required to convert a substance from the liquid to the gaseous state with no temperature change (also called latent heat of vaporization).

heat exchanger. A vessel in which an outgoing hot liquid or vapor transfers a large part of its heat to an

incoming cool liquid; in the case of vapors, the latent heat of condensation is thus utilized to heat the entering liquid. The shell-and-tube type is widely used, in which the hot liquid or vapor is contained in the shell while the cool liquid passes through the tubes, which are usually arranged in coils for maximum contact with the heat source. Heat exchangers are used in many chemical operations, e.g., evaporation and pulp manufacture, as well as to produce steam from the heat developed in nuclear reactors for power generation. See also evaporation; heat transfer.

heat transfer. Transmission of thermal energy from one location to another by means of a temperature gradient existing between the two locations. It may take place by conduction, convection or radiation. Heat transfer is involved in many types of industrial operations, including distillation, evaporation, canning of foods, baking, curing, etc. In some cases a heat exchanger is utilized. Fluids of high heat capacity are widely used to remove unwanted heat, or to transfer it from one place to another within a system; examples are air, water, ethylene glycol. See also coolant.

heavy. A nontechnical word used in a number of scientific senses: (1) referring to atomic weight (heavy water, heavy metal); (2) referring to production volume (heavy chemical); (3) referring to physical weight (heavy spar); (4) referring to thickness (heavy-gauge wire); referring to distillation range (heavy oil).

heavy chemical. A chemical produced in tonnage quantities, often in a relatively impure state. Examples are sodium chloride, sulfuric acid, soda ash, salt cake, sodium hydroxide, etc. See also fine chemical.

heavy hydrogen. See deuterium.

heavy metal. A metal of atomic weight greater than sodium (22.9) that forms soaps on reaction with fatty acids, e.g., aluminum, lead, cobalt. See soap (2).

heavy oil. An oil distilled from coal-tar between 230 and 330°C, the exact range not at all definite. See coal tar.

heavy oxygen. See oxygen 18.

heavy spar. See barite.

heavy water (deuterium oxide; D_2O) Water composed of 2 atoms of heavy hydrogen (deuterium) and 1 atom of oxygen. In lower states of purity the proportion of heavy water molecules decreases. Deuterium oxide is present to the extent of about 1 part of 6,500 of ordinary water. Deuterium oxide freezes at 3.8°C, boils at 101.4°C and has sp. gr. of 1.1056 at 25°C.

Derivation: There are several methods of separating or concentrating D_2O : (a) Fractional distillation; (b) Girdler-Spevack process; (c) hydrogen-ammonia exchange process; (d) electrolysis; (e) cryogenic methane distillation.

Commercially available: D_2O 99.75% pure, in up to 5000 g lots.

Use: Moderator in some types of nuclear reactors. See also tritium (hydrogen of atomic weight 3) which combines with oxygen to give another variety of heavy water.

hecto-. Prefix meaning 10^2 units (symbol h); e.g., 1 hg = 1 hectogram = 100 grams.

hectorite (hector clay $Mg_{2.67}Li_{0.33}Si_4O_{10}(OH)_2$). One of the montmorillonite group of minerals that are principal constituents of bentonite (q.v.).

hedeoma oil (American pennyroyal oil; pulegium oil). Properties: Yellowish limpid essential oil; mint-like odor and taste. Sensitive to light. Soluble in two or more parts of 70% alcohol, ether and chloroform; slightly soluble in water; sp. gr. 0.925–0.940; refractive index 1.482. Combustible; low toxicity.

Chief constituent: Pulegone.

Derivation: Distilled from the leaves and tops of *Hedeoma pulegioides*.

Uses: Medicine; insectifuge; perfumery; manufacture of pulegone and its derivatives.

hedonal (methylpropylcarbinolurethane)

Properties: White crystalline powder; faint aromatic odor and taste; soluble in alcohol, ether, organic solvents; sparingly soluble in cold water; more soluble in hot water. Fusing point 76°C. B.p. 215°C.

Use: Medicine (sedative).

HEDTA. See hydroxyethylethylenediaminetriacetic acid.

Hehner number. The percent by weight of water-insoluble fatty acids in oils and fats.

Heisenberg, Werner K. (1901–1976). A native of Germany, Heisenberg received his doctorate from the University of Munich in 1923, after which he was closely associated for several years with Niels Bohr in Copenhagen. He was awarded the Nobel prize in physics in 1932 for his brilliant work in quantum mechanics. In 1946 he became Director of the Max Planck Institute. His notable contributions to theoretical physics, best known of which was the Uncertainty Principle, imparted new impetus to nuclear physics and made possible a better understanding of atomic structure and chemical bonding. See also uncertainty principle.

helenine. A nucleoprotein derived from the mold *Penicillium funiculosum* and used with some success as an antiviral drug.

Helianthine B. See methyl orange.

"Helindon."³⁰⁷ Trademark for vat dyestuffs used for dyeing wool.

"Helio."³⁰⁷ Trademark for organic dyestuffs, used for paints, lacquers, printing inks, wallpaper, coated paper, rubber and organic plastics.

"Heliogen."³⁰⁷ Trademark for phthalocyanine dyestuffs used for paint, lacquers, printing inks, wallpaper, coated paper, rubber, and plastics.

heliotropyl acetate. See piperonyl acetate.

"He-Li-Ox" 500 Series.³²⁹ Trademark for a series of PVC heat stabilizers for extruding, injection molding, calendaring, and blow molding. All ingredients conform to F.D.A. requirements for food packaging.

"Heliozone."⁷²⁸ Trademark for a blend of waxy material used to retard sun checking and cracking of rubbers.

helium He Inert element of atomic number 2; first element in the noble gas group of the periodic table. Atomic weight 4.0026; valence 0 (not known to combine with any other element). Helium nuclei are alpha particles (q.v.). Most important isotope is helium-3.

Properties: Colorless, noncombustible gas; odorless and tasteless; liquefies at 4.2°K to form helium I; at

2.2°K there is a transition (lambda) point at which helium II is formed (see below). B.p. -268.9°C (1 atm); f.p. -272.2°C (25 atm) lowest of any substance. Density 0.1785 g/l, or 0.138 (air = 1) at 0°C. Very slightly soluble in water; insoluble in alcohol. Rate of diffusion through solids is 3 times that of air. Helium is an asphyxiant gas. See also noble gas.

Occurrence: Texas, Oklahoma, Kansas, New Mexico, Arizona, Canada. Originally discovered in sun's atmosphere and recently confirmed in atmosphere of Jupiter.

Derivation: From natural gas, by liquefaction of all other components, followed by purification over activated charcoal.

Grades: U.S.P.; technical; 99.995% pure.

Containers: (compressed gas) Cylinders; tank cars; semitrailers; (liquid) vacuum-insulated semitrailers; pipeline.

Uses: To pressurize rocket fuels; welding; inert atmospheres (growing germanium and silicon crystals); inflation of weather and research balloons; heat-transfer medium; leak detection; chromatography; cryogenic research; magnetohydrodynamics; luminous signs; geological dating; aerodynamic research; diving and space vehicle breathing equipment. Possible future uses include coolant for nuclear fusion power plants and in superconducting electric systems. Shipping regulations: (gaseous) (Rail) Green label; (Air) Nonflammable Gas label; (liquid, nonpressurized) (Air) Not acceptable; (liquid, pressurized) (Air) Nonflammable Gas label. Not acceptable on passenger planes; (liquid, low-pressure) (Air) No label required. Helium-oxygen mixtures Green label; (Air) Nonflammable Gas label.

Note: Liquid helium has unique thermodynamic properties too complex to be adequately described here. Liquid helium I has refractive index 1.026, sp. gr. 0.125, and is called a "quantum fluid" because it exhibits atomic properties on a macroscopic scale. Its b.p. is near absolute zero and viscosity is 25 micropoises (water = 10,000). See also superconductivity. Helium II, formed on cooling helium I below its transition point, has the unusual property of "superfluidity," extremely high thermal conductivity, and viscosity approaching zero.

"Helix" Rosin.⁷⁹ Trademark for a specially processed pale limed wood rosin; contains very little free lime. Uses: Linoleum print paint; varnish-air drying; varnish-baking; varnish-gloss oil; printing ink.

"Heloplex."⁸⁵ Trademark for the sodium bisulfite complex of heliotropin

$$[(\text{CH}_2\text{O})_6\text{C}_6\text{H}_3\text{CH}(\text{OH})\text{SO}_3\text{Na} \text{ (bicyclic)}]$$
 Properties: Dry, white to gray powder; slightly soluble in water.

Containers: 100-lb fiber drums.

Use: Zinc plating industry for compounding of brighteners.

HEMA. See hydroxyethyl methacrylate.

hematein $\text{C}_{16}\text{H}_{12}\text{O}_6$. A tetracyclic compound. An oxidation product of hematoxylin, the coloring principle of logwood. Not to be confused with hematin.

Properties: Dark purple solid; m.p. > 320°C; insoluble in water; slightly soluble in alcohol and ether; soluble in dilute sodium hydroxide giving a bright red color; soluble in ammonia with brownish-violet color.

Derivation: By adding ammonia to logwood extract and exposing to air.

Use: Indicator; biological stain.

hematin $C_{34}H_{32}N_4 \cdot FeOH$. The hydroxide of heme (q.v.). Not to be confused with hematein.

Properties: Blue to brown-black powder; decomposes at $200^\circ C$ without melting; soluble in alkalies; hot alcohol or ammonia; slightly soluble in hot pyridine; insoluble in water, ether and chloroform.

Derivation: By dissolving hemin in dilute potassium hydroxide, precipitating with acetic acid and recrystallizing from pyridine.

Use: Biochemical research.

hematite, red (red iron ore; bloodstone). Iron oxide (Fe_2O_3), with impurities.

Properties: Brilliant black to blackish red or brick red mineral with brown to cherry red streak and metallic to dull luster. Sp. gr. 4.9–5.3; Mohs hardness about 6. Noncombustible, except as powder.

Uses: The most important ore of iron. Also certain varieties are used as paint pigments and for rouge.

See also iron oxide reds and ferric oxide.

hematoporphyrin $C_{34}H_{38}O_6N_4$. Deep red crystals; soluble in alcohol; sparingly soluble in ether; insoluble in water. Obtained from hemin or hematin by the action of strong acids. It is nontoxic and is reported to be preferentially absorbed by cancerous tissues, making them fluoresce under ultraviolet light.

Use: Medical and biochemical research.

heme (hem) $C_{34}H_{32}FeN_4O_4$. The nonprotein portion of hemoglobin and myoglobin, consisting of reduced (ferrous) iron bound to protoporphyrin (see porphyrin, hemin).

Use: Medical and biochemical research.

hemel. Generic name for hexamethylmelamine (HMM) $C_3N_3[N(CH_3)_2]_3$ (cyclic).

Properties: Solid; insoluble in water; soluble in acetone.

Use: Chemosterilant for insects.

hemicellulose. Cellulose (q.v.) having a degree of polymerization of 150 or less. A collective term for beta and gamma cellulose. The pure form is obtained from corn grain hulls. It is not an important component of cellulosic products and is of chiefly theoretical interest. Hemicellulose obtained by treating a mixture of hard- and softwoods with steam has been used as an animal feed supplement.

hemimellitene (1,2,3-trimethylbenzene) $C_6H_3(CH_3)_3$. Liquid; sp. gr. 0.8944 ($20/4^\circ C$); f.p. $-25.5^\circ C$; b.p. $176^\circ C$. Insoluble in water; soluble in alcohol. Occurs in some petroleum. Combustible.

hemin (Teichmann's crystals) $C_{34}H_{32}N_4O_4FeCl$. The chloride of heme.

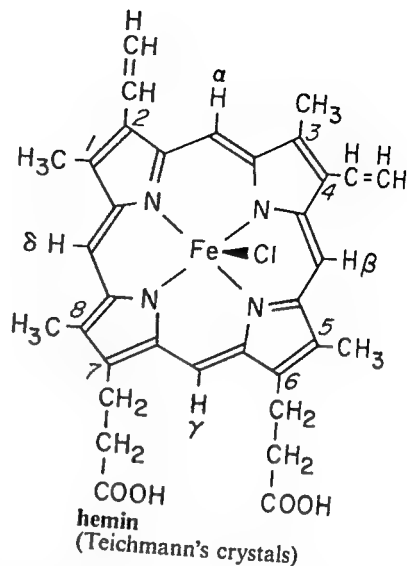

Properties: Crystals which are brown by transmitted light and steel blue by reflected light. Sinters at $240^\circ C$. Freely soluble in ammonia water; soluble in strong organic bases; insoluble in carbonate solutions, dilute acid solutions; insoluble but stable in water.

Derivation: By heating hemoglobin with acetic acid and sodium chloride.

Use: Identification of blood stains; biochemical research.

hemisulfur mustard (2-chloroethyl methyl sulfide) $CICH_2CH_2SCH_3$.

Properties: Liquid; sp. gr. 1.1155 ($20/4^\circ C$); b.p. $138^\circ C$ (744 mm); refractive index ($n_{20/D}$) 1.4908. Soluble in fat solvents. Characteristic mustard odor.

Hazard: Highly toxic. Irritating to skin, eyes, and mucous membranes.

Use: Medicine.

hemoglobin (Hb). Approximate formula (molecular weight 65,000): $(C_{738}H_{1166}FeN_{208}S_2)_4$. The respiratory protein of the red blood cells; it transfers oxygen from the lungs to the tissues and carbon dioxide from the tissues to the lungs. Its affinity for carbon monoxide is over 200 times that for oxygen.

Hemoglobin is a conjugated protein consisting of approximately 94% globin (protein portion) and 6% heme (q.v.). Each molecule can combine with one molecule of oxygen to form oxyhemoglobin (HbO_2). The iron (in the heme portion) must be in the reduced (ferrous) state to enable the hemoglobin to combine with oxygen.

Oxyhemoglobin is available commercially as a brownish red powder or crystals; soluble in water. Used in medicine; usually called hemoglobin.

hemp. Soft, white fibers, 3–6 ft long, obtained from the stems of *Cannabis sativa*. It is coarser than flax but stronger, more glossy, and more durable than cotton. Combustible, not self-extinguishing. See also abaca.

Sources: Central Asia, Italy, U.S.S.R., India, U.S.

Hazard: May ignite spontaneously when wet.

Use: Blended with cotton or flax in toweling and heavy fabrics; twine; cordage; packing.

See also cannabis.

hempa. Generic name for hexamethylphosphoric triamide (hexamethylphosphoramide; HMPA) $[N(CH_3)_2]_3PO$.

Properties: Water-white liquid, mild amine odor; soluble in water and polar and nonpolar solvents; b.p. 230 – $232^\circ C$ (739.4 mm); sp. gr. 1.021 ($60/60^\circ F$). Combustible.

Hazard: Toxic; a carcinogen.

Uses: Ultraviolet inhibitor in polyvinyl chloride; chemosterilant for insects; promoting stereospecific reactions; specialty solvent.

hempseed oil. A drying oil similar in properties and uses to linseed. Nontoxic and edible. Iodine value about 160; sp. gr. 0.923; refractive index 1.470–1.472. Contains about 10% saturated fatty acids (palmitic and stearic); unsaturated acids present are linoleic, linolenic, and oleic. Saponification value

190-193. Produced chiefly in U.S.S.R., southern Europe, Japan, Chile; little in U.S. Combustible.

henda-compounds. See corresponding unde-compound.

n-heneicosanoic acid $\text{CH}_3(\text{CH}_2)_{19}\text{COOH}$. A saturated fatty acid not normally found in natural fats or waxes. White crystalline solid; m.p. 74.3°C . Synthetic product available for organic synthesis; 99% purity. Combustible.

henequen. Hard, strong, reddish fibers obtained from the leaves of *Agave fourcroydes*. It is similar to sisal but coarser and stiffer. Combustible. Denier ranges from 300 to 500.

Source: Mexico, Cuba.

Use: Binder twine; cordage.

"Hennig Purifier."¹⁷⁷ Trademark for a preparation having a soda-ash base and other materials. Produced as walnut-sized briquettes. Packed in 100-lb paper bags. Used as a ladle addition to produce cleaner steel by aiding in removal of dissolved oxides and silicates and fluxing non-metallic inclusions to slag.

Henry's law. When a liquid and a gas remain in contact, the weight of the gas that dissolves in a given quantity of liquid is proportional to the pressure of the gas above the liquid. Thus if air is kept in contact with water at standard atmospheric pressure, each kilogram of water dissolves 0.017 gram of oxygen at 20°C ; if this pressure is halved (by doing the experiment at high altitude where the pressure is only half an atmosphere) the water dissolves only 0.0085 gram of oxygen. The law holds true only for equilibrium conditions, i.e., when enough time has elapsed so that the quantity of gas dissolved is no longer increasing or decreasing.

hentriacontane. $\text{C}_{31}\text{H}_{64}$ or $\text{CH}_3(\text{CH}_2)_{29}\text{CH}_3$. Properties: Crystals; sp. gr. 0.781 (68°C); b.p. 302°C (15 mm); m.p. 68°C . Combustible.

HEOD. See dieldrin.

heparin. A complex organic acid (mucopolysaccharide) present in mammalian tissues; a strong inhibitor of blood coagulation. A dextrorotatory polysaccharide built up from hexosamine and hexuronic acid units containing sulfuric acid ester groups. Precise chemical formula and structure uncertain; a formula of $(\text{C}_{12}\text{H}_{16}\text{NS}_2\text{Na})_{20}$ and molecular weight of 12000 have been suggested for sodium heparinate.

Properties: White or pale-colored, amorphous powder; nearly odorless, hygroscopic; soluble in water; insoluble in alcohol, benzene, acetone, chloroform, and ether; pH in 17% solution between 5.0 and 7.5.

Derivation: Animal livers or lungs.

Grade: U.S.P.

Use: Medicine; biochemical research; rodenticides.

heptabarbital (5-[1-cyclohepten-1-yl]-5-ethylbarbituric acid; 5-ethyl-5-cycloheptenylbarbituric acid) $\text{C}_{13}\text{H}_{18}\text{N}_2\text{O}_3$.

Properties: White, odorless crystalline powder; slightly bitter taste. M.p. 174°C . Very sparingly soluble in water; slightly soluble in alcohol; soluble in alkaline solutions. Forms water-soluble sodium, magnesium and calcium salts.

Use: Medicine. See also barbiturate.

heptachlor $\text{C}_{10}\text{H}_7\text{Cl}_7$. Generic name for 1,4,5,6,7,8,8-heptachloro-3a, 4, 7, 7a-tetrahydro-4, 7-methanoindene.

Properties: White to light tan, waxy solid; m.p. $95-96^\circ\text{C}$; sp. gr. 1.57-1.59. Insoluble in water; soluble in xylene, and alcohol.

Containers: Drums.

Hazard: Toxic by ingestion, inhalation and skin absorption. Tolerance, 0.5 mg per cubic meter of air. Use has been restricted. May be carcinogenic.

Use: Insecticide.

heptachlorepoxyde $\text{C}_{10}\text{H}_9\text{Cl}_7\text{O}$. A degradation product of heptachlor which also acts as an insecticide.

heptachlorotetrahydromethanoindene. See heptachlor.

n-heptacosane $\text{C}_{27}\text{H}_{56}$ or $\text{CH}_3(\text{CH}_2)_{25}\text{CH}_3$.

Properties: Crystals; soluble in alcohol; insoluble in water; sp. gr. 0.804; b.p. 270°C (15 mm); m.p. 59.5°C . Combustible.

n-heptadecane $\text{C}_{17}\text{H}_{36}$ or $\text{CH}_3(\text{CH}_2)_{15}\text{CH}_3$.

Properties: Leaflets; soluble in alcohol; insoluble in water; sp. gr. 0.778; b.p. 303°C ; m.p. 22.5°C . Combustible.

n-heptadecanoic acid (margaric acid)

$\text{CH}_3(\text{CH}_2)_{15}\text{COOH}$. A saturated fatty acid not normally found in natural fats or waxes.

Properties: Colorless crystals; m.p. 61°C ; sp. gr. 0.8355 ($90.6/4^\circ\text{C}$); b.p. 363.8°C , 230.7°C (16 mm); refractive index 1.4324 (70°C). Soluble in alcohol and ether; insoluble in water. Available as a 99% pure synthetic product.

Uses: Organic synthesis.

heptadecanol. Any saturated C_{17} alcohol. See, for example, *n*-heptadecanol and 3,9-diethyl-6-tridecanol. Combustible; low toxicity.

n-heptadecanol $\text{C}_{17}\text{H}_{35}\text{OH}$.

Properties: Colorless liquid. Slightly soluble in water; sp. gr. 0.8475 ($20/20^\circ\text{C}$); b.p. 308.5°C ; vapor pressure <0.01 mm (20°C); flash point 310°F ; wt/gal 7.1 lb (20°C). Combustible. Low toxicity.

Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Organic synthesis; plasticizer; intermediates; perfume fixatives; soaps and cosmetics; manufacture of wetting agents and detergents.

2-(8-heptadecenyl)-2-imidazoline-1-ethanol. See amine 220.

2-heptadecylglyoxalidine (2-heptadecylimidazoline)

$\text{C}_{20}\text{H}_{40}\text{N}_2$ or $\text{C}_{17}\text{H}_{35}\text{C}_3\text{H}_5\text{N}_2$.

Properties: Waxy solid; m.p. 85°C ; b.p. 200°C (2 mm); slightly soluble in water; soluble in alcohol, benzene; hydrolyzes on standing to form *N*-2-aminoethyl stearamide. Combustible.

Derivation: By reacting stearic acid with ethylene diamine.

Use: Fungicide.

2-heptadecylglyoxalidine acetate. See glyodin.

2-heptadecylimidazoline. See 2-heptadecylglyoxalidine.

2-heptadecyl-2-imidazoline acetate. See glyodin.

heptafluorobutyric acid (perfluorobutyric acid)

$\text{C}_3\text{F}_7\text{COOH}$.

Properties: Colorless hygroscopic liquid with sharp odor. B.p. 120°C (735 mm); f.p. -17.5°C ; sp. gr. 1.641 (25°C); refractive index (*n* 25/D) 1.290; surface tension 15.8 dynes/cm (30°C). Miscible with water, acetone, ether, and petroleum ether; soluble

in benzene and carbon tetrachloride; insoluble in carbon disulfide and mineral oil.

Derivation: By electrolysis of a solution of butyric acid in hydrogen fluoride.

Hazard: Irritant to tissue.

Uses: Intermediate; surfactant; acidulant.

"Heptagran."¹⁴⁷ Brand name for a granular insecticide containing 2½, 10, or 25% heptachlor.

Hazard: Toxic. See heptachlor.

heptaldehyde. See heptanal.

heptalin acetate. See methylcyclohexanol acetate.

heptamethylene. See cycloheptane.

heptamethylnonane $C_{16}H_{34}$. Isomer of cetane (hexadecane); ignition value 15 on cetane-alpha-methylnaphthalene scale. In 1964 it replaced alpha-methylnaphthalene as ignition standard for diesel fuels.

Hazard: Flammable, moderate fire risk.

heptanal (heptaldehyde; enanthaldehyde; aldehyde C-7) $C_7H_{14}CHO$.

Properties: Oily, colorless liquid; penetrating fruity odor. Hygroscopic. Soluble in 3 volumes of 60% alcohol; slightly soluble in water, soluble in ether. Sp. gr. 0.814-0.819; refractive index 1.42; m.p. 43°C; b.p. 153°C. Combustible.

Derivation: Castor oil, from decomposition of the ricinoleic acid glyceride.

Containers: Up to 55-gal drums.

Uses: Manufacture of 1-heptanol; organic synthesis; perfumery; pharmaceuticals; flavoring.

heptane (dipropylmethane) $CH_3(CH_2)_5CH_3$.

Properties: Volatile, colorless liquid; freezing point -90.595°C; b.p. 98.428°C; refractive index (n 20/D) 1.38764; sp. gr. 0.68368 (20°C); flash point 25°F (closed cup). Soluble in alcohol, ether, chloroform; insoluble in water. Distillation range 200-210°F; vapor pressure 2.0 psi absolute (100°F) (max); color, Saybolt +30 (min); maximum sulfur content 0.01 wt %; corrosion, passes ASTM D 130-30 test; autoignition temp. 433°F.

Derivation: Fractional distillation of petroleum. Purified by rectification.

Grades: Commercial; 99%; spectro; ASTM reference fuel; research, 99.92 mole %.

Containers: Bottles; drums; special tank cars.

Hazard: Flammable, dangerous fire risk; moderately toxic by inhalation. Tolerance, 500 ppm in air.

Uses: Standard for octane rating determinations (pure normal heptane has zero octane number); anesthetic; solvent; organic synthesis; preparation of laboratory reagents.

See also octane number.

Shipping regulations: (Rail) Red label (Air) Flammable Liquid label.

1,7-heptanedicarboxylic acid. See azelaic acid.

1,7-heptanedioic acid. See pimelic acid.

n-heptanoic acid (enanthic acid; n-heptylic acid; heptic acid) $CH_3(CH_2)_5COOH$.

Properties: Clear, oily liquid; unpleasant odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.9181 (20/4°C); f.p. -7.0°C; b.p. 221.9°C; refractive index 1.4229. Combustible; low toxicity.

Derivation: By oxidizing heptanal with potassium dichromate and sulfuric acid.

Uses: Organic synthesis; production of special lubricants for aircraft and brake fluids.

1-heptanol. See heptyl alcohol.

2-heptanol. See methyl amyl carbinol.

3-heptanol $CH_3CH_2CH(OH)C_4H_9$.

Properties: Liquid; sp. gr. (20°C) 0.8224; f.p. -70°C; b.p. 156.2°C; flash point 140°F (open cup); slightly soluble in water.

Containers: Cans, drums, tank cars.

Hazard: Moderately toxic by inhalation and ingestion. Moderate fire risk.

Uses: Flotation frother; solvent and diluent in organic coatings; intermediates.

2-heptanone. See methyl n-amyl ketone.

3-heptanone. See ethyl butyl ketone.

4-heptanone. See dipropyl ketone.

"Hepteen Base."²⁴⁸ Trademark for a heptaldehydeaniline reaction product.

Properties: Dark-brown, free-flowing liquid; sp. gr. 0.93; soluble in acetone, benzene, and ethylene dichloride; moderately soluble in gasoline; insoluble in water.

Hazard: Probably toxic by ingestion.

Uses: Rubber accelerator.

1-heptene (1-heptylene) C_7H_{14} or $CH_3(CH_2)_4CH=CH_2$.

Properties: Colorless liquid; sp. gr. 0.6968 (20/4°C); b.p. 93.3°C; f.p. -119.2°C; refractive index (n 20/D) 1.3994; soluble in alcohol, acetone, ether, petroleum, coal-tar solvents; insoluble in water.

Hazard: Probably flammable.

Grade: 95% purity.

Uses: Organic synthesis.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label; (Air) Flammable Liquid label.

2-heptene (2-heptylene) $CH_3(CH_2)_3CH=CHCH_3$. (cis and trans isomers).

Properties: Colorless liquid; sp. gr. (cis) 0.708, (trans) 0.704, (commercial) 0.7010-0.7050 (20/4°C); b.p. (trans) 98.0°C, (cis) 98.5°C, (commercial) 97-99°C; refractive index (n 20/D) 1.406; flash point (commercial) 28°F; soluble in alcohol, acetone, ether, petroleum, coal-tar solvents; insoluble in water. Low toxicity.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label; (Air) Flammable Liquid label.

3-heptene (3-heptylene) C_7H_{14} or $C_3H_7CH=CHC_2H_5$.

Properties: (mixed cis or trans isomers): Colorless liquid; b.p. 95°C; sp. gr. (60/60°F) 0.705; refractive index (20/D) 1.405; flash point 21°F.

Hazard: Flammable, dangerous fire risk.

Use: Suggested as plant growth retardant.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label; (Air) Flammable Liquid label.

heptene C_7H_{14} . A mixture of isomers.

Properties: Liquid. Sp. gr. (15.56/15.56°C) 0.711; b.p. 189.5°C.

Derivation: Olefin fraction produced by catalytic polymerization of propylene and butylene.

Containers: Up to tank cars.

Hazard: Flammable, dangerous fire risk.

Uses: Lubricant additive; catalyst; surfactants.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label; (Air) Flammable Liquid label.

heptoic acid. See heptanoic acid.

heptyl acetate $C_7H_{15}OOCCH_3$. Liquid with fruity odor.

Hazard: Experiments on animals indicate irritant properties.

Use: Artificial fruit essences.

heptyl alcohol (1-heptanol; enanthyl alcohol). $C_7H_{15}OH$. Properties: Colorless fragrant liquid; f.p. $-34.6^\circ C$; b.p. $175^\circ C$; sp. gr. 0.824 ($20/4^\circ C$); refractive index ($n_{20/D}$) 1.4233. Flash point $170^\circ F$. Combustible. Low toxicity.

Derivation: From heptaldehyde by reduction.

Containers: Up to 55-gal lined drums.

Uses: Organic intermediate, solvent, cosmetic formulations.

heptylamine $C_7H_{15}NH_2$.

Properties: Colorless liquid; sp. gr. 0.777 ($20/4^\circ C$); f.p. $-23^\circ C$; b.p. $155^\circ C$; flash point $140^\circ F$ (open cup); slightly soluble in water; soluble in alcohol or ether. Combustible.

heptyl formate $HCOOC_7H_{15}$.

Properties: Colorless liquid with fruity odor; b.p. $176.7^\circ C$; sp. gr. 0.894 ($0^\circ C$). Combustible.

Use: Artificial fruit essences.

heptyl heptoate $C_7H_5OOCCH_2H_{13}$.

Properties: Colorless liquid with fruty odor; sp. gr. 0.865 ($19^\circ C$); b.p. $273-274^\circ C$ (754 mm). Combustible.

Use: Artificial fruit essences.

n-heptylic acid. See heptanoic acid.

heptyl pelargonate $C_7H_{15}OOCCH_2H_{17}$.

Properties: Liquid, with pleasant odor; sp. gr. 0.866 ($15.5/15.5^\circ C$); b.p. $300^\circ C$; refractive index 1.4360. Combustible.

Uses: Flavors and perfumes.

"Hepzide."¹²³ Trademark for nithiazide for treatment of blackhead in turkeys and chickens.

"Herban."²⁶⁶ Trademark for norea; a preemergence herbicide.

"Herbandin."⁵⁰⁵ Trademark for an ester derived from petrochemicals.

Properties: Colorless oily liquid; sp. gr. 1.046; refractive index ($n_{20/D}$) 1.498; saponification value 245; acid value 0.7.

Use: Extension and support of lavandin oil.

herbicide (weed killer). A pesticide (q.v.), either organic or inorganic, used to destroy unwanted vegetation, especially various types of weeds, grasses, and woody plants. Until 1924 inorganics such as sodium chlorate, sodium chloride, ammonium sulfamate, arsenic, and boron compounds were used. At that time the more specific organics were introduced, typified by 2,4-dichlorophenoxyacetic acid (2,4-D). Herbicides may be of two major types: (1) selective, such as 2,4-D; 2,4,5-T; phenols; carbamates, and urea derivatives, permitting elimination of weeds without injury to the crop; and (2) nonselective, comprising soil sterilants (sodium compounds) and silvicides (ammonium sulfamate). The latter kill wood plants and trees. Some types act as overstimulating growth hormones. Many herbicides are highly toxic and should be handled and applied with care; use of chlorinated types may be restricted. See also defoliant.

"Herclor."²⁶⁶ Trademark for a group of specialty elastomers based on epichlorohydrin, claimed to have unique service performance properties. Uses include automotive and aircraft parts, wire and cable coating, seals and gaskets, packings, hose, belting, and coated fabrics. "Herclor H" is a homopolymer, and "Herclor C" a copolymer with ethyl-

ene oxide, both having high resistance to ozone, heat, solvents, and chemical attack.

"Hercoflat."²⁶⁶ Trademark for a polypropylene texturing agent.

"Hercoflex."²⁶⁶ Trademark for a series of plasticizers. 150. Di(n-octyl, n-decyl) phthalate.

290. Di(n-octyl, n-decyl) adipate.

600. High-boiling ester of pentaerythritol and a saturated aliphatic acid.

707. High molecular weight polyol ester. Used in high-temperature vinyl electrical insulation.

900. High molecular weight polyester plasticizer for polyvinyl acetate.

J15. Saturated aliphatic ester of pentaerythritol for plasticizing vinylidene chloride.

"Hercogel" A.²⁶⁶ Trademark for a water-resistant, plastic, ammonia gelatin. A permissible dynamite used under the most severe water conditions.

Hazard: High explosive.

"Hercolube."²⁶⁶ Trademark for synthetic lubricant base stocks derived from pentaerythritol esters of saturated fatty acids.

"Hercolyn" D.²⁶⁶ Trademark for a pale, viscous liquid, the hydrogenated methyl ester of rosin. Used as a plasticizing resin.

"Hercomix" 1.²⁶⁶ Trademark for premixed, prill- and fuel-oil nitrocarbonitrates used where water conditions are not too severe.

Hazard: High explosive.

"Herco."²⁶⁶ Trademark for high-quality pine oil; predominantly secondary and tertiary cyclic terpene alcohols.

Use: Odorant.

"Herculoid."²⁶⁶ Trademark for nitrocellulose containing 10.9 to 11.2% nitrogen. Used for pyroxylin plastics.

Hazard: See nitrocellulose.

"Herculon."²⁶⁶ Trademark for polypropylene olefin fibers. Available in bulked continuous and continuous multifilament yarns, staple, and uncut tow.

Uses: Apparel, home furnishings, and industrial applications.

"Heresite."¹⁷ Trademark for a series of pure phenol-formaldehyde resinous coatings and related products of the thermosetting type. Applied by spraying, dipping, or roller-coating, followed by curing at temperatures of approximately $400^\circ F$.

Uses: Anticorrosive lining for shipping containers, machinery and equipment for chemicals, food, drugs, and petroleum industries. Lining of tank cars for sulfuric acid and other corrosive chemicals.

heroin. See diacetylmorphine.

"Herrox."²⁸ Trademark for nylon filaments, used in brushes.

herring oil. See fish oil.

hesperidin $C_{28}H_{34}O_{15}$. A natural bioflavonoid of the flavanone group.

Properties: Fine needles. M.p. $258-262^\circ C$; soluble in dilute alkalis, pyridine; very slightly soluble in water, acetone, benzene, and chloroform. Tasteless.

Derivation: Extraction from citrus fruit peel.

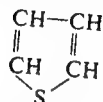

Uses: Synthetic sweetener research.

Hess's law. The heat evolved or absorbed in a chemical process is the same whether the process takes place in one or in several steps; also known as the law of constant heat summation.

"Het" Acids.⁶² Trademark for chlorendic acid (q.v.).

heteroaromatic. See heterocyclic.

heterocyclic. Designating a closed-ring structure, usually of either 5 or 6 members, in which one or more of the atoms in the ring is an element other than carbon, e.g., sulfur, nitrogen, etc. Examples are pyridine, pyrrole, furan, thiophene, and purine.

thiophene

pyridine

heterogeneous (Latin, "different kinds"). Any mixture or solution comprised of two or more substances, whether or not they are uniformly dispersed. Common examples are such diverse materials as air (a mixture of 1/5th oxygen and 4/5ths nitrogen), milk, marble, paint, gasoline, blood, mayonnaise. In all such cases the mixtures can be separated mechanically into their components. "Homogenized" milk is technically as heterogeneous as regular milk, and the term is, strictly speaking, a misnomer. See also homogeneous; mixture.

heterogeneous catalysis. See catalysis, heterogeneous.

heteromolybdates (heteropolymolybdates). A large group of complex molybdenum salts and acids in which the anion contains oxygen atoms and from 2 to 18 hexavalent molybdenum atoms, as well as one or more other metal or nonmetal atoms (phosphorus, arsenic, iron and tellurium). The latter are referred to as hetero atoms and any of about 35 elements may be present in this manner. Example: $\text{Na}_3\text{PMo}_{12}\text{O}_{40}$, sodium phospho-12-molybdate. The molecular weights of these compounds range up to 3000. The acids and most of the salts are very soluble in water, and the acids and some salts are soluble in organic solvents.

Uses: Phosphomolybdates and phosphotungstates are used as precipitants for basic dyes to form lakes and toners. The phospho- and silicomolybdate groups are of key importance in the functioning of certain enzymes. There are many uses in analytical chemistry.

HETP.

(1) Abbreviation for hexaethyl tetraphosphate.

(2) Abbreviation for height equivalent to a theoretical plate. It is the height of a distillation or fractionating column which gives a separation equivalent to that of a theoretical plate in the physical separation process involved. A theoretical plate is one that produces the same difference in composition as exists at equilibrium between two phases.

"Hetron."⁶² Trademark for a series of polyester resins.

hexabromoethane C_2Br_6 .

Properties: Yellowish-white, rhombic needles. Slightly soluble in water, alcohol. M.p. 149°C (decomposes with separation of bromine).

Derivation: Action of bromine on diiodoacetylene.

Use: Organic synthesis.

hexacalcium phytate. See calcium phytate.

hexachloroacetone (hexachloro-2-propanone)
 $\text{Cl}_3\text{CCOCCl}_3$.

Properties: Yellow liquid; b.p. 204°C ; f.p. -3°C ; sp. gr. 1.744 ($12/12^\circ\text{C}$); slightly soluble in water; soluble in acetone. Combustible.

Hazard: Moderately toxic by ingestion and inhalation; strong irritant. Evolves phosgene when heated.

Uses: Desiccant; herbicide.

hexachlorobenzene (perchlorobenzene) C_6Cl_6 .

Properties: White needles. Soluble in benzene and boiling alcohol; insoluble in water. M.p. 229°C ; b.p. 326°C . Combustible. Flash point 468°F .

Hazard: EPA recommends upper limit of 0.5 ppm in fatty tissues of cattle, pigs, and sheep, subject to change after further toxicological research. Previous work on laboratory animals had indicated a low level of toxicity. Do not confuse with benzene hexachloride.

Uses: Organic synthesis; fungicide for seeds; wood preservative.

hexachlorobutadiene C_4Cl_6 , or $\text{Cl}_2\text{C}:\text{CClCCl}:\text{CCl}_2$.

Properties: Clear, colorless liquid with mild odor; freezing range -19 to -22°C ; boiling range 210 – 220°C ; refractive index ($n_{20/D}$) 1.552 ($\pm .001$); flash point, none; sp. gr. 1.675 ($15.5/15.5^\circ\text{C}$); 13.97 lb/gal (15.5°C); purity 98% (min); vapor pressure 22 mm (100°C); 500 mm (200°C); viscosity (100°F) 2.447 cp; 1.479 centistokes; (210°F) 1.131 cp; 0.724 centistokes; insoluble in water; compatible with numerous resins; soluble in alcohol and ether. Nonflammable.

Containers: 55-gal steel drums.

Uses: Solvent for elastomers; heat-transfer liquid; transformer and hydraulic fluid; wash liquor for removing C_4 and higher hydrocarbons.

1,2,3,4,5,6-hexachlorocyclohexane (BHC; HCH; HCH: TBH: benzene hexachloride) $\text{C}_6\text{H}_6\text{Cl}_6$. A systemic insecticide. The gamma isomer is lindane.

Properties: White or yellowish powder or flakes; musty odor; color, odor, melting point vary with isomeric composition. Sp. gr. 1.87. Vapor pressure about 0.5 mm (60°C); stable toward moderate heat but decomposed by alkaline substances. Melting points of the pure isomers are: (alpha-trans) 157 – 158°C ; (beta-cis) 297°C (sublimes); (gamma) 112.5°C ; (delta) 138 – 139°C ; (epsilon) 217 – 219°C . Insoluble in water; soluble 100% alcohol, chloroform, and ether.

Derivation: Chlorination of benzene in actinic light.

Method of purification: Fractional crystallization.

The technical grade may run 10–15% gamma isomer, but can be brought up to 99% (lindane).

Grades: Technical (mixture of isomers); 25% gamma isomer; 99% gamma isomer (lindane).

Containers: Bags, fiber drums.

Hazard: Highly toxic by ingestion, moderately by inhalation. Absorbed by skin; strong irritant to skin and eyes. CNS depressant. Tolerance (lindane), 0.5 mg per cubic meter of air. Use may be restricted.

Uses: Component of insecticides toxic to flies, cockroaches, aphids, grasshoppers, wire worms, and boll weevils.

hexachlorocyclopentadiene (perchlorocyclopentadiene) C_5Cl_6 .

Properties: Pale yellow liquid; pungent odor. B.p. 239°C ; freezing point 9.6°C ; sp. gr. 1.717 ($15/15^\circ\text{C}$); wt/gal 14.30 lb (15.5°C); refractive index ($n_{25/D}$) 1.563; flash point, none. Nonflammable.

Grade: Technical.

Containers: 55-gal drums; tank cars.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.01 ppm in air.

Uses: Intermediate for resins, dyes, pesticides. fungicides, pharmaceuticals.

hexachlorodiphenyl oxide $C_{12}H_4Cl_6O$.

Properties: Light yellow, very viscous liquid. B.p. 230–260°C (8 mm); sp. gr. 1.60 (20/20°C); lb/gal 13.12 at 25°C; refractive index 1.621 (25°C); flash point, none. Soluble in methanol, ether. Very slightly soluble in water. Nonflammable.

Hazard: Probably toxic.

Uses: Solvent; intermediate.

1,1,1,4,4,4-hexachloro-1,4-disilabutane. See bis(trichlorosilyl)ethane.**hexachloroendomethylenetetrahydrophthalic acid.** See chlrendic acid.**hexachloroendomethylenetetrahydrophthalic anhydride.** See chlrendic anhydride.**hexachloroethane** (perchloroethane; carbon trichloride; carbon hexachloride) Cl_3CCl_3 .

Properties: Colorless crystals; camphor-like odor; sp. gr. 2.091; m.p. 185°C; b.p. sublimates at 185°C. Soluble in alcohol and ether; insoluble in water.

Hazard: Toxic by ingestion and inhalation. Strong irritant. Absorbed by skin. Tolerance, 1 ppm in air.

Uses: Organic synthesis; retarding agent in fermentation; camphor substitute in nitrocellulose; rubber accelerator; pyrotechnics and smoke devices; solvent; explosives.

hexachloromethylcarbonate (triphosgene) $(OCCl_3)_2CO$.

Properties: White crystals. Odor similar to that of phosgene. Decomposed by hot water and alkali hydroxides. Only slowly acted upon by cold water. Soluble in alcohol, benzene, ether. Sp. gr. 2 (approx); b.p. 205–206°C (partial decomposition); m.p. 78–79°C.

Derivation: Chlorination of dimethyl carbonate exposed to direct sunlight.

Hazard: Toxic; strong irritant to eyes and skin.

Use: Tear gas.

Shipping regulations: (Rail, Air) Tear gas materials, Poison label or Tear Gas label. Not acceptable on passenger planes.

hexachloromethyl ether $O(CCl_3)_2$.

Properties: Liquid. Phosgene-like odor. Sp. gr. 1.538 (18°C); b.p. 98°C (partial decomposition).

Derivation: Chlorination of dichloromethyl ether.

Hazard: Toxic; strong irritant to eyes and skin.

hexachloronaphthalene $C_{10}H_2Cl_6$.

Properties: White solid.

Hazard: Highly toxic by inhalation; strong irritant. Absorbed by skin. Tolerance, 0.2 mg per cubic meter of air.

hexachlorophene (2,2'-methylene bis-(3,4,6-trichlorophenol); bis-(3,5,6-trichloro-2-hydroxyphenyl)methane. $(C_6HCl_3OH)_2CH_2$).

Properties: White, free-flowing powder; odorless; m.p. 161–167°C. Soluble in acetone, alcohol, ether; chloroform; insoluble in water.

Derivation: Condensation of 3,4,5-trichlorophenol with formaldehyde in the presence of sulfuric acid.

Containers: Cans; drums.

Hazard: Toxic properties have caused FDA to prohibit its use unless prescribed by a physician.

Uses: Formerly as bactericide and bacteriostat.

hexachloro-2-propane. See hexachloroacetone.**hexachloropropylene** (hexachloropropene; perchloropropylene) $CCl_3CCl=CCl_2$.

Properties: Water-white liquid; b.p. 210°C; insoluble in water; miscible with alcohol, ether, chlorinated compounds.

Hazard: May be toxic.

Uses: Solvent; plasticizer; hydraulic fluid.

hexacotane $C_{60}H_{122}$. High molecular weight hydrocarbon.

Properties: Waxy solid. M.p. 101°C. Combustible; nontoxic.

hexacosanoic acid. See cerotic acid.**n-hexadecane** (cetane) $C_{16}H_{34}$.

Properties: Colorless liquid; sp. gr. 0.77335 (20/4°C); b.p. 286.5°C; m.p. 18.14°C; refractive index (n 20/D) 1.43435. Soluble in alcohol, acetone, ether; insoluble in water. Combustible. Autoignition temp. 401°F.

Grades: Technical; ASTM.

Uses: Solvent; organic intermediate; ignition standard for diesel fuels. See also cetane number.

hexadecanoic acid. See palmitic acid.**1-hexadecanol.** See cetyl alcohol.**hexadecanoyl chloride.** See palmitoyl chloride.**1-hexadecene** (cetene; alpha-hexadecylene)

$CH_3(CH_2)_{13}CH=CH_2$.

Properties: Colorless liquid; m.p. 4°C; b.p. 274°C; sp. gr. 0.784 (15/4°C); refractive index (n 20/D) 1.4441; insoluble in water; soluble in alcohol, ether, petroleum and coal-tar solvents. Combustible.

Derivation: Treatment of cetyl alcohol with phosphorus pentoxide.

Grade: 95% purity.

Uses: Organic synthesis.

cis-9-hexadecenoic acid. See palmitoleic acid.**6-hexadecenolide.** See ambrettolide.**hexadecyl mercaptan.** See cetyl mercaptan.**tert-hexadecyl mercaptan** $C_{16}H_{33}SH$.

Properties: Colorless liquid; unpleasant odor; boiling range (5 mm) 121 to 149°C; sp. gr. (60/60°F) 0.874; refractive index (n 20/D) 1.474; flash point 265°F. Combustible.

Containers: Drums and tank cars.

Hazard: Probably toxic.

Use: Polymer modification.

See also thiol.

1-hexadecylpyridinium chloride. See cetylpyridinium chloride.**hexadecyltrichlorosilane** $C_{16}H_{33}SiCl_3$.

Properties: Colorless to yellow liquid. B.p. 269°C; sp. gr. 0.996 (25/25°C); refractive index (n 25/D) 1.4568; flash point 295°F. Combustible.

Derivation: By Grignard reaction of silicon tetrachloride and hexadecylmagnesium chloride.

Grade: Technical.

Hazard: Highly toxic; strong irritant; evolves hydrochloric acid in presence of moisture.

Use: Intermediate for silicones.

Shipping regulations: (Rail) White label (Air) Corrosive label. Not acceptable on passenger planes.

hexadecyltrimethylammonium bromide. See cetyl trimethylammonium bromide.**1,4-hexadiene** C_6H_{10} or $CH_2:CHCH_2CH:CHCH_3$.

Properties: Colorless liquid; sp. gr. 0.6996 (20/4°C);

b.p. 64°C (745 mm); refractive index 1.4162 (20/D); flash point -6°F; insoluble in water.

Derivation: Reaction between ethylene and butadiene with a special catalyst.

Hazard: Highly flammable. Explosive limits in air 2 to 6.1%.

Use: As third monomer in EPDM synthetic elastomers.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

2,4-hexadienoic acid. See sorbic acid.

1,5-hexadiyne. See dipropargyl.

"Hexadow."²³³ Trademark for insecticide formulations containing benzene hexachloride.

Hazard: May be toxic.

hexa-2-ethylbutoxydisiloxane

$[(CH_3CH(C_2H_5)CH_2CH_2O)_3Si]_2O$.

Properties: Colorless oil; b.p. 195°C (0.2 mm). Combustible.

Derivation: Reaction of silicon tetrachloride, 2-ethylbutanol and water.

Uses: Aircraft hydraulic fluid.

hexaethyl tetraphosphate (HETP). A mixture of ethyl phosphates and ethyl pyrophosphate (TEPP).

Properties: Yellow liquid. Sp. gr. 1.26-1.28 (25/4°C); f.p. -90°C; refractive index 1.427; decomposes at high temperatures; soluble or miscible in water and many organic solvents except kerosine; hydrolyzes in low concentrations; hygroscopic.

Containers: 55-gal drums.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Cholinesterase inhibitor.

Use: Contact insecticide.

Shipping regulations: (Rail, Air) Poison label. Not acceptable on passenger planes. *Note:* Hexethyl tetraphosphate and compressed gas mixtures not accepted by air or by rail express. For details consult regulations.

hexafluoroacetone CF_3COCF_3 .

Properties: Colorless, hygroscopic, highly reactive gas. B.p. -27°C; f.p. -122°C; liquid density 1.33 g/ml (25°C). Reacts vigorously with water and other substances, releasing considerable heat. Nonflammable. Minimum purity 95%.

Containers: Compressed gas in steel cylinders.

Hazard: Highly toxic by inhalation. Tolerance, 0.1 ppm in air.

Use: Intermediate in organic synthesis.

Shipping regulations: (Rail) Poisonous gas, n.o.s., Poison Gas label. Not accepted by express. (Air) Nonflammable Gas label. Not acceptable on passenger planes.

hexafluorobenzene C_6F_6 . Liquid; b.p. 80.26°C; m.p. 5.2°C; sp. gr. 1.613. Combustible.

Use: Chemical intermediate; solvent in NMR spectroscopy.

hexafluoroethane (fluorocarbon 116) CF_3CH_3 .

Properties: A gas; b.p. -78.2°C. Sp. gr. 1.59. One of the most stable of all organic compounds. Insoluble in water; slightly soluble in alcohol. Nonflammable; nontoxic.

Grade: 99.6% pure.

Containers: Steel cylinders.

Uses: Dielectric and coolant; aerosol propellant; refrigerant.

Shipping regulations: (Air) Nonflammable Gas label.

hexafluorophosphoric acid HPF_6 .

Properties: (65% solution): Colorless, fuming liquid;

sp. gr. 1.81; m.p. 31°C ($6H_2O$). Stable in neutral and alkaline solutions.

Hazard: Highly toxic; strong irritant to tissue.

Uses: Metal cleaners, electrolytic or chemical polishing agents, for the formation of protective coatings for metal surfaces, and as a catalyst.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

hexafluoropropylene (perfluoropropene) $CF_3CF=CF_2$.

Properties: Gas; f.p. -156°C; b.p. -29°C; sp. gr. 1.583 (-40/4°C). Nonflammable.

Shipping regulations: (Rail) Green label. (Air) Nonflammable Gas label.

hexafluoropropylene epoxide (HFPO) $CF_2CF_2CF_2$.

Derivation: Oxidation of hexafluoropropylene with alkaline hydrogen peroxide at about -30°C.

Use: Monomer for HFPO polymers that are heat-resistant to 410°C, noncombustible and of low toxicity. See also "Freon E" and "Krytox."

hexafluorosilicic acid. See fluosilicic acid.

hexaglycerol. See trimethylolpropane; polyglycerol.

"Hexagon."³¹⁹ Trademark for grain alcohol, pure and specially denatured.

hexahydric alcohol. See mannitol, sorbitol, and dulcitol.

hexahydroaniline. See cyclohexylamine.

hexahydrobenzene. See cyclohexane.

hexahydrobenzoic acid (cyclohexanecarboxylic acid, a naphthenic acid) $C_6H_{11}COOH$.

Properties: Colorless monoclinic prisms; m.p. 31°C; b.p. 233°C; sp. gr. 1.048 (15/4°C); refractive index 1.4561 (33.8°C); slightly soluble in water, soluble in alcohol and ether.

Uses: Paint and varnish driers, drycleaning soaps, lubricating oils; stabilizer for rubber.

hexahydrocresol. See methylcyclohexanol.

hexahydromethylphenol. See methylcyclohexanol.

hexahydrophenol. See cyclohexanol.

hexahydrophthalic anhydride (1,2-cyclohexanedicarboxylic anhydride) $C_6H_{10}(CO)_2O$.

Properties: Clear, colorless, viscous liquid which becomes a glassy solid at 35-36°C; b.p. 158°C (17 mm); sp. gr. (40°C) 1.19; miscible with benzene, toluene, acetone, carbon tetrachloride, chloroform, ethanol and ethyl acetate; slightly soluble in petroleum ether.

Containers: 5-gal tins; 55-gal drums.

Hazard: Strong irritant to eyes and skin; toxic by inhalation.

Uses: Intermediate for alkyds, plasticizers, insect repellents and rust inhibitors; hardener in epoxy resins.

hexahydropyridine. See piperidine.

hexahydrotoluene. See methylcyclohexane.

hexahydro-1,3,5-trinitro-sym-triazine. See cyclonite.

hexahydroxycyclohexane. See inositol.

hexahydroxylene. See dimethylcyclohexane.

hexakis(methoxymethyl)melamine

$NC(NR)NC(NR)NC(NR)$ where $R = (CH_2OCH_3)_2$.

Uses: Crosslinking agent for alkyds, epoxies, celluloses and vinyls.

n-hexaldehyde (caproic aldehyde) $CH_3(CH_2)_4CHO$.

Properties: Colorless liquid. Sharp, aldehyde odor. Sp. gr. 0.8156 (20/20°C); b.p. 128.6°C; vapor pres-

sure 10.5 mm (20°C); flash point 90°F (open cup); wt/gal 6.9 lb (20°C); f.p. -56.3°C. Immiscible with water.

Grades: Technical.

Containers: 5-, 55-gal drums.

Hazard: Flammable, moderate fire risk.

Uses: Organic synthesis of plasticizers, rubber chemicals, dyes, synthetic resins, insecticides.

"Hexalin."²⁸ Trademark for cyclohexanol (usually shipped with 2.25% methanol as antifreeze).

Hazard: Toxic by ingestion.

hexamethonium chloride $(\text{CH}_3)_3\text{NCl}(\text{CH}_2)_6\text{NCl}(\text{CH}_3)_3$. Hexamethylenebis(trimethylammonium chloride).

Properties: White, crystalline, hygroscopic powder with faint odor. M.p. 289–292°C (dec); very soluble in water; soluble in alcohol, methanol and n-propanol; insoluble in chloroform and ether. Available commercially as unhydrated form or as dihydrate.

Use: Medicine.

hexamethylbenzene $\text{C}_{12}\text{H}_{18}$ or $\text{C}_6(\text{CH}_3)_6$.

Properties: Colorless plates; soluble in alcohol; insoluble in water. B.p. 265°C; m.p. 165.5°C. Combustible.

hexamethyldiaminoisopropanol diiodide. See propiodal.

hexamethyldisilazane (HMDS) $(\text{CH}_3)_3\text{SiNHSi}(\text{CH}_3)_3$.

Properties: Liquid; sp. gr. 0.77 (25°C); refractive index 1.4057 (25°C); b.p. 125°C; flash point 77°F. Soluble in acetone, benzene, ethyl ether, heptane, perchloroethylene. Reactive with methyl alcohol and water.

Purity: 99% min.

Hazard: Flammable, moderate fire risk.

Uses: Chemical intermediate; chromatographic packings.

hexamethylene. See cyclohexane.

hexamethylenediamine (1,6-diaminohexane)

$\text{H}_2\text{N}(\text{CH}_2)_6\text{NH}_2$.

Properties: Colorless leaflets; m.p. 39–42°C; b.p. 205°C; somewhat soluble in water, ethyl alcohol, and ether. Combustible.

Derivation: (1) Reaction of adipic acid and ammonia (catalytic vapor-phase) to yield adiponitrile, followed by liquid-phase catalytic hydrogenation.

(2) Chlorination of butadiene followed by reaction with sodium cyanide (cuprous chloride catalyst) to 1,4-dicyanobutylene, and hydrogenation.

Hazard: Toxic by ingestion; strong irritant to tissue.

Use: Formation of high polymers, e.g., nylon 66.

Shipping regulations: (Rail) (solution) White label. (Air) (solid or solution) Corrosive label.

hexamethylenediamine carbamate. See "Diak."

hexamethylene diisocyanate $\text{OCN}(\text{CH}_2)_6\text{NCO}$.

Properties: Liquid; sp. gr. 1.04 (25/15.5°C); flash point 284°F. Combustible.

Hazard: Probably toxic.

Use: Chemical intermediate.

1,6-hexamethylene glycol. See 1,6-hexanediol.

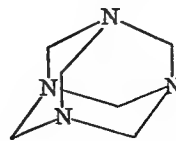

hexamethyleneimine $\text{C}_6\text{H}_{12}\text{NH}$ (cyclic).

Properties: Clear, colorless liquid with an ammonia-like odor; b.p. 138°C; f.p. -37°C; sp. gr. 0.8799 (20/4°C).

Use: Intermediate for pharmaceutical, agricultural, and rubber chemicals.

Shipping regulations: (Air) Corrosive label.

hexamethylenetetramine (methenamine; HMTA; aminoform; hexamine; erroneously "Hexamethyleneamine") $(\text{CH}_2)_6\text{N}_4$. A heterocyclic fused ring structure.

Properties: White crystalline powder, or colorless, lustrous crystals; practically odorless; sp. gr. 1.27 (25°C); soluble in water, alcohol, and chloroform; insoluble in ether; sublimes about 200°C, partly decomposing.

Derivation: Action of ammonia on formaldehyde.

Grades: Technical; N.F. (as methenamine).

Hazard: Moderately toxic; skin irritant. Flammable, dangerous fire risk.

Uses: Catalyst in phenolformaldehyde and resorcinol-formaldehyde resins; ingredient in rubber-to-textile adhesives; protein modifier; organic synthesis; pharmaceuticals; ingredient of high explosive cyclonite (q.v.); fuel tablets.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label.

hexamethylenetetramine mandelate (methenamine mandelate) $\text{C}_6\text{H}_{12}\text{N}_4 \cdot \text{C}_6\text{H}_5\text{CHOHCOOH}$.

Properties: White crystalline powder with sour taste; practically no odor; m.p. 127–130°C; very soluble in water; pH solutions 4; soluble in alcohol.

Grade: U.S.P. (as methenamine mandelate).

Use: Medicine.

hexamethylenetetramine salicylate (methenamine salicylate) $(\text{CH}_2)_6\text{N}_4 \cdot \text{C}_6\text{H}_4\text{OHCOOH}$.

Properties: White crystalline powder; pleasant acidulous taste; soluble in alcohol and water.

Use: Medicine.

1,1,2,3,3,5-hexamethylindan methyl ketone $\text{C}_{17}\text{H}_{24}\text{O}$. See "Phantolid."

hexamethylmelamine. See hemel.

hexamethylparosaniline chloride. See methyl violet.

hexamethylphosphoramide. See hempa.

hexamethylphosphoric triamide. See hempa.

hexamethyltetracosahexaene. See squalene.

hexamethyltetracosane. See squalane.

hexamine. See hexamethylenetetramine.

hexanaphthene. See cyclohexane.

n-hexane $\text{CH}_3(\text{CH}_2)_4\text{CH}_3$.

Properties: Colorless, volatile liquid; faint odor; sp. gr. 0.65937 (20/4°C); b.p. 68.742°C; f.p. -95°C; refractive index (n_D 20/D) 1.37486; flash point -9°F. Autoignition temp. 500°F. Soluble in alcohol, acetone and ether; insoluble in water.

Derivation: By fractional distillation from petroleum (molecular sieve process).

Containers: Bottles; drums; special tank cars.

Grades: 85%, 95%, 99%, spectro, research, and nano-grade.

Hazard: Flammable, dangerous fire risk. Moderately toxic by inhalation and ingestion. Tolerance, 500 ppm in air.

Uses: Solvent, especially for vegetable oils; low temperature thermometers; calibrations; polymerization reaction medium; paint diluent; alcohol denaturant. Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

hexanedioic acid. See adipic acid.

1,6-hexanediol (1,6-hexamethylene glycol)
 $\text{CH}_2\text{OH}(\text{CH}_2)_4\text{CH}_2\text{OH}$.

Properties: Water-white liquid; m.p. 41–42°C; b.p. 244°C; density 0.9531 g/cc (50°C); miscible with water and isopropyl alcohol; flash point 266°F. Combustible. Low toxicity.

Uses: Solvent; resin intermediate; coupling agent.

hexanedione-2,5. See acetylacetone.

1,2,6-hexanetriol

$\text{HOCH}_2\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$.

Properties: Water-white liquid; sp. gr. 1.1063; sets to glass below –20°C (f.p. under controlled conditions 32.8°C); b.p. at 5 mm 178°C; flash point 380°F; miscible with water. Combustible. Low toxicity.

Containers: Cans.

Uses: Alkyd and polyester resin intermediate; softener, moistening agent, and solvent.

hexanitrodiphenyl amine (hexil; hexyl; hexite; dipicrylamine) $(\text{NO}_2)_3\text{C}_6\text{H}_2\text{NHC}_6\text{H}_2(\text{NO}_2)_3$.

Properties: Yellow solid; m.p. 238–244°C; decomposes violently at higher temperatures; insoluble in water, and alcohol; soluble in alkalies and warm acetic or nitric acid.

Derivation: Nitration of diphenylamine; also from dinitrochlorobenzene.

Hazard: Explodes on shock or exposure to heat. Dangerous.

Uses: Booster explosive; analysis for potassium.

Shipping regulations: (Rail) Consult regulations. (Air) Dry or wet with less than 10% water. Not acceptable; wet with not less than 10% water. Flammable Solid label.

hexanitrodiphenyl sulfide (dipicryl sulfide)
 $[(\text{NO}_2)_3\text{C}_6\text{H}_2]_2\text{S}$.

Properties: Golden-yellow leaflets; m.p. 234°C; non-toxic. Sparingly soluble in alcohol and ether; more soluble in glacial acetic acid and acetone.

Derivation: Interaction of picryl chloride and sodium thiosulfate in alcohol solution in the presence of magnesium carbonate.

Hazard: Explodes on shock or exposure to heat. Dangerous.

Use: High explosive.

Shipping regulations: (Rail) Not accepted by express. Consult regulations. (Air) Explosives, n.o.s., Not acceptable.

hexanitromannite. See mannitol hexanitrate.

hexanoic acid. Legal label name for caproic acid (q.v.).

1-hexanol. See hexyl alcohol.

2-hexanone. See methyl n-butyl ketone.

3-hexanone (ethyl propyl ketone) $\text{C}_2\text{H}_5\text{CO}(\text{CH}_2)_2\text{CH}_3$.
Properties: Colorless liquid; b.p. 124°C; sp. gr. 0.813 at 22°C. Combustible.

Hazard: Moderately toxic by ingestion and inhalation; strong irritant. Moderate fire risk.

Uses: Solvent.

hexanoyl chloride $\text{CH}_3(\text{CH}_2)_4\text{COCl}$.

Properties: Colorless liquid, b.p. 151–153°C; refractive index 1.4867 (n_D 20/D); decomposed by water and alcohol; soluble in ether and chloroform. Combustible.

Use: Chemical intermediate.

hexaphenyldisilane $[(\text{C}_6\text{H}_5)_3\text{Si}]_2$.

Properties: White powder; m.p. 352 °C.

Derivation: Sodium condensation of triphenylchlorosilane.

Use: High-temperature applications.

“Hexaphos.”⁵⁵ Trademark for a glassy phosphate of high molecular weight having superior water-softening properties.

Uses: Water-softening; boiler-scale control; component of cleansers; laundry mixes, dishwashing compounds, pitch control in pulp industry, prevention of lime soap deposits in textile operations.

hexatriacontane $\text{C}_{36}\text{H}_{74}$.

Properties: Waxy solid. Combustible. Nontoxic. Sp. gr. 0.797; m.p. 75°C. See also paraffin wax.

“Hex-Cem.”¹⁴⁸⁰ Trademark for liquids and pastes of octoates of calcium, cobalt, iron, lead, manganese, nickel and zinc.

Uses: Driers for paint and printing inks.

1-hexene (hexylene) $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}=\text{CH}_2$.

Properties: Colorless liquid; sp. gr. 0.6734 (20/4°C); b.p. 63.55°C; f.p. –139.8°C; refractive index (in 20/D) 1.3876; flash point –15°F. Insoluble in water; soluble in alcohol.

Grades: 95%, 99%; research.

Hazard: Highly flammable, dangerous fire risk; moderately toxic and irritant.

Uses: Synthesis of flavors, perfumes, dyes, resins; polymer modifier.

Shipping regulations. (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable liquid, n.o.s., Flammable Liquid label.

2-hexene $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}=\text{CHCH}_3$.

Properties (of mixed cis and trans isomers): Colorless liquid; b.p. 68°C; f.p. –146°C; refractive index (20/D) 1.3948; sp. gr. (60/60°F) 0.686; flash point –5°F. Low toxicity. Insoluble in water; soluble in alcohol.

Grades: 95%; 99%.

Hazard: Highly flammable; dangerous fire risk.

Uses: Chemical intermediate.

Shipping regulations: See 1-hexene.

5-hexene-2-one. See allylacetone.

hexenol (leaf alcohol) $\text{C}_6\text{H}_{11}\text{OH}$.

Properties: Liquid; odor of green leaves. B.p. 156°C; refractive index 1.438; sp. gr. 0.85. Combustible.

Occurrence: Grasses, leaves, herbs, tea, etc.

Uses: Odorant in perfumery.

hexestrol $\text{HOC}_6\text{H}_4\text{CH}(\text{C}_2\text{H}_5)\text{CH}(\text{C}_2\text{H}_5)\text{C}_6\text{H}_4\text{OH}$, para-para'-(1,2-Diethylethylene)diphenol. A nonsteroid synthetic estrogen.

Properties: Odorless, white crystalline powder; m.p. 185–188°C. Soluble in ether, acetone, alcohol, and methanol; practically insoluble in water. Sensitive to light.

Derivation: From anethole; by reaction of diacetyl peroxide on para-methoxy-n-propylbenzene.

Use: Medicine.

hexetidine $\text{C}_{21}\text{H}_{45}\text{N}_3$. 5-Amino-1,3-bis(beta-ethylhexyl)-5-methylhexahydropyrimidine.

Properties: Liquid; sp. gr. 0.860–0.875 (25/25°C); b.p. 172–176°C (1 mm); refractive index (n_D 25/D) 1.460–1.466. Soluble in methanol, benzene, petroleum ether; insoluble in water. Combustible.

Grades: Technical; N.D.

Uses: Fungicide, bactericide, algicide; antistatic agent for synthetics; insect repellent; medicine.

hexil. See hexanitrodiphenyl amine.

hexite. See hexanitrodipheyl amine.

hexobarbital (N-methyl-5-cyclohexenyl-5-methylbarbituric acid) $C_{12}H_{16}N_2O_3$.

Properties: White crystals; m.p. 145–147°C.

Use: Medicine (sedative)

See also barbiturate.

"Hexogen."²³⁰ Trademark for a series of paint driers made with odorless solvents, essentially solutions of metallic salts of 2-ethylhexoic acid. Supplied in a variety of high metal concentrations including calcium 4%, calcium 5%, cobalt 6%, lead 24%, manganese 6%, iron 6%, and zinc 8%.

hexoic acid. See caproic acid.

hexokinase. An enzyme which catalyzes the formation of adenosine diphosphate and hexose-6-phosphate from adenosine triphosphate, and glucose or fructose.
Use: Biochemical research.

hexone. See methyl isobutyl ketone.

hexyl. (1) The straight-chain group C_6H_{13} . (2) Hexanitrodiphenyl amine (q.v.)

hexyl acetate. $CH_3COOC_6H_{13}$.

Properties: Colorless liquid; sweet ester odor; insoluble in water; very soluble in alcohol or ether. B.p. 169.2°C; sp. gr. 0.890. Combustible.

Derivation: From primary and sec-hexyl alcohols.

Uses: Solvent for cellulose esters and other resins; spray base.

sec-hexyl acetate. See methyl amyl acetate.

hexyl alcohol (1-hexanol; amyl carbinol)

$CH_3(CH_2)_4CH_2OH$.

Properties: Colorless liquid; sp. gr. 0.8186; f.p. -51.6°C; b.p. 157.2°C; wt/gal 6.8 lb (20°C); refractive index 1.469 (25°C); flash point 149°F (TOC); autoignition temp. 559°F. Slightly soluble in water; soluble in alcohol and ether. Combustible; low toxicity.
Derivation: (a) By reduction of ethyl caproate; (b) from olefins by the Oxo process.

Grades: Technical (90–99%); purified (99.8%).

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Uses: Pharmaceuticals (introduction of hexyl group into hypnotics, antiseptics, perfume esters, etc.); solvent; plasticizer; intermediate for textile and leather finishing agents.

n-hexylamine $CH_3(CH_2)_5CH_2N$.

Properties: Water-white; amine odor; boiling range 126–132°C; f.p. -21°C; sp. gr. 0.767 (20/20°C); refractive index 1.419 (20°C); flash point 85°F (open cup). Slightly soluble in water. Low toxicity.

Hazard: Flammable, moderate fire risk.

n-hexyl bromide (1-bromohexane) $CH_3(CH_2)_5Br$.

Properties: Colorless to slightly yellow liquid; sp. gr. 1.165 (20/20°C); b.p. 155.5°C; soluble in alcohol; esters, ethers; insoluble in water.

Grade: 96–98% pure.

Use: Intermediate, for introduction of hexyl group.

n-hexyl "Carbitol."²¹⁴ Trademark for diethylene glycol monohexyl ether (q.v.).

n-hexyl "Cellosolve."²¹⁴ Trademark for ethylene glycol monohexyl ether (q.v.).

hexyl cinnamaldehyde $C_6H_{13}C(CHO):CHC_6H_5$.

Properties: Pale yellow liquid; jasmin-like odor, particularly on dilution; sp. gr. 0.953–0.959 (25°C); refractive index 1.5480–1.5520 (20°C). Soluble in most

fixed oils and in mineral oil; insoluble in glycerin and in propylene glycol. Nontoxic; combustible.

Grade: F.C.C.

Use: Flavoring agent.

hexylene. See 1-hexene.

hexylene glycol (4-methyl-2,4-pentanediol)

$(CH_3)_2COHCH_2CHOHCH_3$. Colorless, nearly odorless liquid; sp. gr. 0.9216 (20/4°C); b.p. 198.3°C; refractive index (n 20/D) 1.4276; flash point (open cup) 215°F; wt/gal 7.69 lb. Miscible with water, hydrocarbons, and fatty acids. Combustible.

Containers: 5-, 55-gal drums; tank cars.

Hazard: Irritating to skin, eyes, and mucous membranes.

Uses: Hydraulic brake fluids; printing inks; coupling agent and penetrant for textiles; fuel and lubricant additive; emulsifying agent; inhibitor of ice formation in carburetor.

See also 1,6-hexanediol.

n-hexyl ether $C_6H_{13}OC_6H_{13}$.

Properties: Colorless liquid with characteristic odor. Very slightly soluble in water; sp. gr. 0.7942 (20/20°C); 6.6 lb/gal (20°C); f.p. -43.0°C; viscosity 1.68 cp (20°C); flash point 170°F. Combustible. Autoignition temp. 369°F.

Uses: Extraction processes; manufacture of collodion, photographic film, and smokeless powder.

hexylic acid. See caproic acid.

hexyl mercaptan $C_6H_{13}SH$.

Properties: Colorless liquid; b.p. 149–150°C (768 mm); sp. gr. 0.8450 (20/4°C); refractive index 1.4492 (n 20/D); unpleasant odor. Combustible.

Grades: 95% min purity.

Hazard: Moderately toxic.

Uses: Intermediates; synthetic rubber processing. See also thiol.

hexyl methacrylate $C_6H_{13}OOCCH_2CH_2CH_3$. Liquid; sp. gr. 0.88; b.p. 67–85°C (8 mm). Combustible.

Containers: Drums.

Uses: Monomer for plastics, molding powder, solvent coatings, adhesives, oil additives; emulsions for textile, leather, and paper finishing.

para-tert-hexylphenol $C_6H_{13}C_6H_4OH$.

Properties: Water-white liquid, faint phenol odor; sp. gr. 0.986 (20/20°C); boiling range 155–165°C; refractive index 1.520 (20°C); flash point 285°F. Combustible.

Uses: Organic synthesis; preparation of resinous condensation products.

hexylresorcinol (1,3-dihydroxy-4-hexylbenzene)

$C_6H_{13}C_6H_3(OH)_2$.

Properties: White to yellowish-white needle-shaped crystals with a faint, fatty odor and sharp, astringent taste which produces a sensation of numbness when placed on the tongue; slightly soluble in water; freely soluble in alcohol, glycerin, and vegetable oils; m.p. 62–67°C; b.p. 178–180°C (8 mm).

Grade: N.F.

Hazard: Irritant to respiratory tract and skin. Alcohol solutions are vesicant.

Containers: Bottles, fiber drums.

Use: Medicine.

hexyltrichlorosilane $C_6H_{13}SiCl_3$.

Properties: Colorless liquid with a sharp penetrating odor; fumes strongly in moist air. Combustible.

Hazard: Toxic by ingestion and inhalation. Strong irritant.

Use: Chemical intermediate.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

1-hexyne (butyl acetylene) $C_4H_9C\equiv CH$.

Properties: Water-white liquid with characteristic odor.

Sp. gr. 0.7152 (20/4°C); refractive index 1.3990 (20°C); b.p. 71.4°C; f.p. -132°C.

Hazard: Probably flammable.

hexynol (1-hexyn-3-ol) $CH_3(CH_2)_3CHOHC\equiv CH$.

Properties: Light yellow liquid with strong odor; b.p. 142°C; sp. gr. (20/20°C) 0.882; slightly soluble in water, and miscible with most hydrocarbons, chlorinated solvents, ketones, alcohols and glycols.

Containers: 7-, 35- and 380-lb drums.

Hazard: Probably flammable. Toxic by ingestion and inhalation; absorbed by skin.

Uses: Corrosion inhibitor against mineral acids; high-temperature oil well-acidizing inhibitor.

Hf Symbol for hafnium.

HFPO. See hexafluoropropylene epoxide.

Hg Symbol for mercury (Latin: hydrargyrum).

HGF. See glucagon.

"HGI."⁶² Trademark for lindane (q.v.)

"HGR."¹⁸² Trademark for an ion exchange resin used in water treating and chemical process applications; strong acid cation exchange resin, 10% divinylbenzene crosslinked.

HHDN. Abbreviation for hexachlorohexahydrodimethanonaphthalene. See aldrin.

"Hiblak."¹³³ Trademark for a series of aqueous carbon black dispersions designed for darkening concrete and mortar.

"Hi Calcium Phosphate."¹ Trademark for a crystalline monocalcium phosphate with high calcium content. Use: Ingredient of calcium-enriched flour.

"Hi-Cap."²⁸ Trademark for a series of low cost ammonia dynamites used in mining and quarrying softer ores and minerals.

"Hi-Carb."²⁷⁵ Trademark for agglomerates of carbon black and carbon of high purity for carburizing metals; used for conducting electricity or for any use for which hard carbon may be used.

"Hi-D."³¹⁹ Trademark for ammonium nitrate fertilizer. White, roughly cube-like high-density granular material screened to optimum particle size, with special moisture-proof coating.

hiding power. See opacity.

"Hi-Eff."⁴²⁵ Trademark for a series of polyester stationary phases for use in gas chromatography. Examples are "Hi-Eff" 4B, butane-1, 4-diol succinate; "Hi-Eff" 1AP, a pretested diethylene glycol adipate.

"Hi-fax."²⁶⁶ Trademark for plastic molding powders of high-density polyethylene. Offered in three densities, natural or colored.

Uses: Blown containers and industrial items, wire insulation, cable jacketing, conduit, monofilament, sheet, injection-molded items, and shape extrusions.

hi-flash naphtha. See naphtha (2a).

"Hi-Flo."²⁴¹ Trademark for triple superphosphates containing at least 46% available phosphorus pentoxide (P_2O_5). Various forms available.

"Hi-Flow."²⁷⁵ Trademark for carbon blacks used for printing inks.

"Hifos"⁷⁹ Trademark for a limed FF wood rosin. Uses: Linoleum cements; printing inks; dark gloss oils; adhesives; paint and varnish.

high explosive. See explosive, high.

"High Speed."²⁸ Trademark for tinning flux based on zinc chloride and ammonium chloride.

high vacuum distillation. See molecular distillation.

"Hi-Jell."⁴⁷¹ Trademark for a Wyoming sodium bentonite; recommended where extra high gelling and bonding strength are required.

hindered isocyanate. See isocyanate generator.

hindrance. See steric hindrance.

"Hi-N-Dri."³¹⁹ Trademark for low moisture nitrogen solution used as, or in production of, soil fertilizers.

"Hio-Dine."⁵³⁶ Trademark for a source of hypohalous iodine for swimming pool water disinfection in dry powder form.

"Hiperco."³⁰⁸ Trademark for an alloy of cobalt and iron with varying percentages of cobalt, 27%, 35%, 50%, with the highest magnetic saturation of any known commercial alloy. Permeability above 100 oersteds is far superior to iron and the electrical sheet steels. Uses: Core material for motors, generators, and transformers where minimum weight and size are prime requisites.

"Hipernik."³⁰⁸ Trademark for an alloy of approximately equal proportions of iron and nickel. Uses: Audio and instrument transformers, relays, magnetic bridges, shields for electronic tubes; saturable reactors; magnetic amplifiers.

"Hipernom."³⁰⁸ Trademark for a nickel-base alloy containing molybdenum and iron which exhibits extremely high initial and maximum permeability at low magnetizing forces, with minimum hysteresis loss. Chief application is for magnetic shielding.

"Hipersil."³⁰⁸ Trademark for an oriented silicon-iron alloy in rolled sheet form for use as cores for transformers and other inductive devices. The alloy sheet has a preferred grain orientation with the direction of the easiest magnetization in the rolling direction.

"Hippuran."³²⁹ Trademark for brand of iodohippurate sodium, a water-soluble x-ray contrast medium.

hippuric acid. (benzaminooacetic acid; benzoylaminoacetic acid; benzoylglycocol; benzoylglycin) $C_6H_5CONHCH_2COOH$.

Properties: Colorless crystals; sp. gr. 1.371 (20°C); m.p. 188°C; decomposes on further heating; soluble in hot water, alcohol or ether.

Uses: Organic synthesis and medicine.

"Hi-Ratio Silicate."²⁴⁴ Trademark for an anhydrous homogeneous combination of caustic alkali and sodium silicate. Used for metal cleaning, laundering, and other applications.

His Abbreviation for histidine.

"Hi-Sil."¹⁷⁷ Trademark for a group of hydrated, amorphous silicas used as reinforcing pigments in elastomers as fillers and brightening agents in paper and paints, and as flow-conditioners.

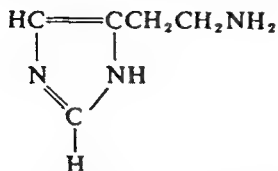

"Hi-Sol."⁴⁵⁷ Trademark for a series of aromatic solvents. Flash points vary from 31 to 250°F. Used as lacquer diluents, in synthetic polymer and enamel

formulations, in printing inks, as solvents for insecticides, and as general industrial solvents.

Hazard: Flammable, dangerous fire risk if flash point is less than 100°F.

histaminase. An enzyme occurring in the animal digestive system; it converts histidine to histamine.

histamine (4-aminoethylglyoxaline; 4-(2-aminoethyl)imidazole; 4-imidazole ethylamine
 $\text{NH}_2\text{CH}_2\text{CH}_2\text{C}_3\text{H}_3\text{N}_2$.

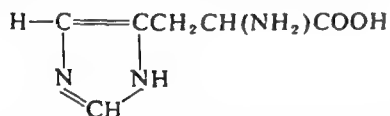

Properties: White crystals; m.p. 83–84°C; b.p. 209–210°C (18 mm); soluble in water; slightly soluble in alcohol. A product of the degradation of histidine, histamine occurs in animal and human body tissues and is liberated by injury to the tissue, or whenever a protein is decomposed by putrefactive bacteria. See also antihistamine.

Uses (as hydrochloride or phosphate): Medicine.

Hazard: A strong allergen.

histidine (alpha-amino-beta-imidazolepropionic acid)
 $\text{HOOCCH}(\text{NH}_2)\text{CH}_2\text{C}_3\text{H}_3\text{N}_2$. An amino acid essential for rats. It is found naturally in the L(–) form.

Properties: colorless crystals; soluble in water; insoluble in alcohol and ether; shows optical activity.

DL-histidine, m.p. 285–6°C with decomposition.

D(+)-histidine, m.p. 287–8°C.

L(–)-histidine, m.p. 277°C with decomposition.

Available commercially as L(+)-histidine hydrochloride, and as the free base.

Derivation: Hydrolysis of protein; organic synthesis.

Uses: Medicine; feed additive; biochemical research; dietary supplement.

histochemistry. A branch of biochemistry devoted to the study of the chemical composition and structure of animal and plant tissues. It involves the use of microscopic, x-ray diffraction, and radioactive tracer techniques in examining the cellular composition and structure of bones, blood, muscle, and other animal and vegetable tissues. It is also applied to study of the action of herbicides, defoliants, etc. See also cytochemistry.

"Hitec."²⁸ Trademark for a eutectic mixture comprised of sodium nitrite, sodium nitrate, and potassium nitrate; used as a heat transfer medium for both heating and cooling operations in the range of 300–1,000°F, such as maintaining reactor temperature, high temperature distillation, and preheating of reactants. Containers: 150-, 400-lb fiber drums.

"Hi-Tri."²³³ Trademark for a grade of trichloroethylene for specific industrial applications.

"Hi-White"²⁸⁵ Trademark for a group of hydrous aluminum silicates (sedimentary kaolins) from Georgia.

HMDS. Abbreviation for hexamethyldisilazane.

HMF black. Abbreviation for high-modulus furnace black. See carbon black.

HMM. Abbreviation for hexamethylmelamine. See hemel.

HMPA. Abbreviation for hexamethylphosphoramide. See hempa.

HMRB. Abbreviation for Hazardous Materials Regulation Board.

HMTA. Abbreviation for hexamethylenetetramine.

HNM. Abbreviation for hexanitromannite. See manitol hexanitrate.

Ho Symbol for holmium.

"Hodag."⁵¹² Trademark for a series of nonionic, surface-active chemicals, including sorbitan and polyoxyethylene sorbitan esters; polyhydric alcohol, glycol, polyglycol and glycerol esters; polyoxyethylene ethers; alkanolamine condensates. Some are FDA-cleared for food applications.

Uses: Emulsifiers, antifoam agents, solubilizers, lubricants.

hog. A large power-driven blade, either straight or serrated, with a short stroke, used for cutting and disintegrating bulky solids of irregular shape, such as pine stumps, bales of crude rubber, and the like.

Hofmann, August Wilhelm (1818–1892). German organic chemist who studied under Liebig. While professor of chemistry at the Royal College of Chemistry in London he did original research on coal-tar derivatives which later led him into a study of organic dyes. Perkin, who first synthesized the dye mauveine in England, was a student of Hofmann. When the latter returned to Germany he continued his work in the field of dyes, which became the basis of German leadership in synthetic dye manufacture which continued until World War I.

Hofmann's reaction. Reaction used for preparation of a primary amine from an amide by treatment with a halogen (bromine, usually) and caustic soda. The resulting amine has one less carbon atom than the amide used.

hole. In semiconductor terminology, a hole is an energy deficit in a crystal lattice due to (1) electrons ejected from unsatisfied covalent bonds at sites where an atom is missing, i.e., a vacancy, or (2) to electrons supplied by atoms of impurities in the crystal, e.g., arsenic or boron. The free electrons from these sources move through the crystal, leaving positively charged energy deficits, which are considered to move as they become alternately filled and vacated by electrons, creating a flow of positive electricity. See also semiconductor.

holmium Ho Metallic element of atomic number 67; group IIIB of the periodic table; one of the rare-earth elements of the yttrium subgroup. Atomic weight 164.9303; valence 3. No stable isotopes. See rare-earth metals.

Properties: Crystalline solid with metallic luster; sp. gr. 8.803; m.p. 1470°C; b.p. 2720°C. Reacts slowly with water; soluble in dilute acids. Has one of the highest nuclear moments of any rare earth. Important magnetic and electrical properties. Low toxicity. Occurrence: In gadolinite and monazite.

Derivation: Reduction of the fluoride by calcium.

Grades: Lumps; ingots; bulk sponge; powder. Highest purity is nuclear grade, 99.9+%.

Uses: Getter in vacuum tubes; research in electrochemistry; spectroscopy.

holmium chloride HoCl_3 . Light yellow solid; m.p. 718°C ; b.p. 1500°C . Soluble in water.
Hazard: Probably toxic.

holmium fluoride HoF_3 . Light yellow solid; m.p. 1143°C ; b.p. greater than 2200°C . Insoluble in water.
Hazard: Probably toxic.

holmium oxide (holmia) Ho_2O_3 .
Properties: Light yellow solid; slightly hygroscopic.
Grades: 98–99%.
Containers: Glass bottles; fiber drums.
Uses: Refractories; special catalyst.

"Holocaine" Hydrochloride.¹⁶² Trademark for phenacaine hydrochloride (q.v.).

holocellulose. The entire water-insoluble carbohydrate fraction of wood (60 to 80%). The balance is lignin.

holopulping. A method for making paper pulp without use of sulfur compounds which may eventually replace the kraft process (sodium sulfate). More selective delignification of the wood fibers is obtained by alkaline oxidation of extremely thin (.03 inch) wood chips at low temperatures and pressures, followed by solubilization of the lignin fraction. Holopulping has the following advantage over the kraft process:

(a) A 65 to 80% carbohydrate yield compared to 45 to 50% for kraft.

(b) Holopulp may be used for a dense paper such as glassine or for a bulky board. Its use in tissue and printing grades offers improved strength.

(c) Low temperatures and atmospheric pressure. (Kraft pulping is carried out at 170°C and under pressure.) Readily adaptable to continuous operation and automatic control.

(d) Air pollution is greatly reduced because the organic materials are burned and few odorous compounds are formed. Stream pollution is minimized by countercurrent washing. The remaining calcium sludge waste is easily disposed of without harmful effects.

(e) Comparable costs.

holothurin. Steroid glucoside (saponin) having antibiotic properties; extracted from the sea cucumber. It is reported to have suppressed growth of tumors in mice.

"Holzon."²⁰⁵ Trademark for a chlorinated rubber coating.

homatropine $\text{C}_{16}\text{H}_{21}\text{NO}_3$. An alkaloid.
Properties: White crystals. Slightly soluble in water; m.p. 95.5°C .
Derivation: Condensation of tropine and mandelic acid.

Hazard: Toxic by ingestion and inhalation.
Use: Medicine (usually in the form of its salts).

homo-. A prefix meaning the same or similar; usually designating a homolog of a compound, differing in formula from the latter by an increase of CH_2 . See homologous series.

homocyclic. A ring compound containing only one kind of atom in the ring structure, e.g., benzene. See also heterocyclic.

homogeneous (Latin, "the same kind"). This term, in its strict sense, describes the chemical constitution

of a compound or element. A compound (q.v.) is homogeneous, since it is composed of one and only one group of atoms represented by a formula (q.v.). For example, pure water is homogeneous, as it contains no other substance than is indicated by its formula H_2O . Homogeneity is a characteristic property of compounds and elements (collectively called substances (q.v.), as opposed to mixtures. The term is often loosely used to describe a mixture or solution comprised of two or more compounds or elements that are uniformly dispersed in each other. Actually, no solution or mixture can be homogeneous; the situation is more accurately described by the phrase "uniformly dispersed." Thus so-called "homogenized" milk is not truly homogeneous; it is a mixture in which the fat particles have been mechanically reduced to a size that permits uniform dispersion and consequent stability. See also mixture; compound; heterogeneous; substance.

homogeneous catalysis. See catalysis, homogeneous.

homogeneous reaction. A chemical reaction in which the reacting substances are in the same phase of matter, i.e., solid, liquid, or gaseous. See also catalysis, homogeneous.

homogenization. A mechanical process for reducing the size of the fat particles of an emulsion (usually milk) to uniform size, thus creating a colloidal system that is unaffected by gravity. The original diameter of the fat particles (from 6 to 10 microns) is reduced to from 1 to 2 microns, with an increase in total surface area of from four to six times. This is done by passing the milk through a homogenizer (or colloid mill), a machine having small channels, under a pressure of from 2000 to 2500 psi at a speed of about 700 feet a second. This operation not only brings about a permanently stable system, but also changes the properties of the milk in respect to taste, color, and the chemical nature of the protective coating on the fat particles. It also increases its sensitivity to light and its tendency to foam. The forces involved are shear, impingement, distention, and cavitation. See also homogeneous.

homologous series. A series of organic compounds in which each successive member has one more CH_2 group in its molecule than the next preceding member. For instance CH_3OH (methanol), $\text{C}_2\text{H}_5\text{OH}$ (ethanol), $\text{C}_3\text{H}_7\text{OH}$ (propanol), $\text{C}_4\text{H}_9\text{OH}$ (butanol), etc., form a homologous series.

homomenthyl salicylate (3,3,5-trimethylcyclohexyl salicylate) $(\text{CH}_3)_3\text{C}_6\text{H}_8\text{OOCCH}_2\text{OH}$. A homolog of menthyl salicylate.

Properties: Light yellow almost odorless oil, neutral and nonirritating to the skin. Absorbs ultraviolet radiation in sunlight, (about 2940 to 3200 Å). Insoluble in water; soluble in alcohol, chloroform and ether.
Uses: Ultraviolet filter for antisunburn creams.

homomorphs. Molecules similar in size and shape. They need have no other characteristics in common. Many properties of several homomorphs can be predicted by knowing properties of one.

homophthalic acid $\text{C}_6\text{H}_4(\text{CH}_2\text{COOH})\text{COOH}$. Light tan powder, used as an intermediate.

homopolymer. A natural or synthetic high polymer derived from a single monomer; an example of a natural homopolymer is rubber hydrocarbon, whose monomer is isoprene; a synthetic homopolymer is typified by polychloroprene or polystyrene, whose monomers are, respectively, chloroprene and styrene. See also polyblend.

ortho-homosalicic acid. See cresotic acid.

4-homosulfanilamide hydrochloride. See mafenide hydrochloride.

homoveratric acid (3,4-dimethoxyphenylacetic acid) $(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{CH}_2\text{COOH}$. Crystals; m.p. 94–101°C; very slightly soluble in water; soluble in most organic solvents.

homoveratrylamine (3,4-dimethoxyphenylethylamine) $(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3(\text{CH}_2)_2\text{NH}_2$. Colorless to pale yellow liquid with slight vanilla odor; sp. gr. 1.09 (25/25°C); solidifies 15°C; b.p. 295°C (with decomposition); refractive index 1.5442–1.5452 (25°C).

honey. A unique mixture of a number of low molecular weight sugars (except sucrose) but including invert sugar. It is considerably sweeter than glucose. It has been used as a food and sweetener since the beginning of civilization. It also has applications in medicine and tobacco curing.

Hooke's law. When a load is applied to any elastic body so that the body is deformed or strained, then the resulting stress (the tendency of the body to resume its normal condition) is proportional to the strain. Stress is measured in units of force per unit area, strain is the extent of the deformation. For example when a bar of metal is subjected to a stretching load, the extent of the increase in length of the bar is directly proportional to the force per unit area, i.e., to the stretching load or stress. In general Hooke's law applies only up to a certain stress called the yield strength.

hopcalite. A mixture of oxides of copper, cobalt, manganese and silver, used in gas masks as a catalyst converting carbon monoxide to carbon dioxide. Hazard: Not safe when nitroparaffin vapors are present.

horizon. See soil.

"Hormodin."¹²³ Trademark for a formulation of indolebutyric acid.

hormone, animal. An organic compound secreted by an endocrine (ductless) gland, whose products are released into the circulating fluid. Hormones regulate such physiological processes as metabolism, growth, reproduction, molting, pigmentation, and osmotic balance. They are sometimes called "chemical messengers." Hormones produced by one species usually show similar action in other species. They vary widely in chemical nature; some are steroids (q.v.)—estrogen, progesterone, cortisone—while others are amino acids (thyroxine), polypeptides (vasopressin), low molecular weight proteins (insulin) and conjugated proteins. Amino acid and steroid hormones have been isolated, and many (including insulin) have been synthesized and are manufactured for medical purposes. Other types are made directly from the endocrine organs of animals.

hormone, plant. See plant growth regulator.

"Horne's Dry Lead."⁵⁰ Trademark for a laboratory chemical used for clarification in sugar analysis. Adopted by the Association of Official Agricultural Chemists. Available in 1-lb, 5-lb, and 10-lb bottles and 25-lb cartons.

"Hornstone."²⁰⁵ Trademark for zinc fluosilicate concrete hardener.

hot. Slang for highly radioactive, e.g., hot laboratory.

hot-melt composition. See adhesive, hot-melt; sealant; asphalt; bitumen.

Houdry process. (1) Catalytic cracking. The vaporized charging stock is passed through a fixed bed of catalyst (activated hydrosilicate of alumina). Cracking and regeneration of catalyst are carried out alternately in two reaction chambers; when the catalyst is fouled, the vapor is diverted to a second chamber while the first is being cleaned by burning off the deposited coke with air. The cracked products are separated in conventional equipment. The process requires complicated timing mechanisms to control the alternate cracking and regeneration periods.

(2) Butadiene production. A one-step process the essential feature of which is adiabatic dehydrogenation of butane, in which the heat of reaction during the on-stream cycle is supplied by burning off coke during the regeneration cycle. The butane is preheated and passed through a fixed bed pelleted alumina-chromia catalyst. Several reactors are used in a series of cycles allowing for cleaning and regeneration of catalyst.

HPA. Abbreviation for hydroxypropyl acrylate (q.v.).

HPC black. Abbreviation for hard-processing channel black. See carbon black.

"HPC."²⁶⁶ Trademark for solutions of ammonium nitrate, ammonia, and urea; available in various concentrations and proportions from 20 to 49% nitrogen.

HS. Abbreviation for hydroxylamine sulfate.

"HSM."⁶⁵ Trademark for hemisulfur mustard seed in medicine.

"H.T."⁵⁸ Trademark for monocalcium phosphate. Free-flowing beads.

"HT-44."²¹² Trademark for an extremely heat-stable liquefying enzyme (an amylase) from a bacterial source high in alpha-amylase activity.

Uses: Textiles, starch adhesives, paper, brewing, industrial grain alcohol.

"HTH."⁶⁴ Trademark for a high-test calcium hypochlorite product commercially available as a stable, water-soluble material in both granular and tablet form, containing a minimum of 70% available chlorine as calcium hypochlorite.

Uses: Bleaching; sterilizing; oxidizing.

"HTH-15."⁸⁴ Trademark for an all-purpose germicide, disinfectant and stain remover. Contains 15% of available chlorine and yields sodium hypochlorite solutions directly when added to water.

Uses: Dairy and poultry farm sanitation; for sterilizing glasses and food utensils, and general sanitation.

HTST. Abbreviation for high-temperature short-time; refers to processes such as pasteurization, sterilization, etc.

HTU. Abbreviation for height of a transfer unit: the height of a distillation column or fractionating tower in which unit separation is achieved by transfer from liquid to vapor or vice versa, of the materials being separated. Unit separation is defined by the differential equation that takes into account the varying concentrations along the column. HTU is also applied to extraction and other countercurrent separation processes.

Huber's reagent. An aqueous solution of ammonium molybdate and potassium ferrocyanide used for detecting free mineral acid. With the exception of boric acid and arsenic trioxide, free mineral acids produce a reddish-brown precipitate, or a turbidity with the reagent.

Hubl's reagent.

(a) 50 grams iodine dissolved in 1 liter of 95% alcohol.

(b) 60 grams mercuric chloride dissolved in 1 liter of alcohol.

(c) Make up an iodine monochloride solution from (a) and (b). Add in excess to a known weight of the fat or oil dissolved in chloroform. The excess of iodine chloride can be estimated by the potassium iodide and thiosulfate method. By running a blank test, the amount of iodide absorbed can be estimated. Use: Determination of iodine values of oils and fats.

humectant. A substance having affinity for water, with stabilizing action on the water content of a material. A humectant keeps within a narrow range the moisture content caused by humidity fluctuations. Example: glycerol.

Uses: Tobacco; baked products; dentifrices.

humic acid. The brown, polymeric constituent of soil humus; it is soluble in bases, but insoluble in mineral acids and alcohols. It is not a well-defined compound, but a mixture of polymers containing aromatic and heterocyclic structures, carboxyl groups, and nitrogen. An excellent chelating agent, important in the exchange of cations in soils. It is a natural stream pollutant and is thought to be capable of triggering the "red tide" phenomenon due to microorganisms in sea water. Detectable to 0.1 ppm in water.

humidity, absolute. The pounds of water vapor per pound of dry air in an air-water vapor mixture.

humidity indicator. A cobalt salt (e.g., cobaltous chloride) that changes color as the humidity of the environment changes. Cobaltous compounds are pink when hydrated and greenish-blue when anhydrous.

humidity, relative. The percentage relation between the actual amount of water vapor in a given volume of air at a definite temperature and the maximum amount of water vapor that would be present if the air were saturated with water vapor at that temperature.

humus. The organic component of soils, containing humic acid (q.v.), fulvic acid, and humin. It is formed by the decay of leaves, wood, and other vegetable matter. It is used as a top soil additive in horticulture, golf courses and truck gardens, and is available in 100-lb paper bags and bulk shipments. See soil (1).

hyaluronic acid. A polymer of acetylglycosamine, $C_5H_{11}NO_6$, and glucuronic acid, occurring as alternate units, with a high molecular weight. Found in vitreous humor (of the eye), synovial fluid, pathology joints, group A and C hemolytic streptococci and skin. It appears to bind water in the interstitial spaces, forming a gel-like substance which holds the cells together. Its solutions are highly viscous. The polymeric structure is broken down by the enzyme hyaluronidase.

"Hyamine."²³ Trademark for quaternary-ammonium-type bactericides, algacides, and fungicides, supplied as water-soluble crystals or aqueous solutions. Non-irritating; low toxicity.

Hyatt, John Wesley (1837-1920). Hyatt is generally credited as being the father of the plastics industry. In 1869 he and his brother patented a mixture of cellulose nitrate and camphor which could be molded and hardened. Its first commercial use was for billiard balls. The trade-mark "Celluloid" was the first ever applied to a synthetic plastic product; its flammability hazard limits its use.

"Hybase."⁵⁴⁴ Trademark for overbased petroleum sulfonates used as additives in motor oils to reduce corrosion; overbased sulfonates have base numbers ranging from 65 to 400.

"Hycar."¹¹⁹ Trademark for various types of synthetic elastomers.

Nitrile Rubbers. Copolymers of butadiene and acrylonitrile.

Polyacrylic Rubbers. Polymers of an acrylic acid ester. Useful in applications where oil and solvent-resistance at high temperatures (to 425°F) is required. Uses: Oil and gasoline hose, packings, automotive transmission gaskets, and conveyor belts.

Styrene Rubber, Copolymer of styrene and butadiene. Oil soluble.

Latexes. Nitrile and acrylic polymers, available as water emulsions with total solids ranging from 40 to 52%.

Uses: Adhesives, abrasion-resistant coatings.

"Hycryl."²² Trademark for a series of thickening agents. Available as

A-1000—modified ammonium polyacrylate (water solution).

A-2000—Latex dispersion which can be converted to ammonium polyacrylate solution through the addition of ammonia.

Uses: Antisettling stabilizer for water dispersions of pigments; compounding rubber latices; thickener for alcoholic nylon coating solutions.

"Hydan."²⁸ Trademark for methionine hydroxy analogue calcium 90%.

Use: A source of methionine (an essential amino acid) for poultry, dog and livestock feeds.

hydantoin (glycolylurea) $NHCONHCOCH_2$.

Properties: White, odorless solid, crystallizing in needles. Slightly soluble in water, ether; soluble in alcohols and solutions of alkali hydroxides. M.p. 220°C.

Uses: Intermediate in the synthesis of pharmaceuticals, textile lubricants, and certain high polymers, including epoxy resins.

hydrabamine penicillin V (hydrabamine phenoxymethylpenicillin) $2C_{16}H_{18}N_2O_5S \cdot C_{42}H_{64}N_2$.

Properties: A water-insoluble mixture of crystalline phenoxymethylpenicillin salts consisting chiefly of the salt of N,N' -bis(dehydroabietyl)ethylenediamine, with smaller amounts of the salts of the dihydro and tetrahydro derivatives.

Use: Medicine.

"Hydraid."¹⁰⁸ Trademark for a family of water soluble organic polymers, some cationic, anionic and nonionic of various molecular weight and coagulation properties.

Uses: Paper and pulp mill retention, drainage and clarification aids.

"Hydralase."³⁰⁹ Trademark for a series of fungal enzymes used principally in the food industries for conversion of starches or dextrans to dextrose and of proteins to amino acids.

hydralazine hydrochloride (1-hydrazinophthalazine hydrochloride) $C_8H_8N_2NNH_2 \cdot HCl$.

Properties: White, odorless, crystalline powder. M.p. 270–280°C (dec); very slightly soluble in ether and alcohol; soluble in water; pH (2% solution) 3.5–4.5.

Grade: N.F.

Use: Medicine (antihypertensive agent).

"Hydra" 700 Series.²²⁶ Trademark for several grades of hydrated aluminum oxide, $Al_2O_3 \cdot 3H_2O$ or $Al(OH)_3$, of extremely fine, uniform particle size. Fluffy, snow-white powders used as fillers in rubber, paper, plastics, adhesives, polishes, inks, paints, cosmetics.

Hydrane process. A method for direct hydrogenation of coal. See hydrogenolysis; gasification.

"Hydraphthal."²⁸ Trademark for a combination solvent and detergent for textile scouring.

"Hydrar" Process.⁴¹⁶ Proprietary process for the catalytic hydrogenation of benzene to cyclohexane, or higher aromatics to their corresponding cycloparaffins. The hydrogenation of benzene is virtually stoichiometric. The purity of the cyclohexane is a function of the purity of the benzene feed.

hydrase. See hydrolase.

"Hydrasperse."²⁸⁵ Trademark for chemically treated hydrous aluminum silicate (kaolin).

hydrate. See hydration.

hydrated aluminum oxide. See alumina trihydrate.

hydrated silica. See silicic acid.

"Hydratex."²⁸⁵ Trademark for a group of hydrous aluminum silicates (kaolin).

hydration. (1) The reaction of molecules of water with a substance, in which the H—OH bond is not split. The products of hydration are called hydrates, i.e.,

A given compound often forms more than one hydrate; the hydration of sodium sulfate can give $Na_2SO_4 \cdot 10H_2O$ (decahydrate), $Na_2SO_4 \cdot 7H_2O$ (heptahydrate), and $Na_2SO_4 \cdot H_2O$ (monohydrate). In formulas of hydrates, the addition of the water molecules is conventionally indicated by a centered dot. The water is usually split off by heat, yielding the anhydrous compound. See also water of crystallization; gas hydrate.

(2) Less specifically, the term hydration is also applied to the sorption of water molecules by other substances, of which cellulose is a good example. In the paper industry it is used to describe the combination of water with wood pulp in the beater, as a result of which fiber-to-fiber adhesion is increased by hydrogen bonding, thus increasing the strength of the finished sheet.

hydraulic cement. See cement, hydraulic.

hydraulic fluid. A liquid or mixture of liquids designed to transfer pressure from one point to another in a system on the basis of Pascal's Law, i.e., pressure on a confined liquid is transmitted equally in all directions. For industrial use, such fluids are based on paraffinic and cycloparaffinic petroleum fractions, usually with added antioxidant and viscosity index improver. Flame-resistant types include additives such as phosphate esters or emulsions of water and ethylene glycol. The brake fluids used in autos are composed of (1) a lubricant (polypropylene glycol of 1000–2000 molecular weight, a castor oil derivative, or a synthetic

polymeric mixture of monobutyl ethers of oxyethylene and oxypropylene glycols); (2) a solvent blend (mixtures of glycol ethers); and (3) additives for corrosion resistance, buffering, etc. Boiling points range from 375 to 550°F. The composition and performance characteristics are specified by the Society of Automotive Engineers.

hydraulic lime. See lime, hydraulic.

hydrazine (hydrazine base; hydrazine, anhydrous; diamine) H_2NNH_2 .

Properties: Colorless, fuming, hygroscopic liquid; m.p. 2.0°C; b.p. 113.5°C; m.p. 1.4°C; sp. gr. 1.004 (25/4 °C); wt/gal 8.38 lbs; flash point (open cup) 126°F. Miscible with water and alcohol; insoluble in chloroform and ether. Strong reducing agent and diacidic, but weak base. Autoignition temp. 518°F. Combustion of hydrazine is highly exothermic, yielding 148.6 kcal/mole; nitrogen and water are products.

Derivation: (a) Sodium hydroxide, chlorine, and ammonia react in aqueous solution to form dilute solution of hydrazine (Raschig process). This is concentrated by distillation to the monohydrate, which is converted to anhydrous hydrazine by azeotropic distillation with aniline. (b) Reaction of ammonia, hydrogen peroxide and methyl ethyl ketone in presence of an amide and a phosphate forms an intermediate that hydrolyzes to yield hydrazine (75% yield reported). Not yet in commercial use.

Grades: To 99% pure.

Containers: Carboys; steel or aluminum drums.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Strong irritant to skin and eyes. Severe explosion hazard when exposed to heat or by reaction with oxidizing materials. Tolerance, 1 ppm in air.

Uses: Rocket propellant; agricultural chemicals (maleic hydrazide); drugs (antibacterials, antihypertension); polymerization catalyst; blowing agent; short-stopping agent; Spandex fibers; antioxidants (petroleum, detergents); plating metals on glass and plastics; fuel cells; solder fluxes; scavenger for gases; explosives; photographic developers; corrosion inhibitors; oil-well drilling in soils containing kaolinite; buoyancy agent for undersea salvage; diving equipment.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Anhydrous, hydrate, or water solutions with 50% or less of water not accepted on passenger planes. Solutions with more than 50% water, Corrosive label.

hydrazine acid tartrate (hydrazine tartrate)

Properties: Colorless crystals; m.p. 182–183°C; soluble in water.

Hazard: See hydrazine.

hydrazine dihydrochloride $N_2H_4 \cdot 2HCl$.

Properties: Colorless crystals; sp. gr. 1.42; m.p. 198°C (loses HCl); b.p. 200°C (dec). Soluble in water; slightly soluble in alcohol.

hydrazine hydrate (diamide hydrate). $H_2NNH_2 \cdot H_2O$.

Properties: Colorless, fuming liquid; f.p. –51.7°C; b.p. 119.4°C; sp. gr. 1.032; wt/gal 8.61 lb; flash point (open cup) 163°F. Miscible with water and alcohol; insoluble in chloroform and ether. Strong reducing agent; weak base. Combustible.

Derivation: See hydrazine.

Hazard: See hydrazine.

Uses: Chemical intermediate; azodicarbonamide.

Shipping regulations: See hydrazine.

hydrazine monobromide $N_2H_4 \cdot HBr$.

Properties: White, crystalline flakes; m.p. 81–87°C; decomposes at about 190°C; soluble in water and lower alcohols; insoluble in most organic solvents.

Grade: 95%.

Use: Soldering flux.

hydrazine monochloride $N_2H_4 \cdot HCl$.

Properties: White crystalline flakes; m.p. 87–92°C, decomposes at about 240°C; soluble in water (37g/100g H_2O at 20°C); somewhat soluble in lower alcohols; insoluble in most organic solvents.

hydrazine nitrate $N_2H_4NO_3$.

Hazard: Severe explosion risk.

Shipping regulations: (Rail) Consult regulations. (Air) Not acceptable.

hydrazine perchlorate $N_2H_4 \cdot HClO_4 \cdot \frac{1}{2}H_2O$.

Properties: Solid; sp. gr. 1.939; m.p. 137°C; b.p. 145°C (dev). Decomposes in water; soluble in alcohol; insoluble in ether, benzene, chloroform, and carbon disulfide.

Hazard: Severe explosion risk.

Use: Rocket propellant.

Shipping regulations: (Rail) Consult regulations. (Air) Not acceptable.

hydrazine sulfate (diamine sulfate; diamidogen sulfate) $NH_2NH_2 \cdot H_2SO_4$.

Properties: White crystalline powder; very soluble in hot water; soluble in 1 part in 33 cold water; insoluble in alcohol; stable in storage; strong reducing agent. Sp. gr. 1.37; m.p. 85°C.

Uses: Manufacture of chemicals; condensation reactions; catalyst in making acetate fibers. Analysis of minerals, slags and fluxes; determination of arsenic in metals; separation of polonium from tellurium; fungicide; germicide; reported useful in cancer treatment.

hydrazinophthalazine hydrochloride. See hydralazine hydrochloride.**hydrazobenzene** (N,N' -diphenylhydrazine) $C_6H_5NHNHC_6H_5$.

Properties: M.p. (min) 126°C; soluble in alcohol; nearly insoluble in water.

Grade: 95%.

Use: Synthesis.

hydrazoic acid (hydrogen azide) HN_3 .

Properties: Colorless, volatile liquid; soluble in water. Obnoxious odor. F.p. –80°C; b.p. 37°C.

Derivation: Reaction of hydrazine and nitrous acid, or of nitrous oxide and sodium amide (with heat).

Hazard: Toxic; strong irritant to eyes and mucous membranes. Dangerous explosion risk when shocked or heated.

Shipping regulations: (Rail) Consult regulations. (Air) Explosives, n.o.s., Not acceptable.

hydrazone. An exotic fuel formed by the action of hydrazine or one of its derivatives on a compound containing the carbonyl group CO .

Hazard and Shipping regulations: See hydrazine.

"Hydrea."⁴¹² Trademark for hydroxy urea (q.v.), used in cancer therapy.

"Hydrex."¹⁸⁹ Trademark for hydrogenated fatty acids and glycerides.

Uses: Buffering compounds; rubber compounding; candles; lubricating grease; crayons; emulsifiers; paper coatings; plasticizers; cosmetics; metallic stearates; textile finishes, polishes.

hydride. An inorganic compound of hydrogen with another element. Some are ionic and others are covalent.

Hydrides may be either binary or complex; the latter are transition-metal complexes, e.g., carbonyl hydrides and cyclopentadienyl hydrides. Most common are hydrides of sodium, lithium, aluminum, boron, etc.

Hazard: Highly toxic and irritant; flammable, dangerous fire risks; react violently with water and oxidizing agents.

See lithium aluminum hydride; sodium borohydride.

"Hydrholic."²³ Trademark for plasticized nitrocellulose lacquer emulsions, including clear finishes, binders and colors. Produce flexible, lacquer-type, cleanable leather finishes from aqueous systems.

Uses: Finishes on glove, garment, handbag and shoe leather.

"Hydricin."²⁰² Trademark for a castor-derived base oil for industrial functional fluids and SAE hydraulic brake fluids.

hydridene. See indan.

"Hydrin."¹¹⁹ Trademark for a series of synthetic rubbers based on epichlorohydrin.

Uses: Industrial and automotive molded goods.

hydriodic acid HI

Properties: Colorless or pale yellow liquid (an aqueous solution of hydrogen iodide, which is a gas at room temperature). A constant-boiling solution is formed of sp. gr. 1.7 containing 57% hydrogen iodide. Hydriodic acid is a strong acid and an active reducing agent. For anhydrous hydrogen iodide: sp. gr. 4.3737; f.p. –51.3°C; b.p. –35.6°C.

Derivation: (a) By passing hydrogen with iodine vapor over warm platinum sponge which acts as a catalyzer, and absorption in water. (b) By the action of iodine on a solution of hydrogen sulfide.

Grades: Technical, 47%; N.F., diluted, 10%.

Hazard: Toxic; strong irritant to eyes and skin.

Uses: Preparation of iodine salts; organic preparations; analytical reagent; disinfectant; pharmaceuticals.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

hydroabietyl alcohol. See dihydroabietyl alcohol.

"Hydro-Benzo #200-K."⁴⁵⁷ Trademark for an aliphatic petroleum naphtha used as a rubber solvent. Distillation range (ASTM D850) 140–195°F.

Hazard: Flammable, dangerous fire risk.

hydrobiotite. A natural ore of magnesium, iron, and aluminum silicate occurring in Montana. Source of verxite (q.v.).

hydroboration. The reaction of diboranes with alkenes (olefins) to form trialkylboron compounds, used in organic synthesis. Prostaglandins have been synthesized by this method.

hydrobromic acid. Hydrogen bromide in aqueous solution. See also hydrogen bromide, anhydrous.

Properties: Colorless or faintly yellow liquid consisting of an aqueous solution of hydrogen bromide, which is a gas at room temperature. F.p. –87°C; b.p. –67°C. Soluble in water and alcohol. A constant-boiling solution is formed, of sp. gr. 1.49, containing 48% hydrogen bromide. Hydrobromic acid is a strong acid and sensitive to light. Sp. gr. (48% solution) 1.488 (20/4C). Noncombustible.

Derivation: By dissolving the gas in water, or by distilling from a mixture of sodium bromide and 50% sulfuric acid.

Grades: Technical 40%; medicinal 48%; 62%.

Containers: Glass bottles; carboys.

Hazard: Highly toxic; strong irritant to eyes and skin.

Uses: Medicine; analytical chemistry; solvent for ore

minerals; manufacture of inorganic and some alkyl bromides; alkylation catalyst.

Shipping regulations: (Rail) White label. (Air) (exceeding 49% strength), Not acceptable; (not exceeding 49% strength), Corrosive label.

hydrocarbon. An organic compound consisting exclusively of the elements carbon and hydrogen. Derived principally from petroleum, coal tar, and vegetable sources. Following is a resume of the principal types.

I. Aliphatic (straight-chain)

- (1) Paraffins (alkanes): generic formula C_nH_{2n+2} . Saturated, single bonds only.
- (2) Olefins: generic formula C_nH_{2n} .
 - (a) alkenes: unsaturated (one double bond)
 - (b) alkadienes: unsaturated (two double bonds) (butadiene)
- (3) Acetylenes: generic formula C_nH_{2n-2} . Unsaturated (triple bond).
- (4) Acyclic terpenes. Unsaturated. (Polymers of isoprene, C_5H_8).

Note: Some aliphatic compounds have branched chains in which the subchain also contains carbon atoms (isobutane); both chains are essentially straight.

II. Cyclic (closed ring).

- (1) Alicyclic: three or more carbon atoms in a ring structure, with properties similar to those of aliphatics.
 - (a) Cycloparaffins (naphthenes): saturated compounds often having a boat or chair structure, e.g., cyclohexane, cyclopentane.
 - (b) Cycloolefins: unsaturated, two or more double bonds, e.g., cyclopentadiene (2), cyclooctatetraene (4).
 - (c) Cycloacetylenes (cyclynes): unsaturated (triple bond).
- (2) Aromatic: unsaturated; hexagonal ring structure (three double bonds); single rings and double or triple fused rings.
 - (a) benzene group (1 ring)
 - (b) naphthalene group (2 rings)
 - (c) anthracene group (3 rings)
- (3) Cyclic terpenes: monocyclic (dipentene) dicyclic (pinene).

hydrocarbon, halogenated. A hydrocarbon in which one or more of the hydrogen atoms has been replaced by fluorine, chlorine, bromine, or iodine. Examples: carbon tetrachloride, chlorobenzene, chloroform, trifluoromethane. This greatly increases the anesthetic and narcotic action of aliphatic hydrocarbons. Many halogenated hydrocarbons are highly toxic; some may detonate on contact with barium. A number of the chlorinated types are used as insecticides. See also fluorocarbon; chlorofluorocarbon.

hydrocellulose. See cellulose, hydrated.

hydrochloric acid. Hydrogen chloride in aqueous solution. See also hydrogen chloride.

Properties: Colorless or slightly yellow, fuming, pungent liquid. F.p. -115°C ; b.p. -85°C ; flash point, none. A constant-boiling acid containing 20% hydrogen chloride is formed. Hydrochloric acid is a strong, highly corrosive acid. The commercial "concentrated" or fuming acid contains 38% of hydrogen chloride and has a sp. gr. 1.19. Soluble in water, alcohol and benzene. Noncombustible.

Derivation: (a) By-product of the chlorination of benzene and other hydrocarbons; by furnace combustion of chlorine and hydrogen.

Grades: U.S.P. (35–38%); N.F. diluted (10%); technical

(usually 18, 20, 22, 23° Bé, corresponding to approx. 28, 31, 35, 37% HCl); F.C.C.

Containers: Glass bottles; carboys; rubber-lined steel drums; rubber-linked tank cars.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to eyes and skin. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Acidizing (activation) of petroleum wells; chemical intermediate; ore reduction; food processing (corn syrup, sodium glutamate); pickling and metal cleaning; industrial acidizing; general cleaning, e.g., of membranes in desalination plants; alcohol denaturant. Shipping regulations: (Rail) White label. (Air) Corrosive label.

hydrocinnamic acid (3-phenylpropionic acid)

Properties: Crystals with hyacinth-rose odor. M.p. 46°C .

Derivation: Reduction of cinnamic acid with sodium amalgam.

Uses: Fixative for perfumes; flavoring.

hydrocinnamic alcohol. See phenylpropyl alcohol.

hydrocinnamic aldehyde. See phenylpropyl aldehyde.

hydrocinnamyl acetate. See phenylpropyl acetate.

hydrocodone bitartrate (USAN). See dihydrocodeinone bitartrate.

hydrocolloid. A hydrophilic colloidal material used largely in food products as emulsifying, thickening and gelling agents. They readily absorb water, thus increasing viscosity and imparting smoothness and body texture to the product, even in concentrations of less than 1%. Natural types are plant exudates (gum arabic), seaweed extracts (agar), plant seed gums or mucilages (guar gum), cereal gums (starches), fermentation gums (dextran), and animal products (gelatin). Semisynthetic types are modified celluloses and modified starches. Completely synthetic types are also available, e.g., polyvinylpyrrolidone. Most are carbohydrate polymers, but a few, such as gelatin and casein, are proteins.

hydrocortisone (17-hydroxycorticosterone; cortisol; hydrocortisone alcohol) $C_{21}H_{30}O_5$. An adrenal cortical steroid hormone.

Properties: White, odorless, crystalline powder; sensitive to light; bitter taste; m.p. $212\text{--}220^\circ\text{C}$ with some decomposition. Freely soluble in dioxane and methanol; insoluble in ether and water; soluble in alcohol and acetone.

Derivation: Isolation from extracts of adrenal glands; synthesis from other steroids.

Grade: U.S.P.

Use: Medicine (anti-inflammatory agent). Also used as the acetate and sodium succinate salts.

See also cortisone.

"Hydrocortone."¹²³ Trademark for hydrocortisone (q.v.).

hydrocracking. The cracking of petroleum or its products in the presence of hydrogen. Special catalysts are used, for example, platinum on a solid base of mixed silica and alumina, or zinc chloride. See also hydrogenation; hydrogenolysis; hydroforming.

hydrocyanic acid (prussic acid; hydrogen cyanide; formonitrile) HCN.

Properties: Water-white liquid at temperatures below

26.5°C; faint odor of bitter almonds; usual commercial material is 96-99.5% pure; sp. gr. (liquid) 0.688 (20/4°C), (gas) 0.938 g/l; b.p. 25.6°C; freezing point -13.3°C; flash point 0°F; soluble in water. The solution is weakly acidic; sensitive to light. When not absolutely pure or stabilized, hydrogen cyanide polymerizes spontaneously with explosive violence. Miscible in all proportions with water, alcohol; soluble in ether. Autoignition temp. 1000°F.

Derivation: (a) By catalytically reacting ammonia and air with methane or natural gas. (b) By recovery from coke oven gases. (c) From bituminous coal and ammonia at 1250 C. HCN occurs naturally in some plants (almond, oleander).

Grades: Technical (96-98%); 2, 5 and 10% solutions. All grades usually contain a stabilizer, usually 0.05% phosphoric acid.

Containers: Bottles; steel cylinders; tank cars.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Flammable, dangerous fire risk. Explosive limits in air, 6 to 41%. Tolerance, 10 ppm in air; absorbed by skin. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Manufacture of acrylonitrile, acrylates, adiponitrile, cyanide salts, dyes; chelates.

Shipping regulations: (Rail) (liquid or liquefied) Poison Gas label. Not accepted by express; (unstabilized) Not accepted; (solutions) Poison label. (Air) (solutions not exceeding 5%) Poison label. Not acceptable on passenger planes; all other forms, Not acceptable.

"Hydrodarco."⁸⁹ Trademark for activated carbons used in municipal and industrial water purification.

hydrodealkylation (HDA). A type of hydrogenation used in petroleum refining in which heat and pressure in the presence of hydrogen are used to remove methyl or larger alkyl groups from hydrocarbon molecules, or to change the position of such groups. The process is used to upgrade products of low value, such as heavy reformat fractions, naphthenic crudes, or recycle stocks from catalytic cracking. Also toluene and pyrolysis gasoline (q.v.) are converted to benzene, and methyl naphthalenes to naphthalene by this process. See also transalkylation.

hydrodistillation (steam distillation). Removal of essential oils from plant components (flowers, leaves, bark, etc.) by the use of high-temperature steam. The process is used chiefly in the perfume and fragrance industry.

hydrofining. A petroleum refining process in which a limited amount of hydrogenation converts the sulfur and nitrogen in a petroleum fraction to forms in which they can be easily removed. Hydrofining is generally a separate treatment prior to more extensive hydrogenation. The usual catalysts are oxides of cobalt and molybdenum. Desulfurization, ultrafining, and catfining have a similar meaning.

hydroflumethiazide (trifluoromethylhydrothiazide)

$C_8H_8F_3N_2O_4S_2$.
Properties: White, crystalline, odorless solid; m.p. 260-275°C. Insoluble in water and acid; soluble in dilute alkali but unstable in alkaline solutions.
Grade: N.D.

Use: Medicine.

hydrofluoric acid (hydrogen fluoride in aqueous solution). See also hydrogen fluoride, anhydrous.
Properties: Colorless, fuming, mobile, liquid. Will attack glass and any silica-containing material.
Derivation: Hydrogen fluoride gas is distilled from a mixture of calcium fluoride (fluorspar) and sulfuric acid. The gas is absorbed in water.

Grades: C.P.; technical; various strengths to 70%.
Containers: Polyethylene bottles; polyethylene-lined steel drums; steel tank cars.

Hazard: Highly corrosive to skin and mucous membranes; highly toxic by ingestion and inhalation.

Uses: Aluminum production; fluorocarbons; pickling stainless steel; etching glass; acidizing oil wells; fluorides; gasoline production (alkylation); processing uranium.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

hydrofluorosilicic acid. See fluosilicic acid.

hydrofluosilicic acid. See fluosilicic acid.

"Hydrofol."²²¹ Trademark for a line of fatty acids and hydrogenated glycerides, including some in food grades. Available up to ton lots.

hydroforming. The use of hydrogen in the presence of heat, pressure and catalysts (usually platinum) to convert petroleum hydrocarbons to molecular structures giving high-octane gasoline for automobiles and airplanes. Dehydrogenation of naphthenic hydrocarbons to form aromatics, and isomerization to more highly branched molecules are typical of hydroforming reactions. Catforming and other words ending in "-forming" are often used with similar meaning.

hydrofuramide (furfuramide) $OC_4H_3CH(NCHC_4H_3O)_2$.

Properties: Light brown to white powder. M.p. 117°C; boils about 250°C with decomposition. Insoluble in cold water; soluble in alcohol and ether.

Derivation: Treatment of furfural with ammonia.

Uses: Rubber accelerator; hardening agent for resins; fungicides.

hydrogasification. Production of gaseous or liquid fuels by catalytic addition of hydrogen to coal. See also gasification.

hydrogen H. Element of atomic number 1. Group IA of Periodic Table. Atomic weight 1.008; valence 1. Isotopes: deuterium (H^2), tritium (H^3). Discovered by Cavendish in 1766; named by Lavoisier in 1783 (water-maker).

Properties: A diatomic gas; density 0.0899 g/l; sp. gr. 0.0694 (air = 1.0); specific volume 193 cu ft/lb (70°F); frz. pt. -259°C; b.p. -252°C. Autoignition temp. 1075°F. Very slightly soluble in water, alcohol and ether. Noncorrosive. Can exist in crystalline state at from 4 to 1 degree Kelvin. Classified as an asphyxiant gas.

Occurrence: Chiefly in combined form (water, hydrocarbons, and other organic compounds); traces in earth's atmosphere. Unlimited quantities in sun and stars. It is the most abundant element in the universe.

Derivation: (1) Reaction of steam with natural gas (steam reforming) and subsequent purification; (2) partial oxidation of hydrocarbons to carbon monoxide, and interaction of carbon monoxide and steam; (4) dissociation of ammonia; (5) thermal or catalytic decomposition of hydrocarbon gases (see "Hypro" process); (6) catalytic reforming of petroleum; (7) reaction of iron and steam; (8) catalytic reaction of methanol and steam; (9) electrolysis of water; (10) Thermochemical decomposition of water is under consideration as a large-scale source of hydrogen; it is said to involve addition to water of calcium, mercury, and bromine and temperatures between 500 and 800°C (Euratom plan). The chief industrial method is (1); but (7) is being developed in connection with hydrogasification, and (9) has long-range

future possibilities by use of a special plastic electrolyte originally developed for fuel cells.

Method of purification: By scrubbing with various solutions (see, especially, the Girbitol absorption process). For very pure hydrogen, by diffusion through palladium.

Grades: Technical; pure, from an electrolytic grade of 99.8% to ultra-pure, with less than 10 ppm impurities. See also para-hydrogen.

Containers: Steel cylinders; tank cars (in cylinders); pipeline.

Hazard: Highly flammable and explosive; dangerous when exposed to heat or flame. Explosive limits in air 4 to 75% by volume.

Uses (Gas): Production of ammonia and methanol; hydrocracking, hydroforming and hydrofining of petroleum; hydrogenation of vegetable oils; hydrogenolysis of coal; reducing agent for organic synthesis and metallic ores; reducing atmospheres to prevent oxidation; as oxyhydrogen flame for high temperatures; atomic-hydrogen welding; instrument-carrying balloons; making hydrochloric and hydrobromic acids; production of high-purity metals.

(Liquid): Coolant and propellant; fuel for nuclear rocket engines for hypersonic transport (mach 6); missile fuel; cryogenic research.

Shipping regulations: (gas) (Rail) Red Gas label; (Air) Flammable Gas label. Not accepted on passenger planes. (liquid) (Rail) Red Gas label; not accepted by express. (Air) Not accepted. For other carriers, consult authorities.

Note: In view of the energy-releasing capacity of hydrogen, especially its isotope tritium (H^3), which occurs in thermonuclear reactions, hydrogen is regarded by some authorities as the ultimate energy source. Splitting of the water molecule by thermochemical or nuclear reactor technology is considered to be an active future possibility for producing hydrogen in high volume for use as an energy source. The electrolytic method is too inefficient for this purpose. Research on development of a controlled hydrogen fusion reaction is in progress, but positive results are unlikely in this century. The use of hydrogen as a transportation fuel for naval ships and aircraft is under active investigation.

ortho-hydrogen. See para-hydrogen.

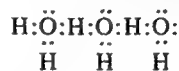

para-hydrogen. Type of molecular hydrogen preferred for rocket fuels. Molecular hydrogen (H_2) exists in two varieties, ortho and para, named according to their nuclear spin types. Ortho-hydrogen molecules have a parallel spin; para- an antiparallel spin. By cooling to liquid air temperature and use of a ferric oxide gel catalyst, the normal equilibrium of 3 ortho- to 1 para- is displaced and para-hydrogen may be isolated. It is being produced with less than 5 ppm impurities.

hydrogenation. Any reaction of hydrogen with an organic compound. It may occur either as direct addition of hydrogen to the double bonds of unsaturated molecules, resulting in a saturated product, or it may cause rupture of the bonds of organic compounds, with subsequent reaction of hydrogen with the molecular fragments. Examples of the first type (called addition hydrogenation) are the conversion of aromatics to cycloparaffins and the hydrogenation of unsaturated vegetable oils to solid fats by addition of hydrogen to their double bonds. Examples of

the second type (called hydrogenolysis) are hydrocracking of petroleum and hydrogenolysis of coal to hydrocarbon fuels. See also hydrogenolysis; hydrocracking; hydroforming.

hydrogen azide NH_3 . See hydrazoic acid.

hydrogen bond. An attractive force, or bridge (q.v.) occurring in polar compounds such as water, in which a hydrogen atom of one molecule is attracted to two unshared electrons of another. The hydrogen atom is the positive end of one polar molecule and forms a linkage with the electronegative end of another such molecule. In the formula below, the hydrogen atom in the center is the "bridge."

Hydrogen bonds are only one-tenth to one-thirtieth as strong as covalent bonds (q.v.), but they have pronounced effects on the properties of substances in which they occur, especially as regards melting and boiling points and crystal structure. They are found in compounds containing such strongly electronegative atoms as nitrogen, oxygen and fluorine. They play an important part in the bonding of cellulosic compounds, e.g., in the paper industry, and occur also in many complex structures of biochemical importance, e.g., adenine-uracil linkage in DNA.

hydrogen bromide. See hydrobromic acid; hydrogen bromide, anhydrous.

hydrogen bromide, anhydrous HBr .

Properties: Colorless gas; sp. gr. 2.71 (referred to air); f.p. $-86^\circ C$; b.p. $-66.4^\circ C$; specific volume 4.8 cu ft/lb ($70^\circ F$, 1 atm). Soluble in water and alcohol. Nonflammable.

Derivation: (a) By passing hydrogen with bromine vapor over warm platinum sponge, which acts as a catalyst. (b) As a byproduct in the bromination of organic compounds. The gas is liquefied under a pressure of 350 psi at $25^\circ C$.

Grades: Up to 99.8% min purity.

Containers: Cylinders.

Hazard: Toxic by inhalation; strong irritant to eyes and skin. Tolerance 3 ppm in air.

Uses: Organic synthesis; makes bromides by direct reaction with alcohols; intermediates for barbiturate manufacture; acts as intermediate in the manufacture of synthetic hormones; alkylation catalyst.

Shipping regulations: (Rail) Green label. (Air) Nonflammable Gas label. Not acceptable on passenger planes.

See also hydrobromic acid.

hydrogen chloride HCl .

Properties: Colorless, fuming gas with a suffocating odor; sp. gr. 1.268 (referred to air); f.p. $-114^\circ C$; b.p. $-85^\circ C$; specific volume 10.9 cu ft/lb ($70^\circ F$, 1 atm). Very soluble in water; soluble in alcohol and ether. Nonflammable.

Derivation: The large-scale commercial processes are designed to produce hydrochloric acid (q.v.). Anhydrous hydrogen chloride may be made by (a) a fractional distillation process under pressure, or (b) independent of the acid processes, by passing hot burner gases (source of hydrogen) over anhydrous calcium chloride.

Containers: Cylinders.

Hazard: Toxic by inhalation; strong irritant to eyes and skin. Tolerance, 5 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Production of vinyl chloride from acetylene and alkyl chlorides from olefins; hydrochlorination (see rubber hydrochloride), polymerization, isomerization, alkylation, and nitration reactions.

Shipping regulations: (Rail) Green label. (Air) Non-flammable Gas label. Not accepted on passenger planes.

See also hydrochloric acid.

hydrogen cyanide. See hydrocyanic acid.

hydrogen dioxide. See hydrogen peroxide.

hydrogen electrode. See electrode, hydrogen.

hydrogen fluoride. See hydrofluoric acid; hydrogen fluoride, anhydrous.

hydrogen fluoride, anhydrous HF.

Properties: Colorless, fuming, mobile, liquid, or colorless gas, very soluble in water. The liquid and gas consist of associated molecules; the vapor density corresponds to HF only at high temperatures. F.p. -83°C ; b.p. 19.5°C ; sp. gr. liquid 0.988 (14°C); sp. vol. 17 cu ft/lb (70°F , 1 atm). Nonflammable.

Derivation: Distillation from the reaction product of calcium fluoride and sulfuric acid; also from fluosilicic acid.

Grade: To 99.9% min purity.

Containers: Cylinders; tank cars.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to eyes, skin and mucous membranes. Tolerance, 3 ppm in air.

Uses: Catalyst in alkylation, isomerization, condensation, dehydration, and polymerization reactions; fluorinating agent in organic and inorganic reactions; production of fluorine and aluminum fluoride; additive in liquid rocket propellants; refining of uranium.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes. See also hydrofluoric acid.

hydrogen hexafluorosilicate. See fluosilicic acid.

hydrogen iodide, anhydrous HI. See also hydriodic acid.

Hazard: Toxic; strong irritant.

Shipping regulations: (Air) Nonflammable Gas label. Not accepted on passenger planes.

hydrogen ion concentration. See pH.

hydrogenolysis (destructive hydrogenation). A type of hydrogenation reaction in which molecular cleavage of an organic compound occurs, with addition of hydrogen to each portion. An important application is hydrocracking (hydrogenative splitting) of large organic molecules, with formation of fragments that react with hydrogen by use of catalysts and high temperatures. Hydrogenolysis of coal to gaseous and liquid fuels was used in Germany in the 1940's; a similar method (Hydrane process) is under development in the U.S. The German process used pulverized coal made into a paste with heavy oil and a metallic catalyst; the mixture plus the necessary hydrogen was subjected to from 300 to 700 atm at about 500°C . The coal was converted into heavy oil, distillable oil, gasoline, and hydrocarbon gases. Large quantities of hydrogen are necessary. See also gasification; hydrogenation.

hydrogen peroxide H_2O_2 (molecular formula); $\text{H}-\text{O}-\text{O}-\text{H}$ (structural formula).

Properties (pure anhydrous): Density, solid, 1.71 grams per cc; density, liquid, 1.450 grams per cc at 20°C ; viscosity, liquid, 1.245 centipoises; surface tension, 80.4 dynes per cm at 20°C ; f.p., -0.41°C ; b.p. 150.2°C . Soluble in water and alcohol. (Solutions): Pure hydrogen peroxide solutions, completely free from contamination, are highly stable; a low percentage of an inhibitor such as acetanilide or sodium stannate, is usually added to counteract the catalytic effect of traces of impurities, such as iron, copper, and other heavy metals. A relatively stable sample of hydrogen peroxide typically decomposes at the rate of about 0.5% per year at room temperature.

Derivation: (a) autooxidation of an alkyl anthrahydroquinone, such as the 2-ethyl derivative, in a cyclic continuous process in which the quinone formed in the oxidation step is reduced to the starting material by hydrogen in the presence of a supported palladium catalyst; (b) by electrolytic processes in which aqueous sulfuric acid or acidic ammonium bisulfate is converted electrolytically to the peroxydisulfate which is then hydrolyzed to form H_2O_2 ; (c) by autooxidation of isopropyl alcohol. Method (a) is most widely used.

Grades: U.S.P. (3%); technical (3, 6, 27.5, 30, 35, 50 and 90%); F.C.C. Most common commercial strengths are 27.5, 35, 50, and 70%.

Containers: Amber glass bottles; carboys; aluminum drums; non-returnable polyethylene drums with fiber and steel overpacks; tank trucks and tank cars.

Hazard: Concentrated solutions are highly toxic and strong irritants. Dangerous fire and explosion risk. Strong oxidizing agent. Tolerance, 1 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C. for conc. over 27.5%.

Uses: Bleaching and deodorizing of textiles, wood pulp, hair, fur, etc; source of organic and inorganic peroxides; pulp and paper industry; plasticizers; rocket fuel; foam rubber; manufacture of glycerol; antichlor; dyeing; electroplating; antiseptic; laboratory reagent; epoxidation; hydroxylation; oxidation and reduction; viscosity control for starch and cellulose derivatives; refining and cleaning metals; bleaching and oxidizing agent in foods; neutralizing agent in wine distillation; seed disinfectant; substitute for chlorine in water and sewage treatment.

Shipping regulations: (Rail) (water solutions containing over 8% H_2O_2 by weight) White label. (Air) solutions containing not more than 8% H_2O_2 by weight, not restricted; solutions containing more than 8% but not more than 40% H_2O_2 by weight, Corrosive label; solutions containing more than 40% H_2O_2 by weight, not acceptable. (Solid) Organic peroxide label.

hydrogen phosphide. See phosphine.

hydrogen, phosphoretted. See phosphine.

hydrogen selenide H_2Se .

Properties: Colorless gas; soluble in water, carbon disulfide, phosgene; b.p. -42°C ; f.p. -64°C ; sp. gr. 2.00.

Grade: 98% pure.

Containers: Cylinders.

Hazard: Highly toxic by inhalation. Strong irritant to skin; damaging to lungs and liver. Dangerous fire and explosion risk; reacts violently with oxidizing materials. Tolerance, 0.05 ppm in air.

Uses: Preparation of metallic selenides and organoselenium compounds; in doping gas mixtures for preparation of semiconductor materials containing controlled amounts of significant impurities.

Shipping regulations: (Air) Not acceptable.

hydrogen slush. A mixture of solid and liquid hydrogen at the hydrogen triple point, 13.8°K and 1.02 psia. It is denser and less hazardous than liquid hydrogen.

hydrogen sulfide (sulfuretted hydrogen) H_2S .

Properties: Colorless gas; offensive odor; sweetish taste. Soluble in water and alcohol; sp. gr. 1.1895 referred to air; f.p. -83.8°C ; b.p. -60.2°C ; sp. vol. 11.23 cu ft/lb (70°F , 1 atm); autoignition temp. 500°F .

Derivation: (a) By the action of dilute sulfuric acid on a sulfide, usually iron sulfide; (b) by direct union of hydrogen and sulfur vapor at a definite temperature and pressure; (c) as a by-product of petroleum refining.

Containers: Steel cylinders; as liquid at 350–400 psi in 60-ton tank cars or 13-ton trailers (specially designed equipment is required for bulk shipment).

Grades: Technical 98.5%; purified 99.5% min.; C.P.

Hazard: Toxic by inhalation; strong irritant to eyes and mucous membranes. Highly flammable, dangerous fire risk. Explosive limits in air 4.3 to 46%. Tolerance, 10 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Purification of hydrochloric and sulfuric acid; precipitating sulfides of metals; reagent; manufacture of elementary sulfur.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes.

hydrogen tellurate. See telluric acid.

hydrogen telluride H_2Te . Colorless gas or yellow needles; sp. gr. (liq.) 2.57 (-20°C); f.p. -49°C ; b.p. -2°C . Soluble in water but unstable; soluble in alcohol and alkalis.

Hazard: See hydrogen selenide.

Shipping regulations: Not listed.

hydrol. See tetramethyldiaminobenzhydrol.

hydrolase (hydrase). An enzyme which catalyzes the removal of water from the substrate. See enzyme.

"Hydrolin."⁸⁴ Trademark for an ammonium nitrate base blasting agent which requires specially constructed primers for detonation.

Use: For seismic prospecting at sea.

Hazard: See ammonium nitrate.

hydrolube. A water-glycol base noncombustible hydraulic fluid.

"Hydrolux" D.⁴² Trademark for a clear straw-colored liquid, completely miscible in water. A complex organic, stabilized reducing agent for vat color dyeing and printing.

hydrolysis. A chemical reaction in which water reacts with another substance to form two or more new substances. This involves ionization of the water molecule as well as splitting of the compound hydrolyzed, e.g., $\text{CH}_3\text{COOC}_2\text{H}_5 + \text{H} \cdot \text{OH} \rightarrow \text{CH}_3\text{COOH} + \text{C}_2\text{H}_5\text{OH}$. Examples are conversion of starch to glucose by water in the presence of suitable catalysts; conversion of sucrose (cane sugar) to glucose and fructose by reaction with water, in the presence of an enzyme or acid catalyst; conversion of natural fats into fatty acids and glycerin by reaction with water in one process of soap manufacture; and reaction of the ions of a dissolved salt to form various products, such as acids, complex ions, etc.

"Hydromagma."¹²³ Trademark for magnesium hydroxide (q.v.).

"Hydron."³⁰⁷ Trademark for sulfide blues derived from carbazole.

hydronium ion. An ion (H_3O^+) formed by the transfer of a proton (hydrogen nucleus) from one molecule of H_2O to another; a companion ion (OH^-) is also formed; the reaction is $2\text{H}_2\text{O} \rightarrow \text{H}_3\text{O}^+ + \text{OH}^-$. Formation of such ions is statistically rare, resulting from the interaction of water molecules in a ratio of 1 to 556 million.

hydroperoxide. An organic peroxide having the generalized formula ROOH . An example is ethyl hydroperoxide ($\text{C}_2\text{H}_5\text{OOH}$). Methyl and ethyl hydroperoxides are unstable, and thus are strong oxidizing agents and explosion hazards; those of higher molecular weight are more stable. Hydroperoxides can be derived by oxidation of saturated hydrocarbons, or by alkylating hydrogen peroxide in a strongly acidic environment; they are used as polymerization initiators.

hydrophilic. Having a strong tendency to bind or absorb water, which results in swelling and formation of reversible gels. This property is characteristic of carbohydrates, such as algin, vegetable gums, pectins, and starches, and of complex proteins such as gelatin and collagen.

hydrophobic. Antagonistic to water; incapable of dissolving in water. This property is characteristic of all oils, fats, waxes and many resins, as well as of finely divided powders like carbon black and magnesium carbonate.

hydroponics. See nutrient solution.

"Hydro-Pruf."³⁰⁰ Trademark for a silicone water repellent for fabrics. Applied with a catalyst at high curing temperatures.

hydroquinol. See hydroquinone.

hydroquinone (quinol; hydroquinol; para-dihydroxybenzene) $\text{C}_6\text{H}_4(\text{OH})_2$.

Properties: White crystals; soluble in water, alcohol and ether. Sp. gr. 1.330; m.p. 170°C ; b.p. 285°C . Flash point 329°F ; combustible; autoignition temp. 960°F .

Derivation: Aniline is oxidized to quinone by manganese dioxide and is then reduced to hydroquinone.

Grades: Technical; photographic.

Containers: Glass bottles; multiwall paper sacks; fiber drums.

Hazard: Toxic by ingestion and inhalation; irritant.

Tolerance, 2 mg per cubic meter of air.

Uses: Photographic developer (except color film); dye intermediate; medicine; antioxidant; inhibitor; stabilizer in paints and varnishes, motor fuels and oils; antioxidant for fats and oils; inhibitor of polymerization.

hydroquinone benzyl ether. See para-benzoyloxyphenol.

hydroquinone dibenzyl ether

$\text{C}_6\text{H}_5\text{CH}_2\text{OC}_6\text{H}_4\text{OCH}_2\text{C}_6\text{H}_5$.

Properties: Tan powder; m.p. 119°C (min); purity 90% (min). Insoluble in water; soluble in acetone, benzene, and chlorobenzene. Combustible. Low toxicity.

Uses: Solvent; perfumes, soap, plastics and pharmaceuticals.

hydroquinone di-n-butyl ether (1,4-dibutoxybenzene) $C_6H_4[O(CH_2)_3CH_3]_2$

Properties: White flakes with no appreciable odor; melting point 45–46°C; b.p. 124°C (1.3 mm), 158°C (15.0 mm); insoluble in water; soluble in benzene, acetone, ethyl acetate, and alcohol. Combustible. Low toxicity.

hydroquinone diethyl ether (1,4-diethoxybenzene) $C_6H_4(OC_2H_5)_2$

Properties: White, granular solid with anise-like odor; m.p. 71–72°C; b.p. 246°C; neither boiling caustic nor acid solution cause any hydrolysis; absorbs ultraviolet light; insoluble in water; soluble in benzene, acetone, ethyl acetate, and alcohol. Combustible. Low toxicity.

hydroquinone, di(beta-hydroxyethyl) ether (para-di-[2-hydroxyethoxy]benzene) $C_6H_4(OC_2H_4OH)_2$

Properties: White solid. M.p. 99°C; b.p. 185–200°C (0.3 mm). Slightly soluble in water and most organic solvents; miscible with water at 80°C. Combustible. Low toxicity.

Containers: Lined steel drums.

Uses: Preparation of polyester, polyolefins, polyurethanes and hard waxy resins; organic synthesis.

hydroquinone dimethyl ether (1,4-dimethoxybenzene; DMB; dimethyl hydroquinone) $C_6H_4(OCH_3)_2$

Properties: White flakes with sweet clover odor; b.p. 213°C; m.p. 56°C; density 1.0293 g/ml (65°C); viscosity 1.04 cp (65°C); dielectric constant 2.8; absorbs ultraviolet light in range 2800–3000 Å. Soluble in benzene and alcohol; insoluble in water. Combustible. Low toxicity.

Containers: Glass bottles; fiber drums.

Uses: Weathering agent in paints and plastics; fixative in perfumes; dyes; resin intermediate; cosmetics, especially suntan preparations; flavoring.

hydroquinone mono-n-butyl ether $CH_3(CH_2)_3OC_6H_4OH$

Properties: White flakes; m.p. 64–65°C; b.p. 115°C (1.4 mm); insoluble in water; soluble in benzene, acetone, ethyl acetate, and alcohol. Combustible. Low toxicity.

hydroquinone monoethyl ether (4-ethoxyphenol) $C_6H_4OC_2H_5OH$

Properties: White solid; m.p. 63–65°C; b.p. 246–247°C; slightly soluble in water; soluble in benzene, acetone, ethyl acetate, and alcohol. Combustible. Low toxicity.

Uses: See hydroquinone monomethyl ether.

hydroquinone monomethyl ether (4-methoxyphenol; para-hydroxyanisole) $CH_3OC_6H_4OH$

Properties: White waxy solid; m.p. 52.5°C; b.p. 243°C; sp. gr (20/20°C) 1.55. Slightly soluble in water; readily soluble in benzene, acetone, ethyl alcohol, and ethyl acetate. Combustible.

Containers: Fiber drums.

Hazard: Moderately toxic.

Uses: Manufacture of antioxidants, pharmaceuticals, plasticizers, dyestuffs; stabilizer for chlorinated hydrocarbons and ethyl cellulose; inhibitor for acrylic monomers and acrylonitriles; ultraviolet inhibitor.

hydrosilicofluoric acid. See fluosilicic acid.

hydrosolvation. Solvent extraction of coal (containing up to 5% sulfur) under hydrogen pressure with use of a catalyst such as zinc chloride; pressures from 1000 to 2000 psi are necessary for suitable conversion. This process offers a means of deriving fuel oil and petrochemical feedstocks directly from coal.

hydrosulfite. Sodium hydrosulfite (q.v.).

hydrosulfite-formaldehyde. One of several mixtures of sodium formaldehyde hydrosulfite and sodium

formaldehyde bisulfite, used as discharges and stripping or reducing agents in dyeing and other textile operations. In some cases the zinc derivatives are used. Derivation is by the action of formaldehyde on aqueous sodium hydrosulfite, or from zinc, formaldehyde, sulfur dioxide and sodium hydroxide. Hazard: Probably toxic by ingestion.

hydrotrope. A chemical which has the property of increasing the aqueous solubility of various slightly soluble organic chemicals. Used especially in the formulation of liquid detergents.

hydroxocobalamin (USAN) $C_{62}H_{89}CoN_{13}O_{15}P$. alpha-(5,6-Dimethylbenzimidazolyl)hydroxocobamide. A form of vitamin B₁₂; used in medicine. See vitamin B₁₂.

hydroxyacetal. See hydroxycitronella dimethyl acetal.

para-hydroxyacetanilide. See para-acetylaminophenol.

hydroxyacetic acid (glycolic acid). $CH_2OHCOOH$

Properties: Colorless crystals, deliquescent; m.p. 78–79°C; b.p., decomposes; soluble in water, alcohol and ether. Available commercially as a 70% solution; light straw-colored liquid; odor like burnt sugar; sp. gr. 1.27; m.p. 10°C; combustible.

Derivation: From chloroacetic acid by boiling with water or aqueous alkali; by oxidation of glycol. Occurs naturally in sugar cane syrup.

Grades: Technical, 70% solution; pure crystals.

Containers: Drums; tank cars.

Hazard: Moderately toxic by ingestion.

Uses: Leather dyeing and tanning; textile dyeing; cleaning, polishing, and soldering compounds; copper pickling; adhesives; electroplating; breaking of petroleum emulsions; chelating agent for iron.

hydroxyacetone. See hydroxy-2-propanone.

ortho-hydroxyacetophenone $C_6H_4(OH)COCH_3$

Properties: Greenish-yellow liquid with minty odor; sp. gr. (20.8°C) 1.1307; b.p. (717 min) 213°C; refractive index (n 20/D) 1.5580; slightly soluble in water. Combustible.

2-hydroxyadipaldehyde $OHCCH_2CH_2CH_2CHOHCHO$

Properties: (25% aqueous solution); Sp. gr. (20°C) 1.066; b.p. 37°C (50 mm); vapor pressure (20°C) 17 mm; f.p. –3.5°C; pH approx 3.0. Combustible.

Containers: 55-gal drums.

Hazard: May be toxic.

Uses: Intermediate; insolubilizing agent for proteins and polyhydroxy materials; crosslinking agent for polyvinyl compounds; shrinkage control agent (textiles).

beta-hydroxyalanine. See serine.

5-hydroxy-3-(beta-aminoethyl)indole. See serotonin.

hydroxyamphetamine [para-(2-aminopropyl)phenol] $HOC_6H_4CH_2CHNH_2CH_3$

Properties: Crystals with m.p. 125–126°C. Soluble in water, alcohol, chloroform, and ethyl acetate.

Derivation: From para-nitrobenzyl chloride and a salt of nitroethane or from anisaldehyde and nitroethane.

Hazard: May be toxic.

Use: Medicine (also as hydrobromide).

hydroxyaniline. See aminophenol.

ortho-hydroxyanisole. See guaiacol.

para-hydroxyanisole. See hydroquinone monomethyl ether.

9-hydroxyanthracene. See anthranol.

hydroxyapatite $\text{Ca}_{10}(\text{PO}_4)_6(\text{OH})_2$. The major constituent of bone and tooth mineral. It is a finely divided, crystalline, non-stoichiometric material rich in surface ions (carbonate, magnesium, citrate) which are readily replaced by fluoride ion, thus affording protection to the teeth. See also fluoridation; calcium phosphate, tribasic.

para-hydroxyazobenzene-para-sulfonic acid

Properties: Orange-red crystals; very soluble in water. Uses: Analytical reagent; precipitant for numerous organic bases.

meta-hydroxybenzaldehyde $\text{HO} \cdot \text{C}_6\text{H}_4 \cdot \text{CHO}$.

Properties: Orange-pink crystals; m.p. 101.5°C; slightly soluble in cold water; very soluble in hot water and aromatic hydrocarbons.

Hazard: May be toxic by ingestion.

Uses: Intermediate for dyes, plastics, pharmaceuticals and bactericides; color reagent for Schiff's reagent; sensitizing agent in photographic emulsions.

ortho-hydroxybenzaldehyde. See salicylaldehyde.

para-hydroxybenzaldehyde $\text{HO} \cdot \text{C}_6\text{H}_4 \cdot \text{CHO}$.

Properties: Colorless needles; soluble in alcohol, ether, or water; sp. gr. 1.129; m.p. 116°C (sublimes).

Uses: Pharmaceuticals.

ortho-hydroxybenzamide. See salicylamide.

hydroxybenzene. See phenol.

2-hydroxy-1',2'-benzocarbazole-3-carboxylic acid

$\text{C}_{17}\text{H}_{11}\text{NO}_3$. A four-ring structure. Light green powder; m.p. 315–320°C; soluble in ethyl alcohol and acetone; insoluble in water. Used in the manufacture of dye intermediates and other organic chemicals.

meta-hydroxybenzoic acid $\text{C}_6\text{H}_4(\text{OH})\text{COOH}$.

Properties: White powder; m.p. 200°C. Soluble in water and hot alcohol. Nontoxic.

Uses: Intermediate for plasticizers; resins; light stabilizers; petroleum additives; pharmaceuticals.

ortho-hydroxybenzoic acid. See salicylic acid.

para-hydroxybenzoic acid $\text{C}_6\text{H}_4(\text{OH})\text{COOH} \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals; soluble in alcohol, water, and in ether. M.p. 210°C. Nontoxic.

Derivation: Interaction of para-aminobenzoic acid and nitrous acid.

Uses: Intermediate; synthetic drugs; food preservative (up to 0.1%) (approved by FDA). Its methyl, propyl and butyl esters are preservatives for cosmetics and pharmaceuticals.

2-hydroxybenzophenone $\text{C}_6\text{H}_5\text{COC}_6\text{H}_5\text{OH}$. A solid; m.p. 41°C; b.p. 210°C (27 mm). Insoluble in water; soluble in alcohol. An ultraviolet absorber used in plastics.

ortho-hydroxybenzyl alcohol. See salicyl alcohol.

beta-hydroxybutyraldehyde. See aldol.

beta-hydroxybutyric acid $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{COOH}$.

Properties: Viscid, yellow mass; m.p. 48–50°C; b.p. 130°C (12 mm); very soluble in water, alcohol, and ether.

Derivation: Interaction of acetoacetic acid and sodium amalgam.

Grades: Technical; reagent.

Use: Intermediates.

2-hydroxycamphane. See borneol.

hydroxy-beta-carotene. See cryptoxanthin.

hydroxychloroquine sulfate $\text{C}_{18}\text{H}_{26}\text{ClN}_3\text{O} \cdot \text{H}_2\text{SO}_4$.

Properties: White, crystalline, odorless powder. Bitter taste; pH of solutions 4.5. Freely soluble in water. Insoluble in alcohol, chloroform, ether. Exists in two forms: m.p. usual form 240°C; m.p. other form 198°C.

Grade: U.S.P.

Use: Medicine.

3-β-hydroxycholestane. See dihydrocholesterol.

hydroxycitronellal (citronellal hydrate; 3,7-dimethyl-7-hydroxyoctanal)

Properties: Viscous, colorless or faintly yellow liquid; sweet lily-type odor; sp. gr. 0.925–0.930 (15°C); refractive index (n 20/D) 1.448–1.450; optical rotation (Java type) +9 to +10.5°; boiling range 94–96°C (1 mm). Soluble in alcohol (50%), fixed oils; slightly soluble in water, glycerol, and mineral oil. Combustible; nontoxic.

Derivation: From citronellal (Java citronella or Eucalyptus citriodora).

Grades: Perfume; F.C.C.

Containers: Cans.

Uses: Perfumery (fixative, muguet odor); flavoring; soap and cosmetic fragrances.

hydroxycitronellal dimethyl acetal (hydroxyacetal)

Properties: Colorless liquid; light floral odor; sp. gr. 0.925–0.930 (25/25°C); refractive index 1.4410–1.4440 (20°C). Soluble in most fixed oils, mineral oil, propylene glycol. Insoluble in glycerin. Combustible; nontoxic.

Grades: Perfume; F.C.C.

Uses: Flavoring agent in foods; perfumery.

hydroxycitronellal-methyl anthranilate Schiff base

Properties: Linden-orange flower odor; yellow honey-like viscous liquid; stable; refractive index (n 20/D) 1.5350–1.5460; flash point (TCC) 206°F. Soluble in 2 parts of 70% alcohol, 1 part of 80% alcohol. Combustible; nontoxic.

Use: Perfumery.

17-hydroxycorticosterone. See hydrocortisone.

2-hydroxy-para-cymene. See carvacrol.

3-hydroxy-para-cymene. See thymol.

1-hydroxy-2,4-diamylbenzene. See diamyl phenol.

para-hydroxydiphenylamine (anilinophenol)

$\text{C}_6\text{H}_5\text{NHC}_6\text{H}_4\text{OH}$. Gray solid leaflets; m.p. 70°C (approx); purity 98% (min); b.p. 330°C; insoluble in water; soluble in alcohol, ether, acetone, chloroform, alkali, and benzene.

Hazard: Probably toxic and irritant.

hydroxydiphenyl. See phenylphenol.

2-hydroxyethanesulfonic acid. See isethionic acid.

hydroxyethylacetamide. See N-acetyethanolamine.

2-hydroxyethyl acrylate (HEA). A functional monomer for the manufacture of thermosetting acrylic resins (q.v.).

2-hydroxyethylamine. See ethanolamine.

Properties: Crystalline deliquescent solid; m.p. 43°C; b.p. 130–135°C (1 mm); density 1.2852 g/cc (20°C); flash point 370°F. Miscible with water; soluble in alcohol and acetone; insoluble in benzene and chloroform. Combustible.

hydroxyethylcellulose ("Cellosize").
Properties: Nonionic.

Properties: Nonionic, water-soluble ether of cellulose. White, free-flowing powder insoluble in organic solvents; soluble in hot or cold water. Stable in concentrated salt solutions; grease and oil resistant. Nontoxic. Combustible.

Containers: Fiber drums.

Uses: Thickening and suspending agent; stabilizer for vinyl polymerization; retards evaporation of water in cements, mortars, and concrete; binder in ceramic glazes; films and sheeting.

Properties: Hygroscopic liquid. Mild, ammoniacal odor. Soluble in water. Sp. gr. 1.0304 (20/20°C); b.p. 243.7°C; vapor pressure 0.01 mm (20°C); flash point 275°F; wt/gal 8.6 lb (20°). Combustible. Low toxicity.

Uses: Textile finishing compounds (antifuming agents, dyestuffs, cationic surfactants); resins, rubber products, insecticides, and certain medicinals.

Properties: Solid; m.p. 159°C; soluble in water and methanol.

Use: Chelating compound.

1-(2-hydroxyethyl)-2-n-heptadecenyl-2-imidazoline
 $C_{22}H_{42}N_2O$. A liquid cationic detergent.
 Uses: Corrosion inhibitor.

Uses: Corrosion inhibitor; acid-stable emulsifier.

Properties: Colorless, slightly viscous liquid; sp. gr. (20°C) 1.11; f.p. -70°C; boiling range (25 mm) 145-153°C; flash point 224°F; completely miscible with water; soluble in lower alcohols; slightly soluble in ether. Combustible.

Grade: 70%.
Hazard: May be toxic and irritant. Moderate fire risk.
Use: Intermediate.

Properties: Clear mobile liquid; sp. gr. 1.064 (77/60°F); f.p. -12°C; refractive index 1.4505 (25/D). Miscible with water and soluble in common organic solvents. An inhibitor is usually added to solutions to prolong shelf life. The 30% solution is made with xylene.

Hazard: 30% grade (with xylene) is flammable; moderate fire risk.

Grades: 30%; 96%.

Containers: 55-gal drums.
Uses: As a disinfectant.

Uses: Acrylic resins; binder for nonwoven fabrics; enamels.

N-hydroxyethyl piperazine
HOCH₂CH₂NCH₂CH₂NHCH₂CH₂

Properties: Liquid; sp. gr. 1.0614 (20/20°C); b.p.

246.3°C; f.p. -10°C; flash point 255°F. Miscible with water. Combustible. Low toxicity.
Uses: Intermediate for pharmaceuticals, anthelmintics, surface-active agents, and synthetic fibers.

hydroxyethyltrimethylammonium bicarbonate (choline bicarbonate) $(\text{CH}_3)_3\text{NCH}_2\text{CH}_2\text{OH} \cdot \text{HCO}_3^-$.
Properties: Colorless liquid.

Properties: Colorless liquid; sp. gr. 1.0965 (25/4°C); f.p. -21.3°C; refractive index 1.3967 (25/D); miscible with water. Low toxicity.

Grade: Industrial grade is a 44–46% aqueous solution of a mixture of carbonate and bicarbonate.

Uses: Alkaline catalyst; intermediate for choline salts and surfactants.

1-hydroxyfenchane. See fenchyl alcohol.

hydroxyl group. The chemical group —OH , occurring in many inorganic compounds that ionize in solution to yield OH^- radicals. Also the characteristic group of alcohols. See also -ol.

Properties: Colorless crystals. Soluble in alcohol, acids and cold water. Sp. gr. 1.227; m.p. 33°C. The free base is unstable.

Derivation: By decomposing hydroxylamine hydrochloride or sulfate with a base and distilling in vacuo.

Hazard: Decomposes rapidly at room temperature, violently when heated. Strong irritant to tissue.
Uses: Reducing agent; organic synthesis.

Properties: White to brown crystalline solid; very hygroscopic; soluble in water and methanol; slightly soluble in alcohol. Wt/gal 15-16 lb (20°C); m.p. indefinite (decomposes); pH of 0.1 M aqueous solution 1.6.

Uses: Reducing agent; photographic developer; purification agent for aldehydes and ketones; synthesis of dyes, pharmaceuticals; rubber chemicals; reagent.

Properties: Colorless hygroscopic crystals; sp. gr. 1.67 (17°C); soluble in water, glycerol and alcohol; insoluble in ether. M.p. 152°C (decomposes); pH of 0.1 M aqueous solution 3.4.

Derivation: Reduction of ammonium chloride, frequently by electrolysis.

Uses: Organic synthesis; photographic developer; medicine; controlled reduction reactions; nondiscoloring short-stopper for synthetic rubbers; anti-oxidant for fatty acids.

Properties: Colorless crystals; solution has a corrosive action on the skin; m.p. 177°C (dec); soluble in water; slightly soluble in alcohol.

Uses: Reducing agent; photographic developer; purification agent for aldehydes and ketones; chemical synthesis; textile chemical; oxidation inhibitor for fatty acids; catalyst; biological and biochemical research; making oximes for paints and varnishes; rustproofing; nondiscoloring short-stopper for synthetic rubbers.

hydroxylammonium acid sulfate. See hydroxylamine acid sulfate.

hydroxylammonium chloride. See hydroxylamine hydrochloride.

hydroxylammonium sulfate. See hydroxylamine sulfate.

hydroxymercurichlorophenol (2-chloro-4-(hydroxymercuri)phenol) $C_6H_3Cl(HgOH)(OH)$. Insoluble in water and common organic solvents. Soluble in solutions of acids and alkalis with the formation of salts.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to eyes and skin. Use may be restricted. Tolerance, 0.05 mg per cubic meter of air.

Uses: Seed disinfectant and fungicide.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

hydroxymercuricresol $C_6H_3CH_3(HgOH)(OH)$. A pesticide.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to eyes and skin. Use may be restricted. Tolerance, 0.05 mg per cubic meter of air.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

hydroxymercurinitrophenol $C_6H_3NO_2(HgOH)(OH)$. A pesticide.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to eyes and skin. Use may be restricted. Tolerance, 0.05 mg per cubic meter of air.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

2-hydroxy-3-methylbenzoic acid. See cresotic acid.

3-hydroxy-3-methylbutanone-2

$CH_3COH(CH_3)C(O)CH_3$. Colorless liquid; sp. gr. 0.95 (25/25°C). Used as an intermediate. Combustible.

7-hydroxy-4-methylcoumarin. See beta-methyl umbelliferone.

4-hydroxymethyl-2,6-di-tert-butylphenol

$[(CH_3)_3C]_2C_6H_2(OH)(CH_2OH)$.

Properties: White crystalline powder; m.p. 140–141°C; b.p. 162°C (2.6 mm); flash point 375°F; vapor pressure 0.03 (100°C); bulk density 26 lb/cu ft; no odor. Partially soluble in methanol, ethanol, and acetone; insoluble in water. Combustible.

Hazard: May be toxic by ingestion.

Uses: Antioxidant for gasoline and other hydrocarbons.

hydroxymethylethylene carbonate. See glycerin carbonate.

DL-alpha-hydroxy-gamma-methylmercaptobutyric acid, calcium salt. See methionine hydroxy-analog calcium.

2-hydroxymethyl-5-norbornene. See 5-norbornene-2-methanol.

4-hydroxy-4-methylpentanone-2. See diacetone alcohol.

2-(2'-hydroxy-5'-methylphenyl)benzotriazole

$HOC_6H_4(CH_3)N_3C_6H_4$.

Properties: Off-white, crystalline powder; m.p. 129–130°C; b.p. 225°C (10 mm); insoluble in water; soluble in methyl ethyl ketone, methyl methacrylate.

Uses: Protector against ultraviolet radiation; thermal stabilizer, antioxidant; chelation of metals.

3-hydroxy-2-methyl-1,4-pyrone. See maltol.

hydroxynaphthalene. See naphthol.

3-hydroxy-2-naphthoic acid (beta-hydroxynaphthoic acid; 3-naphthol-2-carboxylic acid; beta-oxynaphthoic acid) $C_{10}H_6OHCOOH$.

Properties: Yellow rhombic leaflets; soluble in alcohol and ether. M.p. 217.5–219°C. Insoluble in water.

Derivation: By treating sodium 2-naphtholate with carbon dioxide under pressure.

Hazard: Moderately toxic and irritant.

Uses: Dyes and pigments.

beta-hydroxynaphthoic anilide (naphthol AS; azoic coupling component 2) $C_{10}H_6OHCONHC_6H_5$.

Properties: Cream-colored crystals. Sodium salt is soluble in water; m.p. 246.0°C.

Derivation: Condensation of beta-hydroxynaphthoic acid and aniline.

Hazard: May be toxic.

Use: Dyes.

2-hydroxy-1,4-naphthoquinone $C_{10}H_6O_2(OH)$.

Properties: Yellow to orange-yellow needles or powder; m.p. 192–195°C (dec.). Redox potential 0.362 volt; soluble in cold water, benzene, carbon tetrachloride and petroleum ether.

Uses: Intermediate for pharmaceuticals, henna hair and wool dye, bactericides; seed disinfectant.

5-hydroxy-1,4-naphthoquinone (juglone). This compound, derived from walnuts, is the starting point in the 16-step synthesis of oxytetracycline.

N-(7-hydroxyl-1-naphthyl)acetamide (1-acetylamino-7-naphthol) $C_{10}H_6(OH)NHCOOH_3$. A granular paste used as a chemical intermediate.

4-hydroxy-3-nitrobenzenearsonic acid (3-nitro-4-hydroxyphenylarsonic acid)

$HOC_6H_3(NO_2)AsO(OH)_2$.

Properties: Pale-yellow crystals.

Derivation: Heating phenol with arsenic and treating the para-hydroxyphenyl arsonate with nitric and sulfuric acids.

Hazard: Toxic by ingestion.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

4-hydroxynonanoic acid, gamma-lactone. See gamma-nonyl lactone.

cis-12-hydroxyoctadec-9-enoic acid. See ricinoleic acid.

12-hydroxyoleic acid. See ricinoleic acid.

15-hydroxypentadecanoic acid lactone. See pentadecanolid.

3-hydroxyphenol. See resorcinol.

2-hydroxy-2-phenylacetophenone. See benzoin.

beta-para-hydroxyphenylalanine. See tyrosine.

2-(2'-hydroxyphenyl)benzotriazole $HOC_6H_4N_3C_6H_4$. An ultraviolet light absorber used in plastics.

para-hydroxyphenyl benzyl ether. See para-benzyl oxyphenol.

4-(para-hydroxyphenyl)-2-butanone acetate. See cue-lure.

para-hydroxyphenylglycine (glycine[photographic]; photo-glycin) $HOC_6H_4NHCH_2COOH$.

Properties: White to buff crystals or powder; m.p.

240°C (with decomposition); slightly soluble in water; soluble in alkaline solutions.

Derivation: By condensation of para-aminophenol with chloroacetic acid.

Uses: Photographic developer; cellulose and nitrocellulose acetate lacquers and varnishes.

2-hydroxyphenylmercuric chloride (chloromercuriphenol) $\text{HO} \cdot \text{C}_6\text{H}_4\text{HgCl}$.

Properties: White to faint pink, fine crystals; 0.1 parts in 100 soluble in water (25°C); soluble in hot water, alkali, and alcohol. M.p. 152°C.

Hazard: Highly toxic. Skin irritant. Tolerance, 0.05 mg per cubic meter of air.

Uses: Antiseptic; fungicide.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

1-(para-hydroxyphenyl)-2-methylaminoethanol tartrate. See synephrine tartrate.

hydroxyphenylstearic acid. A derivative of phenylstearic acid (q.v.) potentially useful as oxidation and corrosion inhibitor.

11-alpha-hydroxyprogesterone $\text{C}_{21}\text{H}_{30}\text{O}_3$.

Properties: White crystalline powder; m.p. 163°C approx; specific rotation +179°; insoluble in water; soluble in alcohol.

Derivation: From progesterone by microbiological oxidation.

Use: A steroid intermediate; biochemical research.

hydroxyproline (Hyp) $\text{HO} \cdot \text{C}_4\text{H}_7\text{NCOOH}$. (4-hydroxy-2-pyrrolidinedicarboxylic acid.)

Properties: Colorless crystals; very soluble in water; slightly soluble in alcohol; insoluble in ether; optically active.

DL-hydroxyproline, m.p. 261–262°C with decomposition.

L-hydroxyproline, m.p. 270°C (natural).

D-hydroxyproline, m.p. 274°C.

Derivation: Hydrolysis of protein (gelatin); organic synthesis.

Use: Biochemical research. Available commercially as L-hydroxyproline.

2-hydroxy-1,2,3-propanetricarboxylic acid. See citric acid.

hydroxy-2-propanone (acetol; acetonol alcohol; acetylcarbinol; hydroxyacetone; pyruvic alcohol) $\text{CH}_3\text{COCH}_2\text{OH}$.

Properties: Colorless liquid; sp. gr. 1.0824 at 20/20°C; b.p. 146°C; f.p. –17°C. Soluble in water, alcohol, and ether. Combustible. Low toxicity.

Derivation: (a) By action of potassium acetate or potassium formate on a solution of bromo- or chloroacetone in dry methanol; (b) by bacterial fermentation of propylene glycol.

Grade: Technical

Use: Solvent for nitrocellulose.

alpha-hydroxypropionic acid. See lactic acid.

3-hydroxypropionitrile. See ethylene cyanohydrin.

alpha-hydroxypropionitrile. See lactonitrile.

beta-hydroxypropionitrile. See ethylene cyanohydrin.

hydroxypropyl acrylate (HPA). A functional monomer used in manufacture of thermosetting acrylic resins for surface coatings.

2-hydroxypropylamine. See isopropanolamine.

hydroxypropyl cellulose. A cellulose ether with hydroxypropyl substitution.

Properties: White powder; soluble in water, methyl and

ethyl alcohols and other organic solvents. Combustible. Nontoxic. Thermoplastic; can be extruded and molded. Insoluble in water warmer than 100°F.

Grades: F.C.C.

Uses: Emulsifier; film former; protective colloid; stabilizer; suspending agent; thickener; food additive.

hydroxypropylglycerin.

Properties: Pale straw-colored liquid; sp. gr. 1.084 (25/25°C); refractive index 1.459 (25°C); flash point 380°F; pour point –23°C; soluble in water and methanol. Combustible; low toxicity.

Uses: Intermediate for alkyd resins and polyesters; plasticizer for cellulose, glue, starch, etc.

hydroxypropyl methacrylate

$\text{CH}_3\text{CHOHCH}_2\text{OOC}(\text{CH}_3)\text{CH}_2$.

Properties: Clear, mobile liquid; sp. gr. 1.066 (25/16°C); refractive index (n_D 25/D) 1.446; flash point 206°F. Limited solubility in water; soluble in common organic solvents. Combustible. Low toxicity.

Uses: Monomer for acrylic resins; nonwoven fabric binders; detergent lube oil additives.

hydroxypropyl methylcellulose (methylcellulose, propylene glycol ether).

Properties: White powder. Swells in water producing clear to opalescent, viscous, colloidal solution. Insoluble in anhydrous alcohol, in ether, and in chloroform. Combustible. Nontoxic.

Grades: N.F.; F.C.C.

Uses: Medicine (suspending agent); in food products as thickening agent, stabilizer, emulsifier; thickener in paint-stripping preparations.

2-(alpha-hydroxypropyl)piperidine. See conhydrine.

N-beta-hydroxypropyl-ortho-toluidine

$\text{CH}_3\text{C}_6\text{H}_4\text{NHCH}_2\text{CH}(\text{OH})\text{CH}_3$.

Properties: Color, amber; distillation range, 170–180°C (20 mm); sp. gr. 1.035–1.045 (20/20°C); refractive index 1.540–1.550 (20°C).

Hazard: May be toxic.

Use: Dye intermediate.

4-hydroxy-2H-pyran-3,3,5,5-(4H,6H)tetramethanol. See anhydroenneaheptitol.

2-hydroxypyridine-N-oxide. Bactericidal agent related to aspergillid acid; made from pyridine-N-oxide.

1-hydroxy-2-pyridine thione (2-pyridinethiol-1-oxide)

$\text{C}_5\text{H}_4\text{NOH}(\text{S})$. Apparently exists in equilibrium with the -SH form. Forms chelates with iron, manganese, zinc, etc.

Hazard: May be toxic.

Uses: Fungicide; bactericide.

4-hydroxy-2-pyrrolidinedicarboxylic acid. See hydroxyproline.

8-hydroxyquinoline (8-quinolinol; oxyquinoline; oxine) $\text{C}_8\text{H}_6\text{NOH}$.

Properties: White crystals or powder; darkens when exposed to light; technical grade usually tan; almost insoluble in water; soluble in alcohol, acetone, chloroform, benzene, also in formic, acetic, hydrochloric and sulfuric acids, and in alkalis; phenolic odor; m.p. 73–75°C; b.p. 267°C.

Grades: C.P.; technical.

Hazard: Moderately toxic.

Uses: Precipitating and separating metals; preparation of fungicides.

8-hydroxyquinoline benzoate $\text{C}_8\text{H}_6\text{NOH} \cdot \text{C}_6\text{H}_5\text{COOH}$.

Properties: Yellowish-white crystals with a saffron odor; m.p. 56–61°C; almost insoluble in water; soluble in alcohol and glycerol.

Hazard: Moderately toxic.

Uses: Antiseptics; fungicide, recommended for Dutch elm disease.

8-hydroxyquinoline sulfate $(C_6H_7NO)_2 \cdot H_2SO_4$.

Properties: Pale yellow powder; slight saffron odor; burning taste. Melting range 167–182°C. Soluble in water; slightly soluble in alcohol; insoluble in ether.

Hazard: Moderately toxic.

Uses: Antiseptic, antiperspirant, deodorant; fungicide.

8-hydroxyquinoline-5-sulfonic acid $C_9H_5N(OH)SO_3H$.

Properties: Pale yellow, needlelike crystals or powder; soluble in water; slightly soluble in organic solvents; m.p. 213°C with decomposition.

Hazard: Moderately toxic.

4-hydroxysalicylic acid. See beta-resorcylic acid.

12-hydroxystearic acid

$CH_3(CH_2)_5(CHOH)(CH_2)_{10}COOH$. A C_{18} straight chain fatty acid with an —OH group attached to the carbon chain; m.p. 79–82°C. It is produced by hydrogenation of ricinoleic acid. Combustible. Low toxicity.

Uses: Lithium greases; chemical intermediates.

1,12-hydroxystearyl alcohol (1,12-octadecanediol). A long-chain fatty alcohol made by reduction of 12-hydroxystearic acid by replacing the —COOH group with a —CH₂OH. Combustible. Low toxicity.

Properties: M.p. 69°C; boiling range 315–335°C.

Uses: Chemical intermediate; synthetic fibers; organic synthesis; pharmaceuticals; surface-active agents; plastics and resins; protective coatings.

hydroxysuccinic acid. See malic acid.

alpha-hydroxytoluene. See benzyl alcohol.

hydroxytoluene. See cresol.

hydroxytoluic acid. See cresotic acid.

5-hydroxytryptamine. See serotonin.

4-hydroxyundecanoic acid, gamma-lactone. See gamma-undecalactone.

hydroxyurea ("Hydrea"). A drug used in cancer therapy, said to inhibit biosynthesis of DNA; especially useful for melanoma.

hydroxyzine hydrochloride. $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$.

Properties: White, odorless powder. Very soluble in water; fully soluble in chloroform, and practically insoluble in ether; melting range 196–204°C (dec.).

Grade: N.F.

Use: Medicine.

"Hydrozin."³⁰⁹ Trademark for normal zinc formaldehyde sulfoxylate used for discharge printing on acetate grounds and for stripping wool, acetates and nylon. Also used as a catalyst for polymerization of vinyl monomers.

hydrozincite (zinc bloom) $Zn_5(OH)_6(CO_3)_2$. A natural basic carbonate of zinc, found in the upper zones of zinc deposits.

Properties: Color white to gray or yellowish; luster dull to silky; fluorescent in ultraviolet light; sp. gr. 3.5–4.0; hardness 2.0–2.5.

Occurrence: Missouri, Pennsylvania, Utah, California, Nevada; Europe.

Use: An ore of zinc.

hydne. Mixture of 60% (by weight) of uns-dimethylhydrazine and 40% diethylenetriamine; used as a high-energy fuel.

"Hyfac."²⁴² Trademark for saturated or hydrogenated fatty acids and glycerides and castor oil derivatives.

"Hyform."⁵⁷ Trademark for water emulsions of pure paraffin wax, microcrystalline wax, or a modification of one of these waxes.

Uses: Binders for pressed ceramic pieces, lubricants for die or mold release, and plasticizers during mold forming.

Hygas process. A method of coal gasification in which hydrogen from an external source is reacted with low-grade coal such as lignite, producing a gas with a Btu value of about 1000. It requires high-pressure fluidization techniques and subsequent methanation to obtain the heating values necessary. The sources of hydrogen may be natural gas reforming (steam-oxygen process) or the steam-iron process. A 75-ton per day pilot plant is in operation, and a full-scale commercial plant is under construction (1975). See also gasification.

"Hygromix."⁵³⁰ Trademark for hygromycin B, a feed and food additive.

hygromycin $C_{23}H_{29}NO_{12}$.

Properties: White powder; weakly acidic; freely soluble in water and alcohol. Produced by *Streptomyces hygrosopicus*.

Use: Veterinary medicine.

hygroscopic. Descriptive of a substance that has the property of adsorbing moisture from the air, such as silica gel, calcium chloride or zinc chloride. The water-vapor molecules are held by the molecules of the agent, which is called a desiccant (q.v.) when used primarily for this purpose. Paper and cotton fabrics are hygroscopic, normally containing from 5 to 8% water after standing in an atmosphere of normal humidity; they are usually kept in constant-humidity rooms before use. Many dry chemicals are hygroscopic, and should be kept in well-stoppered bottles or tightly closed containers. See also deliquescent.

"Hylene."²⁸ Trademark for a series of organic isocyanates.

M-50. 50% methylenebis(4-phenyl isocyanate)

$(C_6H_4NCO)_2$, in monochlorobenzene. Used in adhesives. See diphenylmethane diisocyanate.

MP. Bisphenol adduct of methylenebis(4-phenyl isocyanate). Used as bonding agent for adhering "Dacron" fiber to rubber compositions.

T. Toluene-2,4-diisocyanate; used for urethane products.

TM. 80% toluene-2,4-diisocyanate and 20% toluene-2,6-diisocyanate.

TM-65. 65% 2,4-compound and 35% 2,6-compound.

"Hylox."²¹⁴ Trademark for a polysulfone matrix used as the base for stereotype printing plates. The plate is produced by extruding polypropylene onto the matrix and pressure-forming.

"Hyonic."³⁰⁹ Trademark for a series of products used in liquid detergents, shampoos, textile scouring, metal cleaners, dairy detergents, rug and upholstery shampoos, hard surface cleaners.

Hyp Abbreviation for hydroxyproline.

"Hypalon."²⁸ Trademark for chlorosulfonated polyethylene, a synthetic rubber.

Properties: White chips; sp. gr. 1.10-1.28. Resistant to ozone, as well as the weather, oil, solvents, chemicals, head and abrasion.

Uses: Insulation for wire and cable; shoe soles and heels; automotive components; building products; coatings; flexible tubes and hoses, seals, gaskets, diaphragms. "Hypalon" 45 can accept large amounts of filler and is used as a binder for powdered metal to produce magnetic gaskets for doors, and sheet goods for x-ray barriers.

"Hypaque" Sodium.¹⁶² Trademark for sodium diatrizoate (q.v.).

hyperglycemic-glycogenolytic factor. See glucagon.

hypergolic fuel. A liquid rocket fuel or propellant which consists of combinations of fuels and oxidizers, which ignite spontaneously on contact.

hypersorption. Process in which activated carbon selectively adsorbs less volatile components from a gaseous mixture, while the more volatile components pass on unaffected. Particularly applicable to separations of low-boiling mixtures such as hydrogen and methane, ethane from natural gas, ethylene from refinery gas, etc.

hypertensin. See angiotensin.

"Hypertensin-CIBA."³⁰⁵ Trademark for angiotensin amide.

"Hy-Phos."⁶² Trademark for a form of anhydrous glassy sodium phosphate. Used in detergent formulations.

hypnone. See acetophenone.

hypo-. (1) A prefix used in chemical terminology to indicate a compound (usually an acid) in its lowest oxidation state, or containing the lowest proportion of oxygen in a series of compounds E.g., nitric acid (HNO_3), nitrous acid (HNO_2), hyponitrous acid ($\text{H}_2\text{N}_2\text{O}_2$).

(2) Common term for a photographic chemical. See sodium thiosulfate.

hypoallergenic. A term recently introduced in the cosmetics industry, and defined by FDA as describing a cosmetic product that is less likely to cause adverse allergic reactions than competing products. Claims of hypoallergenicity must be substantiated by specific dermatological tests made by the manufacturer of the product.

hypochlorite solution. An aqueous solution of a metallic salt of hypochlorous acid (q.v.). Strong oxidizing agent.

Hazard: Moderately toxic; irritant to skin and eyes.

Uses: Bleaching of textiles; antiseptic agent.

Shipping regulations: (Rail) (Containing more than 7% available chlorine by weight). White label. (Air) Corrosive label.

hypochlorous acid. HOCl

Properties: Greenish-yellow aqueous solution; highly unstable, weak acid, decomposing to hydrochloric acid and oxygen. Can exist only in dilute solutions.

Derivation: Water solution of chloride of lime (bleaching powder).

Hazard: Moderately toxic; irritant to skin and eyes.

Uses: Textile and fiber bleaching; water purification; antiseptic.

See also hypochlorite solution; calcium hypochlorite; sodium hypochlorite.

alpha-hypophamine. See oxytocin.

beta-hypophamine. See vasopressin.

hypophosphorous acid H_3PO_2 .

Properties: Colorless, oily liquid or deliquescent crys-

tals; sour odor. Soluble in water. Sp. gr. 1.439; m.p. 26.5°C. A strong monobasic acid and reducing agent; sold in solution.

Derivation: Heating concentrated baryta water with white phosphorus and decomposing the barium hypophosphite with sulfuric acid, filtering the liquid and concentrating under reduced pressure.

Grades: Technical; N.F. (30-32% solution, sp. gr. 1.13); 50% purified.

Containers: Bottles; carboys; drums.

Hazard: Fire and explosion risk in contact with oxidizing agents.

Use: Preparation of hypophosphites; electroplating baths.

hypoxanthine $\text{C}_5\text{H}_4\text{N}_4\text{O}$. An intermediate in the metabolism of animal purines; also widely distributed in the vegetable kingdom.

Properties: White to cream powder; decomposes at 150°C; almost insoluble in cold water; slightly soluble in boiling water; soluble in dilute acids and alkalis.

Derivation: Deamination of adenine; reduction of uric acid.

Uses: Biochemical research; biological media.

hypoxanthine riboside. See inosine.

hypoxanthine riboside-5-phosphoric acid. See inosinic acid.

"Hyprin" GP30.²³³ Trademark for hydroxypropylglycerin (q.v.).

"Hypro" Process.⁴¹⁶ Proprietary method for the production of hydrogen from hydrocarbon gas streams. A hydrocarbon, such as methane, is contacted with a catalyst under moderate conditions of temperature and pressure and decomposed into carbon, which remains on the catalyst, and hydrogen, which is mechanically removed. The hydrogen produced is about 94% pure when the charge stock is methane.

"Hyprose" SP80.²³³ Trademark for octakis-(2-hydroxypropyl)sucrose (q.v.).

"Hyros."⁷⁹ Trademark for a special "FF" heat-treated wood rosin. M.p. (capillary tube) 64°C, (ball and ring) 85°C; sp. gr. 1.08 (25/25°C); color "FF."

Uses: Adhesive tape; battery wax; belt dressings; box toes; branding paint; brewers' pitch; core oil; dry core binders; fireworks; linoleum cement; matches; printing ink; rock wool; roofing cement; rubber cement; smoking molds; synthetic rosin oil; tree banding; Venice turpentine; wire-coating compounds.

hysteresis. Hysteresis (derived from the Greek word meaning "to lag behind") is a retardation of the effect, as if from viscosity, when the forces acting upon the body are changing. A common illustration is the retentivity of induction in ferromagnetic materials, such as iron and its alloys, when the magnetizing force is changed. When such a substance is placed in a magnetizing coil and the magnetizing field is gradually increased to a given value, and then decreased, the magnetic induction in decreasing does not follow the same relation to the magnetizing field that it did when the field was increasing, but lags behind the decreasing field.

Hysteresis is analogous to mechanical inertia, and the energy lost is analogous to that lost in mechanical friction. It presents a major problem in the design of electrical machines with iron cores, such as transformers and rotating armatures. In instruments designed for very high frequencies the retardation and losses are so great as to render iron cores useless.

The stress-strain curves of vulcanized rubber, also display hysteresis, in that strain (elongation, crystal-

lization) persists when the deforming stress is removed, thus producing a hysteresis *loop* instead of a reversible pathway of the curves. This loop indicates a *loss* of resilient energy.

Norman E. Gilbert.

"Hystrene."⁴⁷³ Trademark for high-purity saturated fatty acids including caprylic, capric, lauric, myristic, palmitic, triple pressed stearic acid, etc.

"Hytakerol."¹⁶² Trademark for dihydrotachysterol (q.v.).

"Hytrol" O.²⁸ Trademark for cyclohexanone (q.v.).

"Hyvar X."²⁸ Trademark for a wettable powder containing 80% bromacil.

"Hyvar" X-WS is a water-soluble powder containing 50% Bromacil.

I

I Symbol for iodine.

I-131. See iodine 131.

IAA. Abbreviation for 3-indoleacetic acid (q.v.).

IBIB. Abbreviation for isobutyl isobutyrate.

IBP. Abbreviation for initial boiling point; used when a range of boiling temperatures is given. See also DP.

-ic. A suffix used in naming inorganic compounds which indicates that the central element is present in its highest oxidation state; thus in ferric chloride (FeCl_3), the iron has an oxidation number of +3, equivalent to its valence; in an ionized state it would have three positive charges (Fe^{+++}). (A recommended change in this system of nomenclature is to use the common name of the element (iron) together with a Roman numeral showing the oxidation number; thus ferric chloride would be iron (III) chloride).

ICC. Abbreviation for ignition control compound.

ice (H_2O). An allotropic, crystalline form of water; melting point 0°C (32°F); latent heat of melting: 80 calories per gram; sp. gr. 0.91; its property of melting under pressure accounts for "slipperiness." Occurs in nature as Ice I, but several other forms are known.

Uses: Refrigeration; preservation of fish at sea. See also water.

Iceland spar. A form of calcite having unique optical properties. Used in polarizing light (nicol prism).

ichthammol (ammonium ichthosulfonate).

Properties: Brownish-black, syrupy liquid, burning taste, tarry odor. Incompatible with acids, alkalis, carbonates, hydroxides, mercuric chloride. Soluble in water, alcohol-ether or alcohol-ether-water mixtures; partially soluble in alcohol and ether. Miscible with glycerol. Low toxicity.

Derivation: Aqueous solution of sulfonated ammonium compounds derived from the action of sulfuric acid upon distillates from bituminous shales.

Grade: N.F.

Use: Pharmaceutical products such as skin ointments, cosmetic preparations, special dermatological soaps.

"Ichthymall."¹²⁹ Trademark for ichthammol.

"Ichthyol." Trademark for ichthammol.

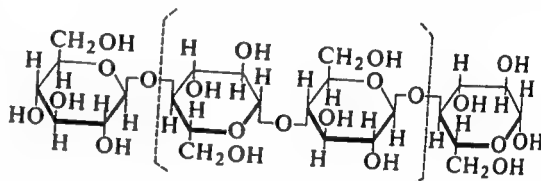

-ide. A suffix used in naming compounds comprised of two elements; in such names, the first element, being electropositive, retains its name without change, but the second, being electronegative, utilizes the suffix -ide as a modification of the elemental name. Examples are: sodium hydroxide, magnesium chloride, hydrogen sulfide, etc. Similarly, oxygen is modified to oxide, fluorine to fluoride, phosphorus to phosphide, and carbon to carbide.

ideal gas (perfect gas). A gas in which there is complete absence of cohesive forces between the component molecules; the behavior of such a gas can be predicted accurately by Boyle's Law, Charles' Law or

the ideal gas equation through all ranges of temperature and pressure. The concept is theoretical, as no actual gas meets the ideal requirement; carbon dioxide especially lacks conformity.

ideal solution. A solution which exhibits no change of internal energy on mixing and complete uniformity of cohesive forces. Its behavior is described by Raoult's Law (q.v.) over all ranges of temperature and concentrations.

identity period. The repeating unit or monomer which occurs n times in a natural or synthetic polymer molecule; for example, the anhydroglucose unit in cellulose is enclosed in brackets:

"Igenal."³⁰⁷ Trademark for a series of dyestuffs for chrome-tanned leather. Characterized by unusual tinctorial power.

"Igepal."³⁰⁷ Trademark for a series of biodegradable nonionic surfactants used as detergents, dispersants, emulsifiers, and wetting agents.

CA, CO, DM, RC: A series of alkylphenoxypoly(oxyethylene)ethanols, resulting from the combination of an alkylphenol with ethylene oxide. The general formula is $\text{RC}_6\text{H}_4\text{O}(\text{CH}_2\text{CH}_2\text{O})_n\text{CH}_2\text{CH}_2\text{OH}$ in which R may be C_8H_{17} or a higher homolog.

LO and A: A series of linear alkylphenol ethoxylates (LO series) and a series of linear aliphatic ethoxylates (A series).

"Igepon."³⁰⁷ Trademark for a series of anionic surfactants used as detergents, wetting agents, emulsifiers, dispersants and foaming agents. T and C types are sulfo-amides derived from N-methyltaurine or N-cyclohexyltaurine and fatty acids and have the general formula: $\text{RCON}(\text{R}')\text{CH}_2\text{CH}_2\text{SO}_3\text{Na}$. A types are sulfo-esters derived from isethionic acid and a fatty acid and have the general formula: $\text{RCOOCH}_2\text{CH}_2\text{SO}_3\text{Na}$. (R and R' are alkyl groups).

ignition control compound. A substance such as methyl-diphenyl phosphate, or trimethyl phosphate which is added to gasoline to control spark plug fouling, surface ignition, and motor rumble.

ignition point. See autoignition point.

ignotine. See carnosine.

"Illium."⁴⁹¹ Trademark for a series of superstainless steel alloys with high corrosion resistance.

ilmeneite (titanic iron ore) $\text{FeO} \cdot \text{TiO}_2$. Iron-black mineral; black to brownish-red streak; submetallic luster. Resembles magnetite in appearance but is readily distinguished by feeble magnetic character. Sp. gr. 4.5-5; Mohs hardness 5-6.

Occurrence: Widely in U.S.; Canada; Sweden; U.S.S.R.; India. Also made synthetically.

Uses: Titanium paints and enamel; source of titanium metal; welding rods; titanium alloys; ceramics.

"Ilosone."¹⁰⁰ Trademark for propionyl erythromycin ester lauryl sulfate.

"Ilotycin."¹⁰⁰ Trademark for erythromycin, U.S.P.

Imhoff sludge. See sewage sludge.

imidazole (glyoxalin) HNCHNCHCH . A dinitrogen ring compound. An antimetabolite (q.v.) and inhibitor of histamine. Colorless crystals, m.p. 90°C; b.p. 257°C. Soluble in water, alcohol, and ether. Used in biological control of pests, especially fabric-feeding insects, often in combination with *dl-p*-fluorophenylalanine, an amino-acid inhibitor; also as a contact insecticide in an oil spray. The mechanism is that of structural antagonism rather than active toxicity. See also antihistamine; antagonist, structural.

4,5-imidazole dicarboxamide. See glycarbylamide.

4-imidazole ethylamine. See histamine.

2-imidazolidinone. See ethylene urea.

2-imidazolidone. See ethylene urea.

imidazo(4,5-d)pyrimidine. See purine.

imide. A nitrogen-containing acid having two double bonds. See succinimide; phthalimide.

imine. A nitrogen-containing organic substance having a carbon-to-nitrogen double bond $\text{R}-\text{CH}=\text{N}$. Such

compounds are highly reactive, even more so than the carbon-nitrogen triple bond characteristic of nitriles.

3,3'-iminobispropylamine (dipropylene triamine; 3,3'-diaminodipropylamine) $\text{H}_2\text{NC}_3\text{H}_6\text{NHC}_3\text{H}_6\text{NH}_2$.

Properties: Colorless liquid; sp. gr. 0.9307 (20/20°C); b.p. 240.6°C; f.p. -6.1°C; flash point 175°F (closed cup); soluble in water and polar organic solvents. Combustible.

Hazard: Moderately toxic by ingestion and inhalation; irritant.

Uses: Intermediate for soaps, dyestuffs, rubber chemicals, emulsifying agents, petroleum specialties, insecticides, and pharmaceuticals.

iminodiacetonitrile $\text{HN}(\text{CH}_2\text{CN})_2$.

Properties: Light tan, crystalline solid; m.p. 77-78°C; soluble in water and acetone.

Hazard: May be toxic.

Use: Chemical intermediate.

iminourea. See guanidine.

"IML-1."²⁸ Trademark for a creamy-white nondusting powder of sodium alkyl sulfates, used as an internal lubricant in elastomer compounds. Improves flow characteristics but does not appreciably reduce tensile strength.

"Imlar."²⁸ Trademark for vinyl resin-base finish used where extreme resistance to abnormal chemical exposure is required.

"Immedial."³⁰⁷ Trademark for a series of sulfur dye-stuffs, used for the dyeing of cotton and rayon. Char-

acterized by very good fastness to light and good fastness to washing and perspiration.

immiscible. Descriptive of substances of the same phase or state of matter that cannot be uniformly mixed or blended. Though usually applied to liquids such as oil and water, the term also may refer to powders that differ widely in some physical property, e.g., specific gravity, such as magnesium carbonate and barium sulfate. See also miscibility.

immune serum globulin. A sterile solution of globulins which contains those antibodies normally present in adult blood. Not less than 90% of the total protein is globulin. It is a transparent, nearly colorless, nearly odorless liquid. Must be kept refrigerated.

Derivation: From a plasma or serum pool of venous or placental blood from 1000 or more individuals.

Grade: U.S.P.

Use: Medicine.

See also antigen.

immunochemistry. That branch of chemistry concerned with the various defense mechanisms of the animal organism against infective agents, particularly the response between the body and foreign macromolecules (antigens), and the interaction between the products of the response (antibodies) and the agents that have elicited them. This involves study of the many proteins (serum globulins, enzymes, bacteria, and viruses) involved in these responses. It developed from the original work of Jenner (1775) and Pasteur (1880). See also antigen-antibody; chemotherapy.

"Imol."⁵¹ Trademark for a group of fire-resistant hydraulic fluids.

IMP. (1) Abbreviation for inosine monophosphate. See inosinic acid or sodium inosinate.

(2) Abbreviation for insoluble metaphosphate. See Maddrell's salts under sodium metaphosphate.

impalpable. Descriptive of a state of subdivision of particles so fine that the individual particles cannot be distinguished as such by pressing a powder between the thumb and index finger.

"Impedex."²⁸ Trademark for sodium propionate (q.v.).

imperial green. See copper acetoarsenite.

"Impermex."²³⁶ Trademark for a water-dispersible organic colloid, developed for the purpose of decreasing the water loss of drilling muds, even in those contaminated with salt, salt water, cement, or other water-soluble electrolyte.

"Implex."²³ Trademark for thermoplastic, high-impact acrylic modling powder, supplied in natural and colored forms. Maximum toughness, gloss, stain- and heat-resistant grades.

Uses: Shoe heels, business-machine and musical instrument keys, housings, automotive parts, knobs, metalized parts, etc.

"Impranil."⁴²² Trademark for isocyanate-based adhesives used for textile finishes.

"Impregnole."⁴² Trademark for a series of water-repellents.

FH. A zirconium-synthetic wax complex.

367. A solvent solution of a mixture of silicone polymers and other ingredients.

"Impruvol."¹¹ Trademark for a solution of di-tert-butyl-para-cresol in a high quality transformer oil.

impurity. The presence of one substance in another in such low concentration that it cannot be measured quantitatively by ordinary analytical methods. It is impossible to prepare an ideally pure substance. In certain metal crystal lattices foreign substances can exist in as low a concentration as one millionth of an atomic percent. For example, arsenic atoms are present in germanium crystals in this percentage; this fact is largely responsible for the semiconducting properties of germanium. Here the impurity is beneficial, but often it is detrimental, for example, in graphite used as a moderator in nuclear reactors, and in many metallic catalysts. In the air, trace amounts of sulfur dioxide and carbon monoxide are 5 ppm of SO₂ and 50 ppm for CO. See also purity, chemical; trace element; air pollution; semiconductor. See also purification.

"Imron."²⁸ Trademark for a polyurethane caulking compound and floor finish.

Imuran. See azothiaprime.

In Symbol for indium.

INAH. Abbreviation for isonicotinic acid hydrazide. See isoniazid.

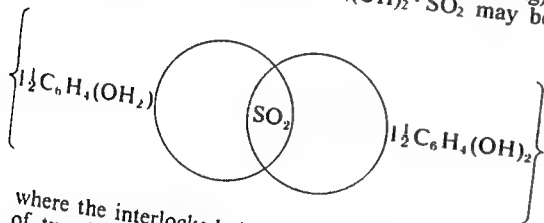

"Inceloid."¹⁷⁶ Trademark for plastic sheets, rods, tubes, moulded products, adhesives, lacquers and dyes.

incendiary gel.

(1) Mixtures of thermite (q.v.) suspended in oil set to a jelly with a small amount of soap, which undergo spontaneous ignition on contact with air. Another type may contain magnesium in jellied oil.

(2) Jellied gasoline combined with thickening agents such as napalm (q.v.) or finely divided magnesium.

inclusion complex (adduct). An unbonded association of two molecules, in which a molecule of one component is either wholly or partly locked within the crystal lattice of the other. There are several types of such complexes, the most familiar being the so-called clathrates (from Latin, crossbars of a grating). The clathrate compound 3C₆H₄(OH)₂ · SO₂ may be depicted as:

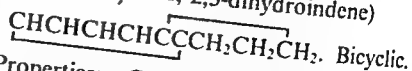

where the interlocked rings denote mutual enclosure of two identical cages. The formula for any clathrate compound is determined by the ratio of available cavities to the amount of cage material. Inclusion compounds can be used to separate molecules of different shapes, e.g., straight-chain hydrocarbons from those containing side chains, as well as structural isomers. They can also be used as templates for directing chemical reactions. See also clathrate compound; gas hydrate.

"Incoloy."²⁸³ Trademark for a group of corrosion-resistant alloys of nickel, iron, and chromium.

"Inconel."²⁸³ Trademark for a group of corrosion-resistant alloys of nickel and chromium.

"Indalone."⁵⁵ Trademark for n-butyl mesityl oxalate (see butopyronoxyl). Used in insect repellents which can be applied directly on the skin. Low toxicity.

indan (hydrindene; 2,3-dihydroindene)

Properties: Colorless liquid; b.p. 176.5°C; f.p. -51.4°C; refractive index 1.5388 (16.4°C); sp. gr. 0.965 (20/4°C); insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: From coal tar.

Hazard: May be irritant to skin and eyes.

Use: Organic synthesis.

indanthrene. See indanthrone.

"Indanthrene."¹⁰⁷ Trademark for a series of vat dyes used for dyeing and printing cotton, rayon, and silk. Characterized by excellent fastness to light, washing, chlorine, etc.

indanthrene yellow. See flavanthrene.

indanthrone (indanthrene) C₂₈H₁₄N₂O₄. A blue vat dye or pigment, also called Indanthrene Blue RS (6,15-dihydro-5,9,14,18-anthrazinetetrone). The molecule consists of two anthraquinone nuclei linked through two NH groups.

Properties: Excellent durability and light-fastness, not decomposed by heating to 250°C. Soluble in dilute alkaline solutions.

Derivation: By fusion of beta-aminoanthraquinone with caustic potash in the presence of potassium nitrate.

Uses: Dyeing unmordanted cotton; pigment in quality paints and enamels.

Properties: Colorless liquid, sp. gr. 1.006 (20/4°C), f.p. -3.5°C; b.p. 182°C; refractive index 1.5726 (n_D²⁵); flash point 173°F. Insoluble in water; soluble in most organic solvents; oxidizes readily in air; forms polymers on exposure to air and sunlight. Combustible. Low toxicity.

Derivation: Contained in the fraction of crude coal tar distillates which boils from 176 to 182°C.

Uses: Preparation of coumarone-indene resins; intermediate. See also coumarone.

Indian red (iron saffron). A red (maroon) pigment made by calcining copperas to obtain red ferric oxide. Fine particle size.

Uses: Pigment in paint, rubber, and plastics; polishing agent.

See also iron oxide red; rouge.

Indian yellow.

(1) (aureolin). A yellow pigment distinguished by being unaffected by hydrogen sulfide. It is durable, without action upon other pigments, and is permanent in oils and water color. It consists of a double nitrite of cobalt and potassium and is prepared by adding excess of potassium nitrite solution to a solution of cobalt nitrate acidified with acetic acid. See cobalt potassium nitrite.

(2) Also sometimes used for the yellow synthetic dye primuline.

indicator. An organic substance (usually a dye or intermediate) which indicates by a change in its color the presence or absence or concentration of some

other substance, or the degree of reaction between two or more other substances. The most common example is the use of acid-base indicators such as litmus, phenolphthalein, and methyl orange to indicate the presence or absence of acids and bases, or the approximate concentration of hydrogen ion in a solution. Their chief use is in analytical chemistry. The pH ranges of several typical indicators are as follows:

		color in acid	color in base
methyl orange	3.1-4.4	red	yellow
phenolphthalein	8.3-10.0	colorless	red
phenol red	6.8-8.4	yellow	red
litmus	4.4-8.3	red	blue
Congo red	3.0-5.2	blue	red
bromthymol blue	6.0-7.6	yellow	blue
chlorophenol red	5.2-6.8	yellow	red
cresol purple	7.4-9.0	yellow	purple

See also titration; pH.

indigo (indigotin; synthetic indigo blue) $C_{16}H_{10}N_2O_2$. C.I. No. 73000. A double indole derivative.

Properties: Dark blue, crystalline powder; bronze luster; sp. gr. 1.35; sublimes at 300°C (decomposes); soluble in aniline, nitrobenzene, chloroform, glacial acetic acid and concentrated sulfuric acid; insoluble in water, ether, and alcohol.

Derivation: From aniline and chloroacetic acid, and fusing the resulting phenylglycine with alkali and sodium amide. Formerly from plants of genus *Indigofera*.

Grades: Technical; pure.

Containers: Tins; fiber drums.

Uses: Textile dyeing and printing inks; manufacture of indigo derivatives; paints; analytical reagents.

"Indigolite." Trademark for a combination of sodium formaldehyde sulfoxylate and a sulfonated quaternary base used to give a discharge on indigo-dyed grounds and discharge printing of vat dye-stuffs.

indirect dye. A mordant dye (q.v.).

indium In Metallic element of atomic number 49, of Group IIIA of the periodic system. Atomic weight 114.82; valences 1,3; two stable isotopes.

Properties: Ductile, shiny, silver-white metal; softer than lead. Soluble in acids. Insoluble in alkalis. Non-toxic. Sp. gr. 7.362; m.p. 156°C. b.p. 1450°C. Corrosion-resistant at room temperature, but oxidizes readily at higher temperatures.

Occurrence: Not found native, but in a variety of zinc and other ores. The indium content is generally very low, rarely exceeding 0.001%. Indium-bearing ores occur in western U.S., Canada, Peru, Japan, Europe, U.S.S.R.

Forms available: Small ingots or bars, shot, pencils, wire, sheets, powder, single crystals.

Purity: Technical; high purity (less than 10 ppm impurities).

Uses: Automobile bearings; electronic and semiconductor devices; low-melting brazing and soldering alloys; reactor control rods; electroplated coatings on silver-plated steel aircraft bearings which are tarnish-resistant; radiation detector.

indium acetylacetonate $In(C_5H_7O_2)_3$. M.p. 186°C. Used as a catalyst.

indium antimonide InSb. M.p. 535°C. Electronic grade is used for semiconductor devices.

Hazard: May be toxic.

indium arsenide InAs. Crystals; m.p. 943°C. Insoluble in acids. Electronic grade is used for semiconductor devices; in injection lasers.

Hazard: Highly toxic by ingestion.

Shipping regulations: (Rail, Air) Arsenical compound, n.o.s., Poison label.

indium chloride (indium trichloride) $InCl_3$.

Properties: White powder; deliquescent; soluble in alcohol and water. Sp. gr. 3.46 (25°C); m.p. 586°C; sublimes at 300°C.

Derivation: Direct union of the elements or by the action of hydrochloric acid on the metal.

indium oxide (indium sesquioxide; indium trioxide) In_2O_3 .

Properties: White to light-yellow powder in both amorphous and crystalline forms, depending on temperature. Soluble in hot acid (amorphous), insoluble (crystalline); sp. gr. 7.179.

Derivation: By burning the metal in air or heating the hydroxide, nitrate, or carbonate.

indium phosphide InP. A brittle metallic mass; m.p. 1070°C. Slightly soluble in mineral acids. Electronic grade is used in semiconductor devices and injection lasers.

indium sesquioxide. See indium oxide.

indium sulfate $In_2(SO_4)_3$.

Properties: Grayish powder; deliquescent; soluble in water; sp. gr. 3.438; decomposed by heat.

indium trichloride. See indium chloride.

indium trioxide. See indium oxide.

"Indo Carbon."³⁰⁷ Trademark for sulfur dyestuffs. Used for the dyeing and printing of cotton and rayon.

"Indocin." Trademark for the drug indomethacin (q.v.), used in treatment of arthritis.

"Indofast."³³⁸ Trademark for vat dyestuff pigments, including carbazole dioxazine violet. Used in paints, printing inks, and plastics.

indole (2,3-benzopyrrole) CHCHCHCHCCCHCHNH .

Properties: White to yellowish scales, turning red on exposure to light and air; unpleasant odor in high concentrations, but pleasant in dilute solutions. Soluble in alcohol, ether, hot water, and fixed oils; insoluble in mineral oil and glycerol. M.p. 52°C; b.p. 254°C.

Derivation: From indigo, and by numerous syntheses. Also can be produced from 220 to 260° fraction from coal tar.

Grades: Technical; C.P.; F.C.C.

Hazard: A carcinogen.

Uses: Chemical reagent; perfumery.

3-indoleacetic acid (IA; IAA; beta-indoleacetic acid; beta-indolylacetic acid) $C_8H_7NCH_2COOH$. A plant hormone.

Properties: Crystals. m.p. 168-170°C. The natural material is levorotatory; specific rotation 20/D is -3.8° in alcohol. Insoluble in water and chloroform; soluble in alcohol and ether. Low toxicity.

Use: Agriculture and horticulture; growth-promoting hormone.

See also auxin; plant growth regulator.

indole-alpha-aminopropionic acid. See tryptophan.

3-indolebutyric acid (hormodin) $C_8H_6N(CH_2)_3COOH$. Properties: White or off-white powder, essentially odorless. M.p. $123^\circ C$. Insoluble in water; soluble in alcohols and ketones. Low toxicity. Containers: Glass bottles; fiber drums. Uses: Plant hormone, especially used in rooting plants. See also auxin; plant growth regulator.

indole-2,3-dione. See isatin.

indomethacin. USAN name for 1-(para-chlorobenzoyl)-5-methoxy-2-methylindole-3-acetic acid $C_{19}H_{16}ClNO_4$. Used in medicine (for treating arthritis).

"Indopol."²¹⁶ Trademark for synthetic mono-olefin polymers of relatively high molecular weight used in caulking compounds, industrial sealants, adhesives, electrical insulation surgical tapes, and also as chemical intermediates.

"Indulin."²²⁸ Trademark for a series of lignin products obtained from wood pulp. Containers: 50-lb multiwall paper bags. Uses: Latex extension; protein removal and recovery; secondary oil recovery; in storage batteries as a negative plate expander; retarding agent for vat and sulfur dyes.

"Indusoil."²²⁸ Trademark for distilled or fractionated tall oils and tall oil products. Uses: For coatings and resins; drying oils; heavy-metal soaps; detergents; cleaners; polishes; core oils; lubricants; floor coverings and flotation.

industrial alcohol. See alcohol, industrial.

industrial carbon. See carbon, industrial.

industrial diamonds. See diamonds, industrial.

industrial dust. See dust, industrial

industrial waste. See waste treatment.

inert. A term used in chemistry to indicate chemical inactivity of an element or compound. Helium, neon and argon are inert gaseous elements; carbon dioxide is an inert gaseous compound. Ingredients added to mixtures chiefly for bulk and weight purposes are said to be inert. See also noble; extender.

inflammable. This term is no longer on approved use.

infrared. The region of the electromagnetic spectrum including wave lengths from 0.78 micron to about 300 microns (i.e., longer than visible light and shorter than microwave). (See also radiation). Use: Spectroscopic analysis; medicine; baking of enamels; drying; photography.

infrared spectroscopy. An analytical technique which may measure either (1) the range of wavelengths in the infrared that are absorbed by a specimen, which characterize its molecular constitution (absorption spectroscopy), or (2) the infrared waves emitted by excited atoms or molecules (emission spectroscopy). Extremely hot bodies (stars) emit spectra in which the atomic composition can be determined by characteristic lines such as the sodium D line in the sun's spectrum. Infrared absorption bands identify molecular components and structures, some of which are:

absorption band (μ)	structure indicated
2.3-3.2	OH and NH groups; H_2
3.2-3.33	aromatics, olefins
3.33-3.55	aliphatics

5.7-6.1

aldehydes, ketones, acids, amides

See also microwave spectroscopy; absorption (2)

"Infrac."²⁸⁰ Trademark for a refractory insulation used as primary linings of fuel-fired and electric furnaces only when protected by a cement facing. Available in brick form.

infusion. An aqueous solution obtained by treating drugs with hot or cold water, without boiling. Generally prepared by pouring boiling water upon the vegetable substance and macerating the mixture in a tightly closed vessel until the liquid cools. When not otherwise specified, they are of 5% strength by weight.

ingot iron. Highly refined steel with a maximum of 0.15% impurity. Due to high purity it has excellent ductility and resistance to rusting.

ingrain dye. An insoluble dye developed by impregnating a fabric with one or more intermediates and then producing the dye by reaction with a different intermediate.

inhibitor. (1) A compound (usually organic) that retards or stops an undesired chemical reaction, such as corrosion, oxidation, or polymerization. Examples are acetanilide which retards decomposition of hydrogen peroxide, and salicylic acid, used to prevent prevulcanization of rubber. Such substances are sometimes called negative catalysts. See also antioxidant. (2) A biological antagonist used to retard growth of pests and insects, and in medicine. See antagonist, structural.

"Inhibitor NPH."³²⁹ Trademark for a synthetic organic chemical which provides an effective means of controlling hard polymer formation in synthetic rubber production.

Properties: Fine, white to yellow-white platelets; density 5 lb/gal; m.p. $160-164^\circ$ (with decomposition); amoniacal odor.

initiating explosive. See explosive, initiating.

initiator. An agent used to start the polymerization of a monomer. Its action is similar to that of a catalyst, except that is usually consumed in the reaction. Organic peroxides and similar compounds are often used, and short-wave radiation has a similar initiating effect. Free radicals usually play a part. See also activator; free radical.

injection molding. A plastic-molding operation, introduced about 1935, performed in a single machine capable of producing both small articles of complex geometry (combs) and large units that could not be made economically in any other way (auto body parts, tubs, etc.). Though used primarily for thermoplastics, the injection method can be modified to handle thermosets. A simplified description is as follows: (1) A molding powder is fed into the heating chamber of the machine, which holds several times as much material as is necessary to fill the mold. The powder is heated to a viscous liquid. (2) An amount of molding powder that is just sufficient to fill the mold cavity is then forced into the rear of the heating chamber by a plunger, thus injecting an equal amount of liquid plastic from the front of the heating chamber into the mold. (3) The material remains in the mold under high pressure until it cools, and is then ejected. The rheological properties of the fluid plastic are of critical importance, as it must flow readily through the sprue and mold gate and fill the mold uniformly. The amount of material injected into a mold can range

from less than an ounce to 25 pounds or more. Modern injection-molding machines have many specialized mechanical features, and are of impressive dimensions.

ink. See printing ink; writing ink.

inorganic. Any chemical compound that does not contain the element carbon, with the exception of the oxides of carbon; compounds containing a carbonate group (CO_3) such as calcium carbonate; carbon disulfide; phosgene; carbonyl sulfide; and metallic carbonyls. Inorganic compounds comprise by far the greater part of the earth's crust, and range from those that are almost wholly inert (sand, limestone, clay) to highly active and corrosive materials (hydrofluoric acid). In recent years the most rewarding progress in inorganic chemistry has been in the field of coordination compounds and transition metals. See also organometallic.

inosine (hypoxanthine riboside) $\text{C}_{10}\text{H}_{12}\text{N}_4\text{O}_5$. An important intermediate in animal purine metabolism. Also available as its barium salt.

Properties: (dihydrate) Crystallizes in needles from water; m.p. 90°C ; (anhydrous) 218°C (dec). Levorotatory in solution. Slightly soluble in water; soluble in alcohol.

Derivation: By deamination of adenosine.

Use: Biochemical research.

inosinic acid (IMP; hypoxanthine riboside-5-phosphoric acid). $\text{C}_{10}\text{H}_{13}\text{N}_4\text{O}_8\text{P}$. An important intermediate in the synthesis and metabolism of animal purines.

Properties: Syrup with agreeable sour taste. Freely soluble in water and formic acid; very sparingly soluble in alcohol and ether.

Derivation: From meat extract or by enzymatic deamination of muscle adenylic acid.

Uses: Biochemical research; flavor enhancer (see sodium inosinate).

inositol (hexahydroxycyclohexane) $\text{C}_6\text{H}_6(\text{OH})_6 \cdot 2\text{H}_2\text{O}$. A constituent of body tissue. There are 9 isomeric forms of inositol (myo-inositol or meso-inositol or specifically the cis-1,2,3,5-trans-4,6-hexahydroxycyclohexane) is the one having vitamin activity.

Properties (i-inositol): White crystals; odorless; m.p. $224\text{--}227^\circ\text{C}$; sweet taste; soluble in water; insoluble in absolute alcohol and ether; stable to heat, strong acid and alkali; sp. gr. 1.524 (dihydrate); 1.752 when anhydrous. Dihydrate melts at $215\text{--}216^\circ\text{C}$. Nontoxic.

Source: Food source: Vegetables, citrus fruits, cereal grains, liver, kidney, heart and other meats. Commercial source: From corn steep liquor by precipitation and hydrolysis of crude phytate.

Units: Amounts are expressed in milligrams of inositol. Grades: N.F.; F.C.C.

Containers: Bottles, cans; drums.

Uses: Medicine; nutrition; intermediate.

inositol hexaphosphoric acid. See phytic acid.

inositol hexaphosphoric acid ester, sodium salt. See sodium phytate.

INPC. Abbreviation for isopropyl N-phenylcarbamate. See IPC.

insecticide. A type of pesticide designed to control insect life that is harmful to man, either directly as disease vectors, or indirectly as destroyers of crops, food products, or textile fabrics. General types are as follows: (1) Inorganic; arsenic, lead, and copper (inorganic compounds and mixtures); the use of these has

diminished sharply in recent years because of the development of more effective types that are less toxic to man. (2) Natural organic compounds, such as rotenone and pyrethrins (relatively harmless to man, since they quickly decompose to nontoxic compounds), nicotine, copper naphthenate, and petroleum derivatives. (3) Synthetic organic compounds: (a) chlorinated hydrocarbons, such as DDT, dieldrin, endrin, chlordane, lindane, p-dichlorobenzene; (b) the organic esters of phosphorus (the parathions and related substances). Another group of organics, of which imidazole is typical, act on the principle of metabolic inhibition (see antimetabolite). Besides direct application, these can be fed to growing plants, with the result that the plants can no longer serve as nutrients for the specific insect.

Hazard: Insecticides are toxic to man in varying degrees. Among the safest are the pyrethrins, rotenone, and methoxychlor. Most of the organophosphorus types (parathion and related compounds) are highly toxic, but are reasonably biodegradable. The chlorinated hydrocarbons resist biodegradation; their use has been restricted, and in some cases (DDT) banned, for agricultural application, due to their harmful ecological effects. The EPA has carefully evaluated substitutes for DDT and has approved several types for some uses of DDT; among those approved, are demeton, parathion, phorate and methyl parathion.

See also pesticide; fumigant; herbicide; rodenticide; repellent.

"Insecti-sol."²⁵ Trademark for a highly purified odorless solvent exceeding CSMA minimum requirements for an insecticide base. The deodorized hydrocarbon distillate is water white and has a 170°F (min.) flash point, a $465\text{--}480^\circ\text{F}$ distillation end point, and a 98% unsulfonatable residue. Also useful in food processing and cosmetic manufacture. Combustible.

insect wax. See Chinese wax.

"Insidol."³⁰⁰ Trademark for a wetting agent used in textile processing. It is a sulfodicarboxylic acid ester composition.

"Instant Acid."²³³ Trademark for a dry acid in granular form. Water-soluble and easily stored. Used in oil-well production.

"Instant-Dri."¹⁰⁸ Trademark for a solid rinsing agent. Reduces surface tension of water.

instantizing. A method of increasing the solubility of dehydrated food products in powder form by moistening the surface of the powders enough to cause them to form aggregates or clumps, after which the material is redried. The resulting product will have slightly darker color and about half the density of the original dehydrated material, but it will be more readily reconstituted.

"Instantreat."¹⁰⁸ Trademark for a high purity specially processed powdered complex phosphate. Contains enough chlorinated ingredient to disinfect feed solution and feed equipment.

Uses: Controls corrosion, lime scale and red water trouble in homes, hotels, restaurants and small industrial water systems.

instrumental analysis. See analytical chemistry; spectroscopy.

"Insular."⁵² Trademark for polyvinyl chloride resins identified by type numbers corresponding roughly to

their molecular weights PVC 250, PVC 230, PVC 200, PVC 185, and PVC 155.

insulating oil. See transformer oil.

"Insulgrease."¹²⁴⁵ Trademark for a series of grease-like silicone dielectric compounds. Used as electrical insulation in connectors, electrical and electronic equipment, as heat transfer media, moisture and corrosion resistant coatings, anti-seize compounds, and insulator coatings.

insulin. A polypeptide hormone having a molecular weight of 5733. It is formed in the isles of Langerhans located in the pancreas, and was so named for this reason. Insulin is composed of 16 amino acids arranged in a coiled chain and cross-linked in several places by the disulfide bonds of cystine residues. The sequence of amino acids has been elucidated. The insulin molecule was synthesized in 1963, but commercial production has not yet been attained. Insulin regulates carbohydrate metabolism in the body by decreasing the blood glucose level. A systemic deficiency leads to diabetes.

Properties: White powder or hexagonal crystals; readily soluble in dilute acids; soluble in water.

Derivation: Extraction of minced pancreas with acidified dilute alcohol, followed by precipitation with absolute alcohol.

Grades: U.S.P., in various solutions of suspensions, which include insulin injection; isophane insulin suspension; protamine zinc insulin suspension; N.F., as globin zinc insulin injection.

Containers: Glass bottles, ampules, phials.

Hazard: Overdosage can be fatal.

Uses: Medicine (for diabetes control).

See also Banting.

"Insuloxide."¹³³⁷ Trademark for a mixture containing a minimum of 94% zirconium oxide and a maximum of 5% silicon dioxide. M.p. 4500°F. Used for thermal insulation; super-refractories.

"Insurok."⁶³ Trademark for a series of laminated and molding plastics characterized by durability, lightweight, resistance to many chemicals, and high dielectric strength.

Use: Replacement for cast aluminum in airplane parts; switches, distributors, commutators, etc.

"Intalox."¹³²⁶ Trademark for a particular shape of tower filling materials available in porcelain, chemical stoneware and carbon.

interface. The area of contact between two immiscible phases of a dispersion, which may involve either the same or different states of matter. Five types are possible: (1) solid/solid (carbon black/rubber); (2) liquid/liquid (water/oil); (3) solid/gas (smoke/air); (4) solid/liquid (clay/water); (5) liquid/gas (water/air). At a fresh surface of either liquid or solid the molecular attraction exerts a net inward pull. Hence the characteristic property of a liquid is surface tension (q.v.) and that of a solid surface is adsorption (q.v.). Both have the same cause, namely, the inward cohesive forces acting on the molecules at the surface. These phenomena provide to some degree the fundamental mechanism for many industrially important processes (catalysis, emulsification, mixing, alloying) and products (detergents, adhesives, lubricants, paints). Such properties as wettability of solid powders, spreading coefficients of liquids, and protective action of colloidal substances are intimately associated with interfacial behavior. See also surface, surface tension, catalysis, emulsion, detergent, wetting agent.

interferon. An antiviral protein produced by vertebrate cells in response to virus infection. Discovered in 1957, it is a product of the infected cell, rather than of the disease-inducing virus. It can be formed by any type of infected cell, and is non-specific in its protection, i.e., it is effective against many viruses, but only in the cells of the organism that produced it. It is quite different from an antibody, which is produced only by specialized cells, and acts by combining directly with a specific virus. Interferon does not inactivate viruses directly, but reacts with susceptible cells, which then resist virus multiplication. The molecular weight of interferon is only 30,000 compared with 100,000 or more for antibody. The mechanism of its formation is controlled by RNA, but only when the latter is double-stranded and protein-free. A plastic copolymer called "Pyran" (q.v.), which has a structure resembling RNA, has been found to increase the formation of interferon in the body. See also antigen-antibody; virus.

intermediate. An organic compound, either cyclic (derived from coal tar or petroleum products such as benzene, toluene, naphthalene, etc.) or acyclic (e.g., ethyl and methyl alcohol). These compounds may be considered as chemical stepping stones between the parent substance and the final product. The cyclic type (e.g., aniline, beta-naphthol, and benzoylbenzoic acid) still predominate as intermediates for synthetic dyes and have few other uses; the acyclic type in general have many independent uses. Exceptions are hexamethylenetetramine, an acyclic intermediate for phenolformaldehyde resin, and butadiene for synthetic elastomers. Intermediates are the foundation of the modern approach to organic technology. The distinction between an intermediate and an end product is not always precise.

intermetallic compound. (1) A compound or alloy formed by two metals that have been placed in intimate contact during the process of brazing or coating, the compound occurring at the interface between the metal surfaces. In some cases, as in galvanizing, the metals form bimetallic compounds; in others they form alloys or solid solutions of varying composition. (2) A two- or three-component metal system prepared with special metals having semiconducting properties, e.g., gallium, for use in lasers, diodes, transistors, etc. See also galvanizing; semiconductor.

International Union of Pure and Applied Chemistry (IUPAC). A voluntary, nonprofit association of national organizations representing chemists in 45 member countries. It was formed in 1919 with the object of facilitating international agreement and uniform practice in both academic and industrial aspects of chemistry. Examples are nomenclature, atomic weights, symbols and terminology, physico-chemical constants, and certain methods of analysis and assay. Reports on such subjects are presented at the biennial conferences of the Union by the numerous Commissions dealing with them, discussed, and, after approval, are published. Its offices are in Basle, Switzerland.

interstitial. (1) Descriptive of a nonstoichiometric compound of a metal and a nonmetal whose structure conforms to a simple chemical formula, but exists over a limited range of chemical composition. Interstitial compounds are represented by borides, nitrides and carbides of the transition metals. (2) Descriptive of an atom of an impurity that causes a defect or dislocation in a crystal lattice, e.g., an atom of carbon or nitrogen in an iron crystal, or of arsenic in a semiconductor. (3) In a biological sense, the term describes cells located between or within layers of tissue.

intumescence. The foaming and swelling of a plastic or other material when exposed to high surface temperatures or flames. Used with respect to polyurethane base coating materials for rocket reentry.

"Invar." Trademark for an iron-nickel alloy containing 40–50% nickel and characterized by an extremely low coefficient of thermal expansion.

Uses: Precision instruments, measuring tapes, weights, etc.

invention. The chief requirement of an invention is that it be unobvious to a person having ordinary skill in the art to which the claim pertains and knowing everything that has gone before, as shown by publication anywhere or public use in the U.S. When reliance for patentability (q.v.) is placed on a new mixture of components that have been used separately, it must be shown that there is some unexpected coaction between the ingredients and not just the additive effects of the several materials. The inventor is the one who contributes the inventive concept in workable detail, not the one who demonstrates it or tests it.

"Invermul."²³⁶ Trademark for a basic emulsifier in the preparation of water in oil-type emulsion drilling muds for oil wells.

invertase (sucrase; invertin). Enzyme produced by yeast and by the lining of the intestines. It is a white powder, soluble in water. It catalyzes the conversion of sucrose (ordinary sugar) to glucose and levulose (fructose) during fermentation of sugars.

Uses: Production of invert sugar (q.v.) for syrups and candy; analytical reagent for sucrose.

invert sugar. A mixture of 50% glucose and 50% fructose obtained by the hydrolysis of sucrose. It absorbs water readily, and is usually only handled as a syrup. Because of its fructose content, invert sugar is levorotatory in solution, and sweeter than sucrose. Invert sugar is often incorporated in products where loss of water must be avoided. Commercially it is obtained from the inversion of a 96% cane sugar solution.

Use: Food industry; brewing industry; medicine; confectionery; tobacco curing.

investment casting. See lost wax process.

in vitro. A condition in which a reaction is carried out in a laboratory experiment (i.e., a glass container, test tube, or beaker), as opposed to a reaction occurring in a living organism (in vivo).

"Iobac."²⁸⁴ Trademark for a "Tamed Iodine" compound combining the germicidal values of iodine with adequate detergent and wetting ingredients. Used for sanitizing dairy equipment.

"Ioclde."²³⁹ Trademark for a water-soluble form of iodine, containing a nonionic detergent. Contains 15.8% polyethoxypolypropoxypolyethoxyethanol-iodine complex, 15.2% nonylphenoxypolyethoxyethanol-iodine complex (provides 3.1% available iodine), and 0.2% hydrogen chloride, remainder water and other inert ingredients. Used as a germicide.

ioeosin (tetraiodofluorescein) C₂₀H₈I₄O₅.

Properties: Red powder; soluble in dilute alkalis; slightly soluble in alcohol and ether; insoluble in water. Derivation: Interaction of fluorescein and iodine in presence of iodic acid.

Use: Indicator in analytical chemistry.

iodic acid HIO₃.

Properties: Colorless, rhombic crystals or white, crystalline powder. A moderately strong acid. Soluble in cold and hot water. Sp. gr. 4.629; m.p. 110°C (decomposes).

Derivation: By adding sulfuric acid to a solution of barium iodate and subsequent filtration and crystallization.

Hazard: Toxic by ingestion; strong irritant to eyes and skin.

Uses: Analytical chemistry; medicine (1 to 3% sol'n).

iodic acid anhydride (iodine pentoxide) I₂O₅.

Properties: White, crystalline powder. Soluble in water and nitric acid; insoluble in absolute alcohol, chloroform, ether, carbon disulfide. Sp. gr. 4.799; m.p. 300°C (decomposes).

Hazard: Toxic by ingestion; strong irritant to eyes and skin. Strong oxidizing agent.

Uses: Oxidizing agent; organic synthesis.

iodine I Nonmetallic, halogen element of atomic number 53, group VIIA of the periodic table; the least reactive of the halogens. Atomic weight 126.9045; Valences 1, 3, 5, 7; no stable isotopes but many artificial radioactive isotopes.

Properties: Heavy, grayish-black plates or granules, having a metallic luster and characteristic odor. Readily sublimed, having a violet vapor. Sp. gr. 4.98; m.p. 113.5°C; b.p. 184°C. Soluble in alcohol, carbon disulfide, chloroform, ether, carbon tetrachloride, glycerol, and alkaline iodide solutions, insoluble in water. Noncombustible.

Derivation: (a) from brine wells in Michigan, Oklahoma, Japan, Indonesia; (b) from mother liquors of Chilean saltpeter. It can also be extracted from kelp.

Method of purification: Sublimation.

Grades: Crude; C.P.; U.S.P.

Containers: Bottles; 100- and 200-lb kegs; drums.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to eyes and skin. Tolerance, 0.1 ppm in air.

Uses: Dyes (aniline dyes, phthalein dyes); catalyst; iodides; iodates; pharmaceuticals; process engraving and lithography; special soaps; analytical reagent; iodized salt; medicine; in special lubricants for titanium and stainless steel parts. See also iodine tincture.

iodine 131 (I-131). Radioactive iodine of mass number 131.

Properties: Half-life 8 days; radiation, beta and gamma.

Derivation: By pile irradiation of tellurium and from the fission products of nuclear reactor fuels.

Forms available: As elemental iodine and in a weakly basic solution of sodium iodide in sodium sulfite; iodine 131 is also available in tagged compounds such as dithymol diiodide, potassium iodate, diiodofluorescein, insulin, ACTH, etc. See also Grades.

Grades: U.S.P. lists iodinated I-131 serum albumin, rose bengal sodium I-131 injection, sodium iodide I-131 capsules and solution, sodium iodohippurate I-131 injection.

Hazard: Moderately toxic.

Uses: Diagnosis and treatment of goiter hyperthyroidism, and other thyroid disorders; internal radiation therapy; in film gauges to measure film thicknesses of the order of one micron; for detecting

leaks in water lines; as a source of radiation in oil field tests; as a tracer in chemical analysis; as a tracer in studying diet iodine for cattle, the functions of the thyroid gland, the efficiency of mixing pulp fibers, the thermal stability of potassium iodate in bread dough, chemical reaction mechanisms, etc. Shipping regulations: Consult regulations.

iodine bisulfide. See sulfur iodine.

iodine bromide. See iodine monobromide.

iodine chloride. See iodine monochloride and iodine trichloride.

iodine cyanide. See cyanogen iodide.

iodine disulfide. See sulfur iodine.

iodine monobromide (bromine iodide) IBr.

Properties: Crystalline, purplish-black mass. Soluble in water with decomposition, alcohol, and ether. M.p. 42°C; b.p. 116°C (dec); sp. gr. 4.41.

Derivation: By the interaction of iodine and bromine.

Hazard: Highly toxic by ingestion and inhalation; vapors corrosive to tissue.

Use: Organic synthesis.

iodine monochloride ICl.

Properties: Reddish-brown, oily liquid; two solid forms, alpha and beta. Soluble in alcohol, water (with decomposition), and dilute hydrochloric acid. M.p. (alpha) 27°C, (beta) 14°C; b.p. 101°C (dec); sp. gr. (alpha) 3.18 (0°C), (beta), 3.24 (liquid, at 34°C).

Derivation: By the action of dry chlorine on iodine.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to eyes and skin.

Uses: Analytical chemistry; organic synthesis.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

iodine number (iodine value). The percentage of iodine that will be absorbed by a chemically unsaturated substance (vegetable oils, rubber, etc.) in a given time under arbitrary conditions. A measure of unsaturation.

iodine pentafluoride IF₅.

Properties: Fuming liquid; b.p. 98°C; m.p. 9.4°C; sp. gr. (liquid) 3.189 (25°C); attacks glass.

Derivation: By igniting iodine in a stream of fluorine. Available in cylinders at 98.0% min purity.

Hazard: Highly toxic by ingestion and inhalation.

Corrosive to skin and mucous membranes. Reacts violently with water. Dangerous fire risk. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Fluorinating and incendiary agent.

Shipping regulations: (Air) Corrosive label. Not acceptable on passenger planes.

iodine pentoxide. See iodic acid, anhydride.

iodine tincture. A solution of iodine and potassium iodide or sodium iodide in alcohol; a reddish-brown liquid having the odors of iodine and alcohol; contains from 44–50% by volume of alcohol, 2 g of iodine and 2.4 g sodium iodide per 100 cc.

Grade: U.S.P.

Hazard: Toxic by ingestion. Avoid using on open cuts.

Use: Antiseptic (use on skin surface only).

iodine trichloride ICl₃.

Properties: Orange-yellow, deliquescent, crystalline powder; pungent, irritating odor. Soluble in water (with decomposition), alcohol and benzene. M.p. 33°C; sp. gr. 3.11.

Derivation: By interaction of iodine and chlorine.

Hazard: Toxic by ingestion and inhalation; corrosive to tissue.

Uses: Medicine; agent for introducing iodine and chlorine in organic synthesis.

iodine value. See iodine number.

iodipamide (CH₂)₄(CONHC₆H₄COOH)₂.

Properties: White, nearly odorless, crystalline powder, very slightly soluble in alcohol, chloroform, ether, and water; pH of saturated solution is between 3.5 and 3.9.

Hazard: Probably toxic.

Use: Medicine (x-ray contrast medium).

iodisan. See propiodal.

iodized oil. An iodine addition product of vegetable oil or oils containing 38–42% organically combined iodine.

Properties: Thick, viscous, oily liquid. Alliacious odor. Oleaginous taste. Affected by air and light.

Soluble in solvent naphtha.

Hazard: Probably toxic by ingestion.

Use: Medicine (radiopaque medium).

iodoethane. See ethyl iodide.

iodoethylene. See tetraiodoethylene.

iodoform (triiodomethane) CHI₃.

Properties: Small, greenish yellow or lustrous crystals or powder; penetrating odor. Soluble in alcohol, glycerol, chloroform, carbon disulfide and ether; insoluble in water. Sp. gr. 4.08; m.p. 115°C.

Derivation: (a) By heating acetone or methyl alcohol with iodine in presence of an alkali or alkaline carbonate. (b) Electrolytically, by passing a current through a solution containing potassium iodide, alcohol and sodium carbonate.

Grades: Technical; N.F.

Hazard: Moderately toxic and irritant. Decomposes violently at 400°F.

Use: Medicine (antiseptic for external use only).

7-iodo-8-hydroquinoline-5-sulfonic acid (ferron; loretin; 8-quinolinol-7-iodo-5 sulfonic acid)
C₉H₆N(I)(OH)(SO₃H).

Properties: Sulfur-yellow, almost odorless, tasteless, crystalline powder; m.p. 260–270°C, with some decomposition. Slightly soluble in water and alcohol; insoluble in ether.

Derivation: Obtained from the potassium salt of 8-hydroxyquinoline-5-sulfonic acid by the action of potassium iodide, bleaching powder and hydrochloric acid.

Hazard: May be toxic.

Use: Medicine; colorimetric reagent for ferric iron.

iodomethane. See methyl iodide.

iodopanoic acid. See iopanoic acid.

iodophor.

(1) A complex of iodine with certain types of surface-active agents that have detergent properties.

(2) More generally, any carrier of iodine.

iodophosphonium. See phosphonium iodide.

2-iodopropane. See isopropyl iodide.

iodopyracet C₅H₇I₂NOCH₂COONH₂(CH₂CH₂OH)₂. A sterile water solution is listed in NF.

Hazard: May be toxic by ingestion.

Use: Medicine (radio-opaque iodine compound).

N-iodosuccinimide (succiniodimide) (—CH₂CO)₂NI.

Properties: Colorless crystals; m.p. 200–201°C; solu-

ble in acetone, methanol; insoluble in carbon tetrachloride and ether. Decomposes in water.

Hazard: May be toxic by ingestion.

Use: Iodinizing agent in synthetic organic chemistry.

"Tokel."²⁴⁴ Trademark for a phosphoric acid solution of a polyoxyethanol alkyl phenol condensate complex of elemental iodine.

Properties: Viscous, dark liquid with acidic reaction.

Miscible in all proportions with water.

Uses: Detergent sanitizer; milk stone remover.

"Iomag."³²⁹ Trademark for a potassium iodide mixture containing 90% potassium iodide and made free-flowing with 8% magnesium carbonate and 2% potassium hydroxide.

ion. An atom or radical that has lost or gained one or more electrons, and has thus acquired an electric charge. Positively charged ions are cations, and those having a negative charge are anions. An ion often has entirely different properties from the element (atom) from which it was formed. Examples: In sodium chloride solutions, the sodium exists as sodium ion (Na^+), i.e., sodium atoms that have lost one electron. The chlorine is present as chloride ion (Cl^-), i.e., chlorine atoms that have gained one electron. Copper sulfate solution contains copper ion (Cu^{2+}), i.e., copper atoms that have lost two electrons, and sulfate ion (SO_4^{2-}), i.e., sulfate radicals that have gained two electrons.

Ions occur in water solution or in the fused state (except in the case of gases). Compounds that form ions are called electrolytes, because they enable the solution to conduct electricity. Ion formation causes an abnormal increase in the boiling point of water and also lowers the freezing point, the extent depending on the concentration of the solution. Ions are also formed in gases as a result of electrical discharge. See also ionizatin; electrolysis; ion exchange.

ion exchange. A reversible chemical reaction between a solid (ion exchanger) and a fluid (usually a water solution) by means of which ions may be interchanged from one substance to another. The superficial physical structure of the solid is not affected. The customary procedure is to pass the fluid through a bed of the solid, which is granular and porous, and has only a limited capacity for exchange. The process is essentially a batch type in which the ion exchanger, upon nearing depletion, is regenerated by inexpensive brines, carbonate solutions, etc. Ion exchange occurs extensively in soils.

Ion exchange resins are synthetic resins containing active groups (usually sulfonic, carboxylic, phenol, or substituted amino groups) that give the resin the property of combining with or exchanging ions between the resin and a solution. Thus a resin with active sulfonic groups can be converted to the sodium form and will then exchange its sodium ions with the calcium ions present in hard water. "Amberlite" resins are of this type.

Some specific applications of ion exchange: Water softening; milk softening (substitution of sodium ions for calcium ions in milk); removal of iron from wine (substitution of hydrogen ions); recovery of chromate from plating solutions; uranium from acid solutions; streptomycin from broths; removal of formic acid from formaldehyde solutions; demineralization of sugar solutions; recovery of valuable metals

from wastes; recovery of nicotine from tobacco-dryer gases; catalysis of reaction between butyl alcohol and fatty acids; recovery and separation of radioactive isotopes from atomic fission; chromatography; establishment of mass micro standards; in cigarette filters to remove polonium from smoke.

See also zeolite.

ion-exchange chromatography. A chromatographic method based on the ability of polymers to sorb ionized solutes reversibly, e.g., cross-linked resins with exchangeable hydrogen or hydroxyl ions. It can be carried out both in columns and on sheets.

ion-exchange resin. See ion exchange.

ion exclusion. The process in which a synthetic resin of the ion exchange type absorbs nonionized solutes such as glycerine or sugar while it does not absorb ionized solutes that are also present in a solution in contact with the resin. Thus sodium chloride and glycerine can be separated by passage of their aqueous solution through a bed of particles of an ion exclusion resin.

ionic atmosphere. A diffuse population of ions surrounding a charged particle in a solution; the particle may be an ion, a molecule, or a colloidal micelle. Most of the ions in the "atmosphere" have a charge opposite from that of the particle they surround, and the net strength of the charge diminishes with their distance from the central particle.

ionic bond. See bond, chemical.

ionic detergent. See detergent.

"Ionite."²⁷¹ Trademark for a lignite-type material used for oil-well drilling muds, as a low-density filler in dark-colored rubber, as an organic base filler for fertilizers, and as a source of humic acid.

ionization. The separation or dissociation of a molecule into ions of opposite electrical charge. This occurs spontaneously in many salts when dissolved in water, or melted. Thus sodium chloride yields positive sodium ions and negative chloride ions. Molecules or atoms of gases are ionized by passage of an electric current through the gas. In this case electrons are removed, leaving a positive charge. See also ion; electrochemistry; electromotive series.

ionizing radiation. See radiation, ionizing.

"Tonol."¹²⁵ Trademark for 2,6-di-tert-butyl-4-methylphenol.

ionomer resin. A copolymer of ethylene and a vinyl monomer with an acid group such as methacrylic acid. They are crosslinked polymers in which the linkages are ionic as well as covalent bonds (see bond, chemical). There are positively and negatively charged groups which are not associated with each other, and this polar character makes these resins unique.

Properties: Transparent, electrically conductive, resilient and thermoplastic. Cannot be completely dissolved in any commercial solvents. High resistance to abrasion, cracking, corona attack; high tensile strength. Working temperature about -160 to 150°F .

Uses: Break-resistant transparent bottles; packaging films; mercury flasks; protective equipment; pipe and tubing; electric distribution elements. As foam, insulation of fresh concrete.

ionone (alpha- or beta-cyclocitrylidenacetone) $C_{13}H_{20}O$. Properties: Light yellow to colorless liquid; violet odor; sp. gr. 0.927–0.933 (25°C); b.p. 126–128°C (12 mm); refractive index ($n_{20/D}$) 1.4970–1.5020. Soluble in alcohol, ether, mineral oil, and propylene glycol; insoluble in water and glycerin.

Grade: 95%; 99%; mixed isomers; F.C.C.

Derivation: (1) Condensing citral with acetone, followed by ring closure with an acid; (2) reaction of acetylene with acetone, followed by hydrogenation, condensation with diketone, and further reaction with acetylene.

Uses: Perfumery; chemical synthesis; flavoring; vitamin A production (beta isomer).

ion retardation. A process based on amphoteric (bi-functional) ion-exchange resins containing both anion and cation adsorption sites. These sites will associate with mobile anions and cations in solution and thus remove both kinds of ions from solutions. These ions may be eluted by rinsing with water. Process can make clean separations of ionic-nonionic mixtures. Has also been suggested for demineralization of salt solutions. See also ion.

iopanoic acid (iodopanoic acid; 3-amino-alpha-ethyl-2,4,6-triodohydrocinnamic acid)
 $C_6H_3NH_2CH_2CH(COOH)C_2H_3$.

Properties: Cream-colored, tasteless powder with faintly aromatic odor; m.p. 152–158°C (dec); darkens on exposure to light; soluble in acetone, ether, alcohol, chloroform and dilute alkalis; insoluble in water.

Grade: U.S.P.

Hazard: May be toxic.

Use: Medicine (radiopaque medium).

IPA. (1) Abbreviation for isophthalic acid. (2) Abbreviation for isopropyl alcohol.

IPAE. See isopropylaminoethanols.

IPC (INPC; isopropyl N-phenylcarbamate)

$C_6H_5NHCOOCH(CH_3)_2$.

Properties: White to gray crystalline needles, odorless when pure; m.p. 84°C (technical grade); soluble in alcohol, acetone, isopropyl alcohol; slightly soluble in water.

Hazard: Toxic by ingestion and inhalation.

Use: Pre-emergence herbicide.

IPC, chloro-. See chloro-IPC.

"IPCF."¹⁷⁷ Trademark for isopropyl chloroformate (q.v.).

ipecac. Dried root of *Cephaelis ipecacuanha*.

Habitat: Brazil and Bolivia; cultivated in India.

Grades: Technical; U.S.P.

Hazard: May have adverse side effects.

Use: Medicine (emetic); production of emetine.

"IPP."¹⁷⁷ Brand name for isopropyl percarbonate. See diisopropyl peroxydicarbonate.

Ir Symbol for iridium.

"Iroco" Aluminum Coatings.⁵²⁶ Trademark for chromate conversion coatings for aluminum which provide corrosion resistance by themselves and also increase the corrosion resistance and adhesion of subsequent paint films. Application of spray, dip or roller coat.

"Iroco" Bond.⁵²⁶ Trademark for crystalline zinc phosphates used as a base for oil and paint, as an aid to drawing and forming of steel, as a nonembrittling etchant for steel, and as a wearing surface on cer-

tain types of steel parts. Application by dip, automatic or barrel methods.

"Iroco" Iron Phosphates.⁵²⁶ Trademark for specially blended compounds of acidic salts which produce an iridescent iron phosphate coating on cold-rolled steel surfaces, providing paint base by increasing adhesion and corrosion resistance. Application by spray or immersion.

"Irocolene."⁵²⁶ Trademark for special polar-type rust-proofing oils for indoor-outdoor protection of ferrous or nonferrous metals. Application by spray, dip or dip-spin centrifugal methods.

"Iroco Lube."⁵²⁶ Trademark for oil-absorptive manganese phosphate coatings for mating moving steel surfaces. Application by dip, automatic or barrel methods.

"Irganox."²¹⁹ Trademark for a series of complex, high-molecular-weight stabilizers that inhibit oxidation and thermal degradation of many organic materials. They contain multifunctional chemical groupings. Several are hindered polyphenols. All are white, crystalline, free-flowing powders; non-staining, non-volatile, and odorless.

iridic chloride (iridium chloride; iridium tetrachloride) $IrCl_4$.

Properties: Brownish-black mass. Hygroscopic. Soluble in water, alcohol, and dilute hydrochloric acid.

Derivation: Action of chlorine or aqua regia on the ammonium salt, $(NH_4)_2IrCl_6$.

Uses: Analysis (testing for nitric acid in the presence of nitrous acid); microscopy; plating solution.

iridium Ir Metallic element of atomic number 77, one of the platinum metals, group VIII of the periodic system. Atomic weight 192.22; valences 1,2,3,4,6; two stable isotopes.

Properties: Silver-white. Low ductility. Does not tarnish in air. On heating strongly a slightly volatile oxide is formed. Insoluble in acids, slowly soluble in aqua regia and in fused alkalis. Density 22.65 g/cc (20°C) (calculated) (the heaviest element known); m.p. 2443°C; b.p. about 4500°C. Most corrosion-resistant element; modulus of elasticity is one of highest: 75,000,000 psi. Brinell hardness (cast) 218. Highly resistant to chemical attack. Toxicity probably low.

Occurrence: Canada, So. Africa, U.S.S.R., Alaska.

Derivation: Occurs with platinum; remains insoluble when the crude platinum is treated with aqua regia; occurs as iridosmine. The powder is obtained by hydrogen reduction of ammonium chloroiridate.

Forms: Powder; single crystals.

Use: Alloy with platinum for ammonia fuel-cell catalyst; electric contacts and thermocouples; commercial electrodes, and resistance wires; laboratory ware; extrusion dies for glass fibers; jewelry. Primary standards of weight and length.

iridium 192. Radioactive iridium of mass number 192.

Properties: Half-life, 74 days; radiation, beta and gamma.

Derivation: Pile irradiation of iridium.

Forms available: Iridium metal, or potassium or sodium chloroiridate in hydrochloric acid solution.

Uses: Radiography of light castings; treatment of cancer.

Shipping regulations: Consult regulations.

iridium bromide. See iridium tribromide.

iridium chloride. See iridic chloride; iridium trichloride.

iridium potassium chloride (potassium chloroiridate; potassium iridium chloride) K_2IrCl_6 .

Properties: Dark-red crystals. Soluble in water (hot). Sp. gr. 3.549.

Use: Black pigment (porcelain decoration).

The Ir (III) salt is also known: K_3IrCl_6 , greenish yellow.

iridium sesquioxide Ir_2O_3 .

Properties: Black powder. Slightly soluble in hydrochloric acid (conc); insoluble in water. Dec. at $400^\circ C$.

Derivation: By heating the chloroiridate K_2IrCl_6 with sodium carbonate.

Use: Ceramics (porcelain decoration).

iridium tetrachloride. See iridic chloride.

iridium tribromide (iridium bromide) $IrBr_3 \cdot 4H_2O$.

Olive-green, brown or black crystals; soluble in water; insoluble in alcohol. Prepared by action of hydrobromic acid on iridium trihydroxide.

iridium trichloride (iridium chloride) $IrCl_3$. Dull green to blue-black particles; m.p. $763^\circ C$. (dec); insoluble in water and alcohol. Prepared by action of chlorine on iridium powder at $600^\circ C$.

iridosmine (osmiridium). A natural alloy of iridium and osmium containing some platinum, rhodium, ruthenium, iron, copper, palladium. Tin-white to light steel gray in color; streak, same; metallic luster. Composition is variable ranging from 10.0–77.2% iridium, 17.2–80.0% osmium, 0–10.1% platinum, 0–17.2% rhodium, 0–8.9% ruthenium, 0–1.5% iron, 0–0.9% copper, trace, palladium, Unattacked by aqua regia. Sp. gr. 18.8–21.12; Mohs hardness 6–7.

Occurrence: Alaska; South Africa.

Uses: Fountain-pen point tips; surgical needles; watch pivots; compass bearings; hardening platinum (standard weights, jewelry); source of iridium and osmium.

Irish moss See carrageenan.

"Irisol."³⁰⁷ Trademark for a fast alizarine direct violet.

"Irisone."²²⁷ Trademark for a series of compounds consisting of alpha- and beta-ionones.

"IRN."²⁹⁹ Trademark for a group of magnetic iron oxides, black ferrous-ferric oxides (Fe_3O_4) and brown gamma ferric oxides (Fe_2O_3), with application in ferric cores and electronic parts, magnetic inks, data-handling accounting systems, recording and instrumentation tapes.

iron Fe Metallic element of atomic number 26; Group VIII of the Periodic Table. Atomic weight 55.847; valences 2, 3. Four stable isotopes; four artificially radioactive isotopes.

Properties: Silver-white, malleable metal; tensile strength 30,000 psi; Brinell hardness 60; m.p. $1536^\circ C$; b.p. $3000^\circ C$; specific gravity 7.87 ($20^\circ C$); magnetic permeability 88,400 gauss ($25^\circ C$). The only metal that can be tempered (q.v.). Mechanical properties are altered by impurities, especially carbon.

Iron is highly reactive chemically; a strong reducing agent; oxidizes readily in moist air; reacts with steam when hot to yield hydrogen and iron oxides. Dissolves in nonoxidizing acids (sulfuric and hydro-

chloric) and in cold dilute nitric acid. For biochemical properties, see below.

Major ores: Hematite, limonite, magnetite, siderite; also taconite (low-grade, 25–30% iron).

Occurrence: Minnesota (Mesabi), Alabama, Labrador, Yukon, Europe, South America.

Major types:

(1) Molten (or pig) iron. Derived (a) by smelting ore with limestone and coke in blast furnaces (purity 91–92%); (b) by continuous direct reduction in which iron ore and limestone are preheated in a fluidized bed, followed by heating to $1700^\circ F$, by melting at $3500^\circ F$, and reduction to iron at $3000^\circ F$ with powdered coal (purity 99%) (proprietary process).

Uses: Steels of various types; other alloys (cast and wrought iron); source of hydrogen by reaction with steam.

See also steel.

(2) Powdered iron. Derived (a) by treatment of ore or scrap with hydrochloric acid to give ferrous chloride solution, which is then purified by filtration, vacuum-crystallized, and dehydrated to ferrous chloride hydrate powder; this is reduced at $800^\circ C$ to metallic iron (briquettes or powder) of 99.5% purity. (b) By thermal decomposition of iron carbonyl [$Fe(CO)_5$] at $250^\circ C$ (99.6–99.9% pure); (c) By hydrogen reduction of high-purity ferric oxide or oxalate. (d) By electrolytic deposition from solutions of a ferrous salt (99.9% pure)

Uses: Powder metallurgy products; magnets; high-frequency cores; auto parts; catalyst in ammonia synthesis.

(3) Cast iron and wrought iron are mixtures of iron and other materials; see specific entry.

(4) Single crystals and whiskers are also available.

(5) Iron sponge (q.v.)

Hazard: Tolerance (as oxide fume): 10 mg per cubic meter of air. Dust and fine particles suspended in air are flammable and an explosion risk.

Biochemistry: Iron is a constituent of hemoglobin (q.v.) and is essential to plant and animal life; an important factor in cellular oxidation mechanisms. Used in medicine and dietary supplements. Essentially non-toxic.

For further information refer to the American Iron and Steel Institute, 150 East 42 St. New York, N.Y.

iron 55. Radioactive iron of mass number 55.

Properties: Half-life 2.91 years; decays through β capture. See iron 59.

Hazard: Highly toxic.

Shipping regulations: Consult regulations.

iron 59. Radioactive iron of mass number 59.

Properties: Half-life 46.3 days; radiation, beta and gamma.

Derivation: Pile irradiation of iron metal, giving a product which contains iron 55 impurity. Both iron 55 and iron 59 are produced pure in cyclotron. (See iron 55). Enriched samples of each are also available.

Hazard: Highly toxic.

Uses: Medicine; tracer element in biochemical and metallurgical research.

Shipping regulations: Consult regulations.

iron acetate liquor (iron liquor; black liquor; black mordant; iron pyrolignite).

Properties: Intensely black liquor, sometimes containing copperas or tannin. Absorbs oxygen from the air. Sp. gr. 1.09–1.115, containing 5–5.5% iron.

Derivation: (a) By the action of pyroligneous acid on

iron filings; (b) double decomposition of ferrous sulfate with calcium pyrolignite (calcium acetate).
Uses: Mordant, especially for alizarine and nitroso dyes.

iron alum. See ferric potassium sulfate.

iron black (contains no iron).

Properties: Fine black powder.

Derivation: Action of zinc upon an acid solution of an antimony salt, a black antimony being precipitated as a fine powder.

Uses: Imparting the appearance of polished steel to papier maché and plaster of Paris.

iron blue. A pigment (of which there are several varieties) prepared by precipitating a ferrous ferrocyanide from a soluble ferrocyanide and ferrous sulfate. Subsequent oxidation produces a complex ferriferrocyanide whose shade and pigment properties are dependent upon the oxidizing agent, reactant concentrations, pH, temperature, size of batch and other conditions of manufacture. Common oxidants are nitric acid, sulfuric acid, potassium dichromate with sulfuric acid, perchlorates, and peroxides. Low toxicity.

Properties: Insoluble in water, oils, alcohol, hot paraffin, organic solvents, and unaffected by dilute acids. Unstable to alkalis of all concentrations or reducing media. Resistant to light and ordinary baking temperatures.

Containers: Barrels, carloads.

Uses: Paints, printing inks, plastics; cosmetics (eye shadow); artist colors, laundry blue, paper dyeing, fertilizer ingredient, baked enamel finishes for autos and appliances; industrial finishes.

iron carbonate, precipitated. See iron oxide, brown.

iron carbonyl. See iron pentacarbonyl.

iron, cast. See cast iron.

iron compounds. See corresponding ferric or ferrous compounds.

iron, electrolytic. See iron.

iron mass. See iron sponge (2).

iron octoate. Same as ferric octoate. Used as a catalyst for curing silicone resins and rubbers.

iron-ore cement. Cements in which ferric oxide replaces a large part of the alumina. There must be some alumina present, however. Iron-ore cement is rather slow setting and hardening, but is more resistant to sea water than is Portland cement. It is light to chocolate brown in color and has a specific gravity about 3.31, higher than Portland cement.

iron ore, chrome. See chromite.

iron ore, magnetic. See magnetite.

iron ore, red. See hematite, red.

iron oxide, black (ferrosoferric oxide; ferroferric oxide; iron oxide, magnetic; black rouge)
 $\text{FeO} \cdot \text{Fe}_2\text{O}_3$ or Fe_3O_4 . See also the mineral form, magnetite.

Properties: Reddish or bluish black amorphous powder; sp. gr. 5.18; m.p. 1538°C (dec); soluble in acids; insoluble in water, alcohol and ether.

Derivation: (a) Action of air, steam or carbon dioxide on iron. (b) Specially pure grade by precipitating hydrated ferric oxide from a solution of iron salts, dehydrating and reducing with hydrogen. (c) Occurs in nature as the mineral magnetite.

Grades: Technical; pure (96% min).

Containers: Bags; carloads.

Uses: Pigment; polishing compound; metallurgy; medicine; magnetic inks and in ferrites for electronic industry; coatings for magnetic tape.

iron oxide, brown (iron subcarbonate; iron carbonate, precipitated)

Properties: Reddish-brown powder, containing ferric carbonate with ferric hydroxide $\text{Fe}(\text{OH})_3$, and ferrous hydroxide $\text{Fe}(\text{OH})_2$ in varying quantities. Not a true oxide. Soluble in acids; insoluble in water and alcohol.

Derivation: By the interaction of solution of ferrous sulfate and sodium carbonate.

Grade: Technical.

Containers: Bags; carloads.

Use: Paint pigment.

iron oxide, hydrated. See ferric hydroxide.

iron oxide, metallic brown. A naturally occurring earth, principally ferric oxide, to which extenders have been added. Used as a paint pigment.

iron oxide process. A process for the removal of sulfides, from a gas by passing the gas through a mixture of iron oxide, Fe_2O_3 , (called iron sponge or iron mass) and wood shavings. The iron oxide is converted to iron sulfide and can be regenerated by allowing the iron sulfide to contact air. See iron sponge, spent.

iron oxide red (burnt sienna, Indian red; red iron oxide; red oxide; rouge (1); Turkey red). Pigments composed mainly of ferric oxide, Fe_2O_3 . See also ferric oxide for a description of the pure material.

Containers: Multiwall paper bags; fiber drums.

Uses: Marine paints, metal primers; polishing compounds; pigment in rubber and plastic products; theatrical rouge; grease paints.

iron oxide yellow. Hydrated ferric oxide, $\text{Fe}_2\text{O}_3 \cdot \text{H}_2\text{O}$. A precipitated pigment of finer particle size and greater tinctorial strength than the naturally occurring oxides such as ochre (q.v.); excellent lightfastness and resistance to alkali.

Containers: Fiber drums, multiwall paper bags.

Uses: Paints; rubber products; plastics.

iron pentacarbonyl (iron carbonyl) $\text{Fe}(\text{CO})_5$.

Properties: Mobile yellow liquid. Evolves carbon monoxide on exposure to air or to light. Soluble in nickel tetracarbonyl and most organic solvents; soluble with decomposition in acids and alkalies; insoluble in water. Sp. gr. 1.466 (18°C); b.p. 102.8°C (749 mm); decomposes at 200°C ; m.p. -21°C . Flash point 5°F .

Derivation: Finely divided iron is treated with carbon monoxide, in the presence of a catalyst such as ammonia.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Flammable, dangerous fire risk.

Uses: Organic synthesis; antiknock agent; source of carbonyl iron powder.

Shipping regulations: Flammable liquid, n.o.s. (Rail)
Red label. (Air) Flammable Liquid label.

iron powder. See iron.

iron protochloride. See ferrous chloride.

iron protoiodide. See ferrous iodide.

iron protosulfide. See ferrous sulfide.

iron pyrite. See pyrite.

iron pyrolignite. See iron acetate liquor.

iron pyrophosphate. See ferric pyrophosphate.

iron red. Red varieties of ferric oxide that are used as pigments. See iron oxide red.

iron sponge.

(1) Sponge iron, a finely divided porous form of iron made by reducing an iron oxide at such low temperatures that melting does not occur, usually by mixing iron oxide and coke and applying limited increase in temperature.

Uses: For precipitating copper or lead from solutions of their salts, and in electric furnace steel operations.

(2) Iron mass (iron oxide). Finely divided iron oxide, distributed on a support so as to give a large surface area. One form is a mixture of wood shavings covered with a hydrated iron oxide. This may be made by mixing wet wood shavings with iron borings or similar material and allowing rusting to occur to produce finely divided iron oxide. In another method wood shavings are mixed with a slurry of the hydrated ferric oxide produced in purifying alum, and then dried. The iron sponge or iron mass is used for removing sulfur from coal gas or similar materials. See iron oxide process. See also iron sponge, spent.

Shipping regulations: (not properly oxidized) (Rail) Yellow label; not accepted by express. (Air) Not acceptable. Not restricted if properly oxidized.

iron sponge, spent (iron mass, spent; spent oxide). Iron sponge after saturation with sulfur. It is liable to spontaneous heating. See iron oxide process.

Shipping regulations: (Rail) Yellow label; not accepted by express. (Air) Not accepted.

iron, stainless. Alloys containing 3 to 38% chromium, with or without traces of nickel; essentially magnetic and ferritic in character. High chromium irons are brittle after welding. Most popular composition for fabrication is 15–18% chromium, 0.1% carbon (max). See ferritic stainless steel, under steel, stainless.

irradiation. Exposure to radiation of wavelengths shorter than those of visible light (gamma, xray or ultraviolet) either for medical purposes (cancer therapy, removal of skin blemishes), for destruction of bacteria in milk and other foodstuffs, or for inducing polymerization of monomers or vulcanization of rubber. UV irradiation was formerly used to induce activation of vitamin D in milk, and has been used for some time to sterilize the air in operating rooms, etc.

"Irrathene."²⁴⁵ Trademark for a thermosetting form of polyethylene (q.v.) formed by irradiation of polyethylene with high energy cathode rays (electrons). Does not melt (up to 250°C) but oxidizes rapidly at elevated temperatures unless protected by an inhibitor. Its resistance to acids, alkalies, and solvents is superior to that of polyethylene and it has excellent electrical resistance even at 200°C. It is available in films and tapes used for packaging and electrical insulation.

irreversible. A permanent chemical or physicochemical change. Examples are: (1) A chemical reaction that can proceed only to the right, giving a product that is stable and that cannot revert to the original constituents; most reactions are of this type. (2) A colloidal system that cannot be restored to its original form after coagulation or precipitation, for example, the hardening of egg white or milk protein by heat, the formation of butter from milk (mechanical action), and the coagulation of rubber latex by acid (chemical action).

See also: reversible.

"Iron."¹⁶⁹ Trademark for 8-quinolinol-7-iodo-5-sulfonic acid used in the colorimetric determination of iron.

"IR-S Latices."⁵² Trademark for a series of emulsion copolymers of butadiene and styrene.

Uses: Paper and fabric impregnations; adhesives for laminating; textile and carpet backing; mastics; tire cord dipping; asphalt emulsions; caulking compounds; chewing gum bases.

"Irrtran" 4.¹¹⁵ Trademark for an optical material made from zinc selenide (q.v.)

ISAF black. Abbreviation for intermediate super abrasion furnace black.

isanolic acid (erythrogonic acid). An 18-carbon fatty acid with acetylene triple bonds at the 9 and 11 positions and having also an ethylene bond but no hydroxyl substituent.

isatin (ortho-aminophenylglyoxalic lactim; ortho-aminobenzoylformic anhydride; isatic acid anhydride; indole-2,3-dione) $C_8H_4COC(OH)N$ (bicyclic).

Properties: Yellowish-red or orange crystals; bitter taste. Soluble in water, alcohol, and ether. M.p. 200–203°C.

Derivation: From indigo by oxidation.

Uses: Dyestuffs; pharmaceuticals; analytical reagent.

isatoic anhydride $C_8NO_3H_5$. A bicyclic molecule composed of a benzene ring attached at the ortho and meta positions to a heterocyclic ring. It forms useful anthranilic acid derivatives by reaction with hydrogen.

Properties: Tan powder.

Grade: Technical, 96% min.

Containers: Bags; drums; bulk.

Uses: Intermediate for polymer curing agents, anthranilic esters, heterocyclic compounds, and benzene.

isethionic acid (2-hydroxyethanesulfonic acid)

$HOCH_2CH_2SO_3H$.

Properties: Liquid; b.p. 100°C (dec); very soluble in water; insoluble in alcohol.

Uses: Detergents; surfactants; synthesis.

"Ismelin" Sulfate.³⁰⁵ Trademark for guanethidine sulfate; used in medicine.

iso-. A prefix meaning "the same," as in such terms as isomer (the same part), isotope (the same place) isometric (the same measure), isobar (the same pressure), etc. In organic chemistry it denotes an isomer of a compound, especially one having a subordinate chain of one or more carbon atoms attached to a carbon of the straight chain. See isobutane; branched chain.

isoalloxazine (flavin) $C_{10}H_6N_4O_2$. A derivative of isoalloxazine widely distributed in plants and animals, usually as yellow pigments. See also riboflavin.

isoamyl acetate $CH_3COOCH_2CH_2CH(CH_3)_2$.

Properties: Colorless liquid; b.p. 142°C; f.p. -78.5°C; sp. gr. (15/4°C) 0.876; wt/gal (15°C) 7.30 lb; flash point 80°F. Slightly soluble in water; miscible with alcohol and ether. Banana-like odor.

Derivation: Rectification of commercial amyl acetate.

Grades: Reagent; technical.

Hazard: Flammable, moderate fire risk. Moderately toxic, and irritant. Tolerance, 100 ppm in air. Explosive limits in air 1 to 7.5%.

Uses: Flavoring; perfumes; solvent.

See also amyl acetate.

isoamyl alcohol, primary (3-methyl-1-butanol; isobutyl carbinol) $(CH_3)_2CHCH_2CH_2OH$.

Properties: Colorless liquid; pungent taste; disagreeable

odor. B.p. 132.0°C; f.p. -117.2°C; sp. gr. 0.813 (15/4°C); wt/gal 6.79 lb; refractive index (n 20/D) 1.4075; flash point (closed cup) 109°F; autoignition temp. 657°F. Slightly soluble in water; miscible with alcohol and ether. Combustible.

Derivation: Distillation of fusel oil or the mixed alcohols resulting from the chlorination and hydrolysis of pentane.

Grade: Technical.

Containers: Drums, tank cars.

Hazard: Moderate fire risk. Moderately toxic and irritant. Tolerance, 100 ppm in air. Explosive limits in air 1.2 to 9%.

Uses: Photographic chemicals; organic synthesis; pharmaceutical products; medicine; solvent; determination of fat in milk; microscopy; flavoring. See also fusel oil.

isoamyl alcohol secondary. Similar to the primary form except b.p. is 113°C; flash point 103°F, density 0.819, combustible.

isoamyl benzoate (amyl benzoate) $C_6H_5COOC_5H_{11}$. Properties: Colorless liquid, with fruity odor. Sp. gr. 0.986 to 0.989; refractive index 1.493; b.p. 260°C. Soluble in water. Combustible. Uses: Perfumery; flavors.

isoamyl benzyl ether (benzyl isoamyl ether) $C_5H_{11}OCH_2C_6H_5$.

Properties: Colorless liquid; fruity odor; sp. gr. 0.904-0.908; refractive index 1.481-1.485; soluble in 4 parts of 80% alcohol. Combustible. Grade: Technical. Use: Soap perfumes.

isoamyl butyrate $C_5H_{11}OOCC_3H_7$.

Properties: Practically water-white. Sp. gr. 0.866 to 0.868 (15.5°C); boiling range 150 to 180°C. Soluble in alcohol and ether; very slightly soluble in water. Combustible. Low toxicity.

Derivation: By treating isoamyl alcohol with butyric acid.

Method of purification: Distillation.

Grades: Commercial, 95 to 100% ester content; F.C.C. (as amyl butyrate).

Containers: Carboys; tin-lined drums.

Uses: Flavoring extracts; solvent and plasticizer for cellulose acetate.

isoamyl chloride $C_5H_{11}Cl$. Any of several compounds or mixtures thereof may be referred to by this name, since numerous isomers are possible, the most common of which is 1-chloro-3-methylbutane $(CH_3)_2CH(CH_2)_2Cl$. Combustible. Low toxicity.

Properties: Colorless or slightly yellow liquid; b.p. 99.7°C (758 mm); sp. gr. 0.893; refractive index 1.410; insoluble in water; soluble in alcohol and ether.

Derivation: Isoamyl alcohol and hydrogen chloride, or chlorination of isopentane.

Uses (Mixtures, usually also containing normal amyl chloride): solvent (nitrocellulose, varnishes, lacquers, neoprene); rotogravure inks; soil fumigation; organic compounds.

isoamylchloroarsine $C_5H_{11}AsCl_2$.

Properties: Oily liquid. Sweetish odor. Decomposed by water. B.p. 88.5 to 91.5°C (15 mm). Combustible.

Derivation: Interaction of phosphorus trichloride and isoamylarsenic acid.

Hazard: Highly toxic; strong irritant.

Shipping regulations: (Rail, Air) Arsenic compounds, n.o.s., Poison label.

alpha-isoamylene. See 3-methyl-1-butene.

beta-isoamylene. See 3-methyl-2-butene.

isoamyl furoate $C_4H_7OCO_2C_5H_{11}$.

Properties: Colorless liquid, becoming brown in light. Insoluble in water; soluble in alcohol and ether. Sp. gr. 1.0335 (20/4°C); b.p. 232 to 234°C, 135-137°C (25 mm); refractive index 1.4720.

isoamyl isovalerate. See isamyl valerate.

sec-isoamyl mercaptan (2-methylbutyl 3-thiol) $(CH_3)_2CHCH(SH)CH_3$.

Properties: Colorless liquid; distillation range 101-127°C; sp. gr. 0.841 (20/4°C); density 7.04 lb/gal (60°F); refractive index 1.445 (20°C); flash point 46°F.

Containers: Up to 54-gal.

Hazard: Probably toxic. Flammable, dangerous fire risk.

Uses: Polymerization modifier; insecticide intermediate; vulcanization accelerator intermediate; nonionic surface-active agent.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

isoamyl nitrite. See amyl nitrite.

isoamyl pelargonate $(CH_3)_2CHCH_2CH_2OOCC_8H_{17}$.

Properties: Liquid with fruity odor; sp. gr. 0.860 (15.5/15.5°C); b.p. 260°C; refractive index 1.4300 (20°C). Combustible. Low toxicity.

Uses: Flavors and perfumes; chemical intermediate.

isoamyl propionate. See amyl propionate.

isoamyl salicylate (amyl salicylate) $C_6H_4OHCOOC_5H_{11}$.

Properties: Water-white liquid sometimes having a faint yellow tinge which should not be pink or red. Orchid-like odor. Sp. gr. 1.053-1.059 (15°C); refractive index (n 20/D) 1.5050-1.5080; optical rotation 0 to +2.30°; b.p. 280°C. Soluble in alcohol, ether; insoluble in water and glycerol. Combustible. Low toxicity.

Derivation: By esterifying salicylic acid with amyl alcohol. The usual article of commerce is the isoamyl ester.

Method of purification: Distillation.

Grades: A pure grade of at least 99% ester content which should not exceed 100% on analysis (indicating lower esters).

Containers: Carboys; drums.

Uses: Soap perfumes.

isoamyl valerate ("apple essence"; "apple oil"; isoamyl isovalerate; amyl valerianate; amyl valerate) $C_4H_9CO_2C_5H_{11}$.

Properties: Clear liquid; odor of apples when diluted with alcohol; sp. gr. 0.8812; b.p. 203.7°C; soluble in alcohol and ether; slightly soluble in water. Combustible. Low toxicity.

Derivation: By adding sulfuric acid to a mixture of amyl alcohol and valeric acid. Subsequent recovery by distillation.

Grades: Technical; F.C.C. (as isoamyl isovalerate).

Uses: Medicine; fruit essences; flavoring agent.

isoascorbic acid. See erythorbic acid.

isobars. Nuclides having the same mass number but different atomic numbers, in contrast to isotopes, which have the same atomic number but different mass numbers. C-14 and N-14 are isobars.

isobenzan. Generic name for 1,3,4,5,6,7,8,8-octachloro-1,3,3a,4,7,7a-hexahydro-4,7-methanoisobenzofuran, $C_9H_6OCl_8$.

Properties: Solid; m.p. 248-257°C. Soluble in acetone and ether; slightly soluble in alcohols and kerosine; insoluble in water.

Hazard: Probably toxic.

Use: Insecticide.

isoborneol $C_{10}H_{17}OH$. A geometrical isomer of borneol. Properties: White solid with camphor odor; m.p. $216^{\circ}C$ (sublimes). More soluble in most solvents than borneol. Low toxicity.

Derivation: By reduction of camphor.

Uses: Perfumery; chemical esters.

isobornyl acetate $C_{10}H_{17}OOCCH_3$.

Properties: Colorless liquid. Pine-needle odor. Sp. gr. 0.978 ± 0.001 ($20^{\circ}C$); b.p. 220 to $224^{\circ}C$. Soluble in most fixed oils and in mineral oil. Insoluble in glycerol and water. Combustible. Low toxicity.

Derivation: By heating camphene (50 to $60^{\circ}C$) with glacial acetic acid and sulfuric acid and separating by adding water.

Grades: Technical; F.C.C.

Uses: Compounding pine-needle odors; toilet waters; bath preparations; antiseptics; theater sprays; soaps; making synthetic camphor; flavoring agent.

isobornyl salicylate.

Properties: Viscous, colorless oil. Sweet odor. Ester content 96%. Combustible. Low toxicity.

Grade: Technical.

Uses: Perfumery (fixative); cosmetics (filter for sun-tan preparations).

isobornyl thiocyanacetate $C_{10}H_{17}OOCCH_2SCN$. The technical grade contains 82% or more of isobornyl thiocyanacetate, also other terpenes and derivatives.

Properties: Yellow, oily liquid; terpene-like odor. Sp. gr. ($25/4^{\circ}C$) 1.1465; refractive index ($25/D$) 1.512; acid number 1.19. Very soluble in alcohol, benzene, chloroform, and ether; practically insoluble in water. Relatively low toxicity. Combustible.

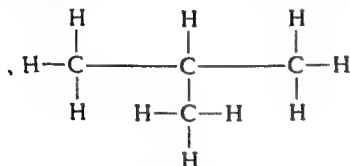

Derivation: By treating isoborneol with chloroacetyl chloride and potassium thiocyanate.

Uses: Insecticide, cattle spray; medicine.

isobornyl valerate $(CH_3)_2CHCH_2COOC_{10}H_{17}$.

Properties: Colorless, neutral liquid, oily taste, peculiar aromatic odor. Does not irritate the stomach. Soluble in alcohol, ether; sparingly soluble in water. B.p. 132 – $138^{\circ}C$ (12 mm); sp. gr. 0.954.

isobutane (2-methylpropane; trimethylmethane). Molecular formula $(CH_3)_2CHCH_3$; Structural formula (branched-chain):

A liquefied petroleum gas.

Properties: Colorless gas; slight odor; stable, does not react with water; has no corrosive action on metals; b.p. $-11.73^{\circ}C$; f.p. $-159.6^{\circ}C$; sp. gr. 0.5572 ($20^{\circ}C$, at saturation pressure); sp. gr. (air = 1) 2.01; soluble in water; slightly soluble in alcohol; soluble in ether; flash point $-117^{\circ}F$; autoignition point $864^{\circ}F$. Non-toxic.

Derivation: An important component of natural gasoline, refinery gases, wet natural gas; also obtained by isomerization of butane.

Grades: Technical; 99 mole % (pure grade), 99.96 mole % (research grade), and other high-purity grades.

Containers: Pressure cylinders; tank cars; tank trucks. Hazard: Highly flammable; dangerous fire and explosion risk. Explosive limits in air 1.9 to 8.5%.

Uses: Organic synthesis; refrigerant; fuel; aerosol propellant; high-octane gasoline (aviation fuel); synthetic rubber; instrument calibration fluid.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes.

isobutane hydrate. See gas hydrates.

isobutanol. See isobutyl alcohol.

isobutanolamine. See 2-amino-2-methyl-1-propanol.

isobutene (2-methylpropene; isobutylene) $(CH_3)_2C:CH_2$. A liquefied petroleum gas.

Properties: Colorless volatile liquid or easily liquefied gas; coal gas odor; b.p. $-6.9^{\circ}C$; f.p. $-139^{\circ}C$; flash point $-105^{\circ}F$; sp. gr. 0.6 ($20^{\circ}C$); soluble in organic solvents. Polymerizes easily and also reacts easily with numerous materials. Nontoxic. Autoignition point $869^{\circ}F$.

Derivation: Gas mixtures containing considerable isobutene are obtained by fractionation of refinery gases resulting from cracking of petroleum.

Containers: Tank cars; cylinders.

Hazard: Highly flammable; dangerous fire and explosion risk. Explosive limits in air 1.8 to 8.8%.

Uses: Production of isooctane, high-octane aviation gasoline; butyl rubber, polyisobutene resins, tert-butyl chloride, tert-butanol methacrylates and other derivatives; copolymer resins with butadiene, acrylonitrile, etc.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes.

isobutyl acetate $C_4H_9OOCCH_3$.

Properties: Colorless, neutral liquid; fruit-like odor. Soluble in alcohols, ether, and hydrocarbons; immiscible with water. B.p. 116 – $117^{\circ}C$; flash point $64^{\circ}F$ (c.c.) sp. gr. 0.8685 ($15^{\circ}C$); refractive index 1.392 (approx.); wt/gal 7.23 lb; f.p. $-99^{\circ}C$. Autoignition temp. $793^{\circ}F$.

Derivation: Treating isobutyl alcohol with acetic acid in the presence of catalysts.

Grades: Technical; solvent; perfume; F.C.C.

Containers: 55-gal drums; tank cars.

Hazard: Flammable, dangerous fire risk. Tolerance, 150 ppm in air.

Uses: Solvent for nitrocellulose; in thinners, sealants, and topcoat lacquers; perfumery; flavoring agent.

Shipping regulations: (Air) Flammable Liquid label.

isobutyl acrylate $(CH_3)_2CHCH_2OOCCH=CH_2$.

Properties: Liquid; b.p. 61 – $63^{\circ}C$ (51 mm); sp. gr. 0.884 ($25^{\circ}C$); refractive index 1.4124 ($25/D$); flash point $86^{\circ}F$ (TOC). Contains 100 ppm monomethyl ether hydroquinone as inhibitor.

Containers: Tank cars and trucks.

Hazard: Flammable, moderate fire risk.

Use: Monomer for acrylate resins.

isobutyl alcohol (isopropylcarbinol; 2-methyl-1-propanol) $(CH_3)_2CHCH_2OH$.

Properties: Colorless liquid. Soluble in water, alcohol, and ether. Sp. gr. 0.806 ($15^{\circ}C$); b.p. $107^{\circ}C$; flash point $100^{\circ}F$ (open cup); f.p. $-108^{\circ}C$; refractive index 1.397 ($15^{\circ}C$). Autoignition point $800^{\circ}F$.

Derivation: Byproduct of synthetic methanol production, purified by rectification.

Containers: 55-gal drums, tank cars and trucks.

Hazard: Flammable, moderate fire risk. Moderately toxic; strong irritant. Tolerance, 100 ppm in air.
Uses: Organic synthesis; latent solvent in paints and lacquers; intermediate for amino coating resins; substitute for *n*-butyl alcohol. Paint removers; fluorometric determinations; liquid chromatography.

isobutyl aldehyde. See isobutyraldehyde.

isobutylamine $(\text{CH}_3)_2\text{CHCH}_2\text{NH}_2$.

Properties: Colorless liquid; amine odor; strongly caustic. Soluble in water, alcohol, ether, and hydrocarbons. Sp. gr. 0.731 (20°C); boiling range 66–69°C; flash point 15°F. Autoignition temp. 712°F.
Containers: 55-gal drums; tank cars.

Hazard: Flammable; dangerous fire risk. Toxic; strong irritant to skin and mucous membranes.

Uses: Organic synthesis; insecticides.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

isobutyl-para-aminobenzoate

Properties: White crystalline scales; m.p. 64–65°C. Almost insoluble in water; soluble in alcohol and vegetable oils.

Use: Medicine.

isobutylbenzene $(\text{CH}_3)_2\text{CHCH}_2\text{C}_6\text{H}_5$.

Properties: Liquid; sp. gr. 0.8532 (20/4°C); f.p. –51.6°C; b.p. 171.1°C; refractive index 1.486 (20°C); flash point 140°F. Autoignition temp. 802°F. Combustible.

Hazard: Moderate fire risk. May be toxic in high concentrations.

Uses: Pharmaceutical intermediate; perfume synthesis; flavoring.

isobutyl benzoate (eglantine) $\text{C}_6\text{H}_5\text{CO}_2\text{CH}_2\text{CH}(\text{CH}_3)_2$.

Properties: Colorless liquid; characteristic odor; sp. gr. 1.002; b.p. 237°C; insoluble in water; miscible with alcohol and ether. Combustible; low toxicity.

Uses: Perfumes; flavors.

isobutyl carbinol. See isoamyl alcohol, primary.

isobutyl cinnamate $\text{C}_6\text{H}_5\text{OOCCH}=\text{CHC}_6\text{H}_5$. Colorless oil, amber fragrance. Sp. gr. 1.001 to 1.004; refractive index 1.541. Soluble in 2 vols. of 70% alcohol. Combustible; low toxicity.

Use: Perfumery.

isobutyl cyanoacrylate. A tissue adhesive effective in surgery and medicine to retard bleeding from internal organs. Also applicable to the mounting of pearls and other jewels. Available as an aerosol spray.

isobutylene. See isobutene.

isobutylene-isoprene rubber. See butyl rubber.

isobutyl furoate $\text{C}_4\text{H}_7\text{OCO}_2\text{C}_4\text{H}_9$.

Properties: Colorless liquid becoming brown in light. Insoluble in water; soluble in alcohol and ether. Sp. gr. 1.0383 (26.5/4°C); b.p. 221–223°C (corr.); refractive index 1.4676 (26.5°C). Combustible; low toxicity.

N-isobutylhendecenamide. See N-isobutylundecylenamide.

isobutyl heptyl ketone. See 2,6,8-trimethyl-4-nonanone.

isobutyl isobutyrate (IBIB)

Properties: Colorless liquid; fruity odor; sp. gr. 0.853–0.857 (20/20°C); f.p. –80.7°C; b.p. 148.7°C; refractive index (n 20/D) 1.3999; insoluble in water; soluble in alcohol and ether. Combustible.

Containers: Drums; tank cars and trucks.

Use: Flavoring; insect repellent; nitrocellulose lacquers and thinners; substitute for methyl amyl acetate.

isobutyl mercaptan. See 2-methyl-1-propanethiol.

isobutyl methacrylate $(\text{CH}_3)_2\text{CHCH}_2\text{OOCCH}(\text{CH}_3)_2$.
Properties: Liquid; density 0.882 g/ml (25/15°C); boiling range 155°C; refractive index 1.4172 (25°C); flash point 120°F (TOC). Contains 25 ppm hydroquinone monomethyl ether as inhibitor. Combustible.

Containers: Tanks.

Hazard: Moderate fire risk.

Use: Monomer for acrylic resins.

isobutyl phenylacetate $(\text{CH}_3)_2\text{CHCH}_2\text{OOCCH}_2\text{C}_6\text{H}_5$.

Properties: Colorless liquid; honey-like odor. Soluble in most fixed oils; insoluble in glycerin, mineral oil, and propylene glycol. Sp. gr. 0.984–0.988 (25°C); refractive index 1.4860–1.4880 (20°C). Combustible.

Grades: Technical; F.C.C.

Uses: Flavoring agent; perfumes.

isobutyl propionate $\text{CH}_3\text{CH}_2\text{COOCH}_2\text{CH}(\text{CH}_3)_2$.

Properties: Water-white liquid; sp. gr. 0.86–0.8635 (20/20°C); b.p. 138°C; f.p. –71.4°C; refractive index 1.3975 (20°C); insoluble in water; very soluble in alcohol and ether. Combustible; low toxicity.

Containers: 55-gal drums; tank cars.

Use: Paint, varnish, and lacquer solvent.

isobutyl salicylate $\text{HOC}_6\text{H}_4\text{COOCH}_2\text{CH}(\text{CH}_3)_2$.

Properties: Colorless liquid. Sp. gr. 1.064–1.065 (25°C); may have slightly yellowish tinge; b.p. 259°C. Soluble in alcohol and mineral oil; insoluble in water and glycerol. Combustible; low toxicity.

Grades: Technical; F.C.C.

Uses: Perfumery; flavoring.

N-isobutylundecylenamide (N-isobutylhendecenamide) $\text{CH}_3(\text{CH}_2)_7\text{CH}=\text{CHCONHC}_4\text{H}_9$. A synergist for pyrethrum, used in insecticides.

isobutyl vinyl ether. See vinyl isobutyl ether.

isobutyraldehyde (isobutyl aldehyde) $(\text{CH}_3)_2\text{CHCHO}$.

Properties: Transparent, colorless, highly refractive liquid; pungent odor. Sp. gr. 0.794 (20/4°C); b.p. 65°C; f.p. –66°C; refractive index (n 20/D) 1.3730; flash point (closed cup) –40°F, (open cup) –11°F, explosive limits in air, 1.6 to 10.6. Autoignition point 490°F. Soluble in alcohol; insoluble in water.

Derivation: (a) Oxo process reaction of propylene with carbon monoxide and hydrogen; (b) dehydrogenation of isobutyl alcohol.

Containers: 55-gal drums; tank cars.

Hazard: Highly flammable; dangerous fire and explosion risk. Irritant to skin and eyes.

Uses: Intermediate for rubber antioxidants and accelerators, for neopentyl glycol; organic synthesis.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

isobutyric acid $(\text{CH}_3)_2\text{CHCOOH}$ (2-methylpropionic acid).

Properties: Colorless liquid; soluble in water, alcohol, and ether. Sp. gr. 0.946 to 0.950 (20/20°C); b.p. 154.4°C; f.p. –47°C; refractive index (n 20/D) 1.3930. Flash point 170°F (TOC); low toxicity. Autoignition temp. 935°F. Combustible.

Grade: Technical.

Containers: Carboys; steel and aluminum drums; tank cars and trucks.

Hazard: Strong irritant to tissue.

Uses: Manufacture of esters for solvents, flavors and perfume bases; disinfecting agent; varnish; deliming hides; tanning agent.

Shipping regulations: (Air) Corrosive label. (Rail) Corrosive liquid, n.o.s., White label.

isobutyric anhydride $[(CH_3)_2CHCO]_2O$. Liquid with boiling range 180 to 187°C; sp. gr. 0.951–0.956 (20/20°C). Flash point 139°F; autoignition temp. 665°F. Combustible.

Containers: 55-gal drums, tank trucks, tank cars.

Hazard: Strong irritant to tissue.

Uses: Chemical intermediate.

Shipping regulations: (Air) Corrosive label. (Rail) Corrosive liquid, n.o.s., White label.

isobutyronitrile (2-methylpropanenitrile; isopropyl cyanide) $(CH_3)_2CHCN$.

Properties: Colorless liquid; sp. gr. 0.773 (20/20°C); b.p. 107°C; f.p. –75°C; slightly soluble in water; very soluble in alcohol and ether. Combustible.

Containers: Tank cars.

Hazard: May be toxic.

Uses: Intermediate for insecticides, etc.

isobutyryl chloride (isobutyryl chloride; 2-methylpropanoyl chloride) $(CH_3)_2CHCOCl$. Colorless liquid; refractive index 1.4079; sp. gr. 1.013 (20/4°C); f.p. –90°C; b.p. 92°C; soluble in ether; reacts with water and alcohol.

Hazard: May be toxic and irritant.

Use: Chemical intermediate.

isocetyl laurate $C_{11}H_{23}COOC_{16}H_{33}$.

Properties: Oily liquid; almost odorless; sp. gr. 0.858; f.p. below –65°C; viscosity 19.6 cp at 25°C; insoluble in water; soluble in most organic solvents. Combustible; low toxicity.

Uses: Cosmetics and pharmaceuticals (lubricant, fixative and solvent); plasticizer; mold release agent; textile softener.

isocetyl myristate $C_{11}H_{23}COOC_{14}H_{29}$.

Properties: Oily liquid with practically no odor; sp. gr. 0.857; f.p. –39°C; viscosity 25.6 cp at 25°C; insoluble in water; soluble in most organic solvents. Combustible; low toxicity.

Uses: See isocetyl laurate.

isocetyl oleate $C_{11}H_{23}COOC_{18}H_{37}$.

Properties: Oily liquid with practically no odor; sp. gr. 0.862; f.p. –57°C; viscosity 29.0 cp at 25°C; insoluble in water; soluble in most organic solvents. Combustible; low toxicity.

Uses: See isocetyl laurate.

isocetyl stearate $C_{11}H_{23}COOC_{18}H_{37}$.

Properties: Oily liquid with practically no odor; sp. gr. 0.857; f.p. 0°C; viscosity 32.0 cp at 25°C; insoluble in water; soluble in most organic solvents. Combustible; low toxicity.

Uses: See isocetyl laurate.

isocil. Generic name for 5-bromo-3-isopropyl-6-methyluracil $OCCBrC(CH_3)NHC(O)NCH(CH_3)$. Crystals, m.p. 158°C, soluble in absolute alcohol.

Hazard: May be toxic.

Use: Herbicide.

isocinchomeronic acid (2,5-pyridinedicarboxylic acid) $HOOC(C_4H_4N)COOH$.

Properties: Light-tan powder, leaflets or prisms, no odor, m.p. 254°C, sublimes as nicotinic acid above this temperature, insoluble in cold water, alcohol, ether, benzene, slightly soluble in boiling water, boiling alcohol, soluble in hot dilute mineral acids.

Use: Intermediate for nicotinic acid, insecticides, polymers, dyestuffs.

isocrotonic acid. See crotonic acid.

isocyanate. A compound containing the isocyanate radical, $-NCO$. Monoisocyanates are in use, as in the treatment of cellulose to obtain a cellulose tri-carbamate, but the term isocyanate usually refers to a diisocyanate (q.v.).

isocyanate generator (hindered isocyanate). An isocyanate derivative that decomposes to an isocyanate upon heating. In one type phenol is combined with an isocyanate, and the resulting urethane is stable at room temperature, but dissociates at 160°C to the original phenol and isocyanate. These generators are used commercially in a mixture with a polyester which can be stored indefinitely, but which upon heating produces a polyurethane resin.

isocyanate resin. See polyurethane resin.

isocyanic acid (cyanic acid) $HN=C=O$. A gas resulting from depolymerization of cyanuric acid at 300–400°C in a stream of carbon dioxide. An intermediate product in the formation of urethanes and allophanates.

Hazard: Strong irritant to eyes, skin, and mucous membranes; severe explosion risk.

isocyanine. See cyanine dye.

isocyanurate. A compound closely related to isocyanate, but containing three NCO groups. Its products are similar to polyurethane resins and are particularly useful as rigid foams for insulation in the building and construction industry. For combustibility, see foam, plastic. See also isocyanuric acid.

isocyanuric acid (s-triazine-2,4,6-trione)

$OCNHCONHCONH$. White crystalline powder; the

ketone isomer of cyanuric acid (q.v.). Derivatives of isocyanuric acid, as dichloro- and trichloroisocyanuric acid, and potassium and sodium dichloroisocyanurate, are used as bleaches and sanitizers.

isodecaldehyde $C_{10}H_{18}CHO$ (mixed isomers).

Properties: Liquid. Sp. gr. 0.8290; b.p. 197.0°C; f.p. –80°C; insoluble in water; weight 6.9 lb gal; flash point 185°F. Combustible.

Hazard: Probably toxic; strong irritant.

Uses: Intermediate for pharmaceuticals, dyes, resins.

isodecane. See 2-methylnonane.

isodecanoic acid $C_{10}H_{20}O_2$ (mixture of branched chain acids, primarily trimethylheptanoic and dimethyloctanoic).

Properties: Liquid; b.p. 254°C, 137°C (10 mm), sp. gr. 0.9019 (20/20°C), 1 p., glass below –60°C, very slightly soluble in water; viscosity 12.9 cp at 20°C, refractive index 1.4355 (n_D 20/D). Combustible.

Uses: Intermediate for metal salts, ester type lubricants, plasticizers.

isodecanol $C_{10}H_{21}OH$ (mixed isomers)

Properties: Colorless liquid. Sp. gr. 0.8395; insoluble in water, flash point 220°F, b.p. 220°C. Combustible.

Use: Antifoaming agent in textile processing.

isodecyl chloride $C_{10}H_{21}Cl$ (mixed isomers)

Properties: Colorless liquid. Sp. gr. 0.8767; b.p. 210.6°C, 1 p. –150°C (verts to a plastic, insoluble in water, flash point 200°F). Combustible. Low toxicity.

Uses: Solvent for oils, fats, greases, tars, gums, etc.

tractants, cleaning compounds; intermediate for insecticides, pharmaceuticals, plasticizers, polysulfide rubbers, resins, and cationic surfactants.

isodecyl octyl adipate.

Properties: Light-colored, oily liquid; sp. gr. 0.924 (20/20°C); mid-b.p. 227°C (4 mm); refractive index 1.448 (25°C); viscosity 20 cp (20°C); flash point 400°F; combustible. Low toxicity.
Use: Plasticizer.

isodecyl pelargonate. A synthetic lubricant.

(CH₃)₂CH(CH₂)₈CH₂OOC(CH₂)CH₃.

isodrin. Generic name for 1,2,3,4,10,10-hexachloro-1,4,4a,5,8,8a-hexahydro-1,4-endo, endo-5,8-dimethanonaphthalene C₁₂H₈Cl₆. An isomer of aldrin.
Properties: Crystals; decomposes above 100°C.
Hazard: Highly toxic. Use may be restricted.
Use: Insecticide.

Shipping regulations: (Air) Poison label.

isodurene (1,2,3,5-tetramethylbenzene) (CH₃)₄C₆H₂.

Properties: Liquid. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.896; b.p. 197°C; f.p. -24°C. Combustible.
Derivation: From coal tar.
Grade: Technical.
Use: Organic synthesis.

isoelectric point. The pH at which the net charge on a molecule in solution is zero. At this pH amino acids exist almost entirely in the zwitterion state, that is, the positive and negative groups are equally ionized. A solution of proteins or amino acids at the isoelectric point exhibits minimum conductivity, osmotic pressure, and viscosity. Proteins coagulate best at this point. Typical isoelectric points (pH) are: glycine 6.6; gelatin 4.7; serum albumin 5.4.

isoeugenol (CH₃CHCH)₂C₆H₃OHOCH₃. 1-Hydroxy-2-methoxy-4-propenylbenzene.

Properties: Pale yellow oil, spice-clove type odor. Soluble in alcohol, ether, and other organic solvents; slightly soluble in water. Sp. gr. 1.081-1.084; m.p. 19°C; b.p. 268°C; refractive index (n_D¹⁹) 1.5739.
Combustible; low toxicity.
Derivation: From eugenol by isomerization with caustic potash.

Grades: Perfumer's grade; F.C.C.

Uses: Perfumes; vanillin; flavoring agent.

isoeugenol acetate. See acetylisoeugenol.

isoeugenol ethyl ether (1-ethoxy-2-methoxy-4-propenylbenzene) C₃H₅(CH₃O)₂C₆H₃OC₂H₅.

Properties: Synthetic white crystalline powder; m.p. 64°C; insoluble in water; soluble in alcohol, ether, benzene. Combustible; low toxicity.
Uses: Sweetening agent and odorant fixative.

isofluorophate. See diisopropyl fluorophosphate.

"Isoforming." Proprietary process for fixed-bed hydroisomerization, requiring a non-noble metal catalyst. Claimed to give high yields of C₈ (xylene) isomers with low hydrogen consumption and minimal catalyst regeneration.

isohexane. See 2-methylhexane.

isohexane C₆H₁₄. A mixture of branched-chain isomers.

Properties: Colorless liquid. Boiling range 54 to 61°C; sp. gr. 0.671 (60/60°F); flash point -26°F. Low toxicity.
Grade: Commercial.
Containers: 5-, 54-gal drums.
Hazard: Highly flammable; dangerous fire and explosion risk. Explosive limits in air, 1 to 7%.

Uses: Solvent; freezing-point depressant.

Shipping regulations: Flammable liquid, n.o.s. (Rail)
Red label. (Air) Flammable Liquid label.

isolan. See 1-isopropyl-3-methyl-5-pyrazolyl dimethylcarbamate.

isoleucine (2-amino-3-methylpentanoic acid; Ile).

CH₃CH₂CH(CH₃)CH(NH₂)COOH. An essential amino acid, found naturally in the L-(+) form.

Properties: Crystalline; slightly soluble in water; nearly insoluble in alcohol; insoluble in ether.

Derivation: Hydrolysis of protein (zein, edestin); amination of the alpha-bromo-beta-methylvaleric acid.
Uses: Medicine; nutrition; biochemical research.

"Isoline."⁵⁵⁰ Trademark for a dehydrated castor oil, a synthetic drying oil used in lithographic inks, linoleum, paints and varnishes. Supplied in various grades.

"Isomax" Process.^{416,564} Proprietary hydrocracking process to convert hydrocarbon distillates (including vacuum gas oils) and residua into gasolines and/or high quality middle distillates and also to manufacture liquid petroleum gas. The C₅-C₆ light naphtha has a leaded (3ml. TEL/gal) research octane number of about 100. Leaded research octane ratings for the heavy naphtha vary from about 78-95. Premium quality low freeze point (less than -76°F) jet fuels and low pour point, high cetane number diesel fuels can also be manufactured. The process requires catalysts trademarked "Isocracking."

"Isome."³⁴² Trademark for di-n-propyl 6,7-methylene-dioxy-3-methyl-1,2,3,4-tetrahydronaphthalene-1,2-dicarboxylate. Used in insecticides. See propyl isome.

isomer. (1) One of two or more molecules having the same number and kind of atoms and hence the same molecular weight, but differing in respect to the arrangement or configuration of the atoms. Butyl alcohol (C₄H₉OH or C₄H₁₀O) and ethyl ether (C₂H₅OC₂H₅ or C₄H₁₀O) have the same molecular formulas but are entirely different kinds of substances; normal butyl alcohol (CH₃CH₂CH₂CH₂OH) and isobutyl alcohol ((CH₃)₂CHCH₂OH) are the same kinds of substances, differing chiefly in the shape of the molecules; sec-butyl alcohol (CH₃CHOHCH₂CH₃) exists in two forms, one being a mirror image of the other (enantiomer). Isomers often result from location of an atom or group of a compound at various positions on a benzene ring, e.g., xylene, dichlorobenzene. See also geometric isomer; optical isomer. (2) Nuclides (i.e., kinds of atomic nuclei) having the same atomic and mass numbers, but existing in different energy states. One is always unstable with respect to the other, or both may be unstable with respect to a third. In the latter instance the energy of transformation in the two cases will differ.

isomerase. A class of enzymes. See enzyme.

isomerism. See isomer.

isomerization. Process for converting a hydrocarbon or other organic compound into an isomer (q.v.). An important example is the conversion of normal butane into branched-chain isobutane, in connection with the production of isooctane and other high-grade motor fuels.

isomethptene (2-methylamino-6-methyl-5-heptene)

(CH₃)₂C:CHCH₂CH₂CH(NHCH₃)CH₃.

Properties: Colorless or slightly yellow, oily liquid with an amine-like odor. B.p. 175-177°C; sp. gr. 0.794-0.798 (25/25°C); refractive index 1.4428-1.4438 (n_D²⁵). Miscible with the dilute mineral acids and

most organic solvents; volatile with steam. Insoluble in water.

Hazard: Moderately toxic by ingestion.

Use: Medicine.

Available also as the isomethheptene tartrate, the hydrochloride, and the mucate.

alpha-isomethylionone (gamma-methylionone)

$C_{14}H_{22}O$.

Properties: Slightly yellow liquid; sp. gr. 0.925–0.929 (25/25°C); refractive index (20°C) 1.5000–1.5010; flash point 217°F (TCC). Soluble in 5 parts of 70% alcohol. Combustible; low toxicity. A synthetic product.

Uses: Floral perfumes, particularly of a violet character; flavoring.

isomorphism. The state in which two or more compounds that form crystals of similar shape have similar chemical properties and can usually be represented by analogous formulas, e.g., Ag_2S and Cu_2S .

"Isomate."⁵²⁰ Trademark for isocyanate foam systems. Available as non-burning, pour-in-place froth, or spray foams.

isoniazid (N-isonicotinyl hydrazine; INAH; isonicotinic acid hydrazide) $C_5H_4NCONHNH_2$.

Properties: Colorless or white crystals; odorless; affected by air and light; m.p. 170–173°C; sparingly soluble in alcohol, slightly soluble in benzene and ether; freely soluble in water. Solutions practically neutral to litmus.

Derivation: From gamma-picoline.

Grade: U.S.P.

Use: Medicine.

isonicotinic acid $\overline{CHCHNCHCHCCOOH}$. Pyridine-4-carboxylic acid.

Properties: White, practically odorless powder; m.p. 314–317°C (sealed capillary); slightly soluble in water; pH of saturated aqueous solution at 20° 3.6.

Containers: Fiber drums.

Use: Synthesis of isoniazid and similar substances.

isonipacaine hydrochloride. See meperidine hydrochloride.

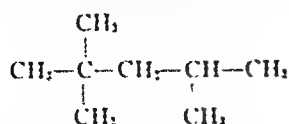

"Isanol C100."⁵²⁰ An aromatic reinforcing polyol. $C_8H_5N[CH_2CH(CH_3)OH]$.

Properties: Amber liquid. Viscosity (50°C) 1000 cps (max.); sp. gr. (23°C) 1.055. Water content 0.05%. Combustible.

Uses: Ingredient of polyurethane foams, coatings, sealants, and elastomers; intermediate in organic synthesis.

isononyl alcohol $C_8H_{17}CH_2OH$. A higher alcohol developed in early 1968; used as a basis of plasticizers such as diisononyl adipate. Combustible.

isooctane (2,2,4-trimethylpentane). Molecular formula $(CH_3)_3CCH_2CH(CH_3)_2$; structural formula

A branched-chain hydrocarbon.

Properties: Colorless liquid; sp. gr. 0.6919 (20.4°C), f.p. –107.4°C; b.p. 99.2°C; refractive index (n_D 20) 1.3914; flash point 10°F. Insoluble in water, slightly

soluble in alcohol and ether. Autoignition temp. 784°F.

Grades: Technical; pure; research; spectrophotometric.

Containers: 5-, 54-gal drums; tanks.

Hazard: Flammable, dangerous fire risk. Moderately toxic by ingestion and inhalation. Explosive limits in air 1.1 to 6%.

Uses: Organic synthesis; solvent; motor fuel; used with normal heptane to prepare standard mixtures to determine anti-knock property of gasoline. See octane number.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

isooctene C_8H_{16} . Mixture of isomers.

Properties: Colorless liquid; boiling range 190–200°F; bromine number 137; sp. gr. 0.726 (60/60°F). Flash point below 20°F.

Hazard: Flammable, dangerous fire risk.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

isooctyl adipate $(C_8H_{17}OOCCH_2CH_2)_2$. Plasticizer providing low-temperature stability. Used in calendering film, sheeting, vinyl dispersions, extrusions.

isooctyl alcohol (isooctanol). General term applied to any isomer of the formula $C_8H_{17}CH_2OH$ in which the eight carbon atoms form a branched chain. Usually refers to a mixture of isomers made by the Oxo process. A selected C_7 hydrocarbon fraction is reacted with hydrogen and carbon monoxide in the presence of a catalyst at pressures up to 3000 psi. The crude alcohol is recovered and purified.

Properties: Clear liquid. Distillation range 182–195°C; wt/gal 6.95 lb; sp. gr. (20/20°C) 0.832; flash point (Tag open cup) 180°F. Combustible. Low toxicity.

Containers: 55-gal drums; tank cars.

Uses: Ingredient of plasticizers; intermediate for non-ionic detergents and surfactants; synthetic drying oils, cutting and lubricating oils, hydraulic fluids; resin solvent; emulsifier; antifoaming agent; intermediate for introducing the isooctyl group into other compounds.

isooctyl isodecyl phthalate $C_8H_{17}OOC C_{10}H_{21}COOC C_{10}H_{21}$.

Properties: Clear liquid; sp. gr. (20/20°C) 0.976; flash point 445°F; combustible; low toxicity; mild odor.

Grade: Technical.

Containers: Drums; tank trucks; tank cars.

Use: Plasticizer.

isooctyl palmitate $C_8H_{17}OOC C_{16}H_{33}$.

Properties: Clear liquid; sp. gr. 0.863 (20°); acidity 0.2% max (palmitic); moisture 0.05% max; m.p. 6–9°C; b.p. 228°C (5 mm). Soluble in most organic solvents. Combustible; low toxicity.

Uses: Secondary plasticizer for synthetic resins; extrusion aid and plasticizer.

isooctylphenoxypolyoxyethylene ethanol isooctylphenylpolyethylene glycol ether)

$(CH_3)_3CCH_2C(CH_3)_2C_6H_4O(CH_2CH_2O)_nC_8H_{17}OH$.

Properties: Slightly viscous pale amber-colored liquid; only musty odor; m.p. 2–5°C; b.p. 150°C (initial) at 1 micron; density 1.06 g/ml (20°C); flash point 227°C. Combustible; low toxicity.

Use: Surface-active agent.

isooctylphenylpolyethylene glycol ether. See isooctylphenoxypolyoxyethylene ethanol.

isooctyl thioglycolate $\text{HSCH}_2\text{COOCH}_2\text{C}_7\text{H}_{15}$.

Properties: Water-white liquid with faint fruity odor; b.p. 125°C (17 mm); sp. gr. 0.9736 (25°C); refractive index 1.4606 (21°C); acid no., less than 1. Combustible. Grade: 99% (minimum purity).

Uses: Antioxidants, fungicides, oil additives, plasticizers, insecticides, stabilizers, polymerization modifiers.

"Isopar."⁵¹ Trademark for a group of high-purity isoparaffinic materials. Used as odorless solvents, reaction diluents, in proprietary formulations, etc. Have low levels of skin irritation; little tendency to migrate through polyethylene containers, and are permitted under a number of FDA regulations for food-related applications.

isopentaldehyde $\text{C}_4\text{H}_8\text{CHO}$. A mixture of isomeric 5-carbon aldehydes.

Properties: Water-white liquid with sharp odor; sp. gr. 0.8089 ($20/20^\circ$); b.p. 98.6°C ; f.p. -95.4°C ; water dissolves 0.85% aldehyde at 20°C ; water-soluble to 2.2% in the aldehyde. Combustible.

Hazard: Probably toxic.

Uses: Possible intermediate for bis-phenols, epoxy and polycarbonate resins, and modified formaldehyde resins.

isopentane (2-methylbutane; ethyldimethylmethane) $(\text{CH}_3)_2\text{CHCH}_2\text{CH}_3$.

Properties: Colorless, liquid; pleasant odor; f.p. -159.890°C ; b.p. 27.854°C ; sp. gr. 0.61967 (20°C); flash point -70°F ; soluble in hydrocarbons, oils, ether; very slightly soluble in alcohol; insoluble in water. Low toxicity. Autoignition temp. 788°F .

Derivation: Fractional distillation from petroleum; purified by rectification.

Grades: Research (99.99%), pure (99%), technical (95%), commercial.

Containers: Pure: 55-gal drums. Technical and commercial: drums; tank cars.

Uses: Solvent; manufacture of chlorinated derivatives; blowing agent for polystyrene.

Hazard: Highly flammable, dangerous fire risk.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

isopentanoic acid $\text{C}_4\text{H}_8\text{COOH}$. A mixture of isomeric 5-carbon acids.

Properties: Water-white liquid; penetrating odor; sp. gr. 0.9388 ($20/20^\circ\text{C}$); b.p. 183.2°C ; vapor pressure 0.14 mm at 20°C ; f.p. -44°C ; water dissolves 3.24 wt% of acid at 20°C ; acid dissolves 10.4% water at 20°C . Combustible.

Hazard: Strong irritant to tissue.

Uses: Intermediate for plasticizers, synthetic lubricants, pharmaceuticals, metallic salts, vinyl stabilizers; extractant for mercaptans from hydrocarbons.

Shipping regulations: (Air) Corrosive label.

isophane insulin suspension. See insulin.**isophorone** (3,5,5-trimethyl-2-cyclohexen-1-one) $\text{C}(\text{O})\text{CHC}(\text{CH}_3)\text{CH}_2\text{C}(\text{CH}_3)_2\text{CH}_2$.

Properties: Water-white liquid; sp. gr. 0.9229 ($20/20^\circ\text{C}$); 7.7 lb/gal (20°C); b.p. 215.2°C ; vapor pressure 0.2 mm (20°C); f.p. -8.1°C ; viscosity 2.62 cp (20°C); flash point 205°F . Combustible. Autoignition temp. 864°F . Has high solvent power for vinyl resins, cellulose esters and ether, and many substances in water.

Containers: Drums; tank cars.

Hazard: Toxic; irritant to skin and eyes. Tolerance, 10 ppm in air.

Uses: In solvent mixtures for finishes; for polyvinyl and nitrocellulose resins; pesticides; stoving lacquers.

isophthalic acid (meta-phthalic acid; IPA) $\text{C}_6\text{H}_4(\text{COOH})_2$.

Properties: Colorless crystals; m.p. $345\text{--}348^\circ\text{C}$; sublimes. Slightly soluble in water; soluble in alcohol and acetic acid; insoluble in benzene and petroleum ether. Combustible; low toxicity.

Derivation: (a) Oxidation of meta-xylene; (b) liquid phase oxidation of mixed xylenes; (c) direct oxidation of mixed alkyl aromatics with heavy metal salts and bromine as catalysts.

Containers: Drums; tank cars.

Grade: Technical.

Uses: Polyester, alkyd, polyurethane, and other high polymers; plasticizers.

isophthaloyl chloride (meta-phthalyl dichloride) $\text{C}_6\text{H}_4(\text{COCl})_2$.

Properties: Crystalline solid; m.p. 41°C ; b.p. 276°C ; flash point 356°F (COC); combustible; soluble in ether and other organic solvents; reactive with water and alcohol.

Hazard: Irritant to eyes and skin.

Uses: Intermediate; dyes; synthetic fibers; resins; films; protective coatings; laboratory reagent.

isopolyester. A polyester resin based on isophthalic acid.**isoprene** (3-methyl-1,3-butadiene; 2-methyl-1,3-butadiene) $\text{CH}_2=\text{C}(\text{CH}_3)\text{CH}=\text{CH}_2$. The molecular unit of natural rubber.

Properties: Colorless, volatile liquid; f.p. -146°C ; b.p. 34.08°C ; refractive index 1.4216 (n $20/\text{D}$); sp. gr. 0.6808 ($20/4^\circ\text{C}$); flash point -55°F ; insoluble in water; soluble in alcohol and ether. Autoignition temp. 802°F .

Derivation: (1) From cracked products of heavy petroleum oils; (2) dehydrogenation of isopentene; (3) pyrolysis of methyl pentene or of isobutylene-formaldehyde condensation products; (4) dehydration of methyl butenol.

Grades: Polymerization (min. purity 99%); research. (99.99%).

Containers: Drums; tank cars; tank trucks.

Hazard: Highly flammable, dangerous fire and explosion risk; moderately toxic and irritant.

Uses: Monomer for manufacture of polyisoprene; chemical intermediate.

Shipping regulations: (Rail) Red label (Air) Flammable Liquid label.

See also polyisoprene; rubber, natural.

isoprenoid. A compound based on the isoprene structure. These include many naturally occurring materials such as terpenes, rubber, cholesterol and other steroids.**isopropanol**. Legal label name for isopropyl alcohol (q.v.).**isopropanolamine** (MIPA; 2-hydroxypropylamine; 1-amino-2-propanol) $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{NH}_2$.

Properties: Liquid; slight ammonia odor; sp. gr. 0.9619; m.p. 1.4°C ; b.p. 159.9°C ; refractive index 1.4462 ($20/\text{D}$); flash point 170°F . Combustible; low toxicity; soluble in water.

Containers: Cans; drums.

Uses: Emulsifying agent; drycleaning soaps; soluble textile oils; wax removers; metal cutting oils; cosmetics; emulsion paints; plasticizers; insecticides.

isopropenyl acetate $\text{CH}_3\text{COOC}(\text{CH}_3):\text{CH}_2$.

Properties: Water white liquid; sp. gr. 0.9226; b.p. 97.4°C ; f.p. -92.9°C ; solubility in water 3.25% by

weight (20°C); refractive index 1.4020 (20/D); flash point 60°F (o.c.). Low toxicity.

Hazard: Flammable; dangerous fire risk.

isopropenylacetylene (2-methyl-1-buten-3-yne)

$\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{C}\equiv\text{CH}$.

Properties: Colorless liquid; b.p. 33–34°C; freezing point –113°C; sp. gr. (20/20°C) 0.695; refractive index (n 20/D) 1.4168; flash point (TOC) <20°F; very slightly soluble in water and miscible with acetone, alcohol, benzene, carbon tetrachloride and kerosene.

Hazard: Flammable; dangerous fire risk.

Use: Specialty fuel; chemical intermediate.

Shipping regulations: Flammable liquid, n.o.s. (Rail)

Red label. (Air) Flammable Liquid label.

isopropenyl chloride. See chloropropene.

isopropenylchloroformate $\text{ClCOOC}(\text{CH}_3)_2\text{CH}_2$.

Properties: Liquid. Sp. gr. 1.103 (20°C); b.p. 93°C (746 mm).

Derivation: Distillation of the reaction products of acetone and phosgene.

Hazard: Toxic; strong irritant to eyes and skin.

para-isopropoxydiphenylamine

$\text{C}_6\text{H}_5\text{NHC}_6\text{H}_4\text{OCH}(\text{CH}_3)_2$.

Properties: Dark gray flakes; sp. gr. 1.10; set point 80–86°C; purity 92% (min); ash 0.10% (max); insoluble in water; soluble in ethyl alcohol (2B), acetone, benzene and gasoline. Low toxicity.

Use: Rubber antioxidant.

beta-isopropoxypropionitrile $(\text{CH}_3)_2\text{CHO}(\text{CH}_2)_2\text{CN}$.

Properties: Colorless to straw-colored liquid. Combines the chemical and physical properties of ethers and nitriles. F.p. –67°C; b.p. 82–86°C (25 mm) 65–65.5°C (10 mm). Sp. gr. 0.9058 (25°C). Slightly soluble in water; soluble in organic solvents. Flash point 155°F; combustible.

Hazard: May be toxic.

isopropyl acetate $\text{CH}_3\text{COOCH}(\text{CH}_3)_2$.

Properties: Colorless liquid; aromatic odor; b.p. 89.4°C; sp. gr. 0.8690 (25/4°C); refractive index 1.378 (20°C); sp. ht. 0.46 cal/g; f.p. –73.4°C; heat of vaporization 135 Btu/lb; viscosity 0.49 cp (25°C); solubility in water 2.9 wt %; flash point 40°F; 7.17 lb/gal (20°C). Miscible with most organic solvents. Autoignition temp. 860°F.

Derivation: By reacting isopropyl alcohol with acetic acid in the presence of catalysts.

Grades: 95%; 85 to 88%.

Containers: Drums; tank cars.

Hazard: Flammable, dangerous fire risk. Moderately toxic.

Uses: Solvent for nitrocellulose, resin gums, etc.; paints, lacquers, and printing inks, organic synthesis.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

N-isopropylacrylamide (NIPAM). Crystalline solid. Homopolymers and copolymers prepared with this material show inverse solubility in water. They are used as binders in textiles, paper, adhesives, detergents, cosmetics. See also acrylic resin.

isopropyl alcohol (IPA; dimethylcarbinol; sec-propyl alcohol; isopropanol; 2-propanol) $(\text{CH}_3)_2\text{CHOH}$.

Properties: Colorless liquid. Pleasant odor; b.p. 82.4°C; sp. gr. 0.7863 (20 20°C); refractive index 1.3756

(20°C); sp. ht. 0.65 cal/g; f.p. –86°C; critical temperature 235°C; critical pressure 53 atmospheres; vapor pressure 33 mm at 20°C; flash point 59°F (TOC); heat of combustion 14,346 Btu/lb; heat of vaporization 288 Btu/lb; viscosity 2.1 cp (25°C). Autoignition temp. 750°F. Soluble in water, alcohol and ether.

Derivation: By treatment of propylene with sulfuric acid and hydrolyzing.

Method of purification: Rectification.

Grades: 91%; 95%; 99%; N.F. (99%); nanograde.

Containers: Drums; tank trucks and cars.

Hazard: Flammable, dangerous fire risk. Moderately toxic by ingestion and inhalation. Tolerance, 400 ppm in air. Explosive limits in air 2 to 12%.

Uses: Manufacture of acetone and its derivatives; manufacture of glycerol and isopropyl acetate; solvent for essential and other oils, alkaloids, gums, resins, etc.; latent solvent for cellulose derivatives; coatings solvent; deicing agent for liquid fuels; pharmaceuticals; perfumes; lacquers; extraction processes; dehydrating agent; preservative.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Legal label name isopropanol.

isopropylamine (2-aminopropane) $(\text{CH}_3)_2\text{CHNH}_2$.

Properties: Colorless volatile liquid; amine odor; strong alkaline reaction. B.p. 32.4°C; f.p. –95.2°C; sp. gr. (20/20°C) 0.6881; wt/gal (20°C) 5.7 lb, refractive index (n 15/D) 1.3770; flash point (open cup) –35°F; autoignition temp. 756°F. Miscible with water, alcohol, and ether.

Derivation: From isopropyl chloride and ammonia under pressure.

Containers: Drums; tank cars.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue. Tolerance, 5 ppm in air. Highly flammable, dangerous fire risk. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Solvent; intermediate in synthesis of rubber accelerators, pharmaceuticals, dyes, insecticides, bactericides, textile specialties, and surface-active agents; dehairing agent; solubilizer for 2,4-D acid.

Shipping regulations: (Rail) Flammable liquid, n.o.s. Red label. (Air) Flammable Liquid label.

para-isopropylaminodiphenylamine. See N-isopropyl-N'-phenyl-para-phenylenediamine.

isopropylaminoethanol (IPAE). A commercial mixture of approximately 60% isopropylethanolamine,

$(\text{CH}_3)_2\text{CHNHCH}_2\text{CH}_2\text{OH}$, and 40% of isopropylidethanolamine, $(\text{CH}_3)_2\text{CHN}(\text{CH}_2\text{CH}_2\text{OH})_2$.

Properties: Amber to straw-colored liquid, distillation range 110–265°C; f.p. below –50°C; sp. gr. 0.91–0.94 (20 20°C); flash point 145–155°F (open cup). Combustible.

Use: Synthesis of emulsifiers.

N-isopropylaniline $\text{C}_6\text{H}_5\text{NHCH}(\text{CH}_3)_2$.

Properties: Yellowish liquid; b.p. 206°C; pour point less than –67°C; refractive index 1.5365 (20°C); flash point 190°F (COC). Combustible.

Hazard: May be toxic.

Uses: Dyeing acrylic fibers; chemical intermediate.

para-isopropylaniline. See cumidine.

isopropyl antimonite $[(\text{CH}_3)_2\text{CHO}]_3\text{Sb}$.

Properties: Colorless liquid; b.p. 82°C at 7 mm Hg pressure.

Derivation: Reaction of antimony trichloride with isopropanol.

Hazard: May be toxic.

Uses: Cross-linking agent; flameproofing agent.

para-isopropylbenzaldehyde. See cuminic aldehyde.

isopropylbenzene. See cumene.

para-isopropylbenzyl alcohol. See cuminic alcohol.

isopropyl bromide $\text{CH}_3\text{CHBrCH}_3$.

Properties: Colorless liquid; sp. gr. 1.304 (25/25°C); b.p. 58.5–60.5°C; f.p. –90°C; refractive index 1.422 (n_D 25/D); flash point none; slightly soluble in water; soluble in methanol, ether. Probably low toxicity. Nonflammable.

Uses: Synthesis of pharmaceuticals, dyes, other organics.

isopropyl butyrate $(\text{CH}_3)_2\text{CHOOCC}_3\text{H}_7$.

Properties: Colorless liquid; sp. gr. 0.8652 (13°C) b.p. 128°C.

Uses: Solvent for cellulose ethers; flavoring.

isopropylcarbinol. See isobutyl alcohol.

isopropyl chloride $\text{CH}_3\text{CHClCH}_3$.

Properties: Colorless liquid; sp. gr. 0.858 (25/25°C); b.p. 34.8°C; f.p. –117.6°C; refractive index 1.374 (n_D 25/D); flash point –26°F; autoignition point 1100°F; slightly soluble in water; soluble in methanol, ether. Hazard: Highly flammable; fire and explosion risk. Explosive limits in air 2.8 to 10.7%.

Uses: Solvent; intermediate; isopropylamine.

Shipping regulations: Flammable liquid, n.o.s. (Rail) Red label. (Air) Flammable Liquid label.

N-isopropyl-alpha-chloroacetanilide. See 2-chloro-N-isopropylacetanilide.

isopropyl 3-chlorocarbanilate. See chloro-IPC.

isopropyl chloroformate $(\text{CH}_3)_2\text{CHOOCCl}$. Colorless liquid; a phosgene derivative.

Hazard: Toxic by inhalation.

Uses: Chemical intermediate for free-radical polymerization initiators; organic synthesis.

isopropyl N-(3-chlorophenyl)carbamate. See chloro-IPC.

isopropyl-meta-cresol. See thymol.

isopropyl-ortho-cresol. See carvacrol.

isopropyl cresol. A mixture of di- and monoisopropyl cresols used as an antioxidant. See thymol and carvacrol.

isopropyl cyanide. See isobutyronitrile.

isopropyl dichlorophenoxyacetate. See 2,4-D.

isopropyl diethanolamine. See isopropylaminoethanol.

2-isopropyl-4-dimethylamino-5-methylphenyl 1-piperidinecarboxylate methyl chloride

$\text{C}_3\text{H}_7\text{C}_6\text{H}_3(\text{CH}_3)_2\text{N}(\text{CH}_3)_2\text{OOCNC}_5\text{H}_{10} \cdot \text{CH}_3\text{Cl}$. Properties: White solid; m.p. 151–152°C; insoluble in ether; soluble in methanol.

Uses: A plant tranquilizer or antigravibellin, which causes some plants to become dwarfs without otherwise affecting their growth or health.

isopropylethanolamine. See isopropylaminoethanol.

isopropyl ether (diisopropyl ether; diisopropyl oxide) $(\text{CH}_3)_2\text{CHOCH}(\text{CH}_3)_2$.

Properties: Colorless, volatile liquid. Ethereal odor. Somewhat similar to ethyl ether in properties but does tend to form peroxides more readily than ethyl ether. (See ether). Consequently the presence or absence of peroxides should be determined and if present should be destroyed with sodium sulfite before distillation. B.p. 67.5°C; sp. gr. 0.723 (15.5/4°C); refractive index 1.368; f.p. –88°C; solubility in water 0.65% wt (25°C); flash point approx. 0°F; autoignition temp. 830°F; 6.05 lb/gal (60°F). Miscible with most organic solvents and water.

Grade: Technical.

Containers: Drums, tank cars.

Hazard: Flammable, dangerous fire risk. Toxic by ingestion and inhalation. Strong irritant. Explosive limits in air 1.4 to 21%. Tolerance, 250 ppm in air.

Uses: Solvent for animal, vegetable, mineral oils, waxes and resins; extraction of acetic acid from aqueous solutions; solvent for dyes in presence of small amount of alcohol; paint and varnish removers, spotting compositions; rubber cements.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label. Legal label name diisopropyl ether.

isopropylethylene. See 3-methyl-1-butene.

isopropyl furoate $\text{C}_4\text{H}_7\text{OCO}_2\text{C}_3\text{H}_7$.

Properties: Colorless liquid, becoming brown in light.

Insoluble in water; soluble in alcohol and ether; sp. gr. 1.0655 (23.7/4°C); b.p. 198.6°C (corr); refractive index 1.4682 (23.7°C).

isopropylideneacetone. See mesityl oxide.

para, para'-isopropylidenediphenol. See bisphenol A.

isopropyl iodide (2-iodopropane) $\text{CH}_3\text{CHICH}_3$.

Properties: Colorless liquid that discolors in air and light; miscible with chloroform, ether, alcohol, and benzene; slightly soluble in water; sp. gr. 1.703; f.p. –90°C; b.p. about 90°C; refractive index (n_D 20/D) 1.5026.

Uses: Organic synthesis; pharmaceuticals.

isopropyl meprobamate. See N-isopropyl-2-methyl-2-propyl-1,3-propanediol dicarbamate.

isopropyl mercaptan $(\text{CH}_3)_2\text{CH}(\text{HS})$.

Properties: Liquid; extremely unpleasant odor; sp. gr. 0.814 (60/60°F); boiling range 51–55°C; flash point –30°F.

Derivation: Propylene and hydrogen sulfide.

Hazard: Highly flammable, dangerous fire hazard.

Toxic by inhalation; strong irritant.

Uses: Standard for petroleum analysis; intermediate.

Shipping regulations: (Rail) Red label (Air) Flammable Liquid label.

2-isopropyl-5-methylbenzoquinone. See para-thymoquinone.

5-isopropyl-2-methyl-1,3-cyclohexadiene. See alpha-phellandrene.

3-isopropyl-6-methylene-1-cyclohexene. See beta-phellandrene.

1-isopropyl-2-methylethylene. See 4-methyl-2-pentene.

N-isopropyl-2-methyl-2-propyl-1,3-propanediol dicarbamate (isopropyl meprobamate; carisoprodol)

$(\text{CH}_3)_2\text{CHNHCOOCH}_2\text{C}(\text{CH}_3)(\text{C}_3\text{H}_7)\text{CH}_2\text{COONH}_2$. Properties: Crystals; m.p. 92–93°C. Sparingly soluble in water; insoluble in vegetable oils; soluble in many common organic solvents. Stable in dilute acids and alkalis.

Use: Medicine.

1-isopropyl-3-methyl-5-pyrazolyl dimethylcarbamate (isolan) $\text{C}_{10}\text{H}_{17}\text{N}_3\text{O}_2$. Properties: Liquid; sp. gr. 1.07 (20°C); b.p. 103°C (0.7 mm). Miscible with water.

isotonic. A solution having the same osmotic pressure as another solution, for example, human blood and physiological salt solution (q.v.).

isotope. One of two or more forms or species of an element that have the same atomic number, i.e., the same position in the Periodic Table, but different masses. The difference in mass is due to the presence of one or more extra neutrons in the nucleus. Thus "regular" hydrogen, with atomic number 1 and a mass of 1 (proton), is one of the three isotopes of hydrogen. The other two are the naturally occurring deuterium (q.v.), which has a neutron in its nucleus as well as a proton, giving a mass of 2; and the artificially produced tritium (1 proton and 2 neutrons) with a mass of 3 (approx). The atomic weight of an element is the average weight percent of all its natural isotopes. The heavier isotopes usually occur very rarely in the atomic population (1 part in 4500 for hydrogen-2, and 1 part in 140 for U-235; in the exceptional case of chlorine, the ratio of isotopes 35 and 37 is about 3 to 1).

The occurrence of isotopes among the 83 most abundant elements is widespread, but separation methods are complicated and costly. 21 elements have no isotopes, each consisting of only one kind of atom. (See note below). The remaining 62 natural elements have from 2 to 10 isotopes each. There are 287 different isotopic species in nature; noteworthy among them are oxygen-17, carbon-14, uranium-235, cobalt-60, and strontium-90, all but the first being radioactive.

There are three kinds of isotopes: (1) natural non-radioactive, (2) natural radioactive, and (3) artificial radioactive (made by neutron bombardment).
Uses: (Nonradioactive) Preparation of heavy water to moderate nuclear reactors. (Radioactive): Tracers in biochemical, metallurgical, and medical research; in geochemical and archeological research (C-14); irradiation source for polymerization, sterilization, etc.; therapeutic agents in various diseases (iodine, sodium, gold, etc.); electric power generation.
See also Aston; chemical dating; radioactivity; heavy water; decay; tracer; nuclide.

Note: According to this definition, it is strictly improper to refer to elements that exist in only one atomic form as having "one isotope"; actually such elements as beryllium, aluminum, arsenic, iodine, and others have no isotopes, that is, they have no other atomic form that is like them in all respects except mass. The term "isotope" requires the existence of at least two elemental forms, in the same sense that the word "twin" requires the existence of a pair.

"Isotox."²⁵³ Trademark for a type of insecticide containing lindane (q.v.).

"Isotron."²⁰⁴ Trademark for fluorinated hydrocarbons. Used as refrigerants, propellants, blowing agents, and solvents.

11. Trichlorofluoromethane.
12. Dichlorodifluoromethane.
13. Chlorotrifluoromethane.
113. Trichlorotrifluoroethane.
114. Dichlorotetrafluoroethane.
- M Solvent. Trichlorofluoromethane.
- T Solvent. Trichlorotrifluoroethane.
- Precision Solvent Cleaner. Trichlorotrifluoroethane.
- An ultrapure solvent.

isotropic. Descriptive of the property of transmitting light equally in all direction; cubic (isometric) crystals have this property, as well as liquids, gases, and most glasses. See also anisotropic.

isovaleral. See isovaleraldehyde.

isovaleraldehyde (isovaleral; isovaleric aldehyde; 3-methylbutyraldehyde) $(\text{CH}_3)_2\text{CHCH}_2\text{CHO}$. Occurs in orange, lemon, peppermint and other essential oils.

Properties: Colorless liquid; apple-like odor; sp. gr. 0.785; f.p. -51°C ; b.p. 92°C ; refractive index (n 20/D) 1.390. Soluble in alcohol and ether; slightly soluble in water. Combustible; low toxicity.

Derivation: Oxidation of isoamyl alcohol; also by Oxo process from petroleum.

Uses: Flavoring; perfumes; pharmaceuticals; synthetic resins; rubber accelerators.

isovaleric acid (isopropylacetic acid)

$(\text{CH}_3)_2\text{CHCH}_2\text{COOH}$. Occurs in valerian, hop oil, tobacco and other plants.

Properties: Colorless liquid; disagreeable taste and odor; sp. gr. 0.931 (20/20°C); b.p. 176°C ; refractive index (n 20/D) 1.4043; f.p. -29°C ; slightly soluble in water; soluble in alcohol and ether. Combustible; low toxicity.

Derivation: With other valeric acids, by distillation from valerian; by oxidation of isoamyl alcohol.

Uses: Medicine; flavors; perfumes.

isovaleric aldehyde. See isovaleraldehyde.

isovaleroyl chloride (3-methylbutanoyl chloride)

$(\text{CH}_3)_2\text{CHCH}_2\text{COCl}$.

Properties: Colorless liquid; refractive index (n 24/D) 1.4136; sp. gr. 0.9854 (24/4°C); b.p. 113°C ; soluble in ether; reacts with water and alcohols.

Use: Intermediate in synthesis.

isovaleryl-para-phenetidine

$\text{C}_2\text{H}_5\text{OC}_6\text{H}_4\text{NHCOCH}_2\text{CH}(\text{CH}_3)_2$.

Properties: White, glistening needles. Almost insoluble in water and ether; soluble in alcohol and chloroform.

Derivation: By heating isovaleric acid with para-phenetidine.

"Isuprel" Hydrochloride.¹⁶² Trademark for isoproterenol hydrochloride.

itaconic acid (methylene succinic acid)

$\text{CH}_2\text{C}(\text{COOH})\text{CH}_2\text{COOH}$.

Properties: White, odorless crystals; m.p. $167\text{--}168^\circ\text{C}$; soluble in water, alcohols and acetone; sparingly soluble in other organic solvents. Low toxicity.

Derivation: Submerged fermentation by mold or various carbohydrates.

Uses: Copolymerizations; resins; plasticizers; lube oil additives; intermediate.

-ite. A suffix indicating an intermediate oxidation state of a metallic salt, analogous to -ous for acids, e.g., sodium sulfite (NaSO_3), containing one less oxygen atom than the sulfate.

"ITP- 43, 63A, 67."¹⁹ Trademark for a series of imine-terminated polymers derived from poly(alkylene ether) glycols and polyester backbones.

Uses: Solid rocket propellant binders and liners, insulation materials, polymeric plasticizers, sealants, adhesives, coatings and potting compounds.

IUPAC. Abbreviation for International Union of Pure and Applied Chemistry (q.v.).

IVE. Abbreviation for isobutyl vinyl ether. SEc vinyl isobutyl ether.

ivory black. An animal black produced from ivory. The term is sometimes erroneously applied to other animal blacks. Chief use is as a pigment, especially as artists' color in oil.

J

J acid. See 2-amino-5-naphthol-7-sulfonic acid.

J acid urea. See 5,5'-dihydroxy-7,7'-disulfonic-2,2'-disulfonic-2,2'-dinaphthylurea.

japan. A varnish yielding a hard, glossy, dark-colored film. Japans are usually dried by baking at relatively high temperatures. (ASTM D16-52). True Japan varnishes contain a strongly irritant chemical; more recent types contain kauri or copal resin, linseed oil, lead oxide, pigments and solvents such as kerosene or turpentine.

Hazard: Flammable; irritant to eyes and skin.

Uses: Coatings for miscellaneous wood and metal products.

Japan wax. (Japan tallow; sumac wax).

Properties: Pale yellow solid; tallow-like rancid odor. Contains 10-15% palmitin and other glycerides. Soluble in benzene and naphtha. Insoluble in water and in cold alcohol. Sp. gr. 0.970-0.980; m.p. 53°C. Combustible; nontoxic.

Derivation: From a species of *Rhus* by boiling the fruit in water.

Uses: Candles; wax matches; special soaps; substitute for beeswax; food packaging.

jasmine aldehyde. See alpha-amylcinnamic aldehyde.

jasmine oil.

Properties: Light yellow essential oil; characteristic odor. Soluble in alcohol, ether and chloroform. Sp. gr. 1.007-1.018; optical rotation +2.5° to +3.5°. Combustible; low toxicity.

Chief known constituents: Benzyl acetate, linalyl acetate, linalool, indole, and jasmone.

Derivation: Flowers of Spanish jasmine, *Jasminum grandiflorum*.

Uses: Perfumery; flavoring.

jasmone $C_{11}H_{16}O$. 3-Methyl-2-(2-pentenyl)-2-cyclopenten-1-one. A ketone found in jasmine oil and other flower oils. Odor of jasmine; sp. gr. 0.944 (22/0°C).

"Jasmonyl."²²⁷ Trademark for isomeric mixture of nonane-1,3-diol monoacetates.

jatrophone. A diterpenoid growth inhibitor isolated from an alcohol extract of the plant *Jatropha gossypifolia*. Its unique structure includes a 12-membered ring. It is readily attacked by nucleophiles. Useful in study of tumor growth inhibition and other biochemical research.

"Javollal."¹⁸⁸ Trademark for an aromatic concentrate used as a substitute for oil of citronella.

"Jayflex."²⁹ Trademark for a group of resin plasticizers, including dihexyl phthalate, diisooctyl phthalate, di-2-ethylhexyl phthalate, diisodecyl phthalate, dilauryl phthalate and hydrocarbon plasticizers.

"Jaysol."²⁹ Trademark for an ethyl alcohol composition containing an aliphatic solvent, methyl isobutyl ketone, and ethyl acetate.

"Jaysolve."²⁹ Trademark for a group of glycol ether solvents which possess unique solubility characteristics because they have an alcohol and ether group in a single molecule. They dissolve many synthetic and natural resins and are used in a wide variety of surface coating applications.

"Jeffersol."¹³⁷ Trademark for a group of glycol ether solvents.

"Jefron."²³³ Trademark for hematinic iron products.

"Jellitic."¹⁰³ Trademark for a prepared dry wheat paste which is pre-gelatinized over hot rolls to make the starch water-soluble.

jelly. A modified form of the word "gel" (*q.v.*) widely used in popular language, but also used in chemical literature to refer to the mechanical strength of the gel structures occurring with pectins, gelatin and various natural gums. "Jelly strength" is frequently specified in the food industry. Other uses of the word are found in "petroleum jelly" obtained as a distillation product of petroleum residues (petrolatum) and in the so-called "royal jelly," a natural nutrient mixture of proteins and carbohydrates produced by bees as food for the queen bee. See also gel.

"Jet II."¹ Trademark for a series of synthetic lubricants for aviation engines.

jet fuel. A fuel for jet (turbine) engines, usually a petroleum product similar to kerosene. A number of types with somewhat different compositions and properties have been used. The important military jet fuels are as follows:

JP-1: F.p. below -46°C; autoignition temp. 442°F; flash point 95°F.

JP-4: 65% gasoline and 35% light petroleum distillate, with rigidly specified properties. Flash point -10°F; autoignition temp. 468°F.

JP-5: A specially refined kerosene having a flash point of 95°F and a freezing point of -40°C. Used by carrier-based aircraft because it can be stored aboard. Autoignition temp. 475°F.

JP-6: A higher kerosene cut than JP-4, with fewer impurities, used in advanced engines. Flash point 100°F; autoignition temp. 435°F.

Commercial jet planes use ASTM Type A, A-1, or B. A and A-1 are kerosene types. The A-1 has lower freezing point and is used for long range flights; type A is the large volume fuel for short and medium range flights. Type B is a gasoline-kerosene type similar to JP-4.

Hazard: Flammable; dangerous fire risk.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

"Jet Jet."¹⁴¹ Trademark for guar gum drilling mud flocculant.

"Jetron."¹⁷⁹ Trademark for a series of carbon blacks coprecipitated with synthetic SBR polymer.

Jetset. A fast-setting cement developed by the Portland Cement Assn. Reported to harden in 20 minutes after pouring. Accelerating agent has not been disclosed.

"Jet-X"²⁷⁰ Trademark for a protective fire foam for use in passenger aircraft. The aqueous foaming agent is a 2.5% solution of detergent-type alkyl sulfonates reinforced with protein hydrolyzates. The foam acts as both thermal insulator and barrier against toxic fumes; said to fill an aircraft cabin within 30 seconds; does not irritate skin or damage textiles.

JH (methyl-*cis*-10,11-epoxy-7-ethyl-3,11-dimethyl-*trans*, *trans*-2,6-tridecadienoate). A synthetic hormone containing a 13-carbon chain; said to have possibilities as an insecticide. It acts by preventing insects from maturing. Its future depends on the possibility of large-scale production.

"JHR Compound."⁵⁵⁴ Trademark for a thermoplastic compound impervious to mineral acid; does not decompose hydrogen peroxide. Used to coat interiors of tanks and containers for shipment of hydrogen peroxide, acids, etc.

"Jifix."³²⁹ Trademark for an acid-hardening, ammonium thiosulfate fixing bath. Ready-mixed and rapid-acting.

jojoba oil

Properties: Colorless, odorless waxy liquid. Chemically similar to sperm oil.

Derivation: By crushing seeds of an evergreen desert shrub found in southwestern U.S. and northern Mexico. Experimental cultivation in California and Israel. Yield of oil from seeds approaches 50%.

Uses: Substitute for sperm oil, especially in transmission lubricants; high-pressure lubricant; antifoam agent (antibiotic fermentation); substitute for carnauba wax and beeswax; cosmetic preparations.

Joule-Thomson coefficient. The change in temperature per atmosphere change of pressure on a gas or other fluid when the enthalpy remains constant. It is found by measuring the temperature change from T' to T when the pressure P' of a gas on one side of a porous plug changes to P on the other side. The change of temperature ($T' - T$) and of ($P' - P$) are measured under conditions such that no heat is gained or lost, and the pressure of the plug is great enough to insure a nearly constant pressure in the incoming and outgoing gas. The ratio of $(T' - T)/(P' - P)$ at several pressure ranges is extrapolated to the limiting case as $(P' - P)$ approaches zero. This limiting value is the Joule-Thomson coefficient, μ . Thus

$$\mu = \left(\frac{\alpha T}{\alpha P} \right)_H$$

The subscript H indicates that the enthalpy, H , remains constant during the expansion ($\Delta H = 0$).

juglone. See 5-hydroxy-1,4-naphthoquinone.

jute. Bast fibers, 4-10 ft long, obtained from the stems of several species of *Corchorus*, especially *C. capularis*. Contains a higher proportion of lignin and less cellulose than any other commercial vegetable fiber and has relatively poor strength and durability. The fibers are soft and lustrous but lose strength when wet. Combustible; not self-extinguishing.

Sources: Bengal, Pakistan.

Containers: Bales.

Hazard: May ignite spontaneously when wet. Flammable in form of dust.

Uses: Burlap; sacking; linoleum; twine; carpet backing; packing; coarse paper.

"JZF."²⁴⁸ Trademark for *N,N'*-diphenyl-*para*-phenylene diamine (q.v.).

K

k Abbreviation for kilo-, as in kcal.

K Symbol for potassium (from Latin *kalium*); symbol for Kelvin scale.

"K4 and K6."⁴⁷¹ Trademark for Western bentonites for bonding foundry sands and steel castings.

"KA-101."⁴⁷⁵ Trademark for active alumina. Manufactured by carefully controlled calcination of beta [alumina] trihydrate. It is spherical, extremely absorbent, chemically inert. Used extensively to dehydrate fluids and gases in a variety of commercial processes.

K acid. See 1-amino-8-naphthol-4,6-disulfonic acid.

"Kadox."²⁶⁸ Trademark for lead-free zinc oxides manufactured by the French process; produced from zinc metal.

Uses: Rubber, paints and lacquers; sealants for food industry; fast-curing latex.

kainite $\text{MgSO}_4 \cdot \text{KCl} \cdot 3\text{H}_2\text{O}$. A natural hydrated double salt of potassium and magnesium. Color, white, gray, reddish or colorless; streak, colorless; vitreous luster. Contains 30% potassium chloride. Sp. gr. 2.05-2.13; hardness 2.5-3.

Occurrence: Germany. One of the Stassfurt minerals. See potash.

Uses: Chemicals (potassium salts); fertilizer (as such).

"Kaleidoscope" Diphenolic Acid.⁴²⁴ Trademark for 4,4-bis(4-hydroxyphenyl) pentanoic acid (q.v.).

"Kalite."²⁴⁴ Trademark for calcium carbonate, surface-coated. Used in rubber, plastics, and drawing compounds.

kalsomine. See calcimine.

kanamycin sulfate $\text{C}_{18}\text{H}_{16}\text{N}_4\text{O}_{11} \cdot \text{H}_2\text{SO}_4$. A wide-spectrum antibiotic.

Properties: White odorless crystalline powder; decomposes over a wide range above 250°C; soluble in water; practically insoluble in methanol and ethanol.

Grade: U.S.P.

Use: Medicine.

"Kaoeast."⁴⁴⁵ Trademark for an alumina-silica refractory which can withstand temperatures up to 3000°F.

"Kaolex."²⁴⁴ Trademark for a series of hydrous aluminum silicates (sedimentary kaolins) from Georgia and South Carolina.

Properties: P.C.E. 33-35; sp. gr. 2.60; DMR to 350 psi for casting, jiggering, pressing and extruding. Air-floated or water-washed (lump or pulverized).

Containers: 50-lb multiwall bags or bulk.

Uses: Ceramics; refractories; rubber and plastic products.

kaolin (China clay). A white-burning aluminum silicate which, due to its great purity, has a high fusion point and is the most refractory of all clays.

Composition: Mainly kaolinite (40% alumina, 55% silica, plus impurities and water).

Properties: White to yellowish or grayish fine powder; sp. gr. 1.8-2.6. Darkens and develops clay odor when moistened. Insoluble in water, dilute acids, and alkali hydroxides. Has high lubricity (slipperiness). Nontoxic; noncombustible.

Occurrence: Southeastern U.S., England, France.

Grades: Technical; N.F.; also graded on basis of color and particle size.

Containers: Cartons; paper bags; drums; bulk.

Uses: Filler and coatings for paper; rubber; refractories; ceramics; cements; fertilizers; chemicals (especially aluminum sulfate); catalyst carrier; anticaking preparations; cosmetics; insecticides; paint; source of alumina (see Toth process).

See also kaolinite; aluminum silicate; clay.

kaolinite $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2 \cdot 2\text{H}_2\text{O}$. A clay mineral, rarely found pure; the main constituent of kaolin and some other clays.

"Kaomul."⁴⁵⁵ Trademark for a mullite firebrick that combines the properties of alumina-diaspore and mullite refractories; m.p. 3280°F; chemical analysis 61% alumina and 35% silica.

"Kao-Tab."⁴⁵⁵ Trademark for a tabular alumina, high-strength castable refractory for service up to 3300°F.

"Kaowool."⁴⁵⁵ Trademark for a stable, high-temperature alumina-silica ceramic fiber. Can be used up to 2300°F; m.p. 3200°F; diameter of fibers 2.8 microns; length up to 10 inches. Used as insulating material; high temperature filter; pipe and joint protection; for sound absorption. Available in bulk, strip or blanket forms. Noncombustible.

kapok. Cotton-like fibers obtained from the seed pods of various species of *Ceiba* and *Bombax*. Extremely light and resilient but too brittle for spinning. Combustible; not self-extinguishing.

Sources: Indonesia, Philippines, Ecuador, West Africa.

Uses: Life jackets; insulation; pillows; upholstery.

"Kapton."²⁸ Trademark for a polyimide film (1 to 5 mils thick).

"Karathane."²¹ Trademark for an agricultural fungicide-miticide based on dinitro(1-methylheptyl) phenyl crotonate (see dinocap) and supplied as a wettable powder or liquid concentrate. May be combined with most other insecticides and fungicides, except oil-based products.

Use: Controls powdery mildew and various species of mites on plants.

karaya gum (sterculia gum; India tragacanth, kadaya gum). A hydrophilic gum which exudes from certain Indian trees of the genus *Sterculia*. Color varies from white to dark brown or black.

Properties: A carbohydrate polymer of varying chemical composition. Properties depend on freshness and time of storage. Viscosity greatly decreases

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

over six months storage. Forms a translucent colloidal gel in water. Nontoxic.
Grades: Technical; F.C.C.
Uses: Pharmaceuticals; textile coatings; ice cream and other food products; adhesives; protective colloid; stabilizer; thickener; emulsifier.
See also gum, natural.

"Karbate."²¹⁴ Trademark for carbon and graphite made impervious to fluids under pressure by impregnation with chemically resistant materials. Strength is increased but thermal conductivity is not lowered by this impregnation nor are the other properties modified to any extent. Resistant to thermal shock and to attack by most nonoxidizing chemicals.
Forms: Supplied as complete equipment items; also in blocks, cylinders, tubes.
Uses: Pipe; fittings; valves; pumps; heat exchangers; towers and absorbers for chemical process equipment.
See also carbon, industrial.

"Kardel."²¹⁴ Trademark for biaxially oriented polystyrene film. Used for window envelopes and packaging produce.

Karl Fischer reagent. A solution of iodine, sulfur dioxide and pyridine in methanol or methyl "Cello-solve." It is used in the determination of water.
Note: Do not confuse with Fischer's reagent (q.v.).

"Karmex."²⁸ Trademark for a wettable powder containing 80% diuron, a selective or nonselective weed control. "Karmex" DL is a suspension containing 28% diuron for pre-emergence control in cotton.
Containers: 4-lb bags; 50-lb fiber drums.
Hazard: May be toxic by inhalation.

"Kasil."²⁰¹ Trademark for a group of soluble silicates of potassium which vary from a clear, thin syrupy solution to colorless plates or lumps.
Uses: Detergents, deflocculating agents, adhesives, cements, films and coatings, sols and gels, and paints.

"Katadyne" process. A proprietary method of sterilizing water and other potable liquids with a specially prepared form of silver.

kauri. A fossil (hard) copal resin (q.v.), derived from the kauri pine (*Agathis australis*) of New Zealand. Soluble in alcohols and ketones; acid value 60-80; must be heat-treated (cracked) before use in varnishes. Combustible.
Uses: Varnishes and lacquers; paints; organic cements; to evaluate the solvent power of hydrocarbons.

kauri-butanol value. A measure of the aromatic content, and hence the solvent power, of a hydrocarbon liquid. Kauri gum is readily soluble in butanol but insoluble in hydrocarbons. The k.b. value is the measure of the volume of solvent required to produce turbidity in a standard solution containing kauri gum dissolved in butanol. Naphtha fractions have a k.b. value of about 30, and toluene about 105.

kcal Abbreviation for kilogram calorie; Cal has the same meaning.

K-capture (K-radiation). A type of radioactive decay in which an electron is captured by an atomic nucleus and immediately combines with a proton to form a neutron. The product of this radioactivity has the same mass number as the parent but the atomic number is one unit less. Thus Fe-55 with atomic number 26 decays by K-capture to form Mn-55, with atomic number 25. Terms synonymous with K-capture are K-electron capture and orbital electron capture.

Keene's cement. See gypsum cement.

"Keflin."¹⁰⁰ Trademark for cephalothin (sodium salt).

"Kelacid."³²² Trademark for alginic acid (q.v.).
Uses: Tablet disintegrant; hemostatic agent.

Kekulé, August (1829-1896). Born in Darmstadt, Germany, Kekulé laid the basis for the ensuing development of aromatic chemistry. His idea of a hexagonal structure for benzene in 1865 was a monumental contribution to theoretical organic chemistry. "This had been preceded in 1858 by the remarkable notion that carbon was tetravalent and that carbon atoms could be joined to each other in molecules. The theory of the benzene ring has been called the 'most brilliant piece of scientific prediction to be found in the whole field of organic chemistry,' for besides promulgating the idea, he had predicted the number and types of isomers which might be expected in various substitutions on the ring." (L. B. Clapp)

"Kelco-gel."³²² Trademark for refined sodium alginate. Available as HV and LV grades, which vary in viscosity. A hydrophilic colloid.
Uses: Thickening, suspending, stabilizing, binding and gelling agent for foods, pharmaceuticals, cosmetics, welding rods, ceramics, latex paints, industrial gels, pastes, coatings, films.

"Kelcoloid."³²² Trademark for propylene glycol alginate products, available in a wide variety of forms.
Uses: A hydrophilic colloid. Emulsifier, thickener, stabilizer, suspending, foam stabilizing and whipping agent in aqueous media below pH 7.0. Suitable for food, pharmaceutical, cosmetic and industrial uses.

"Kelecin."⁶⁴ Trademark for a group of soybean lecithins.
Uses: Emulsifying and dispersing agents for protective coatings, mastics, animal feeds, automotive specialty chemicals, textiles, rubber processing, plastics, cosmetics, and food products.

"Kel-F."¹⁵⁸ Trademark for a series of fluorocarbon products, including polymers of chlorotrifluoroethylene and certain copolymers available as extrusion and molding powders, resins, dispersions, gums, oils, waxes and greases, that are characterized by high thermal stability, resistance to chemical corrosion, high dielectric strength, high impact, tensile and compressive strength.
Uses: Corrosion control, contamination prevention, insulation, electrical equipment, molded and fabricated industrial equipment, lubricants, gyro and damping fluids. Especially useful under extreme conditions, including jet and space technology.
See also fluorocarbon polymer.

"Kellin."⁶⁴ Trademark for a chemically treated linseed oil which polymerizes rapidly, dries fast, has excellent water resistance. Used in printing inks.

"Kelo-Form."¹⁹ Trademark for esters of para-aminobenzoic acid, such as butyl, ethyl, isobutyl and propyl; used as a local anesthetic in ointments, powders, lozenges and other medicinals; also in preparation of sun tan lotions.

kelp. A large, coarse seaweed occurring chiefly off the coast of California. It is a type of algae (q.v.) and is mechanically harvested by specially equipped barges. Dried kelp contains from 2 to 4% ammonia, 1 to 2% phosphoric acid, 15 to 20% potash and traces of iodine. Kelp can be used for fertilizers, plastics, and conversion to methane by microorganisms. Large-scale growth off California is in process.

"Kelprint."³²² Trademark for an exceptionally high viscosity sodium alginate used in textile printing.

"Kelthane."²³ Trademark for an agricultural miticide based on 1,1-bis(chlorophenyl)-2,2,2-trichloroethanol and supplied as a wettable powder or emulsifiable concentrate.

"Keltrol."⁶⁴ Trademark for vinyltoluene copolymers. Used in fast air dry, forced dry or baking finishes for clear sealers, sanding sealers, primers, aerosol enamels, paper coatings, tub caulks, tile adhesives, hardboard and plywood sealers and primers.

"Kelzan."³²² Trademark for a polysaccharide known as xanthan gum produced by fermentation. Functions as a hydrophilic colloid to thicken, suspend, and stabilize systems where other colloids are unsuitable. See xanthan gum.

"Kemamides."⁴⁷³ Trademark for a group of fatty amides including behenamide, erucamide, oleamide, stearamide.

"Kemamines."⁴⁷³ Trademark for a group of fatty nitrogen derivatives including primary and secondary amines, 1,3-propylene diamines, and quaternary ammonium chlorides.

"Kemesters."⁴⁷³ Trademark for a group of methyl esters of fatty acids.

"Kempore."⁵¹¹ Trademark for a series of azodicarbonamide foaming agents, for vinyls, rubbers, and thermoplastic resins in general.

"Kemprint."¹⁴¹ Trademark for a textile pigment emulsion used for printing on fabrics.

"Kenacort."⁴¹² Trademark for triamcinolone (q.v.).

kenaf. Bast fibers obtained from the stems of *Hibiscus sabdariffa*, grown in Brazil and the West Indies. Used as a substitute for jute in burlap coffee bags.

"Kenalog."⁴¹² Trademark for triamcinolone acetone in cream, paste, suspension, lotion, ointment and spray forms.

"Kenamine."⁴⁷³ Trademark for a series of straight-chain amines from primary through quaternary; available in chain lengths from C₁₂ through C₂₂. They are strongly hydrophobic and are biodegradable. Uses: Cationic intermediates; removal of moisture from surfaces.

"Kenflex."²⁶⁷ Trademark for a synthetic polymer of aromatic hydrocarbons.

Uses: Processing and compounding aid for neoprene. "Hypalon," SBR, vinyl compounds and other plastics; potting compounds; protective coatings, paper and textile coatings; insecticides; inks; chemical synthesis.

"Kennametal."¹⁴⁷ Trademark for a group of hard cemented carbides whose principal ingredient is tungsten carbide plus cobalt with additions of carbides of tantalum, titanium, niobium. Available in varied degrees of hardness from 82.0 to 94.0 Rockwell A and of shock resistance by variation of composition, manufacturing techniques, and structure. There are six major series.

"Kennertium."¹⁴⁷ Trademark for a group of high-density tungsten alloys. Grades W-2 and W-10 are 18.5 and 17.0 g cc, respectively. Easily machinable; used for high inertial applications, balancing and radioactive shielding.

"Kenplast."²⁶⁷ Trademark for a series of hydrocarbon oils, both aromatic and naphthenic, compatible with all elastomers and polymers.

Uses: PVC plasticizers, reclaim oil, SBR, neoprene, butyl, "Thiokol."

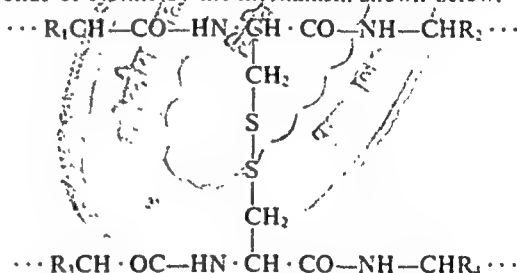

"Kensol."¹⁶⁷ Trademark for a group of products of close-cut petroleum fractions.

Uses: Ink oils, metal rolling oils, petroleum solvents, and solvent naphtha high flash.

"Kentanium."³⁴⁷ Trademark for a group of hard cemented carbides whose principal ingredient is titanium carbide.

"Keranol."³⁰⁰ Trademark for a modified cationic softener for fabrics. Also used on synthetic fibers as antistatic agent.

keratin. A class of natural fibrous proteins occurring in vertebrate animals and man; they are characterized by their high content of several amino acids, especially cystine, arginine, and serine. They are generally harder than the fibrous collagen group of proteins; the softer keratins are components of the external layers of skin, wool, hair, and feathers, while the harder types predominate in such structures as nails, claws, and hoofs. The hardness is largely due to the extent of cross-linking by the disulfide bonds of cystine by the mechanism shown below:

Keratins are insoluble in organic solvents but do absorb and hold water. The molecules contain both acidic and basic groups, and are thus amphoteric. Other than wool, keratins have limited industrial application. A foam based on keratin extracted from chicken feathers is reported useful in protecting growing vegetables from frost damage. See also cross-linking; protein; wool.

"Keripon."⁴⁰⁰ Trademark for a water soluble synthetic fatty ester with wetting and rewetting properties for textile, leather and paper.

kernite Na₂B₄O₇ · 4H₂O. A natural sodium borate, found in Kern County, California. Colorless to white; two good cleavages; luster vitreous to pearly; Mohs hardness 3; sp. gr. 1.95. Noncombustible.

Use: Major source of borax and boron compounds.

kerogen. The organic component of oil shale, ranging from 30 to 60% of total volume. See shale oil.

kerosene (kerosine).

Properties: Water-white, oily liquid; strong odor; sp. gr. 0.81; boiling range 180 to 300°C. Flash point 100 to 150°F; autoignition point 444°F. Combustion properties can be greatly improved by a proprietary hydrotreating process involving a selective catalyst.

Derivation: Distilled from petroleum.

Containers: Drums; trucks; tank cars.

Hazard: Moderate fire risk. Moderately toxic by in-

gestion and inhalation. Explosive limits in air 0.7 to 5.0%.

Uses: Rocket and jet engine fuel; domestic heating; solvent; insecticidal sprays; diesel and tractor fuels.

"Kessco."¹⁵ Trademark for a series of fatty acid esters used as plasticizers, softeners, wetting agents, emulsifiers, etc.

ketene $\text{H}_2\text{C}:\text{CO}$.

Properties: Colorless gas; disagreeable taste. Readily polymerizes; cannot be shipped or stored in a gaseous state. M.p. -151°C ; b.p. -56°C .

Derivation: Pyrolysis of acetone or acetic acid by passing its vapor through a tube at $500-600^\circ\text{C}$.

Containers: Steel bottles for intraplast transfer only.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to skin and mucous membranes. Tolerance, 0.5 ppm in air.

Uses: Acetylating agent, generally reacting with compounds having an active hydrogen atom; reacts with ammonia to give acetamide. Starting point for making various commercially important products, especially acetic anhydride and acetate esters.

ketimine. A type or class of curing agent for epoxy resins which makes it possible to use very high solids content-coatings in spray equipment. Reacts with epoxies very slowly, and thus delays curing time, which prevents setting up of the resin during spraying operation. In presence of water or water vapor, ketimine breaks down to a polyamine and a ketone. Epoxy coatings cured with ketimine should not exceed thickness of ten mils.

4-ketobenzotriazine (benzazimide; 4-keto-(3H)-1,2,3-benzotriazine) $\text{C}_7\text{H}_5\text{N}_3\text{O}$ (bicyclic). Properties: Tan powder; m.p. 210°C (dec.); soluble in alkaline solutions and organic bases. Uses: Organic synthesis.

alpha-ketoglutaric acid (2-oxopentanedioic acid) $\text{HOOCCH}_2\text{CH}_2\text{COCO}_2\text{H}$. M.p. 113.5°C ; soluble in water and alcohol. Important in cell metabolism.

beta-ketoglutaric acid (ADA; acetonedicarboxylic acid) $\text{HO}_2\text{CCH}_2\text{COCH}_2\text{CO}_2\text{H}$. Properties: Colorless needles; m.p. 135°C (dec); soluble in water and alcohol; insoluble in benzene and chloroform.

Derivation: By heating dehydrated citric acid and concentrated sulfuric acid together.

Use: Organic synthesis.

ketohexamethylene. See cyclohexanone.

ketone. A class of liquid organic compounds in which the carbonyl group, $\text{C}=\text{O}$, is attached to two alkyl groups; they are derived by oxidation of secondary alcohols. The simplest member of the series is acetone, $\text{CH}_3\text{C}(\text{O})\text{CH}_3$, but many more complex ketones are known. Ketones are used primarily as solvents, especially for cellulose derivatives, in lacquers, paints, explosives, and textile processing. See also acetone, diethyl ketone, methyl ethyl ketone.

"Ketone BD 9."⁵⁰⁵ Trademark for a bicyclic ketone. Properties: Pale straw-colored liquid; sp. gr. 0.952; refractive index (n_D²⁰) 1.488; b.p. 290°C . Used in woody perfumes.

ketone, Michler's. See tetramethyldiaminobenzo-phenone.

ketonimine dye. A dye whose molecules contain the $-\text{NH}=\text{C}=\text{}$ chromophore group. There are only two members in the class: auramine, and a closely related homolog, methyl aurin in which a methyl group

replaces one of the hydrogen atoms of aurin. These are basic dyes used on cotton with tannin or tartar emetic as mordant.

alpha-etopropionic acid. See pyruvic acid.

gamma-ketovaleric acid. See levulinic acid.

"Kevlar."²⁸ Trade mark for an aromatic polyamide fiber of extremely high tensile strength and greater resistance to elongation than steel. Its high energy-absorption property makes it particularly suitable for use in belting radial tires, for which it was specifically developed; it is also used as a reinforcing material for plastic composites, and in cordage products. See also aramid

Keyes process. A distillation process involving the addition of benzene to the constant-boiling 95% alcohol-water solution to obtain absolute (100%) alcohol. On distillation a ternary azeotrope mixture containing all three components leaves the top of the column while anhydrous alcohol leaves the bottom. The azeotrope (which separates into two layers) is redistilled separately for recovery and reuse of the benzene and alcohol.

"Keyval" TN.⁴⁹⁶ Trademark for a modified EDTA complex; used as a high-capacity iron sequestant.

kg Abbreviation for kilogram = 1000 grams.

"KH-31."⁴⁷⁵ Trademark for hydrated alumina. Used in the manufacture of cracking catalysts for the petroleum industry; in the production of many types of glass to increase resistance to chemical attack, thermal and mechanical shock; to improve the surface luster and smoothness of vitreous enamel and whiteware.

khurchatovium. Artificial element No. 104 discovered by U.S.S.R. physicists in 1967.

Kick's law. The amount of energy required to crush a given quantity of material to a specified fraction of its original size is the same, regardless of the original size.

kieselguhr. See diatomaceous earth.

kieserite $\text{MgSO}_4 \cdot \text{H}_2\text{O}$. A natural magnesium sulfate occurring in enormous quantities in the Stassfurt salt beds, Germany, in Austria and India. See also epsomite and magnesium sulfate.

"killed" steel. Steel deoxidized by the addition of aluminum, ferrosilicon, etc., while the mixture is maintained at melting temperature until all bubbling ceases. The steel is quiet and begins to solidify at once without any evolution of gas when poured into the ingot molds.

"Kilmag."⁵⁰ Trademark for a formulation of calcium arsenate for the control of certain fly maggots under poultry cages. Hazard: Highly toxic.

kilo-. Prefix meaning 10^3 units (symbol k). E.g., 1 kg = 1 kilogram = 1,000 grams.

kilogram.

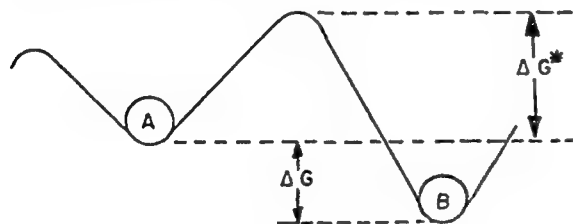

(1) A mass identical with that of the international kilogram, at the International Bureau of Weights and Measures in France. It is the mass of a liter of water at 4°C .

(2) A force equal to the weight of one kilogram mass, measured at sea level.

kinematic viscosity. See viscosity.

kinetics, chemical. Chemical phenomena can be studied from two fundamental approaches: (1) *thermodynamics*, a rigorous and exact method concerned with equilibrium conditions of initial and final states of chemical changes (see *thermodynamics*, chemical); and (2) *kinetics*, which is less rigorous and deals with the rate of change from initial to final states under nonequilibrium conditions. The two methods are related. Thermodynamics, which yields the driving potential—a measure of the tendency of a system to change from one state to another—is the foundation upon which kinetics is built. The rate at which a change will occur depends upon two factors: (a) directly with driving force or potential, and (b) inversely with a resistance. A measure of the tendency of a system to resist chemical change is the so-called activation energy, which is independent of the driving force or so-called free energy of the reaction.

The diagram is a mechanical analogy illustrating the difference between activation energy and driving potential. The chemical system is represented by a sphere resting in a valley. The initial equilibrium state A is at a higher elevation than the final state B. The difference in elevation between A and B is a measure of the free energy change of the reaction, that is, the driving force which will take the system from A to B. This quantity ΔG is determined by the classical methods of thermodynamics. Now both A and B are equilibrium states represented by the valleys. For the system to go from A to B it must first overcome the hill separating the valleys. The elevation of this hill from the valley of the initial state is a measure of the resistance to change in the system in going from A to B. The quantity ΔG^* , known as free energy of activation, is determined by the methods of kinetics.

The system of molecules which is undergoing reaction consists of these molecules in different energy states. If the temperature of a gas is raised, there is an increase in the energy of these states and hence an increase in the collisions of molecules which have the necessary activation energy; as a result, the rate of the reaction will increase. Also, if by means of a catalyst, the activation energy is decreased, more colliding molecules will react and again the rate of reaction will increase.

Note: Adapted from article by Roger Gilmont in "Encyclopedia of Chemistry."
See also thermodynamics.

kinetic theory. A theory of matter based on the mathematical description of the relationship between the volumes, temperatures, and pressures of gases (P-V-T phenomena). This relationship is summarized in the so-called gas laws, as follows: (1) Boyle's law (at constant temperature, the volume of a gas is inversely proportional to its pressure); (2) Charles' law (at constant volume, the pressure exerted by a gas is proportional to its absolute temperature); (3) Avogadro's law (equal volumes of the same or different

gases under the same conditions of temperature and pressure contain the same number of molecules).

The theory involves the basic concept of matter as comprised of atoms and/or molecules which move more rapidly (gases) or vibrate more energetically (solids) as temperature increases. Thus crystals melt at a point where the heat or energy input exceeds the bond energy of the solid state. See also kinetics, chemical; gas; thermodynamics.

king's green. See copper acetoarsenite.

kinin (cytokinin). One of a group of plant growth regulators (q.v.) which promote cell division and differentiation. Best known is kinetin, $C_{10}H_8N_4O$ (6-furfurylamino purine), derived from deoxyribonucleic acid.

Kjeldahl test. An analytical method for determination of nitrogen in certain organic compounds. It involves addition of a small amount of anhydrous potassium sulfate to the test compound, followed by heating the mixture with concentrated sulfuric acid, often with a catalyst such as copper sulfate. As a result ammonia is formed. After alkalyzing the mixture with sodium hydroxide the ammonia is separated by distillation, collected in standard acid and the nitrogen determined by back-titration.

"Kleanrol."²⁸ Trademark for a soldering flux crystal based on zinc chloride and ammonium chloride.

"Klearol."⁴⁵ Trademark for a white mineral oil, technical grade. Sp. gr. 0.828–0.838.

Uses: Cosmetic preparations; shell egg preservation.

"Kleenup."²⁵³ Trademark for a type of insecticide and fungicide containing petroleum oils.

Klein's reagent. A saturated solution of cadmium borotungstate, formula variously given, possibly $2CdO \cdot B_2O_3 \cdot 9WO_3 \cdot 18H_2O$. Sp. gr. 3.28.

Hazard: Probably toxic.

Use: Separation of minerals by specific gravity.

"Klucel."²⁶⁶ Trademark for a hydroxypropyl cellulose (q.v.).

Properties: Water- and organo-soluble; thermoplastic; nontoxic; nonionic; surface-active.

Uses: Thickener, stabilizer, film-forming agent; binder.

knock. Ignition of a portion of the gasoline in the cylinder head due to spontaneous oxidation reactions rather than to the spark. It causes serious power loss, especially in high-compression engines. See also octane number.

Knoop hardness. See hardness.

Koch's acid. See 1-naphthylamine-3,6,8-trisulfonic acid.

"Kodaflex AD-2."²²⁴ Trademark for adhesion-promoting plasticizer for vinyl coatings.

"Kodar."¹¹⁴ Trademark for a thermoplastic polyester resin (1,4-cyclohexylenedimethylene terephthalate, isophthalate copolymer). It is made from terephthalic acid, isophthalic acid, and the glycol cyclohexylenedimethanol. Its main field of use is in so-called blister packaging, for which it is claimed to be superior to polyvinylchloride and polyethylene terephthalate. Available in clear-colored amorphous pellets. Complies with food packaging safety regulations, including meats and poultry.

"Kodel."¹¹⁴ Trademark for a polyester-type fiber.

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

kojic acid

[5-hydroxy-2-(hydroxymethyl)-4-pyrone] $C_6H_6O_4$.
An antibiotic.

Properties: Crystals; m.p. 152–154°C; soluble in water, acetone, alcohol; slightly soluble in ether; insoluble in benzene; mildly antibiotic.

Derivation: Fermentation of starches and sugars by certain molds.

Uses: Chemical intermediate; metal chelates; insecticide; antifungal and antimicrobial agent.

kola. See cola.

Kolbe-Schmidt reaction. The preparation of salicylic acid or its derivatives from carbon dioxide and sodium or potassium phenolate.

"Kolene" DGS Salt.⁵⁵⁷ Trademark for an anhydrous molten oxidizing salt bath using a sodium hydroxide base with additives necessary to provide controlled chemical oxidizing and dissolving properties.

Uses: Descaling of heat treat and hot work oxides and scales; deglazing (removal of glass drawing lubricants), investment, and silica removal; removal of burned-in carbon deposits; cleaning of oils, greases and organic materials from the surface of metals.

"Kolineum."¹¹ Trademark for a highly refined creosote obtained from coal tar by fractional distillation followed by refrigeration and filtration.

"Kollidon."⁴⁴⁰ Trademark for polyvinylpyrrolidone for the production of pharmaceuticals.

"Koloc."²⁴⁸ Trademark for a resin emulsion for application to cotton and wool. It stops the shrinking and felting of wool, increases tensile strength, improves wearing quality, reduces fiber loss in processing and service.

korax. Generic name for 1-chloro-1-nitropropane $ClCH_2CH(CH_3)NO_2$.

Properties: Liquid; b.p. 170.6°C (745 mm). Miscible with most organic solvents; slightly soluble in water. Flash point 144°F. Combustible.

Hazard: Toxic; strong irritant. Moderate fire risk. Tolerance, 20 ppm in air.

Use: Fungicide.

"Koreon."²⁹² Trademark for a group of one-bath chrome-tanning compounds, usually of the basic chromic sulfate type. Range of chromic oxide equivalence 23.5–25.5%; basicity range 33.0–59.0%. Soluble in water.

Containers: Dry: 75-lb paper bags; 231-lb fiber drums. Solution: 700-lb steel drums; tank trucks.

"Koresin."³⁰⁷ Trademark for a rubber tackifier; para-tert-butylphenol-acetylene resin; 100% active.

"Koresin."⁴⁴⁰ Trademark for condensation product of a substituted phenol and acetylene for improving the tackiness and processing properties of synthetic rubber mixes and blends of these with natural rubber.

"Korez."⁴¹ Trademark for a silica-filled, synthetic-resin, acid-proof cement of the phenol-formaldehyde type especially good as a mortar cement for electrorefining work. Can be used up to 360°F.

"Korlan."²³³ Trademark for O,O-dimethyl O-2,4,5-trichlorophenyl phosphorothioate. See ronnel.
Hazard: Toxic. See ronnel.
Use: Insecticide.

"Korundal XD."⁴⁴⁶ Trademark for a 90% alumina brick with high density. Resistant to corrosion and penetration by molten slags and fluxes, thermal

shock, and can withstand load at temperatures up to 3000°F and higher.

Uses: Top checker courses of glass tank furnaces; aluminum alloy furnaces; electric furnaces producing alloys.

"Kovar."³⁰⁸ Trademark for an iron-nickel-cobalt alloy (29% nickel, 17% cobalt, 53% iron, 1% minor ingredients). It has thermal expansion characteristics matching those of hard glass. Used for matched-expansion joints between metals and glass or ceramics. Sp. gr. 8.36; m.p. 1450°C.

Kr Symbol for krypton.

kraft paper. A strong and relatively cheap paper made chiefly from pine by digestion with a mixture of caustic soda, sodium sulfate, sodium carbonate and sodium sulfide. It is by far the largest volume paper made in U.S.

See also holopulping process.

"Kralac A-EP."²⁴⁸ Trademark for a high styrene-butadiene copolymer.

Use: With natural and chemical rubbers, especially recommended for high-grade soles, tiling and molded parts. Main function is that of greatly increasing the hardness of elastomeric compounds.

"Kralastic."²⁴⁸ Trademark for a series of ABS resins.

Properties: Granular rubber-plasticized resins; rigid and tough; dimensionally stable, light in weight; chemically resistant; good electrical resistance.

Uses: Injection and extrusion applications; chemical pipe; cathode edge strips; cams, gears, cable floats, wheels, etc.

"Kralon."²⁴⁸ Trademark for a series of rigid thermoplastic resin-rubber blends used for conduit and irrigation pipe, tool handles, automotive air ducts and other applications.

"Kraton" 101.¹²⁵ Trademark for a styrene-butadiene elastomer which requires no vulcanization while displaying most of the properties of conventional vulcanized polymers. White, free-flowing crumb; readily soluble in a large number of commercially used solvents. Used in pressure sensitive, wet lay-up and hot-melt adhesives, dip coating, spraying, and spreading applications.

Krebs cycle. See TCA cycle.

"Krene."²¹⁴ Trademark for flexible vinyl film and sheeting supplied in continuous roll form for packaging, laminations, seat covers, and shower curtains.

"Krenite" 10.²⁸ Trademark for a solution of urea and ammonium nitrate in aqueous ammonia; contains 43.5% nitrogen. Used in the manufacture of mixed fertilizers.

Containers: tank cars.

Kroll process. A widely used process for obtaining titanium metal. Titanium tetrachloride is reduced with magnesium metal at red heat and atmospheric pressure, in the presence of an inert gas blanket of helium or argon. Magnesium chloride and titanium metal are produced. The reaction is $TiCl_4 + 2Mg \rightarrow Ti + 2MgCl_2$. Essentially the same process is also used for obtaining zirconium.

"Kroma-Clor."³²⁹ Trademark for a turf fungicide with turf color whose active ingredients are mercuric dimethylthiocarbamate, potassium chromate, and cadmium succinate.

Hazard: Toxic by ingestion and inhalation.

"Kromarc."³⁰⁸ Trademark for a chromium-nickel steel containing manganese and molybdenum and small amounts of other additives which is readily formed and exhibits high strength and oxidation resistance at temperatures up to 1200°F. Chief applications are steam turbines and cryogenic equipment.

"Kromatherm."²⁹⁹ Trademark for high-temperature pigments designed for silicone- and fluorocarbon resin-based paint vehicles.

"Kromfax" Solvent."²¹⁴ Trademark for thiodiethylene glycol (q.v.).

"Kromik."¹⁴¹ Trademark for a multiple pigment rust-inhibiting primer for shop coatings or for first field coat on structural steel.

"Kromospere."⁷⁴ Trademark for a pigment dispersant to produce tinting pastes compatible with many aqueous and oil solutions.

"Kroniflex."⁵⁵ Trademark for a series of flame retardant phosphate plasticizers and autiform agents.

"Kronisol."⁵⁵ Trademark for a series of plasticizers.

"Kronitex."⁵⁵ Trademark for a series of synthetic phosphate esters to replace such natural products as tricresyl and cresyl diphenyl phosphates.
Uses: Flame-retardant plasticizers for vinyls; dust filter medium; gas additives; wood-treating chemical; foam control.

"Kryocide."²¹⁴ Trademark for a natural cryolite insecticide.

"Kryolith."²⁰⁴ Trademark for sodium fluoaluminate. See cryolite, synthetic.

krypton Kr Element of atomic number 36, noble gas group of the periodic system. Atomic weight 83.80; valence 2 (possibly others); has six stable isotopes and a number of artificially radioactive forms.

Properties: Colorless, odorless gas; b.p. -152.9°C (1 atm); f.p. -157.1°C; sp. gr. 2.818 (air = 1); sp. vol. 4.61 cu ft/lb (70°F, 1 atm); only slightly soluble in water. Known to combine with fluorine, at liquid nitrogen temperature, by means of electric discharges or ionizing radiation, to make KrF₂ and KrF₄. These compounds decompose at room temperature. Non-toxic; noncombustible. See noble gas.

Derivation: By fractional distillation of liquid air. Air contains 0.000108% of krypton, by volume.

Containers: Hermetically sealed glass flasks; steel containers.

Uses: Incandescent bulbs and fluorescent light tubes; lasers; high-speed photography.

Shipping regulations: (Air) Nonflammable gas label.

Note: Solid krypton exists, at cryogenic temperatures, as a white, crystalline substance, m.p. 116°K.

krypton 85. Radioactive krypton of mass number 85. Properties: Half-life 10.3 years; radiations, beta, with a small component of gamma. Low radiotoxicity. Derivation: A fission product extracted from irradiated nuclear fuel.

Forms available: Gas of high chemical purity, but mixed with other isotopes of krypton, in sealed glass flasks. See also kryptonates.

Uses: Activation of phosphors for self-luminous markers; detecting leaks; medicine, to trace blood flow.

krypton 86. Isotope of krypton used in measurement of standard meter (q.v.).

kryptonates. Materials impregnated with krypton-85 in such a way that the radioactive atoms are held within the crystal lattice structure. Elements, alloys, glasses, inorganic compounds, rubbers and plastics have been so impregnated with tracer atoms.

"Krytox."²⁸ Trademark for a series of hexafluoropropylene epoxide polymers of medium molecular weight, used as lubricating oils and greases. For use in high temperature or corrosive conditions; good chemical inertness, even with boiling sulfuric acid; low solubility in most solvents; good lubricity under load; nonflammable; have thermal stability up to 500°F.

"K-Stay."^{69,466} Trademark for mixture of oil-soluble sulfonic acid of high molecular weight in a petroleum base oil.

Properties: Amber liquid, sp. gr. 0.88-0.90; acid no. 1.0-1.1

Uses: Processing aid for elastomers.

"KT."²⁸⁰ Trademark for self-bonded silicon carbide shapes of very high density. Used for various purposes where resistance to high temperature and/or corrosive or erosive conditions is desired.

"KT-1060" and "KT-1061."⁴⁷⁵ Trademarks for tabular aluminas. A high purity aluminum oxide that has been converted to the corundum state. It will not fuse below 3600°F. Used in the manufacture of high temperature refractory bricks, castables and ramming mixes, in electrical insulators, and in many other high grade ceramic bodies.

KTPP. Abbreviation for potassium tripolyphosphate.

"Kuron."²¹¹ Trademark for a hormone-type weed and brush killer.

Kurroll's salt NaPO₃ (IV). A high temperature crystalline form of sodium metaphosphate (q.v.).

"Kutwell."⁵¹ Trademark for emulsifiable or soluble cutting oils consisting of good quality base mineral oils to which emulsifiers are added. Water emulsions are used as coolants in metal-cutting operations.

"Kydex."²¹ Trademark for a thermoforming acrylic-polyvinyl chloride alloy plastic sheet.

Uses: Housings, trays, covers, containers, protective guards and decorative parts exposed to severe service conditions.

"Kymene."²²² Trademark for a series of wet-strength resins.

557 and 709. Cationic, polyamide-epichlorohydrin resins with wet-strength development independent of papermaking pH.

882 and 917. Cationic, acid-curing, urea-formaldehyde resins.

"Kynol."²²⁰ Trademark for a flame-resistant fiber available as 1.5 inch staple, 1.7 denier. It is a cross-linked amorphous phenolic polymer, inert to all solvents and with fair resistance to oxidizing acids and strong alkalis. Will not ignite up to 2500°C, but will char slowly at 500°F. Potential uses are as abla-

tive agent in spacecraft, flameproof apparel, protective clothing, etc.

"Kyro AC."⁴⁸⁷ Trademark for a modified amine condensate surfactant.

Properties: An amber colored, free-flowing liquid with a cloud point of approximately 50°F.

Uses: As a detergent, emulsifier and dispersing agent in textile applications.

"Kyro EOB."⁴⁸⁷ Trademark for a neutral nonionic surfactant of the 100% ethoxylated alcohol type.

Properties: Water-white liquid readily soluble in hot or cool water. Liquid in all concentrations except about 50%, at which level it forms a gel at room temperature and lower.

Uses: A moderate sudsing nonionic for use where excessive foaming may be objectionable.

L

l Abbreviation for liter.

l- Prefix indicating that a compound is levorotatory. A minus sign (−) is now preferred.

l. Prefix indicating the left-handed enantiomer of an optical isomer. See also D.

"L-26."³⁰⁴ Trademark for the normal lead salt of 2-ethylhexoic acid. Straw-colored viscous liquid; soluble in many common organic solvents; stable at comparatively high temperatures. Used as a curing agent for silicone paints and insulating varnishes.

La Symbol for lanthanum.

labile. Descriptive of a substance that is inactivated by high temperature or radiation, e.g., a heat-labile vitamin; unstable.

laboratory conditions. An ideal set of conditions in which all variant factors except the one under test can be held constant, as for example, rooms provided with constant temperature and humidity control, clean rooms, and the like. Less specifically, the term refers to experimental or small batch conditions, as opposed to large-scale production.

label. (1) A printed notice attached to or stamped on an article held for sale or delivery or offered for transportation. Special labels are legally required for toxic and flammable products and certain food products by the Dept. of Agriculture, the Federal Trade Commission, and the Food and Drug Administration. Transportation warning labels are prescribed by the Hazardous Materials Regulation Board of the Dept. of Transportation (DOT) for rail, water, and truck shipment (the Coast Guard is an agency of DOT), and by the International Air Transport Association for airplane shipment (applied in the U.S. by the Federal Aviation Administration). The transportation labels used are:

	DOT	IATA
Flammable solids	Yellow	Flammablesolid
Flammable liquids	Red	Flammable liquid
Oxidizing material	Yellow	Oxidizer
Corrosive material	White	Corrosive
Flammable gas	Red gas	Flammable gas
Nonflammable compressed gas	Green	Nonflammable compressed gas
Poisonous solids and liquids	Poison	Poison
Explosive materials	Explosive	Explosive
Radioactive material	Radioactive	Radioactive

Many hazardous materials are required to carry warning labels for safe handling, storage, and in-plant movement.

The Manufacturing Chemists Association issues instructions for preparation of warning labels in its publication "Guide to Precautionary Labeling of Hazardous Chemicals." See also hazardous material; toxic material; flammable material.

(2) A radioactive isotope or fluorescent dye added to a chemical compound to trace its course and behavior through a series of reactions, usually in living organisms. This technique has also been used in frictional wear of moving parts in automotive engines. See also tracer; tagged compound.

laccase. An enzyme that oxidizes phenols to ortho- and para-quinones. It occurs in the latex of the lac tree, in potatoes, sugar beets, apples, cabbages and other plants.

lac dye. A brilliant red dye obtained by maceration of crude lac. See shellac.

lachrymator (lacrimator). A gas that is strongly irritant to the eyes; tear gas.

lactoid (resorcinol blue) $(HO)_2C_6H_3N[C_6H_2(OH)_3]_2$. Properties: Lustrous, dark-violet, crystalline scales. Soluble in alcohol, ether, acetone, phenol, and glacial acetic acid; slightly soluble in water; pH 4.4–6.2. Derivation: From resorcinol by treatment with sodium nitrite.

Use: Indicator in analytical chemistry.

"Lacolene."⁴⁵⁷ Trademark for aliphatic petroleum naphthas; used in nitrocellulose lacquer formulations, in printing and roto types of inks. Distillation range (ASTM D86-59) 195–275°F.

lacquer. A protective or decorative coating that dries primarily by evaporation of solvent, rather than by oxidation or polymerization. Lacquers were originally comprised of high-viscosity nitrocellulose, a plasticizer (dibutyl phthalate or blown castor oil), and a solvent. Later, low-viscosity nitrocellulose became available; this was frequently modified with resins such as ester gum or rosin. The solvents used are ethyl alcohol, toluene, xylene, and butyl acetate. Modern automotive lacquers are characterized by their exceptionally high drying rate, a fact which did much to make possible the large-scale production of automobiles in the twenties. Together with nitrocellulose, alkyd resins are used to improve durability. The nitrocellulose (q.v.) used for lacquers has a nitrogen content of 11 to 13.5%, and is available in a wide range of viscosities, compatibilities, and solvencies. Chief uses of nitrocellulose-alkyd lacquers is for coatings for metal, paper products, textiles, plastics, furniture, and nail polish. Various types of modified cellulose are also used as lacquer bases, combined with resins and plasticizers. Many non-cellulosic materials, such as vinyl and acrylic resins, have been introduced in recent years. Bitumens are also used in lacquers, with or without drying oils, resins, etc. See also nitrocellulose.

Hazard: Flammable, dangerous fire and explosion risk.

Shipping regulations: (Lacquer base or chips, dry) (Rail) Yellow label. (Air) Flammable Solid label. (Lacquer base or chips, plastic, wet with alcohol or solvent) (Rail) Red label (Air) Flammable Liquid label

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

- lactalbumin.** A component of skim milk protein (2 to 5%). Can be crystallized. Exact function is not known, but probably aids in stabilization of the fat particles. See also milk.
- lactam.** A cyclic amide produced from amino acids by the removal of one molecule of water. An example is caprolactam (q.v.), $\text{CH}_2(\text{CH}_2)_4\text{CONH}$, derived from epsilon-aminocaproic acid, $\text{NH}_2(\text{CH}_2)_5\text{COOH}$.
- lactase.** An enzyme present in intestinal juices and mucosa which catalyzes the production of glucose and galactose from lactose.
Use: Biochemical research.
- lactic acid** (alpha-hydroxypropionic acid; milk acid) $\text{CH}_3\text{CHOHCOOH}$. (For isomeric structure, see under asymmetry).
Properties: Colorless or yellowish, odorless, hygroscopic syrupy liquid. B.p. (15 mm) 122°C ; m.p. 18°C ; sp. gr. 1.2. Miscible with water, alcohol, glycerin; soluble in ether; insoluble in chloroform, petroleum ether, carbon disulfide. Cannot be distilled at atmospheric pressure without decomposition; when concentrated above 50%, it is partially converted to lactic anhydride. It has one asymmetric carbon and two enantiomeric isomers. The commercial form is a racemic mixture.
Derivation: (a) By fermenting starch, milk whey, molasses, potatoes, etc. and neutralizing the acid as soon as formed with calcium or zinc carbonate. The solution of lactates is concentrated and decomposed with sulfuric acid; (b) synthetically by hydrolysis of lactonitrile (q.v.).
Grades: Technical, 22% and 44%; food, 50 to 80%; plastic, 50 to 80%; U.S.P. (85-90%); C.P.; F.C.C.
Containers: Barrels; carboys; drums; tank trucks.
Uses: Cultured dairy products; as acidulant; flavoring; preservative; chemicals (salts, plasticizers, adhesives, pharmaceuticals).
- lactic acid dehydrogenase.** An enzyme found in animal tissues and yeast which takes part in controlling carbohydrate metabolism in the cell.
Use: Biochemical research.
- lactogenic hormone.** See luteotropin.
- lactoglobulin.** A protein occurring in milk. It comprises from 7 to 12% of the skim milk protein, and is closely associated with casein.
- "Lactol."**¹⁰⁶ Trademark for a solvent naphtha. An aliphatic naphtha in the toluene evaporation range.
- lactone.** An inner ester of a carboxylic acid, formed by intramolecular reaction of hydroxylated or halogenated carboxylic acids, with elimination of water. They occur in nature as odor-bearing components of various plant products; also made synthetically. See butyrolactone; propiolactone.
- lactonitrile** (alpha-hydroxypropionitrile; acetaldehyde cyanohydrin) CH_3CHOHCN .
Properties: Straw-colored liquid, acid to methyl red; f.p. -40°C ; b.p. $182-184^\circ\text{C}$ (slight decomposition); sp. gr. 0.9919 (18.4°C); refractive index (18.4/D) 1.4058. Soluble in water and alcohol. Insoluble in petroleum ether and carbon disulfide. Flash point 170°F . Combustible.
Derivation: Acetaldehyde and hydrocyanic acid.
Grades: Technical; 95-97% purity.
Containers: Carboys.
Hazard: Evolves hydrocyanic acid in presence of alkali.
Uses: Solvent; intermediate in production of ethyl lactate and lactic acid.
- lactose** (milk sugar; saccharum lactis) $\text{C}_{12}\text{H}_{22}\text{O}_{11} \cdot \text{H}_2\text{O}$.
Properties: White, hard, crystalline mass or white powder; sweet taste, odorless. Stable in air. Soluble in water; insoluble in ether and chloroform; very slightly soluble in alcohol. Sp. gr. 1.525; m.p. decomposes at 203.5°C . Nontoxic.
Derivation: From whey, by concentration and crystallization. Cows' milk contains about 5% lactose.
Grades: Crude; fermentation; spray-dried; edible; U.S.P.
Uses: Pharmacy; infant foods; bacteriology; baking and confectionery; margarine and butter manufacture; manufacture of penicillin, yeast, edible protein, and riboflavin.
- lac wax.** A wax obtained from lac consisting of myricyl and ceryl alcohols, free and combined with various fatty acids. Combustible; nontoxic.
- LAD.** Abbreviation for lithium aluminum deuteride (q.v.).
- ladder polymer.** An ordered molecular network of double-stranded chains connected by hydrogen or chemical bonds located at regular intervals along the chains. Many complex proteins, including DNA, are of this nature.
- LAH.** Abbreviation for lithium aluminum hydride.
- lake.** An organic pigment produced by the interaction of an oil-soluble organic dye, a precipitant, and an absorptive inorganic substrate. Insoluble in water. Poor light-fastness makes them unsuitable for use in exterior paints.
Uses: Printing inks; wallpaper inks; metal decorative coatings; coated fabrics; rubber; plastics; food colorants.
See also toner; alizarin; madder lake.
- Lake Red C.** Red pigments made by coupling 2-chloro-5-aminotoluene-4-sulfonic acid with beta-naphthol and forming various metal salts.
Properties: Good resistance to bleeding; reasonable light resistance, good transparency; produces inks with good flow.
Grades: Resinated and non-resinated.
Uses: General purpose color for letterpress, gravure, flexographic, moisture set, heat set inks; specially for offset printing inks.
- Lake Red C Amine.** See 5-amino-2-chlorotoluene-4-sulfonic acid.
- "Laktane."**⁵¹ Trademark for a solvent especially prepared for use as lacquer diluent and in rotogravure printing inks. Its boiling range is typically $218-228^\circ\text{F}$.
- "Lambast."**⁵⁸ Trademark for a contact herbicide containing 25.5% 2,4-bis(3-methoxypropylamino)-6-methylthio-s-triazine $[\text{CH}_3\text{O}(\text{CH}_2)_3\text{NH}]_2\text{C}_3\text{N}_3\text{SCH}_3$.
Properties: White solid; m.p. 55°C . Insoluble in water; slightly soluble in ethanol; very soluble in acetone and benzene.
- lamepon.** An acetylated peptide used as a surface-active agent.
- "Laminac."**⁵⁷ Trademark for a proprietary grade of polyester resin used mainly in the manufacture of reinforced plastics. Most widely used reinforcement is glass fiber. Typical products fabricated include speedboats, radomes, tanks for water and chemical storage, and sports car bodies.
- laminated.** A composite (q.v.) made of any one of several types of thermosetting plastic (phenolic, polyester, epoxy, or silicone) bonded to paper, cloth,

asbestos, wood, or glass fiber. High tensile and dielectric strength, and low moisture absorption are characteristic of these products. Available as sheet, rod, or tubing in mechanical, electrical and general-purpose grades (National Electrical Mfrs. Assn.). Plywood is composed of a veneer, with grain oriented at a 90° angle on successive layers, and bonded with a thermosetting adhesive of the urea or phenol-formaldehyde type to give a high strength, dimensionally stable, weather-resistant construction material. It can be made non-flammable by treatment with salt solution. Polyvinyl butyral sheet is used in safety glass. (See also reinforced plastic).

lampblack. A black or gray pigment made by burning low-grade heavy oils or similar carbonaceous materials with insufficient air, and in a closed system such that the soot can be collected in settling chambers. Properties are markedly different from carbon black. Strongly hydrophobic. Nonflammable.

Uses: Black pigment for cements, ceramic ware, mortar, inks, linoleum, surface coatings, crayons, polishes, carbon paper, soap, etc.; ingredient of insulating compositions, liquid-air explosives, matches, fertilizers, furnace lutes, lubricating compositions; carbon brushes; reagent in cementation of steel.

See also carbon black.

"Lanacid" C.⁴⁶⁰ Trademark for crude lanolin fatty acids consisting of normal branched and hydroxy acids. A light tan, plastic waxy solid.

Uses: Polishes, cleaners; paints; inks; floor waxes; intermediate for heavy-metal soaps; greases; leather specialties.

"Lanacron."⁴⁴³ Trademark for metal-complex dyes for wool and polyamide fibers.

"Lanamid."²⁴¹ Trademark for neutral-dyeing, premetallized dyes.

"Lanaset."⁵⁷ Trademark for a melamine-formaldehyde resin applied to woven and knitted wool fabrics to control wool shrinkage and felting.

langbeinite $K_2Mg_2(SO_4)_6$. A natural sulfate of potassium and magnesium, found in salt deposits.

Properties: Colorless, yellowish, reddish, greenish; luster vitreous; Mohs hardness 3.5–4; sp. gr. 2.83.

Occurrence: New Mexico, Germany, India.

Use: Source of potash.

Langmuir, I. (1881–1957). A brilliant American physical chemist who was awarded the Nobel Prize in 1932 for his fundamental research in surface chemistry, especially monomolecular films. This led to development of modern knowledge of emulsification and detergency. Langmuir also investigated electrical discharges in gases and did pioneer work on cloud-seeding techniques.

lanital. A regenerated protein fiber developed in Italy. The protein used most successfully is casein. It is subject to attack by microorganisms to about the same extent as wool, for which it was designed as a substitute.

"Lanitol."¹³³ Trademark for a group of alkylarylsulfonate type detergents.

A: Liquid biodegradable type.

F: Flake, sodium salt.

CW: Powder; same as flake, plus alkaline builders.

"Lanole B."¹³² Trademark for a blend of sodium oleate and solvents. Amber colored liquid which dis-

perses in water at all temperatures. Used as a scouring agent for the removal of tar, grease, and paint from woolen textile fabrics.

lanolin.

Properties: (Hydrous): Yellowish to gray semisolid containing from 25 to 30% water; slight odor. (Anhydrous): Brownish-yellow semisolid containing no more than 0.25% water, but can be mixed with about twice its weight of water without separation.

Derivation: Purification of degrass, a crude grease obtained by solvent-treatment of wool. Contains cholesterol esters of higher fatty acids. Hydrogenated, ethoxylated and acetylated derivatives are available.

Grades: Technical; cosmetic; U.S.P.

Containers: Drums; tubs.

Uses: Ointments; leather finishing; soaps; face creams; facial tissues; hair-set and suntan preparations.

See also degrass.

lanosterol (ischolesterol) $C_{30}H_{50}O$. An unsaturated sterol closely related to cholesterol; m.p. 139–140°C; optically active crystals.

"Lanoxin."³⁰¹ Trademark for preparations of digoxin (q.v.).

lanthana. See lanthanum oxide.

lanthanide series (lanthanoid series). The rare earth series of elements, atomic numbers 58 through 71. See also rare earth metal.

lanthanum La Element of atomic number 57; group IIIB of the periodic table; a rare earth of the cerium group. Atomic weight 138.905; valence 3. Two stable isotopes.

Properties: White, malleable, ductile metal; oxidizes rapidly in air. Sp. gr. 6.18–6.19; m.p. 920°C; b.p. 3454°C; corrodes in moist air; soluble in acids; decomposes water to lanthanum hydroxide and hydrogen. Superconducting below 6°K.

Derivation: By cracking of monazite or bastnasite ores with conc. sulfuric acid and subsequent separation.

Forms available: Ingots; rods; 20-mil sheets; powdered 99.9% pure.

Hazard: Ignites spontaneously in powdered form.

Uses: Lanthanum salts; electronic devices; pyrophoric alloys; rocket propellants; reducing agent catalyst for conversion of nitrogen oxides to nitrogen in exhaust gases (usually in combination with cobalt, lead, or other metals); phosphors in x-ray screens.

See also rare-earth metal.

lanthanum acetate $La(C_2H_3O_2)_3 \cdot xH_2O$.

Properties: White powder, soluble in water. Purities up to 99.9+%. Soluble in acids.

lanthanum ammonium nitrate $La(NO_3)_3 \cdot 6H_2O \cdot 2NH_4NO_3 \cdot 4H_2O$.

Properties: Colorless crystals; soluble in water.

Grade: Purities to 99.9+%.

Hazard: Explosion and fire risk.

Shipping regulations: Nitrates, n.o.s. (Rail) Yellow label. (Air) Oxidizer label.

lanthanum antimonide LaSb. A binary semiconductor.

lanthanum arsenide LaAs. Made in high purity for use as a binary semiconductor.

Hazard: Highly toxic.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

lanthanum carbonate $\text{La}_2(\text{CO}_3)_3 \cdot 8\text{H}_2\text{O}$.

Properties: White powder; insoluble in water; soluble in acids. Sp. gr. 2.6.

Grades: Up to 99.9+% La salts.

Containers: Glass bottles, fiber drums.

lanthanum chloranilate $\text{La}_2(\text{O} \cdot \text{C}_6\text{Cl}_2\text{O}_2 \cdot \text{O})_3 \cdot n\text{H}_2\text{O}$.

Used as a reagent for fluoride determination.

lanthanum chloride $\text{LaCl}_3 \cdot 7\text{H}_2\text{O}$.

Properties: White crystals; transparent; hygroscopic; m.p. (hydrate) 91°C (dec); (for anhydrous) sp. gr. 3.842 (25°C); m.p. 872°C. Soluble in alcohol, water; acids.

Derivation: Treatment of lanthanum carbonates or oxides with hydrochloric acid in an atmosphere of dry hydrogen chloride.

Grades: Purities to 99.9+%. Single crystals available.

Containers: Glass bottles, fiber drums.

Hazard: Moderately toxic.

Use: Anhydrous trichloride of rare-earth metal is often used to prepare the metal.

lanthanum fluoride LaF_3 .

Properties: White powder, insoluble in water, acids.

Grades: Purities up to 99.9+%. Single crystals available.

Containers: Glass bottles, fiber drums.

Hazard: Toxic by ingestion.

Uses: Phosphor lamp coating (gallium arsenide solid-state lamp); carbon arc electrodes; lasers.

lanthanum nitrate $\text{La}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals; hygroscopic. B.p. 126°C; m.p. 40°C. Soluble in alcohol, water, acids.

Grades: Purities to 99.9+%.

Containers: Glass bottles, fiber drums.

Hazard: Explosion and fire risk; moderately toxic.

Uses: Antiseptic; gas mantles.

Shipping regulations: Nitrates, n.os., (Rail) Yellow label. (Air) Oxidizer label.

lanthanum oxalate $\text{La}_2(\text{C}_2\text{O}_4)_3 \cdot 9\text{H}_2\text{O}$.

Properties: White powder, insoluble in water; soluble in acids.

Grades: Purities to 99.9+%.

Containers: Glass bottles, fiber drums.

lanthanum oxide (lanthana; lanthanum trioxide; lanthanum sesquioxide) La_2O_3 .

Properties: White or buff amorphous powder; sp. gr. 6.51 (15°C); m.p. 2315°C; b.p. 4200°C. Soluble in acids; insoluble in water.

Derivation: Ignition of hydroxide or oxyacid (oxalate, sulfate, nitrate, etc.); direct combustion of free metal (burns with brilliant, white light).

Grades: Purities to 99.9+%.

Containers: Boxes, glass bottles, fiber drums.

Uses: Calcium lights; optical glass; technical ceramics; cores for carbon-arc electrodes; fluorescent phosphors; refractories.

lanthanum phosphide LaP . Made in high purity for use as a binary semiconductor.**lanthanum sesquioxide**. See lanthanum oxide.**lanthanum sulfate** $\text{La}_2(\text{SO}_4)_3 \cdot 9\text{H}_2\text{O}$.

Properties: White crystals. Sp. gr. 2.821; refractive index (n 20/D) 1.564; insoluble in alcohol; slightly soluble in water, acids.

Derivation: By dissolving hydroxide, carbonate or oxide in dilute sulfuric acid.

Grades: Purities to 99.9+%.

Containers: Glass bottles, fiber drums.

Use: The sulfates of the rare-earth elements are

often used for atomic weight determination of the element.

lanthanum trioxide. See lanthanum oxide.**lanthionine** $\text{S}(\text{CH}_2\text{CHNH}_2\text{COOH})_2$. A non-essential amino acid first obtained from deaminated wool.

"**Lanum**."¹²³ Trademark for purified wool fat prepared for medicinal and pharmaceutical use.

lard. Purified internal fat of the hog.

Properties: Soft, white unctuous mass, faint odor, bland taste. Soluble in ether, chloroform, light petroleum hydrocarbons, carbon disulfide, insoluble in water. M.p. 36–42°C. High in saturated fats. Combustible; nontoxic.

Chief constituents: Stearin, palmitin, olein.

Uses: Cooking; pharmacy (ointments, cerates); perfumery (pomades); source of lard oil.

lard oil.

Properties: Colorless or yellowish liquid; peculiar odor and bland taste. Soluble in benzene, ether, chloroform, and carbon disulfide; slightly soluble in alcohol. M.p. –2°C; refractive index (20/D) 1.470; sp. gr. 0.915; saponification value 195–196; iodine value 56–74. Subject to spontaneous heating. Combustible. Nontoxic. Flash point 420°F. Autoignition temp. 883°F.

Chief constituents: Olein, with a small percentage of the glycerides of solid fatty acids.

Derivation: By cold-pressing lard.

Grades: Prime winter edible; prime winter inedible; antibiotic; off prime; extra no. 1; no. 1; no. 2.

Containers: Drums; tank cars; tank wagons.

Uses: Lubricant; metal cutting compounds; oiling wool; soap manufacture; antibiotic fermentation.

"**Larex**."¹⁵² Trademark for a series of nine grades of lard oil.

Uses: Sulfonating, sulfurizing, cutting oils, textile lubricant, nutrient and defoamer for antibiotic fermentations.

"**Laromin**."⁴⁴⁰ Trademark for polyamines for epoxy resins.

"**Larvacide**."⁴⁰¹ Trademark for various products containing chloropicrin.

15. A liquid fumigant containing chloropicrin (15%), carbon tetrachloride, and carbon disulfide.

100. Commercially pure chloropicrin.

70 Aerosol. An aerosol fumigant containing 70% chloropicrin.

85 Aerosol. A fumigant aerosol containing chloropicrin (85%) and methyl chloride (15%).

Soil Fumigant. A pre-plant soil fumigant containing chloropicrin (93.5%) and ethylene dibromide (6.5%).

LAS. See alkyl sulfonate, linear.

laser. A device which produces a beam of coherent or monochromatic light as a result of photon-stimulated emission. Such beams have extremely high energy, as they consist of a single wavelength and frequency. Materials capable of producing this effect are certain high-purity crystals (ruby, yttrium garnet, and metallic tungstates or molybdates doped with rare-earth ions); semiconductors such as gallium arsenide; neodymium-doped glass; various gases, including carbon dioxide, helium, argon, and neon; and plasmas. A chemical laser is one in which the excitation energy is furnished by a chemical reaction, e.g., $\text{H} + \text{Cl}_2 \rightarrow \text{HCl}(\text{active}) + \text{Cl}$; or combustion of carbon monoxide to form excited carbon dioxide.

Hazard: Laser radiation can irreparably damage the eyes. Proper shielding is essential at all times.

Uses: Laser beams are used in industry for cutting diamonds for wire-drawing dies, in flash photolysis, spectroscopy and photography. They also have developing applications in medicine and surgery. In research they are being studied as a possible initiator for controlled fusion reactions and for biomedical investigations. It is also possible to increase the abundance of certain isotopes of such elements as uranium, chlorine and boron by use of laser irradiation. Research on uranium enrichment by this method has been under way for several years. See also fusion (2); enrichment.

LATB. See lithium aluminum tri-tert-butoxyhydride.

latent heat. The quantity of energy in calories per gram absorbed or given off as a substance undergoes a change of state, that is, as it changes from liquid to solid (freezes), from solid to liquid (melts), from liquid to vapor (boils), or from vapor to liquid (condenses). No change in temperature occurs. Water has unusually high latent heat values: the latent heat of fusion (melting) of ice is 80 cal per gram, and the latent heat of condensation of steam (latent heat of vaporization of water) is 540 cal. per gram. The considerable energy delivered by steam condensation is utilized for power generation and for heating a variety of chemical plant equipment (dryers, evaporators, reactors and distillation columns). See also evaporation; heat.

latent solvent. See solvent, latent.

laterite. A low-grade ore similar to bauxite, but containing only half as much aluminum oxide. Possible substitute for bauxite.

latex. A white, free-flowing liquid, obtained from some species of shrubs or trees, in which microscopically small particles or globules of natural rubber are suspended in a watery serum. Natural rubber latex, obtained from the tree *Hevea Braziliensis*, contains about 60% water, 35% rubber hydrocarbon, and 5% proteins and other substances. Coagulation is prevented by protective colloids, but can be induced by addition of acetic or formic acid. Synthetic latexes include polystyrene, SBR rubber, neoprene, polyvinyl cyloride, etc. Both natural and synthetic latexes are available in vulcanized form (see "Vultex"). The function of latex in the plant is not known. Nonflammable.

Containers: Steel drums; tank cars.

Grades: Regular; concentrated.

Hazard: Dangerous to ingest, as coagulation will occur internally.

Uses: Thin rubber products (surgeons' gloves, drug sundries); girdles, pillows, etc.; emulsion paints; adhesives; tire cord coating.

latex paint. See paint, emulsion.

"Lanthanol" LAL.²⁴¹ Trademark for a highly refined sodium "lauryl" sulfoacetate; a biodegradable organic detergent possessing wetting, scouring, emulsifying and dispersing properties; a foaming agent.

Properties: White, dry powder; pH 6.9-7.1 in 0.25% water solution; stable to hard water, stable to acid and alkali in a pH range of 5.0-8.5, solubility in water solution 1% at 25°C, 25% at 100°C, hygroscopic; sp. gr. 0.55; pleasant odor. Nontoxic. Tasteless.

Uses: Tooth pastes; tooth powders; liquid dentrifices; foaming bath salts; shampoos; synthetic detergents.

"Laticrete."²⁴⁸ Trademark for a latex-based surfacing compound, a "flexible concrete" combining the resilient and long-wearing properties of rubber with the structural characteristics of concrete repairing; highways; playgrounds, tennis courts, etc.

lattice. (1) The structural arrangement of atoms in a crystal. Accurate information is obtained by x-rays, which are diffracted by the lattice at various angles. As the atoms are from 1.5 to 3 angstrom units apart in most crystals, the lattice acts as a diffraction grating. See also crystal; dislocation.

(2) The array of nuclear fuel elements and moderator in a nuclear reactor.

"Latyl."²⁸ Trademark for a group of disperse dyes developed particularly for coloration of "Dacron" polyester fiber, on which they have exceptionally good light and wet fastness properties.

laudanidine (levo-laudanine; tritopine) $C_{20}H_{23}O_4N$. An alkaloid.

Properties: White crystals; m.p. 182-185°C; insoluble in water; soluble in alcohol, benzene, chloroform and slightly soluble in ether.

Derivation: From opium.

Use: Medicine.

laudanum. A tincture of opium.

Hazard: Highly toxic by ingestion and inhalation.

Use: Medicine.

laughing gas. See nitrous oxide.

laundry sour. See sour.

lauraldehyde. See lauryl aldehyde.

Laurent's acid. See 1-naphthylamine-5-sulfonic acid.

"Laurex."²⁴⁴ Trademark for the zinc salts of a mixture of fatty acids in which lauric acid predominates. **Properties:** Yellowish white granulated waxy powder; sp. gr. 1.15; m.p. 95-105°C; soluble in benzene; insoluble in acetone, gasoline, ethylene dichloride, and water. Combustible; nontoxic.

Uses: Accelerator activator and plasticizer for rubber.

lauric acid (dodecanoic acid) $CH_3(CH_2)_{10}COOH$. A fatty acid occurring in many vegetable fats as the glyceride, especially in coconut oil and laurel oil. Combustible; low toxicity.

Properties: Colorless needles; sp. gr. 0.833; m.p. 44°C; b.p. 225°C (100 mm); refractive index 1.4323 (n_D 45); insoluble in water, soluble in alcohol and ether.

Derivation: Fractional distillation of mixed coconut or other acids.

Grades: 99.8% pure; technical; F.C.C.

Containers: 55-gal drums, tank cars.

Uses: Alkyd resins; wetting agents; soaps; detergents; cosmetics; insecticides; food additives.

lauric aldehyde. See lauryl aldehyde.

"Laurine."²² Trademark for hydroxycitronellal (q.v.)

laurone. An aliphatic ketone, insoluble in water; stable to high temperatures, acids, alkalis. Compatible with high-melting vegetable waxes, fatty acids, paraffins, etc. Incompatible with resins, polymers, and organic solvents at room temperature, but compatible with them at high temperature. Used as antiblock agent.

N-lauroyl-para-aminophenol

Properties: White to off-white powder; m.p. 123–126°C. Insoluble in water; soluble in polar organic solvents (especially when heated) including alcohol, acetone, and dimethylformamide.

Use: Rubber antioxidant.

lauroyl chloride $\text{C}_{11}\text{H}_{23}\text{COCl}$.

Properties: Water-white liquid; refractive index 1.445 (20°C); f.p. -17°C; b.p. 145°C (18 mm); decomposes in water and alcohol; soluble in ether.

Containers: 13-gal carboys; drums.

Uses: Surfactant, polymerization initiator, antienzyme agent, foamer; synthesis of lauroyl peroxide, sodium N-lauroyl sarcosinate and other sarcosinates.

lauroyl peroxide (dodecanoyl peroxide) $(\text{C}_{11}\text{H}_{23}\text{CO})\text{O}_2$.

Properties: White, coarse powder; tasteless; faint odor; soluble in oils and in most organic solvents; slightly soluble in alcohols; insoluble in water; m.p. 49°C.

Grades: Technical (about 95%).

Hazard: Toxic by ingestion and inhalation; strong irritant to skin. Dangerous fire and explosion risk; will ignite organic materials. Strong oxidizing material.

Uses: Bleaching agent, intermediate and drying agent for fats, oils, and waxes; polymerization catalyst.

Shipping regulations: (Rail) Yellow label. (Air) Organic Peroxide label.

N-lauroylsarcosine $\text{CH}_3(\text{CH}_2)_{10}\text{CON}(\text{CH}_3)\text{CH}_2\text{COOH}$.

Properties: White solid; m.p. 31–35°C; sp. gr. 0.970.

Containers: Drums; tank cars and trucks.

Uses: Surfactant, antienzyme, in cosmetics and pharmaceuticals. Also used in form of sodium N-lauroylsarcosinate.

lauryl acetate. See dodecyl acetate.**lauryl alcohol** (alcohol C-12; n-dodecanol; dodecyl alcohol) $\text{CH}_3(\text{CH}_2)_{10}\text{CH}_2\text{OH}$.

Properties: Colorless solid; floral odor; sp. gr. 0.830–0.836; refractive index 1.428; m.p. 24°C; b.p. 259°C. Insoluble in water. Soluble in 2 parts of 70% alcohol. Flash point (C.C.) > 212°F. Combustible; low toxicity.

Derivation: Reduction of coconut oil fatty acids.

Grades: Technical; F.C.C.

Containers: 55-gal drums; 8000-gal tank cars.

Uses: Synthetic detergents; lube additives; pharmaceuticals; rubber; textiles; perfumes; flavoring agent.

lauryl aldehyde (lauric aldehyde; dodecyl aldehyde; aldehyde C-12 lauric; dodecanal; lauraldehyde) $\text{CH}_3(\text{CH}_2)_{10}\text{CHO}$.

Properties: Colorless solid or liquid; strong fatty floral odor; sp. gr. 0.828–0.836; refractive index 1.433–1.440; m.p. 44°C. Soluble in 90% alcohol; insoluble in water. Combustible; low toxicity.

Grades: Technical; F.C.C.

Uses: Perfumery; flavoring agent.

lauryl bromide (n-dodecyl bromide; 1-bromododecane) $\text{C}_{12}\text{H}_{25}\text{Br}$.

Properties: Amber liquid with coconut odor and low volatility. Sp. gr. 1.026 (25/25°C); boiling range (5–95% at 45 mm) 151–208°C; f.p. -15.5°C. Flash point 291°F. Combustible.

Grade: Technical, approx. 60% pure.

Derivation: Coconut oil.

Use: Intermediate for quaternary ammonium compounds, organometallics and vinyl stabilizers.

lauryl chloride. Commercially, a mixture of n-alkyl chlorides, with $\text{C}_{12}\text{H}_{25}\text{Cl}$ dominant. A clear, water-white, oily liquid, with a faint fatty odor. Com-

pletely miscible with most organic solvents; slightly miscible with alcohol; immiscible with water.

Properties: Sp. gr. 0.863 (15.5/15.5°C); crystallization point -19°C; distillation range 112–160°C (5 mm); flash point 235°F; combustible. Low toxicity.

Grades: Refined; technical.

Containers: Drums; tank cars.

Uses: Synthesis of esters, sulfides, lauryl mercaptan (used in styrene-butadiene polymerization), other organics.

lauryldimethylamine $\text{CH}_3(\text{CH}_2)_{11}\text{N}(\text{CH}_3)_2$. A liquid cationic detergent.

Uses: Corrosion inhibitor; acid-stable emulsifier.

lauryldimethylamine oxide $\text{CH}_3(\text{CH}_2)_{11}\text{N}(\text{CH}_3)_2 \cdot \text{H}_2\text{O}$.

A nonionic detergent, used as a foam stabilizer; stable at high concentrations of electrolytes and over a wide pH range.

lauryl lactate. See "Ceraphyl" 31.**lauryl mercaptan** (n-dodecyl mercaptan) $\text{C}_{12}\text{H}_{25}\text{SH}$ (approx.).

Properties (technical material, mixture of isomers): Water-white or pale-yellow liquid; mild odor; sp. gr. 0.85 (20/20°C); f.p. -7.5°C; distillation range 200–235°C; refractive index 1.45–1.47; insoluble in water; soluble in methanol, ether, acetone, benzene, gasoline, and ethyl acetate. Flash point 210°F. Combustible.

Grades: 95% min.

Containers: Steel drums; carboys; tank cars.

Hazard: May be injurious to eyes.

Use: Manufacture of synthetic rubber and plastics, also in the synthesis of pharmaceuticals, and in insecticides and fungicides; nonionic detergent.

See also thiol.

lauryl methacrylate $\text{CH}_2=\text{C}(\text{CH}_3)\text{COO}(\text{CH}_2)_{11}\text{CH}_3$. The commercial material is a mixture, containing also lower and higher fatty derivatives.

Boiling range 272–344°C; density 0.868 g/ml; flash point 270°F (COC). Combustible. Probably low toxicity.

Containers: Drums.

Uses: Polymerizable monomer for plastics, molding powders, solvent coatings, adhesives, oil additives; emulsions for textile, leather, and paper finishing. See also acrylic resin.

lauryl pyridinium chloride $\text{C}_5\text{H}_5\text{NCl}(\text{C}_{12}\text{H}_{25})$.

Properties: Mottled tan semisolid. Soluble in water and organic solvents. Flash point 347°F; combustible.

Grade: Technical, contains higher and lower fatty acid derivatives.

Uses: Cationic detergent; dispersing and wetting agent; ingredient of fungicides and bactericides.

lauryl pyridinium 5-chloro-2-benzothiazyl sulfide. See "Vancide 26EC."**latal.** A hard aluminum alloy containing 4–5% copper, 1.5–2% silicon and fractional percentages of other metals such as iron, manganese, or magnesium.

"Lauxein."⁵⁸ Trademark for casein and soybean adhesives, dry powders good for low-temperature applications and glue bonding where water-resistance is desired.

Containers: Multiwall bags and fiber drums.

Uses: Bonding and cold-setting glues used in the manufacture of plywood furniture.

"Laukite."⁵⁸ Trademark for a series of urea, phenolic, melamine and resorcinol resins. Available in dry powders or liquids. Used for bonding, cold-setting and

impregnating adhesives and glues for furniture, plywood and aircraft; hot and cold pressing; radio frequency equipment; molding of diversified components from granulated wood.

"Lava." Trademark for synthetic block talc or soapstone used in electron tubes and other devices as an insulator.

lavandin oil, abrial. Essential oil obtained by steam distillation of plant material of a hybrid of true lavender and spike lavender, *lavandula abrialis*.

Properties: Yellow liquid with camphoraceous odor which is suggestive of lavender. Sp. gr. 0.885–0.893 (25°C); refractive index 1.4605–1.4640 (20°C). Soluble in most fixed oils, propylene glycol and mineral oil; relatively insoluble in glycerol.

Grades: Sold on basis of ester content. F.C.C. requires 28–35% ester calculated as linalyl acetate.

Uses: Perfumery; flavoring agent.

lavender oil.

Properties: Essential oil; colorless, yellowish or greenish-yellow; sweet odor; slightly bitter taste. Sp. gr. 0.875–0.888 (25°C); refractive index 1.4590–1.4700 (20°C); angular rotation -3 to -10° ; one volume oil dissolves in 4 volumes 70% alcohol. Combustible; nontoxic.

Chief constituents: Linalool; linalyl acetate; geraniol; pinene; limonene; cineol.

Derivation: Steam-distilled from the fresh flowering tops of *Landula officinalis*.

Grades: N.F.; F.C.C. Both require not less than 35% of esters, calculated as linalyl acetate.

Uses: Perfumery; flavoring agent.

lavender oil, terpeneless

Concentration: About 1.75–2 times that of natural lavender oil. Sp. gr. 0.893–0.898; optical rotation, about -5° . Solubility in alcohol: 15 parts per 100 parts of 60% alcohol; 55 parts per 100 parts of 70% alcohol.

lavender-spike oil. See spike oil.

"Lavenol."¹⁸⁸ Trademark for a series of synthetic lavender oil substitutes of various types.

Lavoisier, Antoine Laurent (1743–1794). French chemist generally regarded as the "father" of chemistry. His "Traité Élémentaire de Chimie" (1789) listed 30 elements, clarified the nomenclature of acids, bases and salts, and described the composition of numerous organic substances. He erroneously believed that oxygen is the characteristic element of acids. However, his fundamental work on combustion, as a result of which he identified and named nitrogen (azote), and on the separation of hydrogen from water by a unique reduction experiment carried out in a heated gun barrel, earned him a leading position among early chemists. (See also Mendeleef).

"Laval."¹⁸⁹ Trademark for a substitute for linalyl acetate.

lawrencium Lr A synthetic radioactive element with atomic number 103, discovered in 1961. Atomic weight 257. Only one other isotope is known (256). The 257 isotope has a half-life of 8 seconds. It has been made by bombarding californium with boron ions. It exhibits alpha radiation. See actinide series.

LC (lethal concentration, 50%) That quantity of a substance administered by inhalation that is necessary to kill 50% of test animals exposed to it within a

specified time. This test applies not only to gases and vapors but to fume, dusts and other particulates suspended in air.

LCL. Abbreviation for "less than carload lot"; used by shippers, traffic managers, railroads, etc.

LD₅₀ (lethal dose, 50%). That quantity of a substance administered either orally or by skin contact necessary to kill 50% of exposed animals in laboratory tests within a specified time.

leaching. See solvent extraction.

lead Pb (from Latin *plumbum*). Metallic element of atomic number 82, Group IVA of the periodic table. Atomic weight 207.2; valences 2, 4; 4 stable isotopes. The isotopes are the end products of the three series of natural radioactive elements uranium (206), thorium (208), and actinium (207).

Properties: Heavy, ductile, soft gray solid. Sp. gr. 11.35; m.p. 327.4°C; b.p. 1755°C; soluble in dilute nitric acid; insoluble in water but dissolves slowly in water containing a weak acid; resists corrosion; relatively impenetrable to radiation. Poor electrical conductor; good sound and vibration absorber. Non-combustible.

Occurrence: U.S., Mexico, Canada, S. America, Australia, Africa, Europe.

Derivation: Roasting and reduction of galena (lead sulfide), anglesite (lead sulfate), and cerussite (lead carbonate). Also from scrap.

Purification method: Desilvering (Parkes process); electrolytic refining (Betts process); pyrometallurgical refining (Harris process). Bismuth is removed by Betterton-Kroll process.

Grades: High purity (less than 10 ppm impurity); pure (99.9+); powdered (99% pure); pig lead; paste.

Forms available: Ingots, sheet, pipe, shot, buckles or straps, grids, rod, wire, etc.; paste; powder; single crystals.

Hazard: Toxic by ingestion and inhalation of dust or fume. Tolerance (lead, fumes and dusts, and inorganic compounds) 0.15 mg per cubic meter of air. A cumulative poison. FDA regulations require zero lead content in foods and 0.05% in house paints.

Uses: Storage batteries; tetraethyllead (gasoline additive); radiation shielding; cable covering; ammunition; sheet and pipe; solder and fusible alloys; type metal; vibration damping in heavy construction; foil; numerous alloys.

For further information refer to Lead Industries Association, 292 Madison Ave., New York.

lead acetate (sugar of lead) $Pb(C_2H_3O_2)_2 \cdot 3H_2O$.

Properties: White crystals or flakes (commercial grades are frequently brown or gray lumps). Sweetish taste. Absorbs carbon dioxide when exposed to air, becoming insoluble in water. Soluble in water; slightly soluble in alcohol; freely soluble in glycerol. Sp. gr. 2.50; m.p. loses H_2O at 75°C; at 200°C decomposes; b.p. (anhydrous) 280°C. Combustible.

Derivation: By the action of acetic acid on litharge or thin lead plates.

Grades: Powdered, granular; crystals; flakes; C P Containers. Multiwall paper sacks; drums, carloads.

Uses: Medicine; lead salts; dyeing of textiles, water-proofing; varnishes; lead driers; chrome pigments, gold cyanation process; insecticide, antilouping paints; analytical reagent.

Hazard: Highly toxic by ingestion, inhalation, skin absorption. Absorbed by skin. Use may be restricted. Shipping regulations. (Air) Poison label.

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

lead alkyl, mixed. A mixture containing various methyl and ethyl derivatives of tetraethyl lead and tetramethyl lead. Thus methyl triethyl lead, dimethyl diethyl lead and ethyl trimethyl lead may all be present with or without tetraethyl and tetramethyl lead.

Hazard: Toxic by ingestion and skin absorption.

Uses: Antiknock agents in aviation gasoline.

lead antimonate (Naples yellow; antimony yellow) $Pb_3(SbO_4)_2$.

Properties: Orange-yellow powder. Insoluble in water. Sp. gr. 6.58 (20°C). Noncombustible.

Derivation: Interaction of solutions of lead nitrate and potassium antimonate, concentration and crystallization.

Hazard: Toxic by inhalation. Tolerance, 0.15 mg per cubic meter of air.

Uses: Staining glass, crockery and porcelain.

lead arsenate (lead orthoarsenate) $Pb_3(AsO_4)_2$.

Properties: White crystals. Soluble in nitric acid; insoluble in water; sp. gr. 7.80; m.p. 1042°C (decomposes).

Derivation: By the action of a soluble lead salt on a solution of sodium arsenate, concentration and crystallization.

Uses: Insecticide; herbicide.

Hazard: Highly toxic. Tolerance, 0.15 mg per cubic meter of air.

Shipping regulations: (Rail, Air) Poison label.

lead arsenite $Pb(AsO_2)_2$.

Properties: White powder; soluble in nitric acid; insoluble in water. Sp. gr. 5.85.

Hazard: Highly toxic.

Use: Insecticide.

Shipping regulations: (Rail, Air) Poison label.

lead azide $Pb(N_3)_2$.

Properties: Colorless needles; an initiating explosive. Should always be handled submerged in water.

Derivation: Reaction of sodium azide with a lead salt.

Hazard: Severe explosion risk; detonates at 350°C (660°F). Highly toxic. Tolerance, 0.15 mg per cubic meter of air.

Use: Primary detonating compound for high explosives.

Shipping regulations: (Air) Not accepted. (Rail) Consult regulations. Not accepted by express.

Note: Explosions have occurred in cases where azide compounds have reacted with the lead in plumbing after being washed down sinks.

lead-base Babbitt. See Babbitt metal.

lead biorthophosphate. See lead phosphate, dibasic.

lead, blue. A term applied to galena to distinguish it from white lead ore. It is also applied to blue basic lead sulfate.

lead borate $Pb(BO_2)_2 \cdot H_2O$.

Properties: White powder. Soluble in dilute nitric acid; insoluble in water. Sp. gr. 5.598; m.p. 160°C (loses water). Noncombustible.

Derivation: Interaction of solutions of lead hydroxide and boric acid, with subsequent crystallization.

Hazard: Highly toxic by inhalation. Tolerance, 0.15 mg per cubic meter of air.

Uses: Varnish and paint drier; waterproofing paints; lead glass; galvanoplastic products.

lead borosilicate. A constituent of optical glass, composed of a mixture of the borate and silicate of lead.

lead bromate $Pb(BrO_3)_2 \cdot H_2O$.

Properties: Colorless crystals. Soluble in hot water; sp. gr. 5.53; decomposes at about 180°C.

lead bromide $PbBr_2$.

Properties: White powder. Slightly soluble in hot water; insoluble in alcohol. Sp. gr. 6.66; b.p. 916°C; m.p. 373°C.

Hazard: Highly toxic by inhalation. Tolerance, 0.15 mg per cubic meter of air.

lead carbolate. See lead phenate.

lead carbonate $PbCO_3$. See lead carbonate, basic.

Properties: White, powdery crystals. Soluble in acids; insoluble in water and alcohol. Sp. gr. 6.6; decomposed by heat 315°C. Noncombustible.

Derivation: By adding a solution of sodium bicarbonate to a solution of lead nitrate. Occurs in nature as cerussite.

Hazard: Toxic by inhalation. Tolerance, 0.15 mg per cubic meter of air.

Impurities: Basic lead carbonate.

Use: Industrial paint pigment.

lead carbonate, basic (lead subcarbonate; white lead; BCWL; lead flake) $2PbCO_3 \cdot Pb(OH)_2$.

Properties: White, amorphous powder. Soluble in acids; insoluble in water; decomposes at 400°C; sp. gr. 6.86. Noncombustible.

Derivation: (a) Dutch process. By the corrosion of lead buckles in pots by acetic acid and carbon dioxide generated by the fermentation of waste tanbark. (b) Carter process. By treating very finely divided lead in revolving wooden cylinders with dilute acetic acid and carbon dioxide.

Hazard: Toxic by inhalation. Tolerance, 0.15 mg per cubic meter of air.

Uses: Industrial paint pigment; putty; ceramic glazes.

lead chloride $PbCl_2$.

Properties: White crystals. Slightly soluble in hot water; insoluble in alcohol and cold water. Sp. gr. 5.88; m.p. 498°C; b.p. 950°C. Noncombustible.

Derivation: By the addition of hydrochloric acid or sodium chloride to a solution of a lead salt, with subsequent crystallization.

Hazard: Toxic by inhalation. Tolerance, 0.15 mg per cubic meter of air.

Uses: Preparation of lead salts; lead chromate pigments; analytical reagent.

lead chlorosilicate complex. See "Lectro" 60.

lead chromate. $PbCrO_4$.

Properties: Yellow crystals. Soluble in strong acids and alkalis; insoluble in water. Sp. gr. 6.123; m.p. 844°C.

Derivation: Reaction of sodium chromate and lead nitrate in solution.

Hazard: Toxic by ingestion and inhalation. May be a carcinogen. Tolerance, 0.1 mg per cubic meter of air.

Uses: Pigment in industrial paints, rubber, plastics, ceramic coatings.

See also chrome pigment.

lead coating. Coatings of lead or lead-rich alloys are (1) deposited by dipping into the molten metal, after applying a layer of tin to secure good adhesion of the lead coating; (2) by electroplating from a fluosilicate or fluoborate bath, or (3) by spraying.

lead cyanide $Pb(CN)_2$.

Properties: White to yellowish powder. Slightly soluble in water; decomposes in acid.

Derivation: Interaction of solutions of potassium cyanide and lead acetate.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance (as CN), 5 mg per cubic meter of air.

Use: Metallurgy.

Shipping regulations: (Rail, Air) Poison label.

lead dimethyldithiocarbamate $\text{Pb}[\text{SCSN}(\text{CH}_3)_2]_2$.

Properties: White powder; sp. g. $2.43 \pm .03$; melting range 310°C ; insoluble in all common organic solvents; slightly soluble in cyclohexanone.

Use: Vulcanization accelerator with litharge.

lead dioxide (lead oxide, brown; plumbic acid, anhydrous; lead peroxide; lead superoxide) PbO_2 .

Properties: Brown, hexagonal crystals. Soluble in glacial acetic acid; insoluble in water and alcohol; sp. gr. 9.375; m.p. 290°C (dec). An oxidizing agent.

Derivation: By adding bleaching powder to an alkaline solution of lead hydroxide.

Hazard: Toxic. Dangerous fire risk in contact with organic materials. Tolerance, 0.15 mg per cubic meter of air.

Uses: Oxidizing agent; electrodes; lead-acid storage batteries; curing agent for polysulfide elastomers; textiles (mordant, discharge in dyeing with indigo); matches; explosives; analytical reagent.

Shipping regulations: (Rail) Oxidizing material, n.o.s., Yellow label. (Air) Oxidizer label.

lead dross (lead scrap). Consists of the scrap, dross, or waste from sulfuric acid tanks; a mixture of metallic lead, lead sulfate, and free sulfuric acid.

lead, electrolytic. Pure lead obtained by electrolytic deposition. See Betts process.

"Lead/Epox."⁵⁰⁴ Trademark for a two-component shielding material designed to be formed after mixing. It is then a putty-like high-density material which can be used as a mortar. No. 250 consists of 94.5 wt.% lead, 5.5 wt.% epoxy resin, for protection against gamma rays. No. 251 consists of 93.8 wt.% lead, 5.7 wt.% epoxy resin and 0.5 wt.% boron.

lead ethylhexoate. See "L-26."

lead flake. See lead carbonate, basic.

lead fluoride PbF_2 .

Properties: Crystalline solid; density 8.2 g/cc; m.p. (approx) 824°C ; very slightly soluble in water. Noncombustible.

Grade: Crystal, 99.93%.

Hazard: Highly toxic; strong irritant. Tolerance, 0.15 mg per cubic meter of air.

Uses: Electronic and optical applications; starting materials for growing single crystal solid-state lasers; high temperature dry film lubricants in the form of ceramic-bonded coatings.

lead fluosilicate (lead silicofluoride) $\text{PbSiF}_6 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals; soluble in water; decomposes when heated.

Hazard: Highly toxic; strong irritant. Tolerance, 0.15 mg per cubic meter of air.

Use: Solution for electrorefining lead.

lead formate $\text{Pb}(\text{CHO}_2)_2$.

Properties: Brownish-white, lustrous, very finely divided, crystalline substance; sp. gr. 4.63; soluble to water. Decomposes at 190°C . Noncombustible.

Hazard: Highly toxic.

Use: Reagent in analytical determinations.

lead fumarate, tetrabasic. See "Electro" "S

lead glass. See glass.

lead hydroxide (lead hydrate; hydrated lead oxide) $\text{Pb}(\text{OH})_2$ or $\text{Pb}_2\text{O}(\text{OH})_2$.

Properties: White, bulky powder. Soluble in alkalis; slightly soluble in water; soluble in nitric and acetic acid; sp. gr. 7.592; m.p., decomposes at 145°C ; absorbs carbon dioxide from air. Noncombustible.

Derivation: By the addition of sodium or ammonium hydroxide to a solution of a lead salt with subsequent filtration and drying.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Use: Lead salts; lead dioxide.

lead hyposulfite. See lead thiosulfate.

lead iodide PbI_2 .

Properties: Golden-yellow crystals or powder; odorless. Soluble in potassium iodide and concentrated sodium acetate solutions; insoluble in water and alcohol; sp. gr. 6.16; m.p. 402°C ; b.p. 954°C . Noncombustible.

Derivation: Interaction of lead acetate and potassium iodide.

Hazard: Tolerance, 0.15 mg per cubic meter of air.

Uses: Bronzing; mosaic gold; printing; photography; cloud seeding.

lead linoleate (lead plaster) $\text{Pb}(\text{C}_{18}\text{H}_{31}\text{O}_2)_2$.

Properties: Yellowish-white paste. Soluble in oils; insoluble in water. Combustible.

Derivation: By heating a solution of lead nitrate with sodium linoleate.

Grades: Technical; fused (contains 26.5% Pb).

Hazard: Toxic; absorbed by skin.

Uses: Medicine; drier in paints and varnishes.

lead maleate, tribasic.

Properties: Soft, yellowish white crystalline powder; sp. gr. 6.3; refractive index 2.08.

Hazard: Toxic; absorbed by skin.

Uses: Vulcanizing agent for chlorosulfonated polyethylene. Highly basic stabilizer with high heat stability in vinyls.

lead metavanadate. See lead vanadate.

lead molybdate PbMoO_4 .

Properties: Yellow powder. Soluble in acids; insoluble in water and alcohol. Absolute density 5.9 g/cc; m.p. 1060 – 1070°C . Noncombustible.

Derivation: By adding a solution of lead nitrate to a solution of ammonium molybdate, concentration and crystallization.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Uses: Analytical chemistry; pigments (see molybdate oranges). Single crystals available for electronic and optical uses.

lead monohydrogen phosphate. See lead phosphate, dibasic.

lead mononitroresorcinate $\text{PbO}_2\text{C}_6\text{H}_3\text{NO}_3$.

Hazard: An initiating explosive; dangerous.

Shipping regulations: (Rail, Air) Not accepted.

lead monoxide. See litharge; massicot.

lead beta-naphthalenesulfonate $\text{Pb}(\text{C}_{10}\text{H}_7\text{SO}_3)_2$.

Properties: White crystalline powder. Soluble in alcohol; insoluble in water. Combustible.

Derivation. By the action of lead acetate on beta-naphthalenesulfonic acid.

Hazard: Toxic. Absorbed by skin.

Use: Organic preparations.

lead naphthenate.

Properties: Soft, yellow, resinous semi-transparent. Gives deposits in highly acid oils, but not when mixed with suitable quantities of cobalt or manganese. Soluble in alcohol; m.p. approx. 100°C. Combustible.

Derivation: Addition of lead salt to aqueous sodium naphthenate solution.

Grades: Liquid; 16%, 24% Pb; solid: 37% Pb.

Containers: Steel drums; fiber drums.

Hazard: Toxic. Absorbed by skin.

Uses: Paint and varnish drier; wood preservative; insecticide; catalyst for reaction between unsaturated fatty acids and sulfates in the presence of air; lube oil additive.

See also soap (2).

lead nitrate $Pb(NO_3)_2$.

Properties: White crystals. Soluble in water and alcohol; sp. gr. 4.53; decomposes at 470°C.

Derivation: By the action of nitric acid on lead.

Hazard: Toxic. Strong oxidizing material. Dangerous fire risk in contact with organic materials. Tolerance, 0.15 mg per cubic meter of air.

Uses: Lead salts; mordant in dyeing and printing calico; matches; paint pigment; mordant for staining mother-of-pearl; oxidizer in the dye industry; sensitizer in photography; explosives; tanning; process engraving and lithography.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

lead nitrite (basic lead nitrite; lead subnitrite).

Properties: Light-yellow powder; variable composition, essentially $3PbO \cdot N_2O_3 \cdot H_2O$. Soluble in dilute nitric acid. Easily decomposed.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

lead ochre. See massicot (1).

lead octoate. See soap (2).

lead oleate $[CH_3(CH_2)_7CH:CH(CH_2)_7COO]_2Pb$.

Properties: White powder or ointment-like granules or mass. Soluble in alcohol, ether, turpentine, and benzene; insoluble in water. Combustible.

Derivation: Reaction of oleic acid with lead hydrate or carbonate, or of lead acetate and sodium oleate.

Hazard: Toxic; absorbed by skin.

Uses: Varnishes; lacquers; paint drier; high-pressure lubricants.

See also soap (2).

lead orthoarsenate. See lead arsenate.

lead orthophosphate, normal. See lead phosphate.

lead orthosilicate. See lead silicate.

lead oxide, black. See lead suboxide.

lead oxide, brown. See lead dioxide.

lead oxide, hydrated. See lead hydroxide.

lead oxide, red (red lead; minium; plumboplumbic oxide) Pb_3O_4 .

Properties: Bright red powder; partly soluble in acids; insoluble in water. Sp. gr. reported variously 8.32–9.16; decomposes between 500 and 530°C. An oxidizing agent; may react with reducing agents.

Derivation: By carefully heating litharge in a furnace in a current of air.

Grades: Technical; 95%, 97%, 98%.

Hazard: Toxic as dust. Tolerance, 0.15 mg per cubic meter of air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Storage batteries; glass; metal-protective paints; pottery and enameling; varnish; purification of alcohol; packing pipe joints.

lead oxide, yellow. See litharge.

lead perchlorate $Pb(ClO_4)_2 \cdot 3H_2O$. White crystals; sp. gr. 2.6; m.p. 100°C (dec). Very soluble in cold water; soluble in alcohol.

Hazard: Toxic; dangerous in contact with organic materials. Strong oxidizing agent.

Shipping regulations: (Rail) Perchlorates n.o.s., Yellow label. (Air) Oxidizer label.

lead peroxide. See lead dioxide.

lead phenate (lead phenolate; lead carbolate)

$Pb(OH)OC_6H_5$.

Properties: Yellowish to grayish-white powder. Soluble in nitric acid; insoluble in water and alcohol.

Derivation: By boiling phenol with litharge.

Hazard: Toxic; absorbed by skin.

lead phenolsulfonate (lead sulfocarbolate)

$Pb(C_6H_4OHOSO_3)_2 \cdot 5H_2O$.

Properties: White crystals or powder. Soluble in water and alcohol.

Hazard: Toxic; absorbed by skin.

lead phosphate (normal lead orthophosphate)

$Pb_3(PO_4)_2$.

Properties: White powder; sp. gr. 6.9–7.3; m.p. 1014°C. Insoluble in water; soluble in acids and alkalis.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

lead phosphate, dibasic (lead monohydrogen phosphate; lead biorthophosphate) $PbHPO_4$.

Properties: Soft white powder of fine plate-like crystals; sp. gr. 5.66 (15°C); m.p., decomposes.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Uses: Imparting heat resistance and pearlescence to polystyrene and casein plastics.

lead phosphite, dibasic $2PbO \cdot PbHPO_3 \cdot \frac{1}{2}H_2O$.

Properties: Fine white acicular crystals; sp. gr. 6.94; refractive index 2.25. Insoluble in water.

Containers: 40-, 350-lb fiber drums.

Uses: Heat and light stabilizer for vinyl plastics and chlorinated paraffins. As an ultraviolet screening and antioxidant stabilizer for vinyl and other chlorinated resins in paints and plastics.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air. Store in closed containers, away from open flame or sparks and at temperatures not to exceed 400°F.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

lead phthalate, dibasic $C_6H_4(COO)_2Pb \cdot PbO$.

Properties: Fluffy, white crystalline powder; insoluble in water; sp. gr. 4.5; refractive index 1.99 (av.).

Derivation: By boiling litharge with phthalic acid.

Hazard: Toxic. Absorbed by skin.

Use: Heat and light stabilizer for general vinyl use.

lead plaster. See lead linoleate.

lead protoxide. See litharge.

lead, red. See lead oxide, red.

lead resinate $\text{Pb}(\text{C}_{20}\text{H}_{29}\text{O}_2)_2$.

Properties: Brown lustrous translucent lumps or yellow-white powder, or yellowish-white paste. Insoluble in most solvents. Combustible.

Derivation: By heating a solution of lead acetate and rosin oil.

Grades: Precipitated, 23% Pb.

Hazard: Toxic; absorbed by skin.

Uses: Paint and varnish drier; textile water-proofing agent.

lead salicylate $\text{Pb}(\text{OOCCH}_2\text{CH}_2\text{OH})_2 \cdot \text{H}_2\text{O}$.

Properties: Soft, creamy white crystalline powder; sp. gr. 2.3; refractive index 1.78; soluble in hot water and alcohol. Combustible.

Hazard: Probably toxic.

Uses: Stabilizer or costabilizer for flooring and other vinyl compounds requiring good light stability.

lead selenide PbSe . Gray crystals; sp. gr. 8.10 (15°C); m.p. 1065°C. Insoluble in water; soluble in nitric acid. A semiconductor used in infrared detectors and thermoelectric devices.

Hazard: Toxic. Moderate fire hazard as dust or in presence of moisture. Tolerance, 0.15 mg per cubic meter of air.

lead sesquioxide Pb_2O_3 .

Properties: Reddish-yellow powder. Soluble in alkalis and acids; insoluble in water. Decomposes at 370°C.

Derivation: By gently heating metallic lead.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Uses: Medicine; ceramics; ceramic cements; metallurgy; varnishes.

lead silicate (lead metasilicate) PbSiO_3 (?)

Properties: White, crystalline powder; insoluble in most solvents. Noncombustible.

Derivations: Interaction of lead acetate and sodium silicate.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Uses: Ceramics; fireproofing fabrics.

lead silicate, basic (white lead silicate; lead silicate sulfate). A pigment made up of an adherent surface layer of basic lead silicate and basic lead sulfate cemented to silica.

Properties: Excellent film-forming properties with drying oils combined with low specific gravity.

Derivation: Fine silica is mixed with litharge and sulfuric acid. The mixture is then furnace in a rotary kiln and ground to break up agglomerates.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Use: Pigment in industrial paints

lead silicochromate. Any of a group of yellow pigments. Normal lead silicon chromate is used as a yellow prime pigment for traffic marking paints. Basic lead silicon chromate is used as a corrosion inhibitive pigment for metal protective coatings, primers and finishes. Also for industrial enamels requiring a high gloss.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air

lead silicofluoride. See lead fluosilicate**lead-silver Babbitt**. See Babbitt metal

lead-soap lubricants. Lead salts saponified with fats; hard at low temperatures, viscous at medium temperatures, but become somewhat fluid on heating by friction. Used as "extreme-pressure lubricants," but are not suited for high-speeds.

See lead naphthenate; lead oleate; lead stearate; also soap (2).

lead sodium hyposulfite. See lead sodium thiosulfate.

lead sodium thiosulfate (lead sodium hyposulfite; sodium lead hyposulfite; sodium lead thiosulfate) $\text{PbS}_2\text{O}_3 \cdot 2\text{Na}_2\text{S}_2\text{O}_3$.

Properties: Heavy, small, white crystals. Soluble in solutions of thiosulfates.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Use: Matches.

lead stannate $\text{PbSnO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Light-colored powder. Insoluble in water.

Approximate temperature of dehydration 170°C.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Uses: Additive in ceramic capacitors; pyrotechnics.

"Leadstar."TM Trademark for normal lead stearate.

lead stearate $\text{Pb}(\text{C}_{17}\text{H}_{35}\text{O}_2)_2$.

Properties: White powder; m.p. 100-115°C; sp. gr. 1.4; soluble in ether; insoluble in alcohol; slightly soluble in water. Combustible.

Derivation: By heating a solution of lead acetate with sodium stearate.

Hazard: Toxic; absorbed by skin.

Uses: Varnish and lacquer drier; high-pressure lubricants; lubricant in extrusion processes; stabilizer for vinyl polymers; corrosion inhibitor for petroleum; component of greases, waxes and paints.

lead styphnate. Legal label name for lead trinitroresorcinate (q.v.).

lead subcarbonate. See lead carbonate, basic.

lead subnitrite. See lead nitrite.

lead suboxide (lead oxide, black; litharge, lead) Pb_2O .

Properties: Black, amorphous material; sp. gr. 8.342; decomposes on heating. Insoluble in water; soluble in acids and bases.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Use: In storage batteries.

lead, sugar of. See lead acetate.

lead sulfate PbSO_4 .

Properties: White, rhombic crystals. Slightly soluble in hot water; insoluble in alcohol. Sp. gr. 6.12-6.39; m.p. 1170°C. Noncombustible.

Derivation: Interaction of solutions of lead nitrate and sodium sulfate

Hazard: Toxic. Strong irritant to tissue. Tolerance, 0.15 mg per cubic meter of air

Uses: Storage batteries, paint pigments

Shipping regulations: (Air) Containing more than 7% free acid. Corrosive Label

lead sulfate, basic (white lead, sublimed, white lead sulfate). Approximate formula $\text{PbSO}_4 \cdot \text{PbO}$

Properties: White monoclinic crystals; sp. gr. 6.92; m.p. 977°C, only slightly soluble in hot water or acids. Noncombustible

Grades: Vary from 72 to 85% lead sulfate and remainder lead oxide. Sold dry or ground in oil.

Derivation: Three methods are used: (a) Lead sulfide ore (galena) is subjected to high temperatures in an oxidizing atmosphere. (b) Molten lead is sprayed into a jet of ignited fuel gas and air in the presence of sulfur dioxide gas. (c) Atomized metallic lead is mixed with water and sulfuric acid is added under controlled conditions.

Containers: Barrels; multiwall paper sacks.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Uses: Paints; ceramics; pigments.

lead sulfate, blue basic (sublimed blue lead; blue lead). Composition: Lead sulfate (min) 45%, lead oxide (min) 30%, lead sulfide (max) 12%, lead sulfite (max) 5%, zinc oxide 5%, carbon and undetermined matter (max) 5%.

Properties: Blue-gray corrosion-inhibiting pigment; insoluble in water or alcohol. Sp. gr. 6.2. Noncombustible.

Derivation: By heating lead ores in special furnaces.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Uses: Component of structural-metal priming coat paints; rust-inhibitor in paints; lubricants; vinyl plastics, and rubber products.

lead sulfate, tribasic $3\text{PbO} \cdot \text{PbSO}_4 \cdot \text{H}_2\text{O}$.

Properties: Fine, white powder; sp. gr. 6.4; refractive index 2.1. Used for electrical and other vinyl compounds requiring high heat stability.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

lead sulfide (plumbous sulfide) PbS .

Properties: Silvery, metallic crystals or black powder. Soluble in acids; insoluble in water and alkalis. Sp. gr. 7.13-7.7; m.p., 1114°C; sublimes at 1281°C.

Derivation: (a) Found in nature as the mineral galena (q.v.); (b) by passing hydrogen sulfide gas into an acid solution of lead nitrate.

Grades: Technical; C.P.; electronic.

Hazard: Toxic by ingestion and inhalation. Tolerance, 0.15 mg per cubic meter of air.

Uses: Ceramics; metallic lead; infrared radiation detector; semiconductor.

lead sulfite PbSO_3 .

Properties: White powder; decomposes on heating. Insoluble in water; soluble in nitric acid.

Hazard: Toxic by ingestion and inhalation. Tolerance, 0.15 mg per cubic meter of air.

lead sulfo-carbolyte. See lead phenolsulfonate.

lead sulfo-cyanide. See lead thiocyanate.

lead superoxide. See lead dioxide.

lead tellurate. A lead derivative of tall-oil. Combustible. Grades: Liquid, 16% Pb; 24% Pb; solid, 30% Pb.

Derivation: By the fusion process.

Hazard: Toxic. Absorbed by skin.

Uses: See soap (2).

lead telluride PbTe .

Properties: Crystalline solid; sp. gr. 8.2; m.p. 905°C. Insoluble in water and most acids.

Hazard: Toxic by ingestion and inhalation. Tolerance, 0.15 mg per cubic meter of air.

Uses: Single crystals used as photoconductor and semiconductor in thermocouples.

lead tetraacetate $\text{Pb}(\text{CH}_3\text{COO})_4$.

Properties: Colorless or faintly pink crystals, sometimes moist with glacial acetic acid. M.p. 175°C;

sp. gr. 2.228 (17°C); soluble in benzene, chloroform, nitrobenzene, hot glacial acetic acid. Combustible.

Derivation: From red lead (Pb_3O_4) and glacial acetic acid in the presence of acetic anhydride.

Containers: Glass bottles; fiber drums.

Hazard: Toxic. Absorbed by skin.

Uses: Selective oxidizing agent in organic synthesis; laboratory reagent.

lead tetraethyl. See tetraethyl lead.

lead thiocyanate (lead sulfocyanate) $\text{Pb}(\text{SCN})_2$.

Properties: White or light-yellow, crystalline powder; soluble in potassium thiocyanate, nitric acid and slightly soluble in cold water; decomposes in hot water. Sp. gr. about 3.8.

Containers: Drums (100 lbs net).

Hazard: Toxic by ingestion and inhalation. Tolerance, 0.15 mg per cubic meter of air.

Uses: Ingredient of priming mixture for small-arms cartridges; safety matches; dyeing.

lead thiosulfate (lead hyposulfite) PbS_2O_3 .

Properties: White crystals. Sp. gr. 5.18. Soluble in acids and sodium thiosulfate solution; insoluble in water. M.p., decomposes.

Derivation: By the interaction of solutions of lead nitrate and sodium thiosulfate, concentration and crystallization.

Hazard: Toxic by ingestion and inhalation. Tolerance, 0.15 mg per cubic meter of air.

lead titanate PbTiO_3 .

Properties: Pale-yellow solid; insoluble in water. Sp. gr. 7.52.

Derivation: Interaction of oxides of lead and titanium at a high temperature. Contains lead sulfate and lead oxide as impurities.

Hazard: Toxic by ingestion and inhalation. Tolerance, 0.15 mg per cubic meter of air.

Use: Industrial paint pigment.

lead trinitroresorcinate (lead styphnate)

$\text{C}_6\text{H}(\text{NO}_2)_3(\text{O}_2\text{Pb})$.

Properties: Sp. gr. 3.1 for monohydrate and 2.9 for anhydrous. Monohydrate is monoclinic orange-yellow crystals; practically insoluble in water.

Derivation: Prepared by adding a solution of magnesium styphnate (from magnesium oxide and styphnic acid) to a lead salt solution.

Hazard: Detonates at 500°F; dangerous explosion risk. An initiating explosive.

Shipping regulations: (Air) Not accepted. (Rail) Consult regulations. Not accepted by express.

lead tungstate (lead wolframate) PbWO_4 .

Properties: Yellowish powder. Soluble in acid; insoluble in water. Sp. gr. 8.235; m.p. 1130°C.

Derivation: By mixing solutions of lead nitrate and sodium tungstate, concentrating and crystallizing.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Use: Pigment.

lead vanadate (lead metavanadate) $\text{Pb}(\text{VO}_3)_2$.

Properties: Yellow powder; insoluble in water; decomposes in nitric acid.

Hazard: Toxic. Tolerance, 0.15 mg per cubic meter of air.

Uses: Preparation of other vanadium compounds; pigment.

"Lead V-1 (Dibasic)."⁷⁴ Precipitated dibasic lead stearate. Uniform white powder, 50% lead content. Used in plastics.

lead water. A 1% solution of basic lead acetate. Toxic. See lead acetate.

lead, white. See lead carbonate, basic; also lead silicate, basic; and lead sulfate, basic.

lead wolframate. See lead tungstate.

lead wool. Fine filaments or threads of metallic lead, prepared and used for packing pipe joints.

lead zirconate titanate (LZT) PbTiZrO_3 . Forms piezoelectric crystals. Used as an element in hi-fi sets and as a transducer for ultrasonic cleaners; ferroelectric material in computer memory units.

"Leafseal."³⁶³ Trademark for a formulation of decylsuccinic acid and its esters. Used for direct application to plants to enable them to resist frost and drought.

leather. An animal skin or hide that has been permanently combined with a tanning agent, which causes a physicochemical change in the protein components of the skin. This change renders it resistant to putrefactive bacteria, enzymes, and hot water, increases its strength and abrasion resistance, and makes it serviceable for long periods of time. Tanning agents are either vegetable, mineral, or synthetic. (See tanning). Hides from cows or steers are chiefly used for men's shoes, transmission belting, and other heavy-duty service. These are usually vegetable-tanned. Lighter grades made from the skins of sheep, calves, or reptiles are used for shoe uppers, luggage, gloves, and similar end products (chrome-tanned).

Leather is a naturally poromeric material which retains the microporosity of the original skin; this property makes it uniquely applicable to footwear; to a limited extent it is able to conform to the contour of the individual foot. Leather is made in many colors, weights and finishes. However, it is being replaced to an increasing extent by plastics for many minor uses and by synthetics for shoe uppers and soles. For further information refer to American Leather Chemists' Assn., University of Cincinnati, Cincinnati, Ohio. See also poromeric.

leavening agent. See yeast; baking powder.

Le Blanc (1742-1806). French inventor of the first successful process for making soda ash. His patent was confiscated by the Revolutionist government and the process was used widely for years without either acknowledgment or remuneration. His original formula was 100 parts salt cake, 100 parts limestone and 50 parts coal.

Le Chatelier (1850-1936). French physical chemist, famous chiefly for his statement of the equilibrium principle (often known as Le Chatelier's Law). His work included investigations of cements, alloys, and gaseous combustion. The principle may be stated: every system in equilibrium is conservative, and tends to resist the changes upon it by reacting in such a way as to help nullify the imposed change.

Leclanché cell. See dry cell.

lecithin. Pure lecithin is a phosphatidyl choline $\text{CH}_2(\text{R})(\text{R}')\text{CH}_2\text{OPO}(\text{OH})(\text{O})(\text{CH}_2)_3\text{N}(\text{OH})(\text{CH}_3)$, R and R' being fatty acid groups. The lecithins are mixtures of diglycerides of fatty acids linked to the choline ester of phosphoric acid. The lecithins are classed as phosphoglycerides or phosphatides (phos-

pholipids). Commercial lecithin is a mixture of acetone-insoluble phosphatides. F.C.C. specifies not less than 50% acetone-insoluble matter (phosphatides).

Properties: Light brown to brown, viscous semiliquid with a characteristic odor; partly soluble in water and acetone; soluble in chloroform and benzene. Nontoxic.

Derivation: Usually from soybean oil; also from corn, other vegetable seeds, egg yolk and other animal sources.

Grades: Technical, unbleached, bleached; fluid; plastic; edible; F.C.C.; 96+% (for biochemical or chromatographic standards).

Uses: Emulsifying, dispersing, wetting, penetrating agent and antioxidant; in margarine, mayonnaise, chocolate and candies, baked goods, animal feeds; paints; petroleum industry (drilling, leaded gasoline); printing inks; soaps and cosmetics; mold release for plastics; blending agent in oils and resins; rubber processing; lubricant for textile fibers.

"Lecton."²⁸ Trademark for acrylic resin-coated glass fabrics and laminates used as electric insulating material because of thermal stability up to 130°C. Resistant to fluorinated hydrocarbons.

"Lectro."³⁰⁴ Trademark for a series of lead vinyl stabilizers.

60. A lead chlorosilicate complex. A fine white powder; sp. gr. 3.9; refractive index, 2.1. Used for vinyl electrical insulation and tapes.

78. Tetrabasic lead fumarate. Creamy white powder; sp. gr. 6.5; refractive index, 2.1. Used for heat stabilizer for electrical grade plastisols, phonograph records and electrical insulation.

Containers: Up to 325-lb fiberboard drums.

"Ledate."⁶⁹ Trademark for lead dimethyldithiocarbamate (q.v.).

Leeuwenhoek, A. van (1632-1723). A self-educated hobbyist and experimenter of Delft, Holland. He was a member of several scientific societies. His chief contribution was invention of the simple microscope about 1700.

legal chemistry (forensic chemistry). The application of chemical knowledge and procedures to matters involving civil or criminal law, and to all questions where control of chemical compounds, products, or processes is vested in agencies of Federal or state governments. Legal chemistry applies to the following areas:

(1) Crime detection: primarily identification of poisons (see toxicology), of bloodstains, writing and typewriter inks, and a host of miscellaneous materials such as textile fibers from clothing, hair, skin, etc. A variety of analytical methods are used in police laboratories, including microscopes, spot tests, color reactions, and spectrophotometry.

(2) Food, drugs, and cosmetics are under the control of the U.S. Food and Drug Administration. New products and proposed additives must be submitted by the manufacturer and approved before being placed on public sale. Control of the manufacture of illicit drugs is an important phase of legal chemistry.

(3) Pesticides are subject to Federal regulation. New products must be registered, labeling must be specific as to chemical composition, active and inert ingredients, and directions for use.

(4) Marketing and competitive pricing of chemical products; fair trade agreements and discriminatory

practices are also under Federal supervision (Robinson-Patman Act). This includes mergers, tie-in sales, and other merchandising practices.

(5) Interstate shipment and labeling of hazardous chemicals is regulated by the Department of Transportation, and the Federal Aviation Agency, as well as by state and local laws (see labeling).

(6) Patent law comprises a vast body of legal practice and court decisions. The patent system is designed to protect inventions and new discoveries, and most chemical companies retain legal counsel in this field.

(7) Water pollution is subject to Federal regulations (Federal Water Pollution Control Act, 1956). This covers the discharge of contaminating industrial waste, sewage, oil, etc., into navigable streams and their tributaries as well as into coastal waters.

(8) Flammability of fabrics.

(9) Use of volatile, toxic solvents on an industrial scale.

(10) Air pollution, including gases and particulates from industrial stacks and auto exhaust emissions.

"Leguval."⁴⁷⁰ Brand name for a series of polyester resins for plastic applications.

"Lehigh."²⁶⁸ Brand name covering a range of leaded zinc oxides.
Uses: Exterior paints and primers.

"Lekutherm."⁴⁷⁰ Trademark for epoxy-based coating resins.

"Lemac."⁶⁵ Trademark for a series of polyvinyl acetates as water-white, odorless, tasteless, uniform free flowing beads or alkali-soluble, copolymer beads. Excellent heat, light, and aging stability; specific heat, 0.39 cal/g/°C; tensile strength, up to 6000 psi; water absorption about 2% at 20°C; sp. gr. varies from 1.19 to 1.20; softening point, from 66°C to 155°C. Used in hot melt adhesives; seam sealers; adhesives for plastics; paper coatings.

"Lemasize."⁶⁵ Trademark for alkali-soluble resin beads, which are dissolved in ammonia or soda ash solution, and applied in warpsizing of acetate and synthetic fibers.

"Lemoflex."⁶⁵ Trademark for a series of internally-plasticized powdered polyvinyl alcohols having excellent flexibility and cold-water solubility. Sp. gr. varies between 1.2-1.3.

Uses: Water-soluble films; gas barrier coatings and films; textile sizes, grease resistant coatings, extruded tubing, protective colloid; mold release agent.

"Lemol."⁶⁵ Trademark for a series of polyvinyl alcohols in partially and fully hydrolyzed form at various molecular weights. Used in adhesives, emulsions, polymerization, film-coatings, polyester release agents, textile printing, finishing and sizing. Supplied as nondusting white granules with sp. gr. 1.2-1.3.

lemon chrome. See barium chromate.

lemongrass oil (verbena oil, Indian). An essential oil obtained by steam distillation of a grass (Cymbopogon).

Properties: Dark yellow to light brown-red; pronounced heavy lemon-like odor; sp. gr. 0.900-0.910 (15/15°C); optical rotation -3° to +1°; refractive index (n_D²⁰) 1.4830-1.4890; soluble in alcohol; slightly soluble in glycerol. Combustible; nontoxic. Source: India; East and West Indies; Guatemala. Chief constituents: Citral (75-85%), geraniol, methylheptenone.

Containers: Cans; drums.

Uses: Perfumes; flavoring; isolates and ionones; source of citral.

lemon oil. See citrus peel oils.

"Lenigallol."⁹ Trademark for pyrogallol triacetate.

lepidine (gamma-methylquinoline; cincholepidine) C₉H₆NCH₃. An alkaloid.

Properties: Oily liquid; quinoline-like odor; turns red-brown on exposure to light. Sp. gr. 1.086; b.p. 266°C; solidifies about 0°C. Soluble in alcohol, ether, and benzene; slightly soluble in water.

Derivation: From cinchonine.

Hazard: Probably toxic.

Use: Organic preparations.

lepidolite (lithia mica) K₂Li₃Al₄Si₇O₂₁(OH,F)₃. A fluosilicate of potassium, lithium, and aluminum, found in pegmatites. Rubidium occurs as an impurity. A variety of mica (q.v.).

Properties: Color pink and lilac to gray; luster pearly; perfect micaceous cleavage; Mohs hardness 2.5-4; sp. gr. 2.8-3.0.

Occurrence: California, South Dakota, New Mexico, South Africa.

Uses: Source of lithium and rubidium; flux in glass and ceramics production.

"Lethane."²³ Trademark for a group of thiocyanate insecticides.

60. 2-Thiocyanoethyl laurate.

384. Beta-butoxy-beta'-thiocyanodiethyl ether.

A-70. Diethylene glycol dithiocyanate.

Leu Symbol for leucine.

leucine (alpha-amino-gamma-methylvaleric acid; alpha-aminoisocaproic acid)

(CH₃)₂CHCH₂CH(NH₂)COOH. An essential amino acid. Found naturally in the L(-) form.

Properties: White crystals; soluble in water; slightly soluble in alcohol; insoluble in ether; optically active (natural form). DL-leucine m.p. 332°C with decomposition. L(-)-leucine m.p. 295°C; sp. gr. 1.239 (18/4°C).

Derivatoin: Hydrolysis of protein (cestin, hemoglobin, zein); organic synthesis from the alpha-bromo acid.

Grades: Commercial (DL-); F.C.C. (L-).

Containers: Drums.

Uses: Nutrient and dietary supplement; biochemical research.

leuco-compounds. See vat dyes.

leucocyte. A white blood cell.

"Leucosol."²⁸ Trademark for a series of vat colors especially prepared for textile printing.

leucovorin. A preferred name for folic acid (q.v.).

"Leukanol."²³ Trademark for synthetic tanning assistants of the sulfonic-type, supplied in liquid and solid grades. Powerful dispersants for vegetable tannins and bleaches for chrome-tanned leather.

"Leukeran."³⁰¹ Trademark for chlorambucil (q.v.).

"Levailr."¹ Trademark for a phosphate leavening agent.

levallorphan tartrate (l-N-allyl-3-hydroxymorphinan bitartrate) C₁₉H₂₅NO · C₄H₆O₆.

Properties: White, odorless crystalline powder. M.p. 174-177°C. Soluble in water; sparingly soluble in alcohol; insoluble in ether and chloroform.

Grade: N.F.

Use: Medicine.

"Levapren 450."⁴⁷⁰ Trademark for ethylene-vinyl acetate copolymer containing approximately 45% vinyl acetate.

levarterenol (*l*-norepinephrine; *l*-arterenol; *l*-alpha-(aminomethyl)-3,4-dihydroxybenzyl alcohol)
 $C_6H_3(OH)_2CH(OH)CH_2NH_2$. A peripheral vasoconstrictor.

Properties: Microcrystals; occurs in adrenal glands. Decomposes at 217°C.

Use: Medicine. Available also as bitartrate (U.S.P.).

leveling. (1) A term used in the paint industry to describe the application properties of a paint, i.e., its ability to cover a dry surface easily and to hold its level without sagging or running. (2) The ability of a nickel-plated coating to cover surface irregularities of the substrate, achieved by the incorporation of one or more brighteners (q.v.) in the plating formulation. (3) Aiding the uniform dispersion of a dye in a dye bath or solution by addition of a suitable material, e.g., lignin.

"Levelume."²⁸⁸ Trademark for bright, high-leveling nickel process. Prepared from nickel sulfate, nickel chloride, boric acid and organic addition agents. Applications are in electrical appliance, automotive trim, plumbing fixtures.

levorotatory. Having the property when in solution of rotating the plane of polarized light to the left or counterclockwise. Levorotatory compounds may have the prefix *l*- to distinguish them from their dextrorotatory or *d*- isomers, but the minus sign (–) is now in more general use.

levulinic acid (gamma-ketovaleic acid; acetylpropionic acid; 4-oxopentanoic acid; levulic acid)
 $CH_3CO(CH_2)_3COOH$.

Properties: Crystals. B.p. 245–246°C; m.p. 33–35°C; sp. gr. 1.1447 (25/4°C); refractive index 1.442 (16 D). Completely soluble in water, alcohol, esters, ethers, ketones, aromatic hydrocarbons. Insoluble in aliphatic hydrocarbons. Combustible; low toxicity.

Containers: 5-, 55-gal containers; carloads.

Uses: Intermediate for plasticizers, solvents, resins, flavors, pharmaceuticals; acidulant and preservative; chrome plating; solder flux; stabilizer for calcium greases; control of lime deposits.

levulose. See fructose.

Lewis, Gilbert N. (1875–1946). American chemist, native of Massachusetts; Professor of chemistry at M.I.T. from 1905 to 1912, after which he became dean of chemistry at University of California at Berkeley. His most creative contribution was the electron-pair theory of acids and bases which laid the groundwork for coordination chemistry. He was also a leading authority on thermodynamics, and his textbook on this subject, written with Merle Randall and published in 1923, became world-famous. See also following entries.

Lewis acid. Any molecule or ion (also called an electrophile) that can combine with another molecule or ion by forming a covalent bond with two electrons from the second molecule or ion. An acid is thus an electron acceptor. Hydrogen ion (proton) is the simplest substance that will do this, but many compounds, such as boron trifluoride, BF_3 , and aluminum chloride, $AlCl_3$, exhibit the same behavior and are therefore properly called acids. Such substances

show acid effects on indicator colors and when dissolved in the proper solvents.

Lewis base. A substance that forms a covalent bond by donating a pair of electrons, neutralization resulting from reaction between the base and the acid with formation of a coordinate covalent bond. It is also called a nucleophile. See also Lewis electron theory.

Lewis electron theory. A theory involving acid and base formation, neutralization, and related phenomena on the basis of exchange of electrons between substances and the formation of coordinate bonds. It represented an important advance in chemical theory, largely replacing earlier concepts. Advanced in 1923 by Gilbert N. Lewis, it contributed much to the development of coordination chemistry, in which the base is represented by the ligand and the acid by the metal ion.

A comparatively recent concept involves the terms "hard" and "soft" acids and bases, which refer to the ease with which the electron orbitals can be disturbed or distorted. Hard acids have a high positive oxidation state, and their valence electrons are not readily excited; soft acids and bases have little or no positive charge and easily excited valence electrons. Hard acids combine preferentially with hard bases, and soft acids with soft bases. Soft acids tend to accept electrons and form covalent bonds more readily than hard acids. For example, the halogen acids arranged in a series by increasing atomic weight (and decreasing chemical activity) show a progression from hard (HF) to soft (HI).

lewisite. Legal label name for beta-chlorovinyl-dichloroarsine (q.v.).

"Lewisol" 28.²⁷⁶ Trademark for a pale, hard resin; a maleic-modified glycerol ester of rosin. Acid number 36, softening point 141°C; USDA color WG.

Lewis, Warren K. (1882–1974) Born in Laurel, Maryland; graduated from MIT in 1905; Ph.D. from University of Breslau, Germany in 1908. Became professor of chemical engineering at MIT in 1910. He is often regarded as the father of chemical engineering in the U.S., as his outstanding books and other publications did much to establish the fundamental theory and practice of unit operations. He was coauthor of the famous textbook "Principles of Chemical Engineering" (1923).

"Lexan."²²¹ Trademark for thermoplastic carbonate-linked polymers produced by reacting bisphenol A and phosgene. Used in molding applications and other industrial arts.

See also polycarbonate resin

"L-310 Fatty Acid."⁴⁴¹ Trademark for a fatty acid derived from linseed oil. The major component acids are oleic, linoleic and linolenic. Light yellow liquid at ambient temperature, obtained from naturally occurring triglycerides; nontoxic, nonirritating.

Containers: Tank cars and trucks.
 Uses: Chemical intermediate, paint and varnishes, alkyd resins and soaps.

Li Symbol for lithium

"Librium" Hydrochloride.²² Trademark for chlorobenzepoxide hydrochloride (q.v.). Manufacture and use restricted.

licanic acid (4-keto-9,11,13-octadecatrienoic acid)

Properties: White crystals, alpha-Licanic acid (naturally occurring isomer) melts at 74–75°C. Readily isomerizes to the beta-form, m.p. 99.5°C. Soluble in organic solvents.

Derivation: Occurs in oiticica and other oils as glycerides.

lichenic acid. See fumaric acid.

licorice. See glycyrrhizin.

lidocaine (alpha-diethylaminoaceto-2,6-xylylide)

Properties: White or slightly yellow crystalline powder; characteristic odor; m.p. 66–69°C; b.p. 180–182°C (at 4 mm); soluble in alcohol, ether or chloroform; insoluble in water.

Derivation: By action of diethylamine on chloroacetyl-xylylide.

Grade: U.S.P.

Use: Medicine (also available as the hydrochloride).

Liebig, Justus Von (1803–1873). German chemist who founded the *Annalen*, a world-famous chemical journal. He was a great teacher of chemistry, training such men as Hofmann, who did basic work on organic dyes. Liebig contributed original research in the fields of human physiology, plant life, soil chemistry, and was the discoverer of chloroform, chloral and cyanogen compounds. He was the first to recommend addition of nutrients to soils and thus may be considered the originator of the fertilizer industry.

ligand. A molecule, ion, or atom that is attached to the central atom of a coordination compound, a chelate, or other complex. Thus the ammonia molecules in $[\text{Co}(\text{NH}_3)_6]^{3+}$, and the chlorine atoms in $[\text{PtCl}_6]^-$ are ligands. Ligands are also called complexing agents, as for example, EDTA, ammonia, etc. See also chelate; coordination compound.

ligase. A class of enzymes. See enzyme.

light hydrocarbon (gas liquid). One of a group of hydrocarbon products derived from natural gas or petroleum (ethane, propane, iso- and normal butane, and natural gasoline (C_3 and heavier). Produced largely in southwest Texas and Louisiana, these are used as feedstocks for a wide variety of organics. See also liquefied petroleum gas.

light metal. In engineering terminology, a metal of specific gravity less than 3 that is strong enough for construction use (aluminum, magnesium, beryllium).

light oil (coal tar light oil). A fractional distillate from coal-tar, with b.p. range from 110–210°C, consisting of a mixture of benzene, pyridine, toluene, phenol and cresols. The term is also sometimes used for oils of about the same b.p. range, but from other sources. Grade: Technical.

Containers: Tank cars; iron drums.

Hazard: Highly flammable, dangerous fire risk.

Uses: Source of benzene, solvent naphthas, toluene, phenol and cresols.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Legal label name: coal tar light oil or distillate.

light water. (1) A fire-fighting agent consisting of a water solution of perfluorocarbon compounds mixed with a water-soluble thickener of the polyoxyethylene compound type. It can be used simultaneously with dry chemical to smother gasoline or similar fires.

(2) Ordinary water (as distinct from heavy water) used to cool and moderate nuclear reactors.

lignin. The major noncarbohydrate constituent of wood (about one fourth). It functions as a natural plastic binder for the cellulose fibers. Its exact formula is unknown. Quinone methides are the most reactive intermediates in its formation. Lignin is removed from wood by both the sulfite and sulfate pulp processes, and limited amounts have been recovered from these sources and other wood waste.

Containers: 70-lb bags; 250-lb drums.

Uses: Components of groundwood paper (newsprint); stabilization of asphalt emulsions; ceramic binder and deflocculant; dye leveler and dispersant; drilling fluid additive; precipitation of proteins; extender for phenolic plastics; special molded products; vanillin (see lignin sulfonate); source of a component of battery expanders.

lignin sulfonate (lignosulfonate). A metallic sulfonate salt made from the lignin of sulfite pulp-mill liquors. Molecular weights range from 1000 to 20,000.

Properties: Light-tan to dark-brown powder; no pronounced odor; stable in dry form and relatively stable in aqueous solution; nonhygroscopic; no definite m.p.; decompose above 200°C; sp. gr. about 1.5. Forms colloidal solutions or dispersions in water; practically insoluble in all organic solvents.

Uses: Dispersing agent in concrete and carbon black-rubber mixes; extender for tanning agents; oil-well drilling mud additives; ore flotation agents; production of vanillin, industrial cleaners, gypsum slurries, dyestuffs, pesticide formulations.

Commercially available as the salts of most metals and of ammonium.

See also "Lignosol."

lignite. A low rank of coal between peat and sub-bituminous. The distinction of lignite from these materials is not sharp, as the transition from one to the other is gradual. Brown coal is a form of lignite closely related to peat. Though it has low Btu value, it is being studied as a possible source of pipeline fuel gas, hydrogen, and electric power. It occurs abundantly in East Germany, Poland and the Netherlands. See also gasification.

Hazard: Flammable in form of dust.

lignoceric acid (n-tetracosanoic acid)

A long-chain saturated fatty acid found in minor quantities in most natural fats.

Properties: Crystals; m.p. 84.2°C; b.p. 272°C (10 mm); sp. gr. 0.8207 (100/4°C); refractive index 1.4287 (100°C); nearly insoluble in ethanol. Nontoxic.

Source: Lignite and beechwood tar; peanut oil; sphingomyelin.

Grades: Technical; 99%.

Use: Biochemical research.

"Lignosol."⁴⁷⁶ Trademark for a series of calcium, sodium, and ammonium lignosulfonates. These compounds are mixtures of lignosulfonates and wood sugars. Special grades are available which have low wood sugar content.

Uses: Binders, dispersing agents and tanning agents.

"Lignosol AA3."⁴⁷⁶ Trademark for a mixture of sodium lignosulfonate and aldonic acids. Used as a substitute for gluconic acid in alkaline paint stripping.

lignosulfonate. See lignin sulfonate.

"Lignox."²³⁶ Trademark for a soluble calcium lignosulfonate in dry powder form. Used for treatment of drilling mud containing calcium ions and in brine emulsion muds.

ligroin A saturated, volatile fraction of petroleum boiling in the range 20–135°C (58–275°F) (based

- on A.S.T.M. definition). There is a special grade of ligroin known as petroleum benzin.
- Hazard:** Highly flammable; dangerous fire risk. Toxic by ingestion and inhalation.
- Shipping regulations:** (Rail) Red label. (Air) Flammable Liquid label. Legal label name: benzine or petroleum ether.
- "Lilial."²²⁷ $C_{11}H_{20}O$. Trademark for para-tert-butyl-alpha-methylhydrocinnamaldehyde.
- "Lily."²²⁸ Trademark for sublimed flowers of sulfur.
- Uses:** For high purity powdered sulfur requirements in pharmaceuticals, stock feeds, and chemicals.
- lime.** Specifically, calcium oxide (CaO); more generally, any of the various chemical and physical forms of quicklime, hydrated lime, and hydraulic lime. (Adapted from ASTM definition C41-47.) Noncombustible (see Hazard). For further information see National Lime Assn., 925 16th St. N.W., Washington, D.C.
- Hazard:** Unslaked lime (quicklime) yields heat on mixture with water, and is a caustic irritant.
- Uses:** See calcium oxide; calcium hydroxide.
- lime acetate.** See calcium acetate.
- lime, agricultural.** Lime slaked with a minimum amount of water to form calcium hydroxide.
- lime, air-slaked.** Lime which has absorbed carbon dioxide and moisture from the atmosphere. It consists of a powder composed of calcium carbonate and calcium hydroxide.
- lime-ammonium nitrogen.** Ammonium nitrate with dolomite.
- lime citrate.** See calcium citrate.
- lime, chlorinated** (chloride of lime; bleaching powder); approximately $CaCl(ClO) \cdot 4H_2O$.
- Properties:** White powder; chlorine odor; m.p. (dec); decomposes in water, acids.
- Derivation:** By conducting chlorine into a box-like structure containing slaked lime spread upon perforated shelves.
- Grades:** 35-37% active chlorine; technical.
- Hazard:** Evolves chlorine and at higher temperatures oxygen. With acids or moisture evolves chlorine freely at ordinary temperatures.
- Uses:** Textile and other bleaching applications; organic synthesis; deodorizer; disinfectant.
- Shipping regulations:** See calcium hypochlorite.
- See also calcium hypochlorite; bleach.
- "Limed Topit."²²⁹ Trademark for a limed tall oil pitch used in adhesives and asphalt tile manufacture.
- lime, fat.** A pure lime which combines readily with water to form a fine white powder, free from grit and makes a smooth stiff paste with excess of water. Must not be loaded hot.
- See also lime, lean.
- lime, hydrated.** See calcium hydroxide.
- lime, hydraulic.** A variety of calcined limestone which, when pulverized, absorbs water without swelling or heating and gives a cement that hardens under water. The limestone burned for this purpose usually contains from 10-17% silica, alumina and iron and from 40-45% lime, magnesia sometimes replacing lime. Must not be loaded hot.
- lime hypophosphite.** See calcium hypophosphite

lime, lean. A lime which does not slake freely with water because it has been prepared from limestone containing a high percentage of impurities, e.g., silica, iron, alumina, etc. Must not be loaded hot.

lime-nitrogen. See calcium cyanamide.

lime oil, distilled. Colorless to greenish yellow volatile oil obtained by distillation from the juice or whole crushed fruit of *Citrus aurantifolia* Swingle.

Properties: Sp. gr. 0.855-0.863 (25°C); refractive index 1.4745-1.4770 (20°C); angular rotation +34° to +47°. Soluble in most fixed oils and mineral oil. Insoluble in glycerin and propylene glycol. Combustible; nontoxic.

Chief constituents: Terpeneol; citral.

Grade: F.C.C. (contains between 0.5 and 2.5% of aldehydes, calculated as citral).

Uses: Extracts; flavoring; perfumery; toilet soaps; cosmetics.

lime oil, expressed. See citrus peel oil.

lime salt peter. See calcium nitrate.

lime, slaked. See calcium hydroxide. ✓

limestone $CaCO_3$. A noncombustible solid characteristic of sedimentary rocks and composed mainly of calcium carbonate in the form of the mineral calcite (q.v.). Mohs hardness about 3. Limestones are sometimes classed according to the impurities contained, e.g.

Dolomitic limestone: Usually a limestone containing more than 5% magnesium carbonate. See dolomite.

Magnesium limestone: Dolomitic limestone. Used as a solid diluent and carrier in pesticides.

Argillaceous limestone: Contains clays; used in cement manufacture, as "cement rock."

Siliceous limestone: A limestone containing sand or quartz.

Limestones are also named according to the formation in which they occur. See also marble.

Uses: Building stone; metallurgy (flux); manufacture of lime; source of carbon dioxide; agriculture; road ballast; cement (Portland and natural); alkali manufacture; removal of SO_2 from stack gases.

lime, sulfured (calcium sulfide, crude) A mixture of calcium sulfide and calcium sulfate.

Properties: Yellowish-gray or grayish-white powder; odor of hydrogen sulfide. Soluble in acids; insoluble in water and alcohol. Noncombustible.

Derivation: By roasting calcium sulfate with coke.

Uses: Medicine; depilatory; luminous paint.

lime-sulfur solution. A solution made by boiling together lime (50 lbs), sulfur 100 (100 lbs) and water (100 gals) and diluting to one-tenth strength. Contains calcium polysulfide, free sulfur, and calcium thiosulfate. Used extensively as a fungicidal spray on fruit trees and as a sheep dip.

lime, unslaked. See calcium oxide.

lime water (calcium hydroxide solution).

Properties: Clear, colorless, odorless, alkaline aqueous solution of calcium hydroxide containing not less than 0.14 g of $Ca(OH)_2$ in each 100 ml at 25°C. (Note: The strength varies with the temperature at which the solution is stored.) Sp. gr. about 1.0 (25°C). Absorbs carbon dioxide from the air.

Grade: U.S.P. (as calcium hydroxide solution)

Use: Medicine (external)

limonene $C_{10}H_{16}$. A widely distributed optically active terpene, closely related to isoprene. It occurs naturally in both D- and L-forms. The racemic mixture of the two isomers is known as dipentene (q.v.).

Properties: Colorless liquid. (a) Sp. gr. 0.8411 (20°C); b.p. 176–176.4°C. (b) Sp. gr. 0.8422 (20°C); b.p. 176–176.4°C. Oxidizes to film in air; oxidation behavior similar to that of rubber or drying oils.

Derivation: (a) Lemon, bergamot, caraway, orange and other oils. (b) Peppermint and spearmint oils.

Uses: Flavoring, fragrance and perfume materials; solvent; wetting agent; resin manufacture.

limonene dioxide. See dipentene dioxide.

limonene, inactive (or racemic or *dl*). See dipentene.

limonene monoxide. See dipentene monoxide.

limonite. See hematite, brown.

"Lin-All."⁴⁸⁰ Trademark for a liquid, paste or flake form of tallates of calcium, cobalt, copper, iron, lead, manganese and zinc.

Uses: Drier for paint and printing inks.

linalool (linalol)

$(CH_3)_2C:CHCH_2CH_2C(CH_3)OHCH:CH_2$. 3,7-Dimethyl-1,6-octadien-3-ol. Linalool is the *l*-isomer; coriandrol is the *d*-isomer.

Properties: Colorless liquid; odor similar to that of bergamot oil and French lavender. Soluble in alcohol and ether. Sp. gr. 0.858–0.868 (25°C); b.p. 195–199°C; angular rotation -2° to $+2^\circ$. Soluble in fixed oils. Combustible; nontoxic.

Derivation: Derived from many essential oils, particularly from bois de rose, petitgrain, linaloe wood, bergamot, and others. Made synthetically from geraniol.

Method of purification: Rectification.

Grades: Ex bois de rose oil; synthetic; F.C.C.

Use: Perfumery; flavoring agent.

linalool oxide (tetrahydro- α , α , 5-trimethyl-5-vinylfurfuryl alcohol) $C_{10}H_{17}O_2$.

Properties: Liquid; refractive index (n 20/D) 1.4523.

Derivation: Synthetically from acetone.

Containers: 55-gal drums.

Uses: Perfuming and flavoring agent.

linalyl acetate $C_{10}H_{17}C_2H_3O_2$.

Properties: Clear, colorless, oily liquid; odor of bergamot; b.p. 108–110°C; sp. gr. 0.908–0.920; refractive index (n 20/D) 1.450–1.458; angular rotation -1° to $+1^\circ$; soluble in alcohol, ether, diethyl phthalate, benzyl benzoate, mineral oil, fixed oils, alcohol; slightly soluble in propylene glycol; insoluble in water, glycerin. Combustible; low toxicity.

Derivation: Action of acetic anhydride on linalool in presence of sulfuric acid. May also be obtained from bergamot and other oils.

Method of purification: Rectification.

Grades: Ex bois de rose oil 92%, 96–98%; F.C.C. (natural and synthetic).

Uses: Extracts; perfumery; flavoring agent; substitute for petitgrain oil.

linalyl formate $C_{10}H_{17}OOCH$.

Properties: Sp. gr. 0.915 (25/4°C); b.p. 100–103°C (10°C); refractive index 1.456–1.457 (20°C). Insoluble in water; soluble in alcohol. Combustible; low toxicity.

Derivation: Synthetically from acetone.

Containers: 55-gal drums.

Uses: Perfume; flavoring.

linalyl isobutyrate $C_{10}H_{17}OOCCH(CH_3)_2$.

Properties: Liquid; sp. gr. 0.890; refractive index 1.4490. Combustible; low toxicity.

Derivation: Synthetically from acetone.

Containers: 55-gal drums.

Uses: Perfume; flavoring.

linalyl propionate $C_{10}H_{17}OOCCH_2CH_3$.

Properties: Colorless liquid; floral odor similar to bergamot oil; sp. gr. 0.895–0.902 (25°C); refractive index 1.4500 to 1.4550 (20°C). Soluble in most fixed oils and in mineral oil; slightly soluble in propylene glycol; insoluble in glycerin. Combustible; low toxicity.

Derivation: Synthetically, starting with acetone.

Grade: F.C.C.

Uses: Perfumery; flavoring agent.

"Linaqua."⁶⁴ Trademark for 85% solids, water-soluble linseed oil vehicle for formulating gloss or flat exterior house paints and primers.

"Lincocin."³²⁷ Trademark for lincomycin hydrochloride monohydrate.

lincomycin $C_{18}H_{34}N_2O_6S$. An antibacterial substance produced by streptomyces lincolnensis var. lincolnensis. The hydrochloride is stable in the dry state and in aqueous solution for at least 24 months. Soluble in water at room temperature in concentrations up to 500 mg/ml.

Use: Medicine.

lindane (gamma-benzene hexachloride) $C_6H_6Cl_6$. Legal label name for gamma isomer of 1,2,3,4,5,6-hexachlorocyclohexane (q.v.).

Hazard: Highly toxic. Use may be restricted. Tolerance, 0.5 mg per cubic meter of air.

"Lindol"¹ Trademark for a product consisting of tricresyl phosphate (q.v.).

"Lindsite."⁸⁸ Trademark for a rare earth oxide glass polishing agent. Contains cerium and other rare earth oxides in the proportion in which they occur naturally.

linear alkyl sulfonate. See alkyl sulfonate, linear.

linoleic acid (linolic acid)

$CH_3(CH_2)_4HC:CHCH_2CH:CH(CH_2)_7COOH$. A polyunsaturated fatty acid (2 double bonds) existing in both conjugated and unconjugated forms. A plant glyceride essential to human diet.

Properties: Colorless to straw-colored liquid; sp. gr. 0.905 (15/4°C); f.p. $-5^\circ C$; b.p. 228°C (14 mm); refractive index 1.4710 (15°C). Insoluble in water; soluble in most organic solvents. Combustible; non-toxic.

Commercial sources: Linseed oil; safflower oil; tall oil.

Grades: Technical, purified (99+ %); edible.

Uses: Soaps; special driers for protective coatings; emulsifying agents; medicine; feeds; biochemical research; dietary supplement; margarine.

Note: Do not confuse with linolenic acid.

linolein. A glyceride of linoleic acid. It is one of the constituents of linseed oil which induces drying.

linolenic acid (9,12,15-octadecatrienoic acid)

$CH_3CH_2CH:CHCH_2CH:CHCH_2CH:CH(CH_2)_7$

$COOH$. A polyunsaturated fatty acid (3 double bonds), which occurs as the glyceride in many seed fats. It is an essential fatty acid in the diet. It is also a constituent of drying oils.

Properties: Colorless liquid; soluble in most organic solvents, insoluble in water; sp. gr. 0.916 (20/4°C);

f.p. -11°C ; b.p. 230°C (17 mm). Combustible; nontoxic.

Grade: Purified 99+%.

Uses: Medicine; biochemical research; drying oils.

Note: Do not confuse with linoleic acid.

linolenin. A glyceride of linolenic acid. Like linolein it is a constituent of drying oils. See linseed oil.

linoleum. A product composed of a coarse fiber backing coated with a mixture of linseed oil, cork filler, and rosin or other binder, plus desired colorants. Now almost completely replaced by plastics.

linolenyl alcohol (octadecatrienol)

$\text{CH}_3\text{CH}_2\text{CH}:\text{CHCH}_2\text{CH}:\text{CHCH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{CH}_2\text{OH}$. The fatty alcohol derived from linolenic acid. Available commercially as 50% pure.

Properties: Colorless solid; iodine value 190; cloud point 50.0°F ; sp. gr. 0.864; combustible; low toxicity. Derivation: Reduction of acid made from linseed oil. Impurities: Oleyl and linoleyl alcohols with some saturated alcohols.

Uses: Paints; flotation; lubricants; surface-active agents; resins; synthetic fibers.

linoleyl alcohol

$\text{CH}_3(\text{CH}_2)_7\text{CH}:\text{CHCH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{CH}_2\text{OH}$. The fatty alcohol derived from linoleic acid. Available commercially as 50–60% pure alcohol.

Properties: Colorless solid; iodine value 137; sp. gr. 0.855; cloud point 59°F . Combustible; low toxicity. Derivation: Reduction of linoleic acid.

Impurities: Mostly oleyl alcohol with some linolenyl, and saturated alcohols.

Uses: Paints; flotation; paper; surface-active agents; resins; leather.

linoleyltrimethylammonium bromide. An amorphous solid from yellow to very light brown in color. Soluble in water, alcohol.

Uses: Germicide; deodorant; algicide; slime control.

linolic acid. See linoleic acid.

linseed cake. The press cake formed when the seeds are crushed and the oil is extracted. See linseed oil meal.

linseed oil (flaxseed oil).

Properties: Golden-yellow, amber or brown drying oil with peculiar odor and bland taste. Sp. gr. 0.931–0.936; iodine value 177; saponification value 189–195; acid no. (max) 4 (ASTM D 234–48); boiling point, none; flash point 432°F ; autoignition point about 650°F . Polymerizes on exposure to air. Soluble in ether, chloroform, carbon disulfide, and turpentine; slightly soluble in alcohol. Heats spontaneously; combustible; nontoxic.

Chief constituents: Glycerides of linolenic, oleic, linoleic and saturated fatty acids. The drying property is due to the linoleic and linolenic groups.

Derivation: From seeds of the flax plant *Linum usitatissimum* by expression or solvent extraction. Various refining and bleaching methods are used.

Grades: Raw, boiled, double-boiled; blown, varnish makers; refined.

Containers: Cans, drums, tank cars.

Uses: Paints, varnishes, oilcloth, putty, printing inks; core oils, linings and packings, alkyd resins, soap, pharmaceuticals.

Note: Use of linseed oil in paints has decreased sharply since the introduction of emulsion paints.

linseed oil, blown. Linseed oil whose viscosity is increased by air bubbled through it at 200°F . The reaction is mainly oxidation followed by polymerization. The resulting product dries to a harder film than heat-bodied oils and is used in interior paints and enamels.

linseed oil, boiled. The term is a misnomer since the oil does not boil. Small amounts of driers (e.g., oxides of manganese, lead, or cobalt, or their naphthenates, resinates or linoleates) are added to hot linseed oil to accelerate drying. The "boiled oil" becomes thicker and darker.

linseed oil, heat-bodied. Linseed oil which has been polymerized by heating at $550\text{--}600^{\circ}\text{F}$. This increases viscosity and acid content and reduces iodine value. Bodied oil dries much faster than unprocessed oil.

linseed oil meal (linseed cake). The crushed and extracted residue from flaxseed (linseed), generally prepared by crushing the seeds, cooking with steam, and hydraulic expression of the oil. The resulting cake is sold by the protein content.

linters, cotton. See cotton linters.

linuron. Generic name for 3-(3,4-dichlorophenyl)-1-methoxy-1-methylurea.

$\text{C}_6\text{H}_3\text{Cl}_2\text{NHC}(\text{O})\text{N}(\text{OCH}_3)\text{CH}_3$.

Properties: Solid; m.p. $93\text{--}94^{\circ}\text{C}$; slightly soluble in water; partially soluble in acetone and alcohol.

Hazard: May be toxic.

Use: Herbicide.

"Lipal." Trademark for a series of polyoxyethylene esters and ethers of fatty acids. Used as detergents, emulsifiers, solubilizers, wetting agents, and coupling agents.

lipase. Any of a class of enzymes that hydrolyze fats to glycerol and fatty acids. Lipase is abundant in the pancreas, but also occurs in gastric mucosa, in the small intestine, and in fatty tissue. It is found in milk, wheat germ, and various fungi. Commercial pancreatin and most trypsin preparations contain lipase.

Derivation: From pork pancreas or calf glands.

Uses: Manufacture of cheese and similar foods; for removal of fat spots in dry cleaning or grease accumulations; in analytical chemistry of fats because it selectively hydrolyzes only fatty acids on the ends of triglycerides.

lipid (lipide). An inclusive term for fats and fat-derived materials. It includes all substances which are (1) relatively insoluble in water but soluble in organic solvents (benzene, chloroform, acetone, ether, etc.), (2) related either actually or potentially to fatty acid esters, fatty alcohols, sterols, waxes, etc., and (3) utilizable by the animal organism. One of the chief structural components of living cells. See also phospholipid; fat; fatty acid.

dl-alpha-lipoic acid (6,8-dithiooctanoic acid, thioctic acid, POF) $\text{SSCH}_2\text{CH}_2\text{CH}(\text{CH}_2)_4\text{COOH}$. A pyru-

vate oxidation factor. Pyruvate is a normal intermediate in carbohydrate metabolism.

Properties: Crystals; m.p. $61\text{--}61^{\circ}\text{C}$, b.p. $160\text{--}165^{\circ}\text{C}$. Practically insoluble in water, soluble in fat solvents, forms a water-soluble sodium salt.

Sources: Food sources; yeast and liver.

Uses: Nutrition, biochemical research.

"Lipoiodine."³⁰⁵ Trademark for ethyl diiodoborssidate.

"Lipopure."⁴²⁵ Brand name for a group of solvents purified to remove contaminants which might interfere with lipid procedures.

lipotropic agent. An agent which, because of its affinity for fats and oils, helps to regulate the metabolism of fat and cholesterol in the animal body. Inositol in an example.

Lipowitz's metal. A fusible alloy.

lipoxidase. An enzyme which catalyzes the addition of oxygen to the double bonds of unsaturated fatty acids of plant origin.

Uses: Biochemical research; whitening bread.

liquidation. The separation of two or more components of a mixture by heating to a temperature at which one component melts, leaving the others as solids. Used in the separation of alloy components.

liquefied natural gas (LNG). See natural gas.

liquefied petroleum gas (compressed petroleum gas; liquefied hydrocarbon gas; LPG). A compressed or liquefied gas obtained as a by-product in petroleum refining or natural gasoline manufacture, e.g., butane, isobutane, propane, propylene, butylenes, and their mixtures. Colorless, noncorrosive, nontoxic. Flash point -100°F . Autoignition temp. $800\text{--}1000^{\circ}\text{F}$. Containers: Cylinders and drums; tank cars and tank trucks; pipelines; ocean tankers.

Hazard: Highly flammable; dangerous fire and explosion risk. Tolerance, 1000 ppm in air.

Uses: Domestic and industrial fuel; automotive fuel; welding, brazing, and metal-cutting.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not accepted on passenger planes. See also compressed gas; natural gas.

"Liquor."⁴⁴¹ Trademark for alkali borate condensation products.

liquid. An amorphous (noncrystalline) form of matter intermediate between gases and solids, in which the molecules are much more highly concentrated than in gases, but much less concentrated than in solids. The molecules of liquids are free to move within the limits set by intermolecular attractive forces. At the air/liquid interface the vibration of the molecules causes some to be ejected from the liquid at a rate depending on the surface tension. (See kinetic theory). The tendency of molecules to escape from a liquid surface is called fugacity, and is largely responsible for evaporation, which occurs when the air space above the liquid is unrestricted. In a closed system, where the air space is restricted, the escaping molecules eventually saturate the air and thus the number of molecules leaving the liquid will be equal to those returning to it as a result of molecular attraction. In these circumstances the liquid/air system is said to be in equilibrium.

Liquids vary greatly in viscosity, melting point, vapor pressure, and surface tension. Mercury has a specific gravity of 13.6 and the highest surface tension of all liquids. Glass has the highest viscosity. Polar liquids are those whose molecules have opposite electrical charges on their terminal atoms or groups, which impart a force called dipole moment (q.v.). Water is a polar liquid with high dielectric constant. Pure hydrocarbon liquids are generally nonpolar.

See also liquid, Newtonian; glass; amorphous; solid; liquid crystal.

liquid chromatography. An analytical method based on separation of the components of a mixture in solution by selective adsorption. All systems include a moving solvent; a means of producing solvent motion, such as gravity or (in more recently developed equipment) a pump; a means of sample introduction; a fractionating column; and a detector. Innovations in functional systems provide the analytical capability for operating in three separation modes: (1) Liquid/liquid: partition in which separations depend on relative solubilities of sample components in two immiscible solvents (one of which is usually water). (2) Liquid/solid: adsorption where the differences in polarities of sample components and their relative adsorption on an active surface determine the degree of separation. (3) Molecular size separations which depend on the effective molecular size of sample components in solution.

Solvents, often referred to as carriers, include isooctane, methyl ethyl ketone, acetone/chloroform, tetrahydrofuran, hexane, and toluene.

Packing materials in columns of varying lengths, include silica gel, alumina, glass beads, polystyrene gel and ion exchange resins.

See also gas chromatography; paper chromatography; thin-layer chromatography.

"Liquid Bright Gold."²⁸ Trademark for a formulation of gold compounds designed to be painted or sprayed on ceramic or glass products, plastics, etc., and subjected to firing or curing temperatures. Used for decoration, printed circuits, etc.

liquid crystal. An organic compound in a transition state between solid and liquid forms. They are viscous, jelly-like materials that resemble liquids in certain respects (viscosity) and crystals in other properties (light scattering and reflection). The various esters of cholesterol are the best-known examples. They have the ability to indicate small temperature differences by changing color, for example, when applied in a thin film to the skin. They are available in microencapsulated form and are applied in water slurry by brush or spray. There are three types: nematic, smectic, and cholesteric. Chief uses are in medicine, color TV and electronic display tubes; temperature-sensitive tape; electronic drives for clocks and calculators; integrated circuit inspection and other devices dependent on temperature determination. They can align with dichroic dye molecules in a thin-layer cell to produce color changes in transmitted light.

liquid dioxide. See nitrogen dioxide.

liquid, Newtonian. Characteristic of liquids is their ability to flow, a property depending largely on their viscosity, and sometimes also on the rate of shear. A Newtonian liquid is one that flows immediately on application of force, and for which the rate of flow is directly proportional to the force applied. Water, gasoline and motor oils at high temperatures are examples. Some liquids have abnormal flow response when force is applied, that is, their viscosity is dependent on the rate of shear. Such liquids are said to exhibit non-Newtonian flow properties. Some will not flow until the force exerted is greater than a definite value called the yield point. [W. A. Gruse].

"Liquidow."²³³ Trademark for dust-laying products based on calcium chloride.

liquid pitch oil. See creosote, coal tar.

liquid rosin. See tall oil.

liquid rubber. See rubber, liquid.

"Liquid Scintillator HF."¹⁰⁹ Trademark for a solution of 5g diphenyloxazole and 0.1g dimethyl-POPOP per liter in a high-flash-point solvent. Maximum fluorescence 4300Å.

"Liquid Stainless Steel."²⁹⁰ Trademark for a protective and decorative coating for steel and other exposed materials consisting of polished stainless steel flake pigment and vinyl, epoxy and other systems.

"Liqui-Moly."²⁹⁹ Trademark for a series of extreme-condition lubricants compounded with submicronized molybdenum disulfide (MoS_2) in a wide range of petroleum and synthetic oils and greases, volatile hydrocarbons and various resin vehicles.

liquor. In chemical technology, any aqueous solution of one or more chemical compounds. In sugar manufacturing it refers to the sirups obtained from various refining steps (mother liquors). The paper industry uses this term extensively as follows: (a) black liquor is liquid digester waste (also called spent sulfate liquor) containing sulfonated lignin, rosin acids, and other waste wood components, from which tall oil is made; (b) green liquor is a solution made by dissolving chemicals recovered in the alkaline pulping process in water; (c) white liquor is made by adding caustic soda to sodium sulfide solution. In dyeing technology, red liquor is an alternate name for mordant rouge.

"Lissolamine" 100¹²⁵ Trademark for a water-soluble polymer. Stripping assistant for vat dyed fibers.

liter. The volume of one kilogram of water at its temperature of maximum density (4°C) at standard atmospheric pressure. A liter is 1.05 quarts, or 0.26 gallon.

"Lithaflux."²⁹⁰ Trademark for lepidolite (q.v.). Used for batch material for glass, porcelain enamel ground coats; ceramic body flux and glaze constituents.

"Lithafrax."²⁹⁰ Trademark for a ceramic material made from beta-spodumene.

litharge (lead oxide, yellow; plumbous oxide; lead monoxide) PbO . An oxide of lead made by controlled heating of metallic lead.

Properties: Yellow crystals; sp. gr. 9.53; m.p. 888°C . Insoluble in water; soluble in acids and alkalis. A strong base. Commercial grades are yellow to reddish, depending on treatment and purity. See also massicot.

Containers: Cans; drums.

Derivation: By oxidizing metallic lead in air. Various forms of lead and various temperatures from 500 to 1000°C are used.

Grades: C.P.; fused; powdered.

Hazard: Toxic by ingestion and inhalation. Tolerance, 0.15 mg per cubic meter of air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Storage batteries; ceramic cements and fluxes, pottery and glazes; glass; chromium pigments; oil refining; varnishes, paints, enamels, ink, linoleum, insecticides, cement (with glycerin); acid-resisting compositions; match-head compositions; other lead compounds, rubber accelerator (dry heat only)

litharge-glycerin cement. Made by mixing glycerin with one sixth to one half portion of water and mixing with enough litharge to give a paste of desired consistency. Must be used as soon as mixed. Fillers

retard the setting and avoid cracking. The product is somewhat resistant to acids.

Hazard: Toxic by ingestion.

litharge, leaded. See lead suboxide.

"Lithcote."¹⁴⁴ Trademark for a series of protective coatings available as LC-19, LC-24, LC-25, LC-34, LC-73 baked phenolic or modified epoxy linings, or as LC-82, LC-610 catalyzed epoxy coatings.

Uses: Tank cars; storage tanks; pipe, etc., to prevent corrosion and product contamination.

lithia. See lithium oxide.

lithic acid. See uric acid.

lithium Li Metallic element of atomic number 3, group IA of Periodic Table; atomic weight 6.941; valence 1; two isotopes. It is the lightest and least reactive of the alkali metals and the lightest solid element.

Properties: Very soft silvery metal. Sp. gr. 0.534 (20°C); m.p. 179°C ; b.p. 1317°C ; Mohs hardness 0.6. Viscosity of liquid lithium less than water; heat capacity about the same as water. Reacts exothermally with nitrogen in moist air at room temperature. High electrical conductivity. Soluble in liquid ammonia. Generally low toxicity. Combustible.

Sources: Spodumene, lepidolite, ambygonite occurring in U.S., Canada, central Africa, Brazil, Argentina, Australia, Europe. Also desert lake brines.

Derivation: By electrolysis of fused mixture of lithium chloride and potassium chloride; high-temperature extraction from spodumene by sodium carbonate; solar evaporation of lake brines.

Grades: 99.86% to 99.9999%. Available as ingots, rods, wire, ribbon, and pellets.

Containers: Glass bottles containing kerosene; hermetically sealed copper or aluminum cartridges; special steel drums.

Hazard: Ignites in air near melting point. Dangerous fire and explosion risk when exposed to water, nitrogen, acids or oxidizing agents. Extinguish fires with chemical only (See "Lith-X").

Uses: Production of tritium (q.v.); reducing and hydrogenating agents; alloy hardeners; pharmaceuticals; Grignard reagents. Scavenger and degasifier for stainless and mild steels in molten state; modular iron; lithium soaps; deoxidizer in copper and copper alloys; catalyst; heat-transfer liquid; storage batteries (with sulfur, selenium, tellurium and chlorine). Rocket propellants; vitamin A synthesis; silver solders; under-water buoyancy devices; nuclear reactor coolant.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes unless in cartridges.

lithium aluminate LiAlO_2 .

Properties: White powder; m.p. 1900 – 2000°C ; sp. gr. (25°C) 2.55. Insoluble in water. Low toxicity.

Grade: Ceramic

Containers: Fiber drums

Use: As a flux in high-refractory porcelain enamels.

lithium aluminum deuteride (LAD) LiAlD_2 .

Properties: White to gray crystals; sp. gr. 1.02. Stable in dry air at room temperature, but very sensitive to moisture. Decomposes above 140°C liberating deuterium. Soluble in diethyl ether, tetrahydrofuran. Slightly soluble in other low-molecular-weight ethers.

Preparation: By acting aluminum chloride with lithium deuteride.

Containers: Glass bottles; vials.

Hazard: Flammable; dangerous fire risk. Requires special handling.

Uses: Introduction of deuterium atom into molecule by reduction of same groups attacked by lithium aluminum hydride.

Shipping regulations: Not listed. Consult authorities.

lithium aluminum hydride (LAH) LiAlH_4 .

Properties: White powder. Sp. gr. 0.917. Sometimes turns gray on standing. Stable in dry air at room temperature, but highly sensitive to moisture, including atmospheric. Decomposes to lithium hydride, aluminum metal and hydrogen above 125°C without melting. Soluble in diethyl ether, tetrahydrofuran, dimethyl "Cellosolve." Slightly soluble in dibutyl ether. Insoluble or very slightly soluble in hydrocarbons and dioxane.

Preparation: Reaction of aluminum chloride with lithium hydride.

Containers: Glass bottles; polyethylene bags placed in metal cans, up to 6-gallon capacity; steel drums; fiber cans. Obtain precautionary instructions before opening containers.

Hazard: Flammable, dangerous fire risk. May ignite spontaneously on grinding or rubbing, or from static sparks. Fires must be extinguished by smothering with powdered limestone.

Uses: Reducing agent for over 60 different functional groups, especially for pharmaceutical, perfume, and fine organic chemicals; converts esters, aldehydes, and ketones to alcohols, and nitriles to amines; source of hydrogen; propellant; catalyst in polymerizations.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

lithium aluminum hydride, ethereal. LiAlH_4 , plus ether.

Properties: Colorless solution in ether; very reactive to water.

Derivation: From lithium hydride and ether solution of aluminum chloride.

Hazard: Flammable; dangerous fire risk.

Use: See lithium aluminum hydride.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

lithium aluminum tri-tert-butoxyhydride (LATB; lithium tri-tert-butoxyaluminumhydride)

$\text{LiAl}[\text{OC}(\text{CH}_3)_3]_3\text{H}$.

Properties: White powder; sp. gr. 1.03. Stable in dry air but sensitive to moisture. Soluble in the dimethyl ether of diethylene glycol, tetrahydrofuran, diethyl ether; slightly soluble in other ethers.

Containers: Glass bottles.

Hazard: Evolves flammable hydrogen at 400°C . Dangerous.

Uses: For stereospecific reductions of steroid ketones and for reductions of acid chlorides to aldehydes.

Shipping regulations: Not listed. Consult authorities.

lithium amide LiNH_2 .

Properties: White crystalline solid; ammonia-like odor; sp. gr. 1.18; melts 380 – 400°C ; decomposes in water, to form ammonia.

Derivation: Reaction of lithium hydride with ammonia.

Grades: 92–95% lithium amide.

Containers: 25-, 100-, 300-lb fiber drums.

Hazard: Flammable; dangerous fire risk. Do not use water to extinguish. (See "Lith-X").

Uses: Organic synthesis, including antihistamines and other pharmaceuticals.

Shipping regulations: (powdered) (Rail) Yellow label. (Air) Flammable Solid label.

lithium arsenate Li_3AsO_4 .

Properties: White powder; sp. gr. 3.07 (15°C). Slightly soluble in water; soluble in dilute acetic acid.

Hazard: Highly toxic.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

lithium benzoate $\text{LiC}_7\text{H}_5\text{O}_2$.

Properties: White crystals or powder; soluble in water and alcohol. Low toxicity.

Derivation: Reaction of benzoic acid with lithium carbonate.

lithium bicarbonate LiHCO_3 . A lithium salt formed by dissolving lithium carbonate in water with excess carbon dioxide. The solution, called lithia water, is used in medicine and prepared mineral waters.

lithium borate. See lithium metaborate, lithium tetraborate.

lithium borohydride LiBH_4 .

Properties: White to gray crystalline powder; decomposes in vacuum above 200°C ; in air at 275°C ; soluble in lower primary amines and ethers; sp. gr. 0.66; extremely hygroscopic.

Derivation: Reaction of sodium borohydride and lithium chloride.

Containers: Glass bottles.

Hazard: Flammable; dangerous fire and explosion risk.

Uses: Source of hydrogen and other borohydrides; reducing agent for aldehydes, ketones and esters.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

lithium bromide LiBr .

Properties: White cubic deliquescent crystals, or as a white to pinkish white granular powder; odorless; sharp, bitter taste. Sp. gr. 3.464; m.p. 547°C ; b.p. 1265°C ; very soluble in water, alcohol, and ether. Slightly soluble in pyridine; soluble in methanol, acetone, glycol. A hot concentrated solution dissolves cellulose. Forms addition compounds with ammonia and amines. Forms double salts with CuBr_2 , HgBr_2 , HgI_2 , $\text{Hg}(\text{CN})_2$, and SrBr_2 . Greatly depresses vapor pressure over its solutions. Low toxicity.

Derivation: Reaction of hydrobromic acid with lithium carbonate.

Grades: 53% (min) LiBr brine; solid; single crystals.

Containers: Glass jars; bags; brine in steel drums.

Uses: Pharmaceuticals; air conditioning; humectant; drying agent; batteries; low temperature heat-exchange medium.

lithium butyl. See butyllithium.

lithium carbide Li_2C_2 . Crystalline white powder; sp. gr. 1.65 (18°C); decomposes in water; soluble in acid, with evolution of acetylene.

Hazard: Fire risk in contact with acids.

lithium carbonate Li_2CO_3 .

Properties: White powder; sp. gr. 2.111; m.p. 735°C ; b.p., decomposes at 1200°C . Sparingly soluble in water. Low toxicity.

Derivation: (a) Finely ground ore is roasted with sulfuric acid at 250°C . Lithium sulfate is leached from the mass and converted to the carbonate by precipitation with soda ash. (b) Reaction of lithium oxide with carbon dioxide or ammonium carbonate solution.

Grades: Technical; C.P.

Containers: Fiber drums; barrels; bags.

Hazard: Water solution is strong irritant.

Uses: Ceramics and porcelain glazes; pharmaceuticals; catalyst; other lithium compounds; coating of arc-welding electrodes; nucleonics; luminescent paints, varnishes and dyes; glass ceramics; aluminum production.

lithium chlorate LiClO_3 .

Properties: Needlelike crystals, deliquescent; sp. gr. 1.119 (18°C); m.p. 128°C; decomposes at 270°C; more soluble in water than any other inorganic salt (313 g per 100 ml water at 18°C); very soluble in alcohol.

Hazard: Dangerous explosion hazard when shocked or combined with organic materials. Strong oxidant. (See "Lith-X").

Uses: Air conditioning; inorganic and organic chemicals; propellants.

Shipping regulations: Chlorates, n.o.s. (Rail) Yellow label. (Air) Oxidizer label.

lithium chloride LiCl .

Properties: White deliquescent crystals; sp. gr. 2.068; m.p. 614°C; b.p. 1360°C; very soluble in water, alcohols, ether, pyridine, nitrobenzene. One of the most hygroscopic salts known. Low toxicity, but should not be used as dietary salt substitute.

Derivation: Reaction of lithium ores with chlorides; natural brines.

Grades: Technical, 99% (min) assay; 35–40% brine, inhibited; single crystals.

Containers: Crystals: 25-, 50-, 100-lb paper-lined drums; brine: 75-, 275-, and 500-lb steel drums.

Uses: Air conditioning; welding and soldering flux; dry batteries; heat-exchange media; salt baths; desiccant; humectant; production of lithium metal; soft drinks and mineral water to reduce escape of carbon dioxide.

lithium chromate $\text{Li}_2\text{CrO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Yellow, crystalline deliquescent powder; soluble in water and forms a eutectic at -60°C. Soluble in alcohols.

Uses: Corrosion inhibitor in alcohol-base antifreezes and water-cooled reactors. Oxidizing agent for organic material, especially in the presence of light.

lithium citrate $\text{Li}_3\text{C}_6\text{H}_5\text{O}_7 \cdot 4\text{H}_2\text{O}$.

Properties: White powder or granules; loses $4\text{H}_2\text{O}$ at 105°C; m.p., decomposes; soluble in water; slightly soluble in alcohol. Low toxicity.

Derivation: Reaction of citric acid with lithium carbonate.

Uses: Beverages; pharmaceuticals; dispersion stabilizer (clay deflocculant).

lithium cobaltite LiCoO_2 . Dark blue powder; insoluble in water. The compound exhibits both the fluxing property of lithium oxide and the adherence-promoting property of cobalt oxide. Low toxicity.

Use: Ceramics.

lithium deuteride LiD .

Properties: Gray crystals; sp. gr. 0.906. Reacts slowly with moist air. Thermally stable to its melting point of 680°C.

Containers: Glass bottles.

Use: Source of deuterium.

lithium dichromate $\text{Li}_2\text{Cr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$.

Properties: Yellowish-red, crystalline powder; sp. gr.

2.34 (30°C); m.p. 130°C; deliquescent; soluble in water; forms eutectic at -70°C.

Uses: Dehumidifying; refrigeration.

lithium ferrosilicon.

Properties: Dark crystalline brittle metallic lumps or powder; evolves flammable gas in contact with moisture. Must be kept cool and dry.

Hazard: Flammable, dangerous fire risk.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

lithium fluoride LiF .

Properties: Fine white powder; sp. gr. 2.635 (20°C); m.p. 842°C; b.p. 1670°C; slightly soluble in water; does not react with water at red heat; soluble in acids and hydrofluoric acid; insoluble in alcohol.

Derivation: Reaction of hydrofluoric acid with lithium carbonate.

Grades: Guaranteed 98% (min) LiF ; C.P.; single pure crystals.

Hazard: Toxic. Strong irritant to eyes and skin. Tolerance: 2.5 mg per cubic meter of air (as F).

Uses: Welding and soldering flux; ceramics; heat-exchange media; synthetic crystals in infrared and ultraviolet instruments; rocket fuel component; radiation dosimetry. Component of fuel for molten salt reactors; x-ray diffraction.

lithium fluorophosphate $\text{LiF} \cdot \text{Li}_3\text{PO}_4 \cdot \text{H}_2\text{O}$.

Properties: White crystals.

Derivation: Interaction of lithium fluoride and lithium phosphate.

Use: Ceramics.

lithium gallate. A material having strong piezoelectric properties; used in electronic devices.

lithium grease. A grease using a lithium soap of the higher fatty acids as a base. Water-resistant; stable when heated above melting point and cooled again. Used in aircraft and low temperature service. See lithium stearate; lubricating grease. Lithium hydroxystearate from hydrogenated castor oil is also widely used.

lithium hydride LiH .

Properties: White, translucent, crystalline mass or powder. Commercial product is light bluish-gray due to minute amount of colloidal dispersed lithium. Sp. gr. (20°C) 0.82; m.p. 680°C; decomposition pressure nil at 25°C, 0.7 mm at 500°C, 760 mm at approx. 850°C. Decomposed by water, forming hydrogen and lithium hydroxide; insoluble in benzene and toluene; soluble in ether.

Derivation: Reaction of molten lithium with hydrogen.

Grades: 93–95%, based on hydrogen evolution.

Containers: Cans; cases; drums.

Hazard: Flammable, dangerous fire risk; ignites spontaneously in moist air. Use dry chemical to extinguish. Tolerance, 0.025 mg per cubic meter of air. (See "Lith-X").

Uses: Desiccant; source of hydrogen; condensing agent in organic synthesis; preparation of lithium amide and double hydrides; nuclear shielding material.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

lithium hydroxide LiOH

Properties: Colorless crystals; sp. gr. 1.46, m.p.

462°C; b.p. 924°C, decomposes; slightly soluble in alcohol and water.

Derivation: Causticizing of lithium carbonate; action of water on metallic lithium; or by addition of Li_2O to water.

Hazard: Water solutions are strong irritants.

Uses: Storage battery electrolyte; carbon dioxide absorbent in space vehicles; lubricating greases; ceramics.

lithium hydroxystearate

$\text{LiOOC}(\text{CH}_2)_{10}\text{CHOH}(\text{CH}_2)_3\text{CH}_3$.

Properties: White powder; m.p. 205°C. Dissolves in hot petroleum oil to form greases. Combustible; low toxicity.

Derivation: From hydrogenated castor oil.

Use: Greasemaking.

lithium hypochlorite LiOCl

Hazard: Strong oxidant; may ignite organic materials.

Uses: Bleach; sanitizing agent.

Shipping regulations: (dry, containing more than 39% available chlorine) (Rail) Yellow label. (Air) Oxidizer label.

lithium iodate LiIO_3

Properties: White powder, sp. gr. 4.487 (25°C); m.p. 50–60°C (transition point from alpha to beta form); soluble in water; insoluble in alcohol. An oxidizing material.

lithium iodide trihydrate $\text{LiI} \cdot 3\text{H}_2\text{O}$

Properties: White crystals; soluble in water and in alcohol. Sp. gr. 3.48 (25°C); m.p. 72°C, loses water; (anhydrous) 450°; b.p. 1171°C. Extremely hygroscopic.

Derivation: Action of hydriodic acid on lithium hydroxide, with subsequent crystallization.

Uses: Air conditioning; catalyst in acetal formation; solubilizes lithium in propylamine; nucleonics.

lithium lactate $\text{LiC}_3\text{H}_5\text{O}_3$

Properties: White odorless powder; very soluble in water with practically neutral reaction. Lithium lactate is nonhygroscopic and stable, whereas sodium lactate can be prepared in solution only.

Use: Wherever a dry alkali lactate is required.

lithium manganite Li_2MnO_3

Properties: Reddish-brown powder. Insoluble in water. Extremely stable.

Hazard: Moderately toxic.

Uses: Smelter addition in the manufacture of frit; as a mill addition; ceramic-bonded grinding wheels.

lithium metaborate dihydrate $\text{LiBO}_2 \cdot 2\text{H}_2\text{O}$

Properties: White crystalline powder; soluble in water; m.p. 840°C (anhydrous).

Uses: Ceramics (flux in enamel cover coats; increases resistance to torsion); welding and brazing (anhydrous form); nucleonics.

lithium metasilicate (lithium silicate) Li_2SiO_3

Properties: White powder; m.p. 1201°C; sp. gr. (25°C) 2.52; insoluble in water.

Uses: Flux in glazes and ceramic enamels; welding rod coating.

lithium methoxide (lithium methylate) LiOCH_3

Properties: White, free-flowing powder; soluble in methanol. Must be protected from moisture.

Grade: Commercially available as a 10% solution in methanol.

Hazard: Solution highly toxic by ingestion.

Uses: Strong base and chemical intermediate where water is undesirable.

lithium methylate. See lithium methoxide.

lithium molybdate Li_2MoO_4 . A white crystalline compound soluble in water. M.p. 705°C; sp. gr. 2.66.

Uses: Steel coating; petroleum cracking catalyst.

lithium niobate (lithium metaniobate) LiNbO_3 . Single crystals available. M.p. 1250°C; sizes up to 6" long and 1/2" diam.

Uses: Infrared detectors; transducer in laser technology.

lithium nitrate LiNO_3

Properties: Colorless powder; sp. gr. 2.38; m.p. 261°C; soluble in water and alcohol.

Derivatoin: Reaction of nitric acid with lithium carbonate.

Grades: Technical; commercially pure; reagent.

Hazard: Dangerous explosion risk when shocked or heated. Strong oxidizing agent.

Uses: Ceramics; pyrotechnics; salt baths; heat-exchange media; refrigeration systems; rocket propellant.

Shipping regulations: Nitrates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

lithium nitride Li_3N

Properties: Brownish-red crystals of hexagonal structure, or fine, free-flowing red powder. Water vapor in moist air causes slow decomposition. Reacts with water giving lithium hydroxide and ammonia. Insoluble in most organic solvents, but sparingly soluble in polyethers. Density approx. 1.3g/cc (25°C); m.p. 845°C; decomposition pressure not measurable below 1250°C.

Hazard: Ignites at high temperatures. Use dry chemicals to extinguish (see "Lith-X").

Uses: Nitriding agent in metallurgy; reducing and nucleophilic reagent in organic reactions; source of bound nitrogen in inorganic reactions.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

lithium orthophosphate. See lithium phosphate.

lithium oxide (lithia) Li_2O

White powder; m.p. 1427°C; density 2.023 g/cc (25°C). A strong alkali.

Hazard: Water solutions of high concentration are strong irritants.

Uses: Ceramics and special glass formulations; carbon dioxide absorbent (mineral water).

lithium perchlorate LiClO_4

Properties: Colorless deliquescent crystals; sp. gr. 2.429; m.p. 236°C; decomposes at 430°C; has more available oxygen than liquid oxygen (on a volume basis). Reacts with 4NH_3 to form an ammoniate. Forms $\text{LiClO}_4 \cdot 3\text{H}_2\text{O}$, colorless crystals with sp. gr. 1.84; m.p. 75°C. Soluble in water and alcohol.

Hazard: Oxidizing agent; dangerous fire and explosion risk in contact with organic materials. Irritating to skin and mucous membranes.

Use: Solid rocket propellants.

Shipping regulations: Perchlorates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

lithium peroxide Li_2O_2

Properties: Fine white powder; m.p., decomposes; density 2.14 g/cc (20°C). In closed container no detectable loss of available oxygen. Soluble in water, 8% (20°C); anhydrous acetic acid, 5.6% (20°C); insoluble in absolute alcohol (20°C).

Derivatoin: Addition of hydrogen peroxide to lithium hydroxide.

Hazard: Dangerous fire and explosion risk in contact with organic materials. Strong oxidizing agent.

Uses: As supplier of active oxygen; commercial samples have 32.5% to 34% available oxygen content.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

lithium prosphate (lithium orthophosphate)

Properties: White, crystalline powder; soluble in acids; slightly soluble in water; sp. gr. 2.41.

lithium ricinoleate $\text{LiOOC}\text{C}_{17}\text{H}_{33}\text{OH}$.

Properties: White powder. M.p. 174°C . Insoluble or limited solubility in most organic solvents. Combustible.

Derivation: Castor oil.

Uses: Alcoholysis and ester interchange catalyst.

lithium silicate. See lithium metasilicate.

lithium silicon. An alloy of lithium and silicon.

Properties: Black, shiny lumps or powder with sharp irritating odor. Keep cool and dry.

Hazard: Dangerous fire risk; reacts with water to form flammable gases.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

lithium stearate $\text{LiC}_{18}\text{H}_{35}\text{O}_2$.

Properties: White crystals; sp. gr. 1.025; m.p. 220°C ; insoluble in cold and hot water, alcohol, and ethyl acetate; forms gels with mineral oils.

Derivation: Reaction of stearic acid with lithium carbonate.

Grades: Grease; cosmetic.

Uses: Cosmetics; plastics; waxes; greases; lubricant in powder metallurgy; corrosion inhibitor in petroleum; flattening agent in varnishes and lacquers; high-temperature lubricant.

lithium sulfate $\text{Li}_2\text{SO}_4 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals; sp. gr. 2.06; m.p. 130°C ; soluble in water, insoluble in 80% alcohol. Does not form alums.

Derivation: Reaction of sulfuric acid with lithium carbonate or with spodumene ore.

Grades: Technical and pharmaceutical.

Uses: Pharmaceutical products; ceramics.

lithium tetraborate $\text{Li}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$.

Properties: White crystalline powder; m.p., loses water 200°C ; very soluble in water, insoluble in alcohol.

Derivation: Reaction of boric acid with lithium carbonate.

Uses: Ceramics; vacuum spectroscopy; metal refining and degassing.

lithium titanate Li_2TiO_3 . White powder. Insoluble in water. Has strong fluxing properties in small percentages in titanium-bearing enamels. The insolubility permits its use in vitreous and semi-vitreous glazes.

lithium tri-tert-butoxyaluminumhydride. See lithium aluminum tri-tert-butoxyhydride.

lithium tungstate Li_2WO_4 . White crystals; sp. gr. 3.71, soluble in water.

lithium vanadate (lithium metavanadate) $\text{LiVO}_3 \cdot 2\text{H}_2\text{O}$

Properties: Yellowish powder; soluble in water

lithium zirconate Li_2ZrO_3 . White powder, insoluble in water. Efficient flux in glasses containing zirconium dioxide; recommended as a flux in zirconium-opacified enamels, glazes and porcelains.

lithium-zirconium silicate $\text{Li}_2\text{O} \cdot \text{ZrO}_2 \cdot \text{SiO}_2$. White powder. A strong flux in enamels, glazes and porcelains. It can be used in place of lithium zirconate.

lithocholic acid $\text{C}_{24}\text{H}_{42}\text{O}_2\text{OH}$. A bile acid.

Properties: Crystallizes in leaflets from alcohol; m.p. $184\text{--}186^\circ\text{C}$. Not precipitated by digitonin. Freely soluble in hot alcohol; soluble in ethyl acetate; slightly soluble in glacial acetic acid; insoluble in water, ligroin.

Derivation: From bile and gallstones; from deoxycholic acid or cholic acid.

Use: Biochemical research.

lithol red. One of a group of pigments made by combining Tobias acid and beta-naphthol.

Available as sodium, barium, and calcium lithols.

Poor resistance to sunlight and weathering; generally good resistance to bleeding and to chemicals.

Uses: Industrial enamels; toys and dipping enamels; rubber, plastics, etc.

lithol rubine $\text{OOC}\text{C}_{10}\text{H}_4(\text{OH})\text{N}:\text{NC}_6\text{H}_4(\text{CH}_3)\text{SO}_2\text{OCa}$.

The calcium salt of an azo pigment, made by diazotizing para-toluidine-meta-sulfonic acid and coupling with 3-hydroxy-2-naphtholic acid. Has poor hiding power; good resistance to bleeding and baking; fair lightfastness and alkali resistance.

Uses: Paints, plastics, printing inks, cosmetics.

lithopone. A white pigment consisting of 28% zinc sulfide and 72% barium sulfate, formerly used widely in paints, white rubber goods, paper, white leather, etc. It has been largely replaced by titanium dioxide pigments.

"Lithosol."²³ Trademark for a group of pigments, specialty dyes, acids and bases. The acids and bases are specially prepared for the manufacture of lakes and organic pigments.

"Lith-X."²⁴ Trademark for a graphite-base dry chemical extinguishing agent suitable for fires of lithium and of metals such as titanium and zirconium.

litmus (lichen blue).

Properties: A blue, amorphous powder (frequently compressed into small cakes or stocks). Soluble in water; changes color with acidity of solution; red at pH 4.5, blue at pH 8.3.

Derivation: By treating lichens (particularly *variolaria lecanora* and *V. roccella*) with ammonia and potash and then fermenting the mass.

Use: Indicator in analytical chemistry where precision is not required; soil testing.

Little, Arthur D. (1863-1935). Born in Boston, Little was a pioneer in the field of industrial research and chemical consulting. Originally an authority on paper technology, he established a consulting industrial chemical laboratory in 1886, which has since become a large institution of world-wide reputation, located in Cambridge, Mass. It has served as a prototype of many industrially oriented consulting firms that have become a significant factor in the growth of research in the last half century. It has made significant contributions in such fields as flavors, food chemistry and acceptability, paper chemistry and rubber chemistry, as well as in corporate management.

liver. A term formerly used to characterize compounds containing sulfides or sulfates, possibly because of the dark brown color, e.g., liver of sulfur, liver of lime, etc. The word is outmoded and should be avoided.

living. A sharp or pronounced increase in the viscosity of a paint or printing ink, as a result of which it becomes a coagulated and unusable mass. This may be due to oxidation or to partial polymerization of the components.

lixivation. See leaching.

"LNA."⁶⁵ Trademark for leucyl aminopeptidase substrate used as diagnostic agent in medicine.

LNG. Abbreviation for liquefied natural gas. See natural gas.

loam. A soil comprised of 25–50% sand, 30–50% silt, and 5–25% clay. See also soil.

"Lo-Bax."⁸⁴ Trademark for a chlorine sterilizer designed especially for handlers of milk and other dairy and food products who require clear, fast-killing bactericidal solutions. It is a stable, quick-dissolving powder containing 50% available chlorine.

"Loctite"⁴⁷⁷ Trademark for anaerobic polymers which retain liquid while exposed to air and which automatically harden without heat or catalysts when confined between closely fitted metal parts. Applied to mating surfaces before, during, and after assembly. Available in range of strengths and viscosities for a wide variety of applications.

locust-bean gum. See carob-seed gum.

"Lodex."²⁴⁵ Trademark for fine particle permanent magnet material and permanent magnets.

logwood (hematoxylin) $C_{10}H_{14}O_6 \cdot 3H_2O$.
See hematein; dye, natural.

"Loloss."⁵⁵¹ Trademark for guar gum drilling fluid additive.

"Lomar."¹⁰⁹ Trademark for condensed naphthalene sulfonate. Used as dispersing agents in paper-making, cement and concrete, gypsum wallboard, emulsion polymerization, dyeing, etc.

"Lomax."⁴¹⁶ Trademark for the catalyst used in the "Isomax" process (q.v.).

London purple, solid. An insecticide containing arsenic trioxide, aniline, lime, and ferrous oxide. Insoluble in water.

Hazard: Highly toxic by ingestion and inhalation.
Shipping regulations: (Rail, Air) Poison label.

loretin (ferron). See 7-iodo-8-hydroxyquinoline-5-sulfonic acid.

"Lorfan" Tartrate.¹⁹⁰ Trademark for a brand of levallorphan tartrate (q.v.).

"Lorite."¹⁴⁸ Trademark for a natural extender composed of predominantly acicular particles containing approximately 80% calcium carbonate and 20% diatomaceous earth. Has a flattening and bodying effect in paints and is recommended for sealers, flats, semi-glosses, undercoaters, and emulsion paints.

"Lorol."²⁸ Trademark for a group of straight-chain (normal) even-numbered-carbon alcohols ranging from C-8 (octyl) to C-18 (stearyl), and including mixtures of these.

Properties: Colorless liquids or white flakes.
Grades: Technical; N.F. ("Lorol" 24, cetyl alcohol); U.S.P. ("Lorol" 28, stearyl alcohol).
Containers: Various up to tank trucks and tank cars.
Uses: Intermediates in manufacture of detergents, lubricating oil additives quaternary ammonium compounds, mercaptans, textile finishing agents, plasticizers, and perfumes; antifoam agents; emulsifying

and softening agents in cosmetics, salves, and ointments.

"Lorothidol."¹⁶² Trademark for bithionol (q.v.).

"Lorox."²⁸ Trademark for either a powder or solution containing linuron (q.v.).

lost wax process. A ceramic or metal casting method used to make reproductions of sculptured pieces, and adapted to industry for manufacture of precision metal parts. It is generally known as precision investment casting. The sequence of operations is (1) a wax prototype is made in a metal mold; (2) several of these are attached to a central member, also made of wax to form a "tree"; (3) the tree is dipped and dried eight times in a ceramic glaze, thus building up a coating or "investment"; (4) the assembly is baked in an oven, thus melting out the wax, leaving a cavity which is then used as a mold for liquid metal. Great accuracy can be obtained with this method. The exact nature of the waxes and coatings are not disclosed.

"Lotol."²⁴⁸ Trademark for a series of compounded latices, based on all synthetic and natural types.

"Loupole."³⁰⁹ Trademark for a detergent used for boiling-off rayon piece goods at low and elevated temperatures; particularly recommended for graphite streak removal; has good compatibility with soap and other detergents.

"Lovibond."⁵⁸¹ Trademark for a color analysis technique for petroleum products used chiefly in England, but never adopted by ASTM.

low-alloy steel. See alloy steel.

low explosive. See explosive, low.

low-melting alloy. See alloy, fusible.

low-pressure resin. See contact resin.

low-soda alumina. Aluminum oxide (Al_2O_3) with less than 0.15% sodium oxide (Na_2O) content.

Use: High-grade electric insulators and other ceramic bodies.

LOX. An abbreviation for liquid oxygen, especially when used as a rocket fuel.

"Loxite."⁷²⁷⁷ Trademark for rubber cements, dispersions, and latices, consisting of natural and synthetic rubbers and reclaimed rubbers in latex form, dispersed in water or dissolved in solvents.

Containers: 55-gal drums.

Uses: Impregnating and spreading paper and textiles; adhesives for rubber to metal, rubber to rubber, etc.

LPG. Abbreviation for liquefied petroleum gas (q.v.).

Lr Symbol for element lawrencium.

LSD. Abbreviation for lysergic acid diethylamide (q.v.).

"L-70 Series Surfactants."²¹⁴ Trademark for a class of organo-silicones.

Uses: Wetting agents, emulsifiers and coemulsifiers, penetrants, foamers and foam stabilizers, defoamers, lubricants, leveling agents, antistats, and textile softeners.

"LSW Dyes"²⁵⁶ Trademark for a series of disperse dyes for polyester fibers.

LTH. Abbreviation for luteotropic hormone. See lutetotropin.

Lu Symbol for lutetium.

lube oil additive. A chemical added in small amounts to lubricating oils to impart special qualities, such as low pour point when chlorinated hydrocarbons are added. Other special properties are:

low viscosity index	butene polymers
detergent and suspensoid properties	metallic stearate soaps
oxidation stability	calcium stearate
reduced foaming tendency	silicone compounds
resistance to high operating temperatures	phosphorus pentasulfide, zinc dithiophosphate

Note: The effect of automotive antipollution devices, which increase the operating temperatures of engines, upon lubricating oils and their additives is being thoroughly researched by lube oil manufacturers. Results may increase the use of some types and reduce or eliminate others.

lubricant, solid. A material having a characteristic crystal habit which causes it to shear into thin, flat plates, which readily slide over one another and thus produce an antifriction or lubricating effect. See mica, graphite, molybdenum disulfide, talc, boron nitride.

lubricant, synthetic. Any of a number of organic fluids having specialized and effective properties that are required in cases where petroleum-derived lubricants are inadequate. Each type has at least one property not found in conventional lubricants. Though their cost is much higher, they can be used over a wide range of temperatures and are stable to heat and oxidation. The major types are polyglycols (hydraulic and brake fluids), phosphate esters (fire-resistant), dibasic acid esters (aircraft turbine engines), chlorofluorocarbons (aerospace), silicone oils and greases (electric motors, antifriction bearings), silicate esters (heat-transfer agents and hydraulic fluids), neopentyl polyol esters (turbine engines), and polyphenyl ethers (excellent heat and oxidation resistance, but poor performance at low temperatures). An unusual property of synthetic lubricants is their exceptional resistance to ionizing radiation.

lubricating grease. A mixture of a mineral oil or oils with one or more soaps. The most common soaps are those of sodium, calcium, barium, aluminum, lead, lithium, potassium and zinc. Oils thickened with residuum, petrolatum or wax may be called greases. Some form of graphite may be added. Greases range in consistency from thin liquids to solid blocks and in color from transparent to black. The specifications for a grease are determined by the speed, load, temperature, environment, and metals in the desired application. Texture of grease may be smooth, buttery, ropy or stringy, fibrous, spongy, or rubbery. The texture does not necessarily indicate the viscosity of the grease, but is related to the formulation and methods of manufacture. See also lubricating oil.

lubricating oil (lube oil). A selected fraction of refined mineral oil used for lubrication of moving surfaces, usually metallic, and ranging from small precision machinery (watches) to the heaviest equipment. Lubricating oils usually have small amounts of additives to impart special properties such as viscosity index and detergency. They range in consistency

from thin liquids to grease-like substances. In contrast to lubricating greases, lube oils do not contain solid or fibrous materials. See also porpoise oil; transformer oil; lubricant, synthetic; extreme-pressure additive (2); lube oil additive.

lubrication. The introduction of a substance of low viscosity between two adjacent solid surfaces, one of which is in motion (bearing). From an engineering point of view, the chemical nature of the substance is not of critical importance. Thus materials as diverse as air, water, and molasses could theoretically be used as lubricants under appropriate conditions. Air and water have been used, as well as some solids such as graphite; but in general oils, fats, and waxes are utilized. The ability of a substance to act as a lubricant is sometimes called lubricity. See also lubricant, solid.

"Lubricin" N-1.²⁰² Trademark for a low viscosity ricinoleate derivative that increases the oiliness and wetting power of mineral oils; decreases corrosion, and exhibits detergent action on tar, varnish, and carbon deposits.

Used as an additive for lubricating oils, motor fuels, and cutting oils.

"Lubricin" V-1.²⁰² Trademark for a lubricant which facilitates the processing of rigid vinyl plastics.

lubricity. See lubrication.

"Lubriseal."¹⁶ Trademark for a lubricating, sealing, and rust-inhibiting stopcock grease or spray.

"Lubrol" 90.³²⁵ Trademark for an oleic acid-ethylene oxide condensate. Emulsifier for mineral oil, kerosine, fatty acid esters.

"Lucalox."²⁴⁵ Trademark for a transparent, polycrystalline alumina; used in special lamp bulbs to produce a golden white light considered superior for industrial, commercial, outdoor and consumer lighting applications.

"Lucidol."¹⁵⁴ Trademark for benzoyl peroxide (q.v.).

luciferase. An enzyme occurring only in fireflies. See luciferin.

luciferin. An albumin present in some animals (notably fireflies) which, under the influence of the enzyme luciferase, exhibits bioluminescence. When luciferin (along with luciferase) comes in contact with adenosine triphosphate, present in all living cells, a chemical reaction occurs which causes luminescence. By correlating its intensity with the amount of adenosine triphosphate present, a means of measuring bacterial growth is obtained. Applications in biomedical technology are envisaged for this so-called "luminescence biometer."

"Lucite."²¹ Trademark for acrylic resins consisting of a series of polymeric esters of methacrylic acid, $\text{CH}_2\text{C}(\text{CH}_3)\text{COOR}$, in which R is methyl, ethyl, n-butyl, isobutyl, or combinations of these alkyl groups. These are water-white, transparent, thermoplastic resins in granular or solution forms; used in lacquers, coatings, adhesives, modifiers for other resins. "Lucite" is also a trademark for an acrylic monomer, methyl methacrylate; for acrylic resins, in the form of injection molding and extrusion powders; for acrylic resin dental materials; and for acrylic syrup, a liquid methyl methacrylate for use in translucent and decorative panels. See acrylic resin

"**Ludox.**"²⁸ Trademark for series of aqueous colloidal silica sols.

Uses: Floor polishes; paints; adhesives; paper coatings; catalyst supports; latex products; textile cleaning treatments; photosensitized paper, binder for inorganic fibrous materials; reactant for synthetic silicates.

"**Lugatol.**"⁴⁴⁰ Trademark for anionic dyes having good tinctorial and fastness properties for all kinds of leather.

Lugol's solution. An aqueous solution containing 5 g iodine and 10 g potassium iodide per 100 ml water. Grade: U.S.P.

Uses: Medicine and pharmaceuticals.

"**Lumatex.**"⁴⁴⁰ Trademark for a series of mineral and organic pigment dyestuffs which can be fixed on all types of textile fibers with suitable binders.

"**Lumigraphic**" **Pigments.**²⁶⁶ Trademark for fluorescent dyestuffs on a resin base. Used in poster paints, inks, plastics, etc., where extreme brightness and daylight fluorescing properties are desirable.

"**Luminal.**"¹⁶² Trademark for phenobarbital (q.v.). See also barbiturate.

luminescence. The emission of visible or invisible radiation unaccompanied by high temperature by any substance as a result of absorption of exciting energy in the form of photons, charged particles, or chemical change. It is a general term which includes both fluorescence and phosphorescence. Special types are chemiluminescence, bioluminescence, electroluminescence, photoluminescence, and triboluminescence. Common examples are light from the firefly, fluorescent lamp tubes and television screens. See also fluorescence; phosphorescence; phosphor.

lupanine $C_{15}H_{24}N_2O$. An alkaloid. Both dextro and levo forms are known. The latter is a colorless oil. The material has also been described as a yellow syrupy liquid with green fluorescence.

Properties: (*d*-form) White needles; m.p. 40°C; distills undecomposed at 220°C (10 mm); slightly soluble in water, with an alkaline reactant; soluble in alcohol, ether, and chloroform; refractive index (*n* 24/D) 1.5444.

Derivation: From the seeds of *Lupinus albus* and *Lupinus angustifolius*.

Use: Medicine.

"**Luperco.**"¹⁵⁴ Trademark for a series of organic peroxides including aromatic diacyl, ketone, and alkyl peroxides.

Hazard: See peroxide (1).

Uses: Crosslinking polyethylene; curing synthetic and natural rubber; vinyl polymerization initiator; catalyst in polyester and vinyl monomers; mild organic oxidizing agents.

"**Luperox.**"¹⁵⁴ Trademark for a group of organic peroxides.

2,5-2,5. 2,5-Dimethylhexane-2,5-dihydroperoxide.

6. Technical bis(1-hydroxycyclohexyl) peroxide.

118. 2,5-Dimethylhexane-2,5-diperoxybenzoate.

Hazard: See peroxide (1).

Uses: Catalyst for polymerization of polyesters and vinyls; elastomer vulcanization.

"**Lupersol.**"¹⁵⁴ Trademark for a group of organic compounds including aliphatic diacyl peroxides, ketone peroxides, alkyl peroxyesters, and alkyl peroxides.

Hazard: See peroxide (1).

Uses: Polyethylene crosslinking, elastomer vulcanization, vinyl and polyester polymerization; replacement for MEK peroxide; pharmaceutical and fumigant applications.

2,6-lupetidine. See 2,6-dimethylpiperidine.

"**Lupolen.**"⁴⁴⁰ Trademark for series of high- and low-density polyethylenes.

"**Luposec.**"³⁰⁹ Trademark for a stable cationic emulsion of waxes with aluminum salts used in one-bath method for showerproofing or water-repelling all textile fabrics.

"**Luposol.**"³⁰⁹ Trademark for a prepared solution of locust bean gum used for finishing or as a printing paste.

"**Luran S**" (ASA polymer).⁴⁴⁰ Trademark for acrylic ester-modified styrene-acrylonitrile terpolymer. A thermoplastic material claimed to be excellent for outdoor use. Highly resistant to sunlight and weathering.

"**Lurex.**"³⁶⁵ Trademark for metallic yarns produced in two forms: (1) lamination of clear plastic films and metallic foil or metallized film; (2) plastic film metallized and coated on both sides with a protective plastic lacquer.

Lurgi process. A coal gasification method in which synthesis gas is obtained from coal by reaction with steam and oxygen. The gas mixture is then catalytically methanated in a fixed-bed reactor at high temperature. A methane content of 90 to 95% and a Btu value of about 1000 is possible. The Lurgi process can also be adapted to production of methyl alcohol. Some 15 plants using this process are in production throughout the world. See also gasification.

"**LuSoil.**"⁹⁹ Trademark for a mineral soil conditioner derived from attapulgite.

"**Lustan.**"⁵¹ Trademark for a pair of glass mold release agents; one grade is an emulsion-type product, the other is graphite-in-oil type.

luster. The appearance of the surface of a substance in reflected light. The term is used particularly in describing minerals. Types of luster are: (a) metallic, like metals, or the mineral pyrite; (b) vitreous, like glass or quartz; (c) adamantine, exceedingly brilliant, like diamond; (d) resinous, like resin, or sphalerite; (e) dull, not bright or shiny; like chalk. See also delustrant.

"**Lustran.**"⁵⁸ Trademark for ABS and SAN molding and extruding compounds.

"**Lustrasol.**"³⁶ Trademark for acrylic and acrylic-modified alkyd solutions.

"**Lustre-Phos.**"⁵⁸ Trademark for dentifrice grade of calcium orthophosphate.

"**Lustrex.**"⁵⁸ Trademark for styrene molding compound, and extruding and calendaring material.

"**Lustrone**"²³ Trademark for plasticized nitrocellulose lacquers tinted with dyes.

Use: Transparent color effects on leather.

lutein. A yellow pigment isolated from the corpus luteum, and found in body fats and egg yolks. It is a carotenoid and is similar to, or identical with xanthophyll (q.v.).

luteotropin (adenohypophyseal luteotropin; prolactin; lactogenic hormone; LTH). One of the hormones

secreted by the anterior lobe of the pituitary gland. It aids in causing growth of the mammary gland and initiates milk secretion by the mammary gland; it also influences the activity of the corpus luteum, including the secretion of progesterone.

Properties: Crystalline protein; molecular weight about 33,300; almost insoluble in water; soluble in dilute acids and acidified methanol and ethanol.

Use: Medicine.

lutetia. See lutetium oxide. See also rare earths.

lutetium Lu. Metallic element. Atomic number 71; group IIIB of the periodic table; a lanthanide rare-earth. Atomic weight 174.97; valence 3. It has one natural radioactive isotope (Lu-176) with half-life of 2.2×10^{10} years. See rare-earth metals.

Properties: Metallic luster. Soft and ductile. Sp. gr. 0.849; m.p. 1652°C; b.p. 3327°C; reacts slowly with water; soluble in dilute acids. Difficult to isolate. Generally low toxicity.

Occurrence: Monazite (about 0.003%) (India, Brazil, Africa, Australia, U.S.).

Derivation: Reduction of the fluoride or chloride with calcium.

Grades: Regular, high purity (ingots, lumps).

Use: Nuclear technology.

lutetium chloride $\text{LuCl}_3 \cdot x\text{H}_2\text{O}$. (Anhydrous) sp. gr. 3.98; m.p. 905°C. Water-soluble.

Purity: Up to 99.9% lutetium salts.

Containers: Glass bottles; fiber drums.

lutetium fluoride $\text{LuF}_3 \cdot 2\text{H}_2\text{O}$. (Anhydrous) m.p. 1182°C; b.p. 2200°C. Insoluble in water.

Purity: Up to 99.9% lutetium salts.

Containers: Glass bottles; fiber drums.

Hazard: Toxic and irritant. Tolerance (as F): 2.5 mg per cubic meter of air.

lutetium nitrate $\text{Lu}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$.

Purity: Up to 99.9% lutetium salts.

Containers: Glass bottles; fiber drums.

Hazard: Fire and explosion risk.

Shipping regulations: Nitrates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

lutetium oxide (lutetia) Lu_2O_3 .

Properties: White solid; slightly hygroscopic; m.p. about 2500°C; sp. gr. 9.42; absorbs water and carbon dioxide.

Derivation: Monazite sand.

Grades: Up to 99.9% purity

Containers: Glass bottles; fiber drums

lutetium sulfate $\text{Lu}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$. Soluble in water

Purity: Up to 99.9% lutetium salts

Containers: Glass bottles, fiber drums

2,6-lutidine (2,6-dimethylpyridine)

$\text{NC}(\text{CH}_3)\text{C}(\text{CH}_3)\text{CHCHCH}_2\text{CH}_3$.

Properties: Colorless oily liquid, peppermint odor, sp. gr. 0.932, b.p. 143°C, f.p. -6.6°C, refractive index 1.4973 (n_D 20). Derived from coal tar

Hazard: May be toxic and flammable

Uses: Pharmaceuticals, resins, dyestuffs, rubber accelerators, insecticides.

Also available as 2,3-, 2,4-, 2,5-, 3,4-, 3,5- isomers

"Lutonal,"TM Trademark for vinyl ether polymers, solid and in solution

"Luxapole" W-1054-R,TM Trademark for a specially prepared sulfonated oil finish, used in textile finishing

"Luxol,"TM Trademark for a series of spirit and lacquer-soluble dyes. Used in lacquers, wood stains, stamp inks, ball point pen inks.

"Luxolene,"TM Trademark for glycerol and sulfated glycerol trioleate.

"LX-685,"TM Trademark for a heat-reactive resin used in the manufacture of ready-mixed aluminum paints, grease- and gasoline-resistant coatings, floor and deck enamels and concrete curing compounds

"Lyamine,"TM Trademark for lysine for use as an animal feed supplement.

"Lycedan,"TM Trademark for a brand of adenosine-5-phosphoric acid for medicinal use.

lycopene $\text{C}_{40}\text{H}_{56}$. A long-chain hydrocarbon with thirteen double bonds, of which eleven are conjugated. Related to carotene (q.v.). Combustible; nontoxic.

Properties: Red crystals; m.p. 175°C; soluble in chloroform and carbon disulfide; slightly soluble in alcohol; insoluble in water.

Source: The main pigment of tomato, paprika, rose hips, etc.

"Lycra,"TM Trademark for a spandex fiber (q.v.) in the form of continuous monofilaments. Available in yarn with denier from 40 to 2240.

Properties: Sp. gr. 1.21 tensile strength 0.8 gpd; break elongation 550%; moisture regain 1.3%; m.p. 230°C; tensile recovery 95% from 50% elongation; soluble in dimethyl formamide (hot). Combustible, but self-extinguishing.

Uses: Foundation garments, swim wear, surgical hose, and other elastic products.

lye. See sodium hydroxide and potassium hydroxide

"Lykapon,"TM Trademark for sodium hydrosulfite (q.v.)

lyocratic. See lyophilic.

"Lyofix,"TM Trademark for thermosetting resins and aftertreating agents used in textile processing

lyophilic. Characterizing a material which readily goes into colloidal suspension in a liquid, if into water, it is called hydrophilic. The colloid is stabilized by the formation of an adsorbed layer of molecules of the dispersing medium about the suspended particles. Systems of this type are said to be lyocratic. Examples: glue, gelatin, milk fat particles

lyophilization. See freeze-drying

lyophobic. Characterizing a material which exists in the colloidal state but with a tendency to repel liquids, if the liquid is water, the material is called hydrophobic. Such colloids are generally stabilized by the adsorption of ions, and coagulate when the charge is neutralized. Examples: colloidal gold, colloidal arsenic sulfide

Lys. Symbol for lysine

lysergic acid $\text{C}_{17}\text{H}_{19}\text{NO}$. Structure based on a condensed 4-ring nucleus

Properties: Crystallized with 1-2 molecules of water in plates from water. M.p. 24°C (dec). It is amphoteric, moderately soluble in pyridine, slightly soluble in water and neutral organic solvents, soluble in alkaline and acid solutions.

Derivation: Alkaline hydrolysis of ergot alkaloids, organic synthesis

Uses: Medical research, synthesis of ergot alkaloids

D-lysergic acid diethylamide (LSD) $C_{20}H_{25}N_3O$. Synthetic derivative of lysergic acid. Only the D-form is active. Tasteless, colorless, odorless.

Hazard: A strong hallucinatory and habit-forming drug, with possible mutagenic effects. Manufacture and sale are under legal restraint.

lysidine (methylglyoxalidine) $CH_3CNCH_2CH_2NH_2$.

Properties: Colorless, hygroscopic crystals; mousy odor; m.p. 105°C ; b.p. 195°C . Soluble in water, alcohol, and ether.

Derivation: From ethylenediamine hydrochloride and sodium acetate by dry distillation, decomposing the hydrochloride of the new base with concentrated potassium hydroxide and crystallizing.

Method of purification: Recrystallization.

Grades: Technical; 50% solution.

Containers: Glass bottles.

Use: Medicine.

lysine (alpha, epsilon-diaminocaproic acid; Lys.)

$NH_2(CH_2)_4CH(NH_2)COOH$. An essential amino acid.

Properties: Colorless crystals; soluble in water; slightly soluble in alcohol; insoluble in ether; optically active. D(-)-lysine, m.p. 224°C with decomposition. L(+)-lysine, m.p. 224°C with decomposition. Nontoxic.

Derivation: Extraction of natural proteins; synthetically by fermentatoin of glucose or other carbohydrates, and by synthesis from caprolactam.

Uses: Biochemical and nutritional research; pharmaceuticals; culture media; fortification of foods and feeds (wheat flour); nutrient and dietary supplement; animal feed additive. Commercially available as DL- and L-lysine monohydrochloride.

lysozyme. An enzyme found in egg white. By hydrolyzing certain sugar linkages in glycoproteins, it can dissolve the mucopolysaccharides found in the walls of certain bacteria, and hence acts as a mild antiseptic. Its three-dimensional structure has been determined by x-ray crystallography. It is a molecule containing about 2200 atoms composing 129 amino acid units strung together and intricately folded (molecular weight 14,500).

M

m Abbreviation for meter.

M Abbreviation for molar, used to characterize the concentration of a solution. A molar solution contains one mole of a substance in one liter of solution.

m- Abbreviation for meta- (q.v.).

μm Abbreviation for micrometer (q.v.).

mm Abbreviation for millimicron (q.v.).

MAC. Abbreviation for methyl allyl chloride (q.v.).

"Macaloid."²³⁶ Trademark for a creamy white beneficiated clay (a magnesium montmorillonite) used as a thickening agent, adsorbent, flocculating agent, and stabilizer for emulsions and suspensions in aqueous systems. Used primarily in paints, cosmetics, and pharmaceuticals.

"Mace" (also called "Chemical Mace"). Trademark for a riot control gas dispersed as an aerosol. See chloroacetophenone.

M acid. See 1-amino-5-naphthol-7-sulfonic acid.

macromolecule. A molecule, usually organic, comprised of an aggregation of hundreds or thousands of atoms. Such giant molecules are in general of two types. (1) Individual entities (compounds) that cannot be subdivided without losing their chemical identity; typical of these are proteins, many of which have molecular weights running into the millions. (2) Combinations of repeating chemical units (monomers) linked together into chain or network structures called polymers; each monomer has the same chemical constitution as the polymer, e.g., isoprene (C_5H_8) and polyisoprene (C_5H_8). Synthetic elastomers (plastics) are typical of this kind of macromolecule; cellulose is the most common example found in nature. Most macromolecules are in the colloidal size range. See also polymer, high; protein; colloid chemistry.

macrose. See dextran.

madder. A natural dyestuff. See alizarin; lake; dye, natural.

Maddrell's salts (IMP). Insoluble sodium metaphosphate, $NaPO_3 \cdot II$ and $NaPO_3 \cdot III$. See sodium metaphosphate.

mafenide hydrochloride (para-aminomethylbenzenesulfonamide hydrochloride; marfanil)
(SO_2NH_2) $C_6H_4CH_2NH_2 \cdot HCl$.

Properties: White crystals; freely soluble in water; m.p. 260–265°C.

Use: Medicine (ear infection; treatment of burns).

"MagAmp."²⁴¹ Trademark for magnesium ammonium phosphate (q.v.).

"Magcarb."¹²³ Trademark for magnesium carbonate (q.v.).

magenta. See fuchsin.

"Mag-Li-Kote."¹³⁹ Trademark for a burned dolomite, ground; used for coating pig casting machine molds, cinder ladles, stools and ingot molds.

"Maglite."¹²³ Trademark for light magnesium oxide.

mag-lith. A magnesium-lithium alloy suggested as a structural metal in space vehicles.

magma.

(1) In medicine, a class of preparations in which finely divided, freshly precipitated, insoluble, inorganic hydroxides are suspended in water to form a viscous, opaque mixture which may settle out on standing. Magmas of bismuth, magnesium and iron are used, commonly called milk of bismuth, milk of magnesia, etc.

(2) In geology, a molten mass within the earth's crust (e.g., lava). The source of igneous rock.

magnalium. An alloy of aluminum and magnesium.

magnesia. Magnesium oxide that has been specially processed. See magnesium oxide.

magnesia alba. See magnesium carbonate; magnesium carbonate, basic.

magnesia-alumina $MgO \cdot Al_2O_3$. A synthetic spinel.

magnesia, burnt. See magnesite, dead-burned.

magnesia, calcined. See magnesite, caustic-calcined.

magnesia, caustic-calcined. See magnesite, caustic-calcined.

magnesia-chromia $MgO \cdot Cr_2O_3$. A synthetic spinel.

magnesia, dead-burned. See magnesite, dead-burned.

magnesia, fused. Used as a refractory and to handle electricity at high temperatures. See "Magnorite."

magnesia, lightburned. A special high-purity magnesium oxide.

magnesite. Natural magnesium carbonate ($MgCO_3$). The term magnesite is loosely used as a synonym for magnesia, as are also the terms caustic-calcined magnesite, dead-burned magnesite, and synthetic magnesite.

Properties: White, yellowish, grayish-white or brown crystalline solid. Sp. gr. 3–3.12; Mohs hardness 3.5–4.5.

Occurrence: United States (California, Washington, Nevada); Austria; Greece.

Uses: To make the various grades of magnesium oxide; to produce carbon dioxide.

See also magnesium carbonate.

magnesite, burnt. See magnesite, dead-burned.

magnesite, caustic-calcined (caustic-calcined magnesia; calcined magnesite; calcined magnesia). Principally magnesia (magnesium oxide) MgO . The product obtained by firing magnesite, or other substances convertible to magnesia upon heating, at temperatures

D-lysergic acid diethylamide (LSD) $C_{20}H_{25}N_3O$. Synthetic derivative of lysergic acid. Only the D-form is active. Tasteless, colorless, odorless.

Hazard: A strong hallucinatory and habit-forming drug, with possible mutagenic effects. Manufacture and sale are under legal restraint.

lysidine (methylglyoxalidine) $CH_3\overline{CNCH_2CH_2NH}$.

Properties: Colorless, hygroscopic crystals; mousy odor; m.p. 105°C ; b.p. 195°C . Soluble in water, alcohol, and ether.

Derivatn: From ethylenediamine hydrochloride and sodium acetate by dry distillation, decomposing the hydrochloride of the new base with concentrated potassium hydroxide and crystallizing.

Method of purification: Recrystallization.

Grades: Technical; 50% solution.

Containers: Glass bottles.

Use: Medicine.

lysine (alpha, epsilon-diaminocaproic acid; Lys.)

$NH_2(CH_2)_4CH(NH_2)COOH$. An essential amino acid.

Properties: Colorless crystals; soluble in water; slightly soluble in alcohol; insoluble in ether; optically active. D(-)-lysine, m.p. 224°C with decomposition. L(+)-lysine, m.p. 224°C with decomposition. Nontoxic.

Derivation: Extraction of natural proteins; synthetically by fermentatoin of glucose or other carbohydrates, and by synthesis from caprolactam.

Uses: Biochemical and nutritional research; pharmaceuticals; culture media; fortification of foods and feeds (wheat flour); nutrient and dietary supplement; animal feed additive. Commercially available as DL- and L-lysine monohydrochloride.

lysozyme. An enzyme found in egg white. By hydrolyzing certain sugar linkages in glycoproteins, it can dissolve the mucopolysaccharides found in the walls of certain bacteria, and hence acts as a mild antiseptic. Its three-dimensional structure has been determined by x-ray crystallography. It is a molecule containing about 2200 atoms composing 129 amino acid units strung together and intricately folded (molecular weight 14,500).

M

MAC. Abbreviation for methyl allyl chloride (q.v.).

"Macaloid."²³⁶ Trademark for a creamy white beneficiated clay (a magnesium montmorillonite) used as a thickening agent, adsorbent, flocculating agent, and stabilizer for emulsions and suspensions in aqueous systems. Used primarily in paints, cosmetics, and pharmaceuticals.

"Mace" (also called "Chemical Mace"). Trademark for a riot control gas dispersed as an aerosol. See chloroacetophenone.

M acid. See 1-amino-5-naphthol-7-sulfonic acid.

macromolecule. A molecule, usually organic, comprised of an aggregation of hundreds or thousands of atoms. Such giant molecules are in general of two types. (1) Individual entities (compounds) that cannot be subdivided without losing their chemical identity; typical of these are proteins, many of which have molecular weights running into the millions. (2) Combinations of repeating chemical units (monomers) linked together into chain or network structures called polymers; each monomer has the same chemical constitution as the polymer, e.g., isoprene (C_5H_8) and polyisoprene ($(C_5H_8)_n$). Synthetic elastomers (plastics) are typical of this kind of macromolecule; cellulose is the most common example found in nature. Most macromolecules are in the colloidal size range. See also polymer, high; protein; colloid chemistry.

macrose. See dextran.

madder. A natural dyestuff. See alizarin; lake; dye, natural.

Maddrell's salts (IMP). Insoluble sodium metaphosphate, $NaPO_3-II$ and $NaPO_3-III$. See sodium metaphosphate.

mafenide hydrochloride (para-aminomethylbenzenesulfonamide hydrochloride; marfanil)
 $(SO_2NH_2)C_6H_4CH_2NH_2 \cdot HCl$.

Properties: White crystals; freely soluble in water; m.p. 260–265°C.

Use: Medicine (ear infection; treatment of burns).

"MagAmp."²⁴¹ Trademark for magnesium ammonium phosphate (q.v.).

"Magcarb."¹²³ Trademark for magnesium carbonate (q.v.).

magenta. See fuchsin.

"Mag-Li-Kote."¹³⁹ Trademark for a burned dolomite, ground; used for coating pig casting machine molds, cinder ladles, stools and ingot molds.

"Maglite."¹²³ Trademark for light magnesium oxide.

mag-lith. A magnesium-lithium alloy suggested as a structural metal in space vehicles.

magma.

(1) In medicine, a class of preparations in which finely divided, freshly precipitated, insoluble, inorganic hydroxides are suspended in water to form a viscous, opaque mixture which may settle out on standing. Magmas of bismuth, magnesium and iron are used, commonly called milk of bismuth, milk of magnesia, etc.

(2) In geology, a molten mass within the earth's crust (e.g., lava). The source of igneous rock.

magnalium. An alloy of aluminum and magnesium.

magnesia. Magnesium oxide that has been specially processed. See magnesium oxide.

magnesia alba. See magnesium carbonate; magnesium carbonate, basic.

magnesia-alumina $MgO \cdot Al_2O_3$. A synthetic spinel.

magnesia, burnt. See magnesite, dead-burned.

magnesia, calcined. See magnesite, caustic-calcined.

magnesia, caustic-calcined. See magnesite, caustic-calcined.

magnesia-chromia $MgO \cdot Cr_2O_3$. A synthetic spinel.

magnesia, dead-burned. See magnesite, dead-burned.

magnesia, fused. Used as a refractory and to handle electricity at high temperatures. See "Magnorite."

magnesia, lightburned. A special high-purity magnesium oxide.

magnesite. Natural magnesium carbonate ($MgCO_3$). The term magnesite is loosely used as a synonym for magnesia, as are also the terms caustic-calcined magnesite, dead-burned magnesite, and synthetic magnesite.

Properties: White, yellowish, grayish-white or brown crystalline solid. Sp. gr. 3–3.12; Mohs hardness 3.5–4.5.

Occurrence: United States (California, Washington, Nevada); Austria; Greece.

Uses: To make the various grades of magnesium oxide; to produce carbon dioxide.

See also magnesium carbonate.

magnesite, burnt. See magnesite, dead-burned.

magnesite, caustic-calcined (caustic-calcined magnesia; calcined magnesite; calcined magnesia). Principally magnesia (magnesium oxide) MgO . The product obtained by firing magnesite, or other substances convertible to magnesia upon heating, at temperatures

below 1450°C so that some carbon dioxide is retained (2-10%) and the magnesia displays adsorptive capacity or activity.

Grades: Technical; chemical; synthetic rubber; U.S.P. (light, medium light, heavy).

Containers: Bags; cartons; car lots.

Uses: Magnesium oxychloride and oxysulfate cements; 85% magnesium oxide insulation; rubber (reinforcing agent, accelerator); uranium processing; chemical processing; rayon; refractories; paper pulp; acid-neutralizing fertilizers; welding rod coatings, fillers, glass constituents, abrasives.

See also magnesium oxide.

magnesite, dead-burned (burnt magnesia; dead-burned magnesia; refractory magnesia; burnt magnesite) Magnesium oxide, MgO . The granular product obtained by burning (firing) magnesite, or other substances convertible to magnesia upon heating, above 1450°C long enough to form . . . granules suitable for use as a refractory . . . (ASTM). Synthetic magnesium hydroxide or chloride is sometimes used instead of magnesite as a source.

Grades: 85-87% (from magnesite ores); 97-99% (from sea water and brines).

Containers: Bulk; car lots.

Uses: Refractories, as grains or basic brick, the latter especially in open hearth furnaces for steel, furnaces for nonferrous metal smelting, and in cement and other kilns.

See also magnesium oxide.

"Magnesite H-W."⁴⁴⁶ Trademark for an over 90% burned magnesia brick with minor added components to control properties. Resistant to molten metal and basic slags. Used in open hearth furnaces, electric steel furnaces, copper and nickel converters, refining industries, and other metallurgical industries.

magnesite, synthetic. Magnesium oxide, MgO , as obtained from sea water, sea water bitterns, or well brines. The preliminary product is usually magnesium hydroxide or chloride, which is then heated, or sometimes treated with steam and heated in the case of the chloride, to obtain the oxide. Synthetic magnesite constitutes the purer grades of dead-burned magnesite.

magnesium Mg Metallic element of atomic number 12, Group IIA of the Periodic Table. Atomic weight 24.305; valence 2. There are three isotopes.

Properties: Silvery, moderately hard metal, readily fabricated by all standard methods. Lightest of the structural metals. Strong reducing agent. Electrical conductivity similar to aluminum. Sp. gr. 1.74; m.p. 650°C; b.p. 1107°C. Soluble in acids; insoluble in water. Magnesium is the central element of the chlorophyll molecule; it is also an important component of red blood corpuscles.

Sources: Magnesite and dolomite; sea water and brines.

Derivation: (a) Electrolysis of fused magnesium chloride (Dow sea-water process); (b) reduction of magnesium oxide with ferrosilicon (Pidgeon process).

Forms available: Ingots; bars; fine powder (up to 99.6% pure); sheet and plate; rods; tubing; ribbon; flakes.

Hazard: (solid metal) Combustible at 650°C; (powder, flakes, etc.). Flammable, dangerous fire hazard. Use dry sand or talc to extinguish.

Uses: Alloys for structural parts, die-cast auto parts, missiles, space vehicles; powder for pyrotechnics and flash photography; production of iron, nickel, zinc, etc.; magnesium compounds and Grignard syntheses;

cathodic protection; reducing agent; precision instruments; optical mirrors; dry and wet batteries.

Shipping regulations: (Rail) (powder, ribbon, etc.)

Yellow label; (dross) Consult regulations. (Air) (pellets, powder, ribbon, etc.) Flammable Solid label; (dross, wet) Not acceptable; (dross, dry) Not restricted.

magnesium acetate (a) $Mg(OOCCH_3)_2$ or (b) $Mg(OOCH_3)_2 \cdot 4H_2O$.

Properties: Colorless crystalline aggregate or monoclinic crystals. Acetic acid odor. (a) M.p. 323°C, sp. gr. 1.42, (b) m.p. 80°C, sp. gr. 1.45. Soluble in water and (dilute) alcohol.

Derivation: Interaction of magnesium carbonate and acetic acid.

Uses: Dye fixative in textile printing; medicine; deodorant, disinfectant and antiseptic.

magnesium acetylacetonate $MgC_5H_7O_2)_2$. Crystalline powder. Slightly soluble in water. Resistant to hydrolysis. A chelating nonionizing compound.

magnesium ammonium orthophosphate. See magnesium ammonium phosphate.

magnesium ammonium phosphate (magnesium ammonium orthophosphate) $MgNH_4PO_4 \cdot 6H_2O$.

Properties: White powder; sp. gr. 1.71; m.p. decomposes to magnesium pyrophosphate, $Mg_2P_2O_7$; soluble in acids; insoluble in alcohol and water.

Derivation: By the interaction of solutions of a magnesium salt and ammonium phosphate.

Uses: Medicine; fire retardant for fabrics; fertilizer.

magnesium arsenate $Mg_3(AsO_4)_2 \cdot xH_2O$. White powder when pure, insoluble in water. Technical material is highly hydrated and made from magnesium carbonate and arsenic acid.

Containers: Fiber cans; drums; multiwall paper sacks.

Hazard: Highly toxic by ingestion and inhalation.

Use: Insecticide.

Shipping regulations: (Rail, Air) Poison label.

magnesium benzoate $Mg(C_6H_5O_2)_2 \cdot 3H_2O$.

Properties: White crystalline powder; loses $3H_2O$ at 110°C; m.p. about 200°C; soluble in water and alcohol.

Use: Medicine.

magnesium biphosphate. See magnesium phosphate, monobasic.

magnesium borate $3MgO \cdot B_2O_3$ (orthoborate) or $Mg(BO_2)_2 \cdot 8H_2O$ (metaborate).

Properties: Transparent, colorless crystals or white powder. Soluble in alcohol, acetic acid, and inorganic acids; slightly soluble in water. Low toxicity.

Derivation: By heating magnesium oxide, boric anhydride and potassium hydrogen fluoride.

Containers: Glass bottles; fiber cans.

Uses: Preservative; antiseptic; fungicide.

magnesium borocitrate

$Mg(BO_2)_2 \cdot Mg_3(C_6H_5O_7)_2 \cdot 14H_2O$.

Properties: White powder or small, white, lustrous scales. Soluble in water. Low toxicity.

Derivation: By mixing magnesium borate and magnesium citrate.

Use: Medicine.

magnesium-boron fluoride

Grade: Technical.

Containers: 145-lb steel drums.

Hazard: Toxic. Strong irritant. Tolerance (as F): 2.5 mg per cubic meter of air.

Use: Metal flux.

magnesium bromate $\text{Mg}(\text{BrO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals or crystalline powder. Soluble in water; insoluble in alcohol. Sp. gr. 2.29; m.p. loses $6\text{H}_2\text{O}$ (200°C); b.p. decomposes.

Derivation: By adding magnesium sulfate to a solution of barium bromate.

Hazard: Moderately toxic. Dangerous fire risk in contact with organic materials.

Use: Analytical reagent; oxidizing agent.

Shipping regulation: (Air) Oxidizer label.

magnesium bromide $\text{MgBr}_2 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless, very deliquescent crystals; bitter taste. Soluble in water; slightly soluble in alcohol. Sp. gr. 2.00; m.p. 172°C ; anhydrous m.p. 700°C .

Derivation: Reaction of hydrobromic acid with magnesium oxide with subsequent crystallization.

Hazard: Moderately toxic.

Uses: Medicine; organic syntheses.

magnesium-calcium chloride. See calcium-magnesium chloride.**magnesium carbonate** MgCO_3 . The term magnesium carbonate is generally reserved for the synthetic, pure variety.

Properties: Light, bulky white powder; bulk density about 4 lb per cubic foot; actual sp. gr. about 3.0; decomposes 350°C . Refractive index about 1.52. Soluble in acids; insoluble in water and alcohol. Non-toxic. Noncombustible.

Derivation: By mixing solutions of magnesium sulfate and sodium carbonate, filtering and drying.

Containers: Bags; car lots.

Grades: Technical; N.F.; F.C.C.

Uses: Magnesium salts; heat insulation and refractory; rubber reinforcing agent; inks; glass; pharmaceuticals, dentrifices and cosmetics; free-running table salts; mineral waters; filtering medium. Used in foods as an alkali, drying agent, color retention agent, anticaking agent, carrier.

magnesium carbonate, basic (magnesia alba). Various formulas are given and may all be possible, because of the method of derivation (see magnesium carbonate). A typical formula is $\text{Mg}(\text{OH})_2 \cdot 3\text{MgCO}_3 \cdot 3\text{H}_2\text{O}$. Properties and uses are almost identical with those listed above.

Derivation: Precipitation from magnesium salt solution.

magnesium chlorate $\text{Mg}(\text{ClO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: White powder. Bitter taste. Very hygroscopic. Soluble in water; slightly soluble in alcohol. Sp. gr. 1.8; m.p. 35°C ; (decomposes at 120°C).

Hazard: Dangerous fire risk in contact with organic materials; strong oxidizing agent. Moderately toxic.

Uses: Medicine; defoliant; desiccant.

Shipping regulations: Chlorates, n.o.s. (Rail) Yellow label. (Air) Oxidizer label.

magnesium chloride (a) MgCl_2 ; (b) $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless or white crystals; deliquescent. Sp. gr. (a) 2.32, (b) 1.56; m.p. (a) 708°C , (b) loses $2\text{H}_2\text{O}$ at 100°C ; if heated rapidly, melts at $116-118^\circ\text{C}$; b.p. (a) 1412°C , (b) decomposes to oxychloride. Soluble in water and alcohol. Combustible.

Derivation: Action of hydrochloric acid on magnesium oxide or hydroxide, especially the latter when precipitated from sea water or brines (Great Salt Lake).

Method of purification: Recrystallization.

Grades: Technical (crystals, fused, flakes, granulated); C.P.

Containers: Bags; drums.

Hazard: Moderately toxic.

Uses: Source of magnesium metal; disinfectants; fire extinguishers; fireproofing wood; magnesium oxychloride cement; refrigerating brines; ceramics; cooling drilling tools; textiles (size, dressing and filling of cotton and woolen fabrics, thread lubricant; carbonization of wool); paper manufacture; road dust-laying compounds; floor sweeping compounds; flocculating agent; catalyst.

magnesium chromate $\text{MgCrO}_4 \cdot 5\text{H}_2\text{O}$, is in the form of small, readily soluble, yellow crystals. Since it does not produce a fusible alkaline residue when thermally decomposed, it is used as a corrosion inhibitor in the water coolant of gas turbine engines. Insoluble basic magnesium chromates also are available. Their potential applications are in the treatment of light metal surfaces.

magnesium citrate, dibasic (acid magnesium citrate) $\text{MgHC}_6\text{H}_5\text{O}_7 \cdot 5\text{H}_2\text{O}$.

Properties: White or slightly yellow, odorless granules or powder. Soluble in water, insoluble in alcohol. Nontoxic. Combustible.

Derivation: Reaction of citric acid and magnesium hydroxide or carbonate.

Use: Medicine; dietary supplement.

magnesium dichromate $\text{MgCr}_2 \cdot 6\text{H}_2\text{O}$, is characterized by high solubility in water. It is an orange-red, deliquescent, crystalline hydrate. Potential applications are in formulations for corrosion prevention and metal treatment. Noncombustible.

magnesium dioxide. See magnesium peroxide.

magnesium fluoride (magnesium flux) MgF_2 .

Properties: White crystals; exhibits fluorescence by electric light. Soluble in nitric acid; insoluble in alcohol and water. Sp. gr. 3.0; m.p. 1263° ; b.p. 2239°C . Noncombustible.

Derivation: By adding sodium fluoride or hydrofluoric acid to a solution of magnesium salt.

Grades: Technical; C.P.; single crystals.

Hazard: Toxic. Strong irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Ceramics; glass; single crystals for polarizing prisms, lenses, and windows.

magnesium fluosilicate (magnesium silicofluoride)

$\text{MgSiF}_6 \cdot 6\text{H}_2\text{O}$.

Properties: White, efflorescent crystalline powder; sp. gr. 1.788; decomposes 120°C . Soluble in water.

Derivation: By treating magnesium hydroxide or carbonate with hydrofluosilicic acid.

Grades: Technical (crystals; solution).

Containers: Crystals: 400-lb barrels; drums. Solution: 400-lb barrels.

Hazard: Toxic. Strong irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Ceramics; concrete hardeners; water-proofing; mothproofing; laundry sour; magnesium casting.

magnesium flux. See magnesium fluoride.

magnesium formate. $\text{Mg}(\text{CHO}_2)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals; soluble in water; insoluble in alcohol and ether. Combustible.

Derivation: Action of formic acid on magnesium oxide.

Uses: Analytical chemistry; medicine.

magnesium gluconate $\text{Mg}(\text{C}_6\text{H}_{11}\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Odorless, almost tasteless, white powder

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

or fine needles. Soluble in water. Nontoxic. Combustible.

Derivation: Magnesia or magnesium carbonate dissolved in gluconic acid.

Grade: Pharmaceutical.

Uses: Medicine; vitamin tablets.

magnesium glycerinophosphate. See magnesium glycerophosphate.

magnesium glycerophosphate (magnesium glycerinophosphate) $\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{OP}(\text{O})(\text{O})_2\text{Mg}$.

Properties: Colorless powder; soluble in water; insoluble in alcohol. Nontoxic. Combustible.

Derivation: Action of glycerophosphoric acid on magnesium hydroxide.

Uses: Medicine; stabilizer for plastics.

magnesium hydrate. See magnesium hydroxide.

magnesium hydrogen phosphate. See magnesium phosphate, dibasic.

magnesium hydroxide (magnesium hydrate; in aqueous suspension: milk of magnesia (q.v.); magnesia magma) $\text{Mg}(\text{OH})_2$.

Properties: White powder; odorless. Soluble in solutions of ammonium salts and dilute acids; almost insoluble in water and alcohol; sp. gr. 2.36; m.p. decomposes at 350°C . Nontoxic. Noncombustible.

Derivation: Precipitation from a solution of a magnesium salt by sodium hydroxide; precipitation from sea water with lime. It occurs naturally as brucite (q.v.).

Grades: Technical; N.F.; F.C.C.

Uses: Intermediate for obtaining magnesium metal; sugar refining; medicine; residual fuel oil additive; sulfite pulp; uranium processing; dentifrices; in foods as alkali, drying agent, color retention agent; frozen desserts.

magnesium hypophosphite $\text{Mg}(\text{H}_2\text{PO}_2)_2 \cdot 6\text{H}_2\text{O}$.

Properties: White efflorescent crystals; sp. gr. 1.59; decomposes at 100°C to evolve phosphine. Soluble in water; insoluble in alcohol. Nontoxic.

Derivation: Action of hypophosphorous acid on magnesium oxide.

Hazard: Evolves toxic gas when heated to 100°C .

Use: Medicine.

magnesium hyposulfite. See magnesium thiosulfate.

magnesium iodide (a) MgI_2 ; (b) $\text{MgI}_2 \cdot 8\text{H}_2\text{O}$.

Properties: White, deliquescent, crystalline powder; discolors in air; soluble in water, alcohol, and ether.

M.p. 632°C ; decomposes above 700°C ; sp. gr. (a) 4.48. (b) Decomposes at 41°C .

Derivation: Heating magnesium in iodine vapors.

Use: Medicine.

magnesium lactate $\text{Mg}(\text{C}_3\text{H}_5\text{O}_3)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White crystals; very bitter taste; soluble in water; slightly soluble in alcohol. Nontoxic. Combustible.

Derivation: Action of lactic acid on magnesium oxide, with subsequent crystallization.

Use: Medicine.

magnesium lauryl sulfate $\text{Mg}(\text{OSO}_3\text{C}_{12}\text{H}_{25})_2$.

Properties: Pale yellow liquid with a mild odor; soluble in methanol, acetone and water; insoluble in kerosene. Low toxicity. Combustible.

Derivation: Sulfonation of lauryl alcohol, and interaction with a magnesium salt.

Containers: Drums; tanks.

Uses: Surfactant and anionic detergent; foaming, wetting and emulsifying agent.

magnesium lime. Same as magnesium limestone. See limestone.

magnesium limestone. See limestone.

magnesium methoxide (magnesium methylate)

$(\text{CH}_3\text{O})_2\text{Mg}$.

Properties: Colorless crystalline solid; decomposes on warming.

Derivation: Reaction of magnesium and methanol.

Uses: Dielectric coating; cross-linking agent to form stable gels; catalyst.

magnesium methylate. See magnesium methoxide.

magnesium molybdate MgMoO_4 . Crystalline powder; absolute density 2.8 g/cc; m.p. 1060°C (approx); soluble in water.

Uses: Electronic and optical applications.

magnesium nitrate $\text{Mg}(\text{NO}_3)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals; soluble in water and alcohol. Deliquescent. Sp. gr. 2.03 (25°C); m.p. 129°C ; decomposes at 330°C .

Derivation: Action of nitric acid on magnesium oxide, with subsequent crystallization.

Hazard: Dangerous fire and explosion risk in contact with organic materials. Strong oxidizing agent.

Use: Pyrotechnics.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

magnesium oleate $\text{Mg}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Yellowish mass; soluble in linseed oil, hydrocarbons, alcohol, and ether; insoluble in water. Combustible. Low toxicity. Combustible.

Derivation: Interaction of magnesium chloride and sodium oleate.

Uses: Varnish driers; in dry-cleaning solvents (to prevent spontaneous ignition); emulsifying agent; lubricant for plasticizers.

magnesium orthophosphate. See magnesium phosphate.

magnesium oxide (magnesia) MgO . Two forms are produced, one a light fluffy material prepared by a relatively low-temperature dehydration of the hydroxide, the other a dense material made by high-temperature furnacing of the oxide after it has been formed from the carbonate or hydroxide. See also periclase.

Properties: White powder, either light or heavy depending upon whether it is prepared by heating magnesium carbonate or the basic magnesium carbonate; sp. gr. about 3.6 (varies); m.p. 2800°C ; b.p. 3600°C ; slightly soluble in water; soluble in acids and ammonium salt solutions. Noncombustible.

Derivation: (a) By calcining magnesium carbonate or magnesium hydroxide; (b) by treating magnesium chloride with lime and heating, or by heating it in air; (c) from sea water via the hydroxide.

Grades: Technical; C.P.; U.S.S.; F.C.C.; 99.5%; fused; low boron; rubber; semiconductor; single crystals.

Containers: Fiber drums; multiwall paper sacks; tonnage lots.

Hazard: Toxic by inhalation of fume. Tolerance, 10 mg per cubic meter of air.

Uses: Refractories, especially for steel furnace linings; polycrystalline ceramic for aircraft windshields; electrical insulation; pharmaceuticals and cosmetics; inorganic rubber accelerator; oxychloride and oxysulfate cements; paper manufacture; fertilizers; removal of sulfur dioxide from stack gases; adsorption and catalysis; semiconductors; pharmaceuticals; food and feed additive.

magnesium oxychloride cement (Sorel cement). A mixture of magnesium chloride and magnesium oxide that reacts with water to form a solid mass, presumed to be magnesium oxychloride. Fillers such as wood flour, sawdust, sand, powdered stone, talc, etc. are usually present. A variety of proprietary mixtures are available. Strength ranges from 7000 to 10,000 psi. Copper powder minimizes water solubility.

magnesium palmitate $\text{Mg}(\text{C}_{16}\text{H}_{31}\text{O}_2)_2$.

Properties: Crystalline needles or white lumps; m.p. 121.5°C; insoluble in water and alcohol. Low toxicity. Combustible.

Uses: Varnish drier; lubricant for plastics.

magnesium pemoline. A combination of 2-imino-5-phenyl-4-oxazolidinone and magnesium hydroxide. Said to be a stimulant of the nervous system because of its action on the enzyme, RNA polymerase.

magnesium perborate $\text{Mg}(\text{BO}_3)_2 \cdot 7\text{H}_2\text{O}$.

Properties: White powder; sparingly soluble in water; decomposes with evolution of oxygen.

Derivation: Action of peroxide or electrolytic oxidation of borate solutions.

Hazard: Moderate fire risk in contact with organic materials.

Uses: Driers; bleaching; antiseptic.

magnesium perchlorate (a) $\text{Mg}(\text{ClO}_4)_2$; (b) $\text{Mg}(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$.

Properties: White, crystalline, deliquescent; very soluble in water and alcohol; (a) sp. gr. 2.21 (18°C); decomposes at 251°C; (b) sp. gr. 1.98; decomposes at 185–190°C. Strong oxidizing material.

Derivation: Reaction of magnesium hydroxide and perchloric acid.

Hazard: Moderately toxic. Dangerous fire and explosion risk in contact with organic materials.

Uses: (a) As a regenerable drying agent for gases, and (b) Oxidizing agent.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

magnesium permanganate $\text{Mg}(\text{MnO}_4)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Bluish-black, friable, deliquescent crystals. Sp. gr. 2.18; m.p., decomposes. Soluble in water. Strong oxidizing material.

Hazard: Moderately toxic; fire hazard in contact with organic materials.

Use: Medicine (strong antiseptic).

magnesium peroxide (magnesium dioxide) MgO_2 .

Properties: White, tasteless, odorless powder. Decomposes above 100°C. Insoluble in water; soluble in dilute acids with formation of hydrogen peroxide. Available oxygen 28.4%. Keep cool and dry. A powerful oxidizing material.

Derivation: From sodium or barium peroxide with magnesium sulfate in a concentrated solution.

Grades: Technical; 15, 25, and 50%.

Hazard: Dangerous fire risk; reacts with acidic materials and moisture.

Uses: Bleaching and oxidizing agent; medicine.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

magnesium phosphate (magnesium orthophosphate).

See magnesium phosphate, dibasic; magnesium phosphate, monobasic; or magnesium phosphate, tribasic.

magnesium phosphate, dibasic (dimagnesium orthophosphate; dimagnesium phosphate; magnesium

phosphate, secondary; magnesium hydrogen phosphate) $\text{MgHPO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: White, crystalline powder; decomposes to pyrophosphate on heating. Soluble in dilute acids; slightly soluble in water. Sp. gr. 2.13; loses one H_2O at 205°C; dec. 550–650°C. Nontoxic. Nonflammable.

Derivation: Action of orthophosphoric acid on magnesium oxide.

Grades: Technical; F.C.C.

Use: Medicine; stabilizer for plastics; food additive.

magnesium phosphate, monobasic (magnesium biphosphate; acid magnesium phosphate; magnesium tetrahydrogen phosphate) $\text{MgH}_2(\text{PO}_4)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White, hygroscopic, crystalline powder; decomposes to metaphosphate on heating. Soluble in water and acids; insoluble in alcohol. Nontoxic. Nonflammable.

Derivation: Action of orthophosphoric acid on magnesium hydroxide.

Uses: Medicine; fireproofing wood; stabilizer for plastics.

magnesium phosphate, neutral. See magnesium phosphate, tribasic.

magnesium phosphate, secondary. See magnesium phosphate, dibasic.

magnesium phosphate, tribasic (magnesium phosphate, neutral; trimagnesium phosphate) $\text{Mg}_3(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$ or $5\text{H}_2\text{O}$.

Properties: Soft, bulky white powder; odorless and tasteless; loses all water at 400°C. Soluble in acids; insoluble in water. Nontoxic. Nonflammable.

Derivation: Reaction of magnesium oxide and phosphoric acid at high temperatures.

Grades: Technical; reagent; N.F. ($5\text{H}_2\text{O}$ variety); F.C.C. (4, 5, or $8\text{H}_2\text{O}$).

Containers: Bags; barrels; drums.

Uses: Dentifrice polishing agent; pharmaceutical antacid, adsorbent, stabilizer for plastics, food additive and dietary supplement.

magnesium pyrophosphate $\text{Mg}_2\text{P}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: White powder; soluble in acids; insoluble in alcohol and water. Sp. gr. 2.56; loses water at 100°C; m.p. (anhydrous) 1383°C.

magnesium ricinoleate $\text{Mg}(\text{OOC}_{17}\text{H}_{33}\text{OH})_2$.

Properties: Coarse, yellow granules with faint fatty acid odor; m.p. 98°C; sp. gr. 1.03 (25/25°C). Used in cosmetics. Combustible.

magnesium salicylate $\text{Mg}(\text{C}_7\text{H}_5\text{O}_3)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless, efflorescent crystalline powder. Soluble in water and alcohol.

Derivation: Action of salicylic acid on magnesium hydroxide.

Use: Medicine.

magnesium silicate $3\text{MgSiO}_3 \cdot 5\text{H}_2\text{O}$ (variable). The F.C.C. specifies a ratio of $2\text{MgO}:5\text{SiO}_2$. See also magnesium trisilicate, serpentine, and talc.

Properties: Fine, white powder; insoluble in water or alcohol. An absorbent. Noncombustible; may be toxic by inhalation.

Derivation: Interaction of a magnesium salt and a soluble silicate.

Grades: Technical; F.C.C.

Hazard: Use in foods restricted to 2%.

Uses: Rubber filler; ceramics; glass; refractories; absorbent for crude oil spills; manufacture of permanently dry resins and resinous compositions; paints.

varnishes, and paper (filler); animal and vegetable oils (bleaching agent); odor absorbent; filter medium; catalyst and catalyst carrier; anticaking agent in foods. See also asbestos.

magnesium silicofluoride. See magnesium fluosilicate.

magnesium stannate $\text{MgSnO}_3 \cdot 3\text{H}_2\text{O}$.

Properties: White crystalline powder. Soluble in water. Approximate temperature of decomposition 340°C .

Hazard: Toxic by inhalation. Tolerance, 2 mg per cubic meter of air.

Use: Additive in ceramic capacitors.

magnesium stearate $\text{Mg}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$, or with one H_2O .

Technical grade contains small amounts of the oleate and 7% magnesium oxide MgO .

Properties: Soft white light powder; sp. gr. 1.028; m.p. 88.5°C (pure), 132°C (technical); tasteless; odorless. Insoluble in water and alcohol. Nontoxic. Nonflammable.

Grades: Technical; U.S.P.; F.C.C.

Containers: Fiber cans; multiwall paper sacks.

Uses: Dusting powder; lubricant in making tablets; drier in paints and varnishes; flattening agent; in medicines; stabilizer and lubricant for plastics; emulsifying agent in cosmetics; in foods as anticaking agent, binder, emulsifier.

magnesium sulfate (a) MgSO_4 ; (b) (epsom salts) $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: Colorless crystals; saline, bitter taste; neutral to litmus; sp. gr. (a) 2.65; (b) 1.678; (a) decomposes 1124°C ; (b) loses $6\text{H}_2\text{O}$ at 150°C ; $7\text{H}_2\text{O}$ at 200°C ; soluble in glycerol; very soluble in water; sparingly soluble in alcohol. Low toxicity. Noncombustible.

Derivation: (a, b) Action of sulfuric acid on magnesium oxide, hydroxide or carbonate; (b) mined in a high degree of purity.

Grades: Technical; C.P.; U.S.P.; F.C.C.

Uses: Fireproofing; textiles (warp-sizing and loading cotton goods, weighting silk, dyeing and calico printing); mineral waters; catalyst carrier; ceramics; fertilizers; paper (sizing); cosmetic lotions; dietary supplement; medicine (antidote).

magnesium sulfide MgS .

Properties: Red brown crystalline solid; sp. gr. 2.84; decomposes above 2000°C . Decomposes in water. Low toxicity.

Uses: Source of hydrogen sulfide; laboratory reagent.

magnesium sulfite $\text{MgSO}_3 \cdot 6\text{H}_2\text{O}$.

Properties: White, crystalline powder; slightly soluble in water; insoluble in alcohol. Sp. gr. 1.725; m.p., loses $6\text{H}_2\text{O}$ at 200°C ; b.p., decomposes. Low toxicity.

Derivation: Action of sulfurous acid on magnesium hydroxide.

Uses: Medicine; paper pulp.

magnesium tetrahydrogen phosphate. See magnesium phosphate, monobasic.

magnesium thiosulfate (magnesium hyposulfite)

$\text{MgS}_2\text{O}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless crystals; soluble in water; insoluble in alcohol. Sp. gr. 1.818; loses $3\text{H}_2\text{O}$ at 170°C .

Use: Medicine.

magnesium titanate Mg_2TiO_4 . Used in electronics.

magnesium trisilicate. U.S.P. specifies not less than 20% MgO and 45% SiO_2 ; similar to the F.C.C. requirements under magnesium silicate. See also talc.

Properties: Fine, white, odorless, tasteless powder; free from grittiness. Insoluble in water and alcohol; readily decomposed by mineral acids. Noncombustible.

Derivation: By reaction of soluble magnesium salts with soluble silicates.

Grades: Technical; U.S.P.

Uses: Industrial odor absorbent; decolorizing agent; antioxidant; medicine.

magnesium tungstate (magnesium wolframate)

MgWO_4 .

Properties: White crystals; sp. gr. 5.66; soluble in acids; insoluble in water and alcohol. Low toxicity. Noncombustible.

Derivation: Interaction of solutions of magnesium sulfate and ammonium tungstate.

Uses: Fluorescent screens for x-rays; luminescent paint.

magnesium zirconate $\text{MgO} \cdot \text{ZrO}_2$.

Properties: Powder; sp. gr. 4.23; m.p. 2060°C .

Use: Electronics.

magnesium zirconium silicate MgZrSiO_4 , or $\text{MgO} \cdot \text{ZrO}_2 \cdot \text{SiO}_2$.

Properties: White solid; m.p. 1760°C ; density 80 lb/cu ft; insoluble in water; alkalies; slightly soluble in acids. Noncombustible.

Containers: 80-lb paper bags; 500-lb drums.

Uses: Electrical resistor ceramics; glaze opacifier.

"Magnesol."⁷⁵⁵ Trademark for a synthetic adsorptive magnesium silicate.

Uses: Solvent purification, clarification and recovery; oil refining; deodorizing and decolorizing of oils and fats.

magnetic separation. Removal of bits of iron and other tramp metal from a material as it passes to a screen or classifying device by means of a magnet placed close to the stream of particles.

magnetite (lodestone; iron ore, magnetic) Fe_3O_4 , often with titanium or magnesium. A component of taconite (q.v.).

Properties: Black mineral; black streak; submetallic, or dull to metallic luster. Contains 72.4% iron. Readily recognized by strong attraction by magnet. Soluble in powder form in hydrochloric acid. Decomposes at 1538°C to ferric oxide Fe_2O_3 . Sp. gr. 4.9-5.2; hardness 5.5-6.5.

See also iron oxide, black.

magnetochemistry. A subdivision of chemistry concerned with the effect of magnetic fields on chemical compounds; analysis and measurement of these effects (e.g., magnetic moment and magnetic susceptibility) are important tools in crystallographic research and determination of molecular structures. Substances that are repelled by a magnetic field are diamagnetic (water, benzene); those that are attracted are paramagnetic (oxygen, transition element compounds). Diamagnetic materials have only induced magnetic moment; paramagnetic materials have permanent magnetic moment. Magnetochemistry has been useful in detection of free radicals, elucidation of molecular configurations of highly complex compounds, and in its application to catalytic and chemisorption phenomena. See also nuclear magnetic resonance.

magnetohydrodynamics (MHD). The behavior of high-temperature ionized gases passed through a magnetic field. A power-generating method using MHD involves an open cycle in which hot combustion gases

seeded with cerium or potassium to increase electrical conductivity constitute the working fluid. These are sent through a nozzle surrounded by a magnet; the electricity induced by movement of the ionized gas through the magnetic field is passed to electrodes, and the gas sent to a steam generator. Efficiency is rated at 50–60%, compared with 40% for conventional fossil fuel plants and 33% for plants using nuclear fuels. Two-phase liquid-metal systems are being studied as auxiliary units for a number of energy converters. MHD is an important field of expansion of research activity on new sources of energy; its high efficiency and low pollution factor indicate that it may have a significant future in electrical power supply. See also plasma (2).

"Magnorite."²⁴⁹ Trademark for fused magnesium oxide refractory products; fusion point up to 4750°F (2620°C) depending on purity. Used for cements; lining metal melting furnaces and chemical reactors; electrical insulating medium.

"Magon."¹⁶⁹ Trademark for 1-azo-2-hydroxy-3-(2,4-dimethylcarboxanilido)naphthalene-1'-(2-hydroxybenzene), used in the colorimetric determination of magnesium.

"Magron."²³³ Trademark for vegetation maturant containing magnesium chlorate.

Maillard reaction. See browning reaction.

"Makrofol."⁴⁷⁰ Trademark for electric insulating films based on polycarbonates.

"Makrolon."⁴⁷⁰ Trademark for a series of polycarbonate resins.

malachite green (benzaldehyde green; victoria green). A triphenylmethane dye (q.v.), the zinc double chloride, oxalate, or ferric double chloride of tetramethyl-para-aminotriphenylcarbinol (see triphenylcarbinol, bis(4-dimethylamino)-). The term is sometimes applied to the mineral malachite.

malachite green toner. See phosphotungstic pigment.

"Malaphos."⁸⁸ Trademark for antidusting, wettable powder and emulsifiable solution containing malathion. Used as insecticide.

Hazard: See malathion.

malathion. Generic name for S-[1,2-bis(ethoxycarbonyl)ethyl] O,O-dimethyl phosphorodithioate, $(\text{CH}_3\text{O})_2\text{P}(\text{S})\text{SCH}(\text{COOC}_2\text{H}_5)_2\text{CH}_2\text{COOC}_2\text{H}_5$.

Properties: Yellow, high-boiling liquid; (b.p. 156–157°C, under 0.7 mm with slight decomposition); m.p. 2.85°C; refractive index (n_D²⁵) 1.4985; sp. gr. 1.2315 (25°C); vapor pressure (20°C) approximately 0.00004 mm. Miscible with most polar organic solvents. Slightly soluble in water. Combustible.

Purity: Technical grade is 95+ % pure.

Derivation: From diethyl maleate and dimethyldithiophosphoric acid.

Hazard: Toxic by ingestion and inhalation. Absorbed by skin. Tolerance, 10 mg per cubic meter of air. Cholinesterase inhibitor.

Use: Insecticide.

Note: Approved by EPA as substitute for certain uses of DDT.

maleic acid (maleinic acid; cis-butenedioic acid)

$\text{HOOCCH}=\text{CHCOOH}$ (cis isomer).

Properties: Colorless crystals; repulsive, astringent taste; faint odor. Soluble in water, alcohol, and ace-

tone; very slightly soluble in benzene; sp. gr. 1.59; m.p. 130–131°C; at temperatures slightly above the m.p., is converted partly to fumaric acid. Combustible.

Derivation: Same as for maleic anhydride, with special recovery conditions.

Grades: Technical; reagent.

Hazard: Moderately toxic; strong irritant to tissue.

Uses: Organic synthesis (malic, succinic, aspartic, tartaric, propionic, lactic, malonic, acrylic, hydroxyacrylic acids); dyeing and finishing of cotton, wool and silk; preservative for oils and fats.

maleic anhydride (2,5-furandione) $\text{HC}=\text{CHC}(\text{O})\text{OC}(\text{O})$.

Properties: Colorless needles; sp. gr. 0.934 (20/4°C); m.p. 53°C; b.p. 200°C; flash point 218°F; soluble in acetone, hydrocarbons, ether, chloroform, petroleum ether. Hydrolyzes slowly in water. Combustible; autoignition temp. 890°F.

Derivation: (a) By passing a mixture of benzene vapor and air over a vanadium oxide catalyst at about 450°C; (b) byproduct from manufacture of phthalic anhydride from naphthalene; (c) catalytic oxidation of butylenes.

Grades: Technical; rods, flakes, lumps, briquettes, and molten.

Containers: Fiber drums (rod, flake, and lump); iron drums (fused); tank cars (molten).

Hazard: Strong irritant to tissue. Tolerance, 0.25 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Polyester resins; alkyd coating resins; fumaric and tartaric acid manufacture; pesticides; preservative for oils and fats; paper; permanent-press resins (textiles).

maleic hydrazide (1,2-dihydro-3,6-pyridazinedione)

$\text{HC}=\text{CHC}(\text{O})\text{NHNHC}(\text{O})$. A plant growth regulator.

Properties: Crystals; m.p. 297°C; slightly soluble in hot alcohol; more soluble in hot water.

Derivation: By treating maleic anhydride with hydrazine hydrate.

Uses: Systemic herbicide; treatment of tobacco plants; post-harvest sprouting inhibitor; weed control; sugar content stabilizer in beets.

maleinic acid. See maleic acid.

maleo-pimaric acid. Reaction product of maleic anhydride and l-pimaric acid; derived from pine gum.

Properties: Crystalline solid; m.p. about 225°C; soluble in most organic solvents; insoluble in water or aliphatic hydrocarbons.

Use: Resins.

malic acid (hydroxysuccinic acid; apple acid)

$\text{COOHCH}_2\text{CH}(\text{OH})\text{COOH}$. (Do not confuse with maleic acid).

Properties: Colorless crystals; sour taste; sp. gr. (dl-form) 1.601, (d or l form) 1.595 (20/4°C); m.p. (dl) 128°C, (d or l) 100°C; b.p. (dl) 150°C (dec), (d or l) 140°C (dec). Very soluble in water and alcohol; slightly soluble in ether. Combustible; low toxicity.

Derivation: Occurs naturally in unripe apples, and other fruits. Made synthetically by catalytic oxidation of benzene to maleic acid, which is converted to malic acid by heating with steam under pressure.

Grades: Technical, active and inactive; F.C.C. The natural material is levorotatory, but the synthetic material is inactive.

Containers: Glass jars; fiber cans; drums.

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

Uses: Medicine; manufacture of various esters and salts; wine manufacture; chelating agent; food acidulant; flavoring.

"Malix 138."⁷⁹ Trademark for a limed M wood rosin used in linoleum print paint; printing inks; gloss oils and varnishes.

"Mallacosorb" A.R.¹²⁹ Trademark for a high-capacity, granular absorbent for CO₂, HCl, SO₂, H₂S, and other acidic gases. Changes from pink to yellowish tan as it loses absorptive capacity.

malonamide nitrile. See cyanoacetamide.

malonic acid (methanedicarbonic acid) CH₂(COOH)₂. Properties: White crystals; soluble in water, alcohol and ether. M.p. 132–134°C; b.p. decomposes; sp. gr. 1.63.

Derivation: From monochloroacetic acid by reaction with potassium cyanide, followed by hydrolysis.

Use: Intermediate for barbiturates and pharmaceuticals.

malonic dinitrile (malononitrile) CH₂(CN)₂. Properties: Colored crystals. M.p. 32.1°C; b.p. 220°C. Use: Organic synthesis; leaching agent for gold.

malonic ester. See ethyl malonate.

malonic ethyl ester nitrile. See ethyl cyanoacetate.

malonic methyl ester nitrile. See methyl cyanoacetate.

malonic mononitrile. See cyanoacetic acid.

malononitrile. See malonic dinitrile.

malonylurea. See barbituric acid.

malt. Yellowish or amber-colored grains of barley which have been partially germinated by artificial means. It contains dextrin, maltose and amylase; characteristic odor and taste. Black malt is grain which has been scorched in the drying process. Uses: Brewing; malted milk and similar food products; extract of malt (with 10% glycerol).

maltase (glucase; alpha-glucosidase). An enzyme that hydrolyzes maltose to glucose. Occurs in the small intestine, in yeast, molds and malt; usually associated with the enzyme amylase.

malt extract (maltine).

Properties: Light brown, sweet, viscous liquid; contains dextrin, maltose, a little glucose, and an amylolytic enzyme. It is capable of converting not less than five times its weight of starch into water-soluble sugars. Soluble in cold water, but more readily soluble in warm water. Sp. gr. not less than 1.350 and not more than 1.430 (25°C).

Derivation: By infusing malt with water at 60°C, concentrating the expressed liquid at a temperature not exceeding 60°C, and adding 10% by weight of glycerol.

Use: Nutrient; emulsifying agent.

maltha. A black, viscous natural bitumen, a component of asphalt, consisting of a complex mixture of waxy hydrocarbons.

maltol (3-hydroxy-2-methyl-4-pyrone)

CH₃C₄H₃O(O)(OH). White crystalline powder having a characteristic caramel-butterscotch odor, and suggestive of a fruity-strawberry aroma in dilute solution. Slightly soluble in water; more soluble in alcohol and propylene glycol. Melting range 160–164°C. Nontoxic.

Grade: F.C.C.

Use: Flavoring agent.

maltose (malt sugar; maltobiose) C₁₂H₂₂O₁₁ · H₂O. The most common reducing disaccharide; composed of two molecules of glucose. Found in starch and glycogen.

Properties: Colorless crystals; m.p. 102–103°C; soluble in water; soluble in alcohol; insoluble in ether. Combustible; nontoxic.

Derivation: By the enzymatic action of diastase (usually obtained from malt extract) on starch.

Containers: Glass bottles; fiber cans; drums.

Uses: Nutrient; sweetener; culture media; stabilizer for polysulfides.

"Mam."³⁴² Trademark for dimethyl anthranilate (q.v.). Used in perfumery.

Man Symbol for mannose; also abbreviation for methacrylonitrile (q.v.).

mandarin oil. See citrus peel oils.

"Mandelamine."⁵⁴⁶ Trademark for hexamethylenetetramine mandelate (q.v.).

mandelic acid (phenylglycolic acid; alpha-phenylhydroxyacetic acid; benzoglycolic acid; known also as amygdalic acid) C₆H₅CHOHCOOH. Exists in stereoisomeric forms. The properties are those of the *dl*-form.

Properties: Large white crystals or powder with a faint odor; sp. gr. 1.30; m.p. 117–119°C. Darkens on exposure to light. Soluble in ether; slightly soluble in water and alcohol.

Derivation: Hydrolysis of the cyanohydrin formed from benzaldehyde, sodium bisulfite, and sodium cyanide. Can be obtained from amygdalin (q.v.).

Hazard: May be toxic.

Use: Medicine; organic synthesis.

mandelonitrile (benzaldehyde cyanohydrin)

C₆H₅CH(OH)CN.

Properties: Oily yellow liquid; sp. gr. 1.1165 (20/4°C); f.p. –10°C; b.p. 170°C (dec). Soluble in alcohol, chloroform, ether; nearly insoluble in water.

maneb. Generic name for manganese ethylenebisdiethiocarbamate (SSCNCH₂CH₂NHCSS)Mn.

Properties: Brown powder; decomposes on heating. See also zineb.

Derivation: Reaction of disodium ethylenebisdiethiocarbamate and a manganese salt.

Hazard: Toxic by ingestion and inhalation. Irritant to skin and eyes.

Uses: Fungicide for foliage.

manganese Mn Metallic element of atomic number 25, Group VIIB of Periodic Table. Atomic weight 54.938; valences 2, 3, 4, 6, 7. No stable isotopes; 4 artificial radioactive isotopes.

Properties: There are four allotropic forms, of which alpha is most important. Brittle, silvery metal; sp. gr. 7.44; Mohs hardness 5; m.p. 1245°C; b.p. 2097°C. Decomposes water; readily dissolves in dilute mineral acids. Pure Mn cannot be fabricated. Manganese is considered essential for plant and animal life.

Occurrence: Usually associated with iron ores in submarginal concentrations. Important ores of Mn are pyrolusite, manganite, psilomelane, rhodochrosite. An important source of Mn is open-hearth slags. Ores occur chiefly in Brazil, India, South Africa, Australia, Cuba, Montana. 90% of U.S. consumption is imported. So-called nodules rich in manganese and containing also cobalt, nickel and copper have been found in huge quantities (estimated at 1.5 trillion tons) on the floor of the Pacific south of Hawaii. Equipment and techniques for salvaging

these is under development. Such nodules have been located in other areas, as well as in Lake Michigan. Derivation: Reduction of the oxide with aluminum or carbon. Pure Mn is obtained electrolytically from sulfate or chloride solution.

Grades: Technical; pure or electrolytic; powdered.

Containers: Drums; car lots.

Hazard: Prolonged inhalation of fume or dust is damaging to central nervous system. Tolerance, 5 mg per cubic meter of air applies to the metal and all its compounds (as Mn). Dust or powder is flammable. Use dry chemical to extinguish.

Uses: Ferroalloys (steel manufacture); nonferrous alloys (improved corrosion resistance and hardness); high-purity salt for various chemical uses; purifying and scavenging agent in metal production; manufacture of aluminum by Toth process (q.v.).

manganese acetate $\text{Mn}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Pale red crystals; very soluble in water and alcohol; sp. gr. 1.59; m.p. 80°C . Combustible.

Derivation: Action of acetic acid on manganese hydroxide.

Containers: Drums.

Hazard: Moderately toxic.

Uses: Textile dyeing; oxidation catalyst; paint and varnish (drier, boiled oil manufacture); fertilizers; food packaging; feed additive.

manganese ammonium sulfate (manganous ammonium sulfate) $\text{MnSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$.

Properties: Light-red crystals; sp. gr. 1.83; soluble in water.

manganese arsenate. See manganous arsenate.

manganese binoxide. See manganese dioxide.

manganese black. See manganese dioxide.

manganese borate MnB_4O_7 .

Properties: Reddish-white powder; insoluble in water. Derivation: By the action of boric acid on manganese hydroxide.

Grades: Technical.

Containers: Fiber drums.

Uses: Varnish and oil drier.

manganese-boron. An alloy of manganese and boron used in making brass, bronze, and other alloys.

manganese bromide. See manganous bromide.

manganese bronze. Alloy of 55 to 60% copper, 38 to 42% zinc, up to 3.5% manganese, with or without small amounts of iron, aluminum, tin or lead.

manganese carbonate (manganous carbonate) MnCO_3 (found as rhodocrosite, q.v.).

Properties: Rose-colored crystals; almost white when precipitated. Soluble in dilute inorganic acids; almost insoluble in common organic acids, both concentrated and dilute; insoluble in water. Sp. gr. 3.125; m.p., decomposes.

Derivation: (1) A precipitate from the addition of sodium carbonate to a solution of a manganese salt. (2) Hydrometallurgical treatment of manganiferous iron ore.

Grades: Chemical (46% Mn).

Containers: Bags; carloads.

Uses: Manufacture of manganese salts; medicine.

manganese chloride. See manganous chloride.

manganese chromate. See manganous chromate.

manganese citrate (manganous citrate) $\text{Mn}_3(\text{C}_6\text{H}_5\text{O}_7)_2$.

Properties: White powder; soluble in water in presence of sodium citrate. Combustible.

Derivation: Action of citric acid on manganese hydroxide.

Uses: Medicine; feed additive; food additive and dietary supplement.

manganese cyclopentadienyl tricarbonyl.

Hazard: Highly toxic; absorbed by skin. Tolerance (as Mn), 0.1 mg per cubic meter of air.

manganese dioxide (manganese binoxide; manganese black; battery manganese; manganese peroxide) MnO_2 .

Properties: Black crystals or powder; soluble in hydrochloric acid; insoluble in water. Sp. gr. 5.026; m.p., decomposes to Mn_2O_3 and oxygen at 535°C .

Derivation: (a) Natural as pyrolusite (q.v.) and as a special African ore of different atomic structure used exclusively for the battery grade; (b) By electrolysis; (c) By heating manganese oxide in presence of oxygen; (d) By decomposition of manganese nitrate.

Grades: Technical; C.P.; Battery.

Containers: Bottles; multiwall paper bags; drums; carloads, African grade: paper-lined burlap bags; paper bags.

Hazard: Oxidizing agent; may ignite organic materials; moderately toxic.

Uses: Oxidizing agent; depolarizer in dry cell batteries (African and synthetic types only); pyrotechnics, matches, etc.; catalyst; laboratory reagent; scavenger and decolorizer; textile dyeing.

manganese dithionate MnS_2O_6 . Crystals; sp. gr. 1.76; soluble in water.

manganese ethylenebisdithiocarbamate. See maneb.

manganese ethylhexoate. See manganese octoate.

manganese fluoride. See manganous fluoride.

manganese gluconate $\text{Mn}(\text{C}_6\text{H}_{11}\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Light pinkish powder or coarse pink granules. Soluble in water; insoluble in alcohol and benzene. Combustible. Nontoxic.

Grades: Pharmaceutical; F.C.C.

Containers: Drums.

Uses: Feed additive; food additive and dietary supplement; vitamin tablets.

manganese glycerophosphate

$\text{CH}_2\text{OHCHOHCH}_2\text{OP}(\text{O})_2\text{Mn}$.

Properties: Yellow-white or pinkish powder; odorless; nearly tasteless. Soluble in water in presence of citric acid; slightly soluble in water; insoluble in alcohol.

Derivation: Action of glycerophosphoric acid on manganese hydroxide.

Grades: Technical; F.C.C.

Containers: Glass bottles; boxes.

Uses: Medicine (for its glycerophosphate content); food additive and dietary supplement.

manganese green. See barium manganate.

manganese hydrate. See manganic hydroxide; manganous hydroxide.

manganese hydrogen phosphate. See manganous phosphate, acid.

manganese hydroxide. See manganic hydroxide; manganous hydroxide.

manganese hypophosphite $\text{Mn}(\text{H}_2\text{PO}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: Pink crystals or powder; odorless; tasteless. Soluble in water; insoluble in alcohol. Nontoxic. Derivation: Interaction of manganese sulfate and calcium hypophosphite.

Grades: Technical; F.C.C.

Containers: Drums.

Hazard: Dangerous fire and explosion risk when heated or in presence of strong oxidizing agents.

Use: Food additive and dietary supplement.

manganese iodide. See manganous iodide.**manganese lactate** $\text{Mn}(\text{C}_3\text{H}_5\text{O}_3)_2 \cdot 3\text{H}_2\text{O}$.

Properties: Pale red crystals; soluble in water and alcohol. Combustible.

Derivation: Action of lactic acid on manganese hydroxide.

Use: Medicine.

manganese linoleate $\text{Mn}(\text{C}_{18}\text{H}_{31}\text{O}_2)_2$.

Properties: Dark brown, plaster-like mass; soluble in linseed oil. Combustible. Low toxicity.

Derivation: By boiling a manganese salt, sodium linoleate and water.

Uses: Paint and varnish drier; pharmaceutical preparations.

manganese monoxide. See manganous oxide.**manganese naphthenate.**

Properties: Hard, brown, resinous mass. Combustible. When precipitated in the cold it is a pale buff in color, but darkens immediately on solution. Soluble in mineral spirits, hardens on exposure to air. M.p. (approx) 130–140°C. Commercial solution contains 6% Mn.

Derivation: Precipitation from mixture of soluble manganese salts and aqueous sodium naphthenate solution.

Containers: 50-lb steel drums.

Hazard: Solution is flammable.

Uses: Paint and varnish drier.

manganese nitrate. See manganous nitrate.**manganese octoate (manganese ethylhexoate)**

$\text{Mn}(\text{OOC}_6\text{H}_{13}[\text{C}_2\text{H}_5])_2$. Commercially formed from 2-ethylhexoic acid and manganous hydroxide. Sold as a clear brown solution in a petroleum solvent containing 6% manganese.

Hazard: Solution is flammable.

Uses: Primarily as a drier for paints, enamels, varnishes, and printing inks.

manganese oleate $\text{Mn}(\text{C}_{18}\text{H}_{31}\text{O}_2)_2$.

Properties: Brown, granular mass; soluble in oleic acid and ether; insoluble in water.

Derivation: By boiling manganese chloride, sodium oleate and water.

Hazard: Solution is flammable.

Uses: Paint and varnish drier; medicine.

manganese oxalate $\text{MnC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$.

Properties: White crystalline powder; soluble in dilute acids; very slightly soluble in water. Sp. gr. 2.453; loses $2\text{H}_2\text{O}$ at 100°C. Combustible.

Derivation: By adding sodium oxalate to manganese chloride.

Hazard: May be toxic.

Uses: Paint and varnish drier.

manganese peroxide. See manganese dioxide.**manganese phosphate.** See manganous phosphate. See also manganous phosphate, acid.**manganese phosphate, dibasic.** See manganous phosphate, acid.**manganese protoxide.** See manganous oxide.**manganese pyrophosphate.** See manganous pyrophosphate.**manganese resinate** $\text{Mn}(\text{C}_{20}\text{H}_{29}\text{O}_2)_2$.

Properties: Dark, brownish-black mass or flesh-colored powder. Soluble in hot linseed oil; insoluble in water.

Derivation: By boiling manganese hydroxide, resin oil and water.

Containers: Drums.

Hazard: Flammable. Dangerous fire risk.

Uses: Varnish and oil drier.

Shipping regulations: (Air) Flammable Solid label.

manganese sesquioxide. See manganic oxide.**manganese silicate.** See manganous silicate.**manganese sulfate.** See manganous sulfate.**manganese sulfide.** See manganous sulfide.**manganese sulfite.** See manganous sulfite.**manganese tallate.** Manganese salts of tall oil fatty acids. Marketed as a solution containing 6% manganese. Used as a drier. Combustible**manganese-titanium.** An alloy containing manganese, titanium, aluminum, iron, silicon.

Properties: (regular) M.p. 2650°F; (special) m.p. 2430°F.

Uses: (regular) Deoxidizer in high grade steel; (special) non-ferrous alloys deoxidizer.

manganic acetylacetonate

$\text{Mn}[\text{OC}(\text{CH}_3):\text{CHCO}(\text{CH}_3)]_3$.

Properties: Brown crystalline solid; m.p. 172°C. Combustible.

Derivation: Reaction of a manganese salt with acetylacetone and sodium carbonate.

manganic fluoride MnF_3 .

Properties: Red crystalline solid; sp. gr. 3.54; decomposed by water and by heat; soluble in acids.

Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Fluorinating agent.

manganic hydroxide (manganese hydroxide; hydrated manganic oxide) $\text{Mn}(\text{OH})_3$. Rapidly loses water to form $\text{MnO}(\text{OH})$.

Properties: Brown powder; sp. gr. 4.2–4.4; m.p., decomposes; decomposes in acids; insoluble in water.

Derivation: By the action of oxygen on precipitated manganous hydroxide.

Containers: Drums.

Uses: Pigment for fabrics; ceramics.

manganic oxide (manganese oxide; manganese sesquioxide) Mn_2O_3 . In nature as manganite; a manganese ore.

Properties: Black, lustrous powder, sometimes tinged brown; very hard; sp. gr. 4.5; decomposes at 1080°C; soluble in cold hydrochloric acid, hot nitric acid (decomposes), hot sulfuric acid; insoluble in water. Noncombustible.

Hazard: Toxic by inhalation of dust. Flammable in finely divided form.

manganic oxide, hydrated. See manganic hydroxide.

“Manganin.”¹⁵⁵ Trademark for a resistance alloy of copper, 87% and manganese, 13%.

Uses: Thermocouples and electrical instruments.

manganous ammonium sulfate. See manganese ammonium sulfate.

manganous arsenate (manganese arsenate; manganous arsenate, acid) MnHAsO_4 .

Properties: Reddish-white powder. Hygroscopic. Soluble in acids; slightly soluble in water.

Hazard: Highly toxic.

Shipping regulations: (Rail, Air) Arsenates, n.o.s., Poison label.

manganous bromide (manganese bromide) $\text{MnBr}_2 \cdot 4\text{H}_2\text{O}$.

Properties: Red crystals; loses H_2O at 64°C ; very soluble in water; deliquescent. Noncombustible.

Derivation: Action of hydrobromic acid with manganous carbonate, or manganous hydroxide.

Hazard: Moderately toxic and irritant.

manganous carbonate. See manganese carbonate.

manganous chloride (manganese chloride) (a) MnCl_2 ; (b) $\text{MnCl}_2 \cdot 4\text{H}_2\text{O}$.

Properties: Rose-colored crystals; deliquescent. Sp. gr. (a) 2.98; (b) 1.913; m.p. (a) 650°C ; (b) 87.5°C ; b.p. (a) 1190°C . Very soluble in water; slightly soluble in alcohol; insoluble in ether. Noncombustible.

Grades: C.P.; anhydrous.

Containers: Drums.

Uses: Catalyst in the chlorination of organic compounds; paint drier; dyeing; pharmaceutical preparations; fertilizer compositions, feed additive; dietary supplement.

manganous chromate (manganese chromate; manganous chromate, basic) $2\text{MnO} \cdot \text{CrO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Brown powder; slightly soluble in water with hydrolysis.

Hazard: Toxic by inhalation. Tolerance (as CrO_3): 0.1 mg per cubic meter of air.

manganous citrate. See manganese citrate.

manganous fluoride (manganese fluoride) MnF_2 .

Properties: Reddish powder; soluble in acids; insoluble in water, alcohol, and ether. Sp. gr. 3.98; m.p. 856°C . Noncombustible.

Derivation: Action of hydrofluoric acid on manganous hydroxide.

Grade: Technical.

Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

manganous hydroxide (manganese hydroxide) $\text{Mn}(\text{OH})_2$. Occurs naturally as pyrochroite.

Properties: White to pink crystals; sp. gr. 3.258; Mohs hardness 2.5; decomposes with heat; insoluble in water and alkali; soluble in acids and ammonium salts.

manganous iodide (manganese iodide) (a) MnI_2 ; (b) $\text{MnI}_2 \cdot 4\text{H}_2\text{O}$.

Properties: (a) White deliquescent, crystalline mass; (b) rose crystals; sp. gr. (a) 5.01; m.p. 9a) 638°C (in vacuum); b.p. (a) 1061°C ; soluble in water with gradual decomposition.

Derivation: Action of hydriodic acid on manganous hydroxide.

Hazard: May be toxic.

manganous nitrate (magnesium nitrate) $\text{Mn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Pink crystals; very soluble in water; deliquescent; soluble in alcohol. Sp. gr. 1.82; b.p. 129°C ; m.p. 26°C .

Hazard: Fire and explosion risk in contact with organic materials.

Uses: Ceramics; intermediates; catalyst; manganese dioxide.

Shipping regulations: Nitrates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

manganous orthophosphate. See manganous phosphate.

manganous oxide (manganese protoxide; manganese monoxide; manganese oxide) MnO .

Properties: Grass-green powder; soluble in acids; insoluble in water. Sp. gr. 5.45; m.p. 1650°C , but converted to Mn_3O_4 if heated in air. Nontoxic. Noncombustible.

Derivation: (a) By reduction of the dioxide in hydrogen. (b) By heating the carbonate with exclusion of air.

Grades: Technical.

Uses: Medicine; textile printing; analytical chemistry; catalyst in manufacture of allyl alcohol; ceramics; paints; colored glass; bleaching tallow; animal feeds; fertilizers; food additive and dietary supplement.

manganous phosphate (manganese phosphate; manganous orthophosphate) $\text{Mn}_3(\text{PO}_4)_2 \cdot 7\text{H}_2\text{O}$.

Properties: Reddish-white powder; soluble in mineral acids; insoluble in water. Low toxicity.

Derivation: By the action of orthophosphoric acid on manganous hydroxide.

Use: Conversion coating of steels, aluminum and other metals.

manganous phosphate, acid (manganese hydrogen phosphate; manganous phosphate, secondary; manganese phosphate, dibasic) $\text{MnHPO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: Pink powder. Contains some tribasic phosphate. Soluble in acids; slightly soluble in water.

Use: Feed additive.

manganous pyrophosphate (manganese pyrophosphate) (a) $\text{Mn}_2\text{P}_2\text{O}_7$; (b) $\text{Mn}_2\text{P}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: White powder; sp. gr. (a) 3.71; m.p. 1196°C . Soluble in solutions of potassium or sodium pyrophosphate; insoluble in water.

manganous silicate (manganese silicate) MnSiO_3 . Occurs naturally as rhodonite.

Properties: Red crystals or yellowish-red powder. Insoluble in water. Sp. gr. 3.72; m.p. 1323°C . Noncombustible.

Derivation: Interaction of manganous salts with sodium silicate.

manganous sulfate (manganese sulfate) $\text{MnSO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Translucent, pale rose-red, efflorescent prisms. Soluble in water; insoluble in alcohol. Sp. gr. 2.107; m.p. 30°C ; anhydrous, m.p. 700°C ; decomposes at 850°C .

Derivation: Byproduct of production of hydroquinone; or by the action of sulfuric acid on manganous hydroxide or carbonate.

Grades: Technical; C.P.; fertilizer; feed.

Containers: Bags; car lots; trucks.

Uses: Fertilizers; feed additive; paints and varnishes; ceramics; textile dyes; medicines; fungicides; ore flotation; catalyst in viscose process; synthetic manganese dioxide.

manganous sulfide (manganese sulfide) MnS . Green crystals; sp. gr. 3.99. Decomposes on melting. Almost insoluble in water. Used as an additive in steel.

manganous sulfite (manganese sulfite; manganous sulfite, normal) MnSO_3 .

Properties: Grayish-black or brownish-red powder. Soluble in solution of sulfur dioxide; insoluble in water.

"Manganox."²⁵⁰ Trademark for brown manganese oxide.

Uses: Welding electrode coatings; oxidizer and slag former; ceramic colorant.

"Mangrid."¹⁵⁵ Trademark for an electronic tube alloy of 95% nickel and 5% manganese.

Manila fiber. See abaca.

Manila resin. A type of copal resin (q.v.) similar to Congo and kauri.

Properties: Soluble in ether, methyl alcohol and ethyl alcohol; partially soluble in amyl alcohol; insoluble in water. Sp. gr. 1.062; m.p. 230–250°C. Combustible; nontoxic.

Occurrence: Philippine Islands and East Indies.

Uses: Varnishes; paints; lacquers; printing inks.

"Manilyl."¹⁸⁸ Trademark for a replacement for natural ylang ylang oil.

mannitol (manna sugar; mannite) $C_6H_8(OH)_6$. A straight-chain hexahydric alcohol.

Properties: White, crystalline powder or granules; odorless; faint, sweet taste. Soluble in water; slightly soluble in lower alcohols and amines; almost insoluble in other organic solvents. Sp. gr. 1.52; m.p. 165–167°C; specific rotation (20°C) between +23° and +24°; b.p. 290–295°C (at 3–3.5 mm). Nontoxic; combustible.

Derivation: By hydrogenation of corn sugar or glucose.

Grades: Reagent; commercial; N.F.; F.C.C.

Containers: Fiber drums.

Uses: Base for tabletting; ingredient in electrolytic condensers; basis of dietetic foods; sweetener, thickener, and stabilizer in food products.

mannitol hexanitrate (hexanitromannite; HNM; nitromannite; nitromannitol) $C_6H_8(ONO_2)_6$.

Properties: Colorless crystals, m.p. 112–113°C. Soluble in alcohol, acetone, ether, insoluble in water.

Derivation: By nitrating mannitol with mixed acid, purifying by precipitation from organic solvents, and stabilizing.

Grades: Technical; pharmaceutical.

Containers: Water-tight wooden barrels for wet shipment.

Hazard: Dangerous fire and explosion risk. An initiating explosive.

Uses: Explosive cap ingredient; medicine (admixed with a large proportion of carbohydrate).

Shipping regulations: (Rail) Consult regulations. Not accepted by express. (Air) Not accepted. Legal label name nitromannite.

D(+)-mannose $C_6H_{12}O_6$. A carbohydrate occurring in some plant polysaccharides.

Properties: Crystals from alcohol or acetic acid; sweet taste with bitter after-taste; m.p. 132°C (dec).

Use: Biochemical research.

"Mansulox."²⁵⁰ Trademark for a high oxygen-bearing manganese sulfide for use on rimming steels to offset the "killing" action of heavy sulfur additions.

Manufacturing Chemists Association, Inc. (MCA). Founded in 1862, this nonprofit trade association of chemical manufacturers represents more than 90% of the chemical industry of U.S. and Canada. It is particularly active in the fields of packaging, transportation, safe handling of hazardous chemicals, and wording of precautionary labels, as well as in progressive chemical education and all aspects of pollution control. It issues a continuing series of safety

data sheets on numerous toxic and flammable materials. Its publications in this field include "Guide to Precautionary Labeling of Hazardous Chemicals" and "Chem-Card Manual." It also has instituted an emergency telephone information service called "Chem-trec" to provide instant information for safety precautions in accidents involving chemicals. Its offices are located at 1825 Connecticut Ave. N.W., Washington, D.C. 20009.

"Mapharsen."³³⁰ Trademark for oxophenarsin hydrochloride.

Hazard: Toxic by ingestion.

"Mapico."¹³³ Trademark for a series of oxides of iron used in paints, cement products, asbestos shingles, stucco, leather finishes, rubber and electronic ferrites. Colors: Black, brown, red, tan, and yellow. See iron oxide.

"MAPO."¹⁹ Trademark for tris[1-(2-methyl)-aziridinyl]-phosphine oxide (q.v.).

"Mapp."²³³ Trademark for a stabilized gas or liquid mixture of methylacetylene, propadiene and hydrocarbon gases, used as an industrial cutting fuel. See also methylene-propadiene, stabilized.

"Maprofix."³²⁸ Trademark for a series of sodium, ammonium, and magnesium lauryl sulfates and lauryl ether sulfates, sodium myristyl sulfate, and several di- and triethanolamine lauryl sulfates. These are anionic detergents, used for foaming, wetting, and emulsifying in cosmetic, household and industrial uses.

"Maprosyl."³²⁸ Trademark for sodium N-lauroyl sarcosinate.

"MAPS."¹⁹ Trademark for tris[1-(2-methyl)-aziridinyl]-phosphine sulfide, $C_3H_8N_3PS$. Properties similar to "MAPO" but has lower water solubility.

"Marabond."¹²¹ Trademark for a partially purified calcium lignosulfonate.

Uses: Oil well cement retarders, foundry supplies, ceramic products.

"Maracarb."¹²¹ Trademark for a series of chelating humectant and dispersing agents which are complex mixtures of the salts of lower molecular weight lignosulfonic acids and the salts of the alkaline reversion products of hexoses and pentoses which are produced from wood in the sulfite pulping process. Available in liquid and powder form.

Uses: Fertilizers, agricultural chemicals, dyestuff pastes.

"Maracell-E."¹²¹ Trademark for a partially desulfonated sodium lignosulfate, developed for use as an organic agent for internal boiler treatments over a wide range of temperatures and pressure. Claimed to prevent or inhibit scale formation in boiler tubes, injectors, feed lines and economizers.

"Maracon."¹²¹ Trademark for water-reducing admixtures, based on medium to high molecular weight lignosulfonate fractions.

Containers: 50-lb bags.

Uses: Cement and concrete.

maraging steel. An alloy containing iron, nickel, cobalt and titanium.

Uses: Solid rocket cases.

"Maraglas."⁴⁷⁸ Trademark for a clear epoxy resin available in liquid, rods, or sheets.

Uses: Models and encapsulation.

"Maraset."⁴⁷⁸ Trademark for an epoxy resin available in liquid or powder foam.
Uses: Adhesive, coating, electrical insulation, and plastic tooling.

"Marasperse."¹²¹ Trademark for a series of lignosulfonates used as dispersants or emulsion-stabilizing agents. The basic lignin monomer unit is a substituted phenyl propane. Available in various types for specific uses.

Properties: Brown powder; completely soluble in water, insoluble in oils and most organic solvents.
Uses: Dyestuffs; oil-well drilling fluids; gypsum board; agricultural chemical formulations; industrial cleaners; carbon black dispersions; ceramics.

"Maratan."¹²¹ Trademark for highly purified lignosulfonate tanning agents used in conjunction with chrome or vegetable tans for high-quality leather. Available in powder (50-lb paper bags) or liquid form (drums, tank cars).

Marathon-Howard process. A treatment of waste sulfite liquor from sulfite pulp manufacture to recover chemicals and reduce stream pollution. The waste sulfite is treated with lime and precipitates (1) calcium sulfite for use in preparing fresh cooking acid for the sulfite pulp process and (2) a basic calcium salt of lignin sulfonic acid (see lignin sulfonates) which can be pressed and used as a fuel or used as raw material for vanillin, lignin plastics, and other chemicals. The remaining liquor, with its biological oxygen demand reduced 80 percent, is the effluent.

marble. A metamorphic form of calcium carbonate, usually containing admixtures of iron and other minerals, which impart variegated color patterns. Marble chips are often used as source of CO₂ in laboratory experiments.

"Marblette."⁴⁷⁸ Trademark for a phenol-formaldehyde resin.
Uses: Imitation jewelry, knife handles, miscellaneous molded articles.

"Marbon."⁵²⁵ Trademark for a series of high-styrene rubber-reinforcing resins.
800A. An easy-processing resin used with natural and synthetic rubbers for smoother calendering and extrusion, reduced shrinkage, faster mixing with lower power consumption. Light color; sp. gr. 1.04.
8000AE. Electrical grade resin.

"Marcol."⁵¹ Trademark for low viscosity N.F. white mineral oils used in pharmaceutical and cosmetic products. Also used on food, cigar and cigarette, candy and baking machinery where a nontoxic lubricant is necessary.

"Marex."¹²² Trademark for low viscosity ammonium alginate. Used as a stabilizer, moisture-controlling, suspending and plasticizing agent.

"Marezine."¹⁰¹ Trademark for cyclizine lactate. Used in medicine.

marfanil. See mafenide hydrochloride.

margaric acid. See n-heptadecanoic acid.

marijuana. See cannabis.

"Marincate."¹²¹ Trademark for magnesium trisilicate.

"Marinco."¹²¹ Trademark for magnesium hydroxides, oxides and carbonates.

marjoram oil (calamintha oil).

Properties: Colorless, yellowish or greenish-yellow essential liquid; strong, penetrating odor. Soluble in alcohol, ether, and chloroform. Sp. gr. 0.890–0.910; optical rotation +5° to +18°. Low toxicity. Combustible.

Chief known constituents: Terpineol; terpenes.

Derivation: Distilled from the flowering herb of *Origanum marjorana* L.

Uses: Perfuming soaps; toilet preparations; flavoring.

marjoram oil, Spanish.

Properties: Volatile, slightly yellow essential oil; odor of camphor. Soluble in most fixed oils; insoluble in glycerin, propylene glycol and mineral oil. Sp. gr. 0.907–0.915 (25°C); refractive index 1.4630–1.4660 (20°C); angular rotation –5° to +10°. Low toxicity. Combustible.

Derivation: Steam distillation of the flowering plant *Thymus mastichina* L.

Grade: F.C.C.

Use: Flavoring.

"Mark II."¹³⁴ Trademark for semibright, sulfur-free nickel plating additive.

"Marlate."²⁸ Trademark for technical grade methoxychlor insecticides, supplied in 50% wettable powder and an emulsifiable formulation containing 2 lb/gal.

"Marlex."³⁰¹ Trademark for a complete family of polyolefin plastics including polyethylenes, low, medium, and high density (ASTM Type I, II, and III); ethylene copolymers, high-density (ASTM Type III); and high-density tailored resins (ASTM Type III). Densities range from 0.914 to 0.970.

Uses (high-density): Heavy-duty automotive greases that are stable to temperature change; blow molding; injection molding, film and sheets.

(Low-density): Coatings; films; wire and cable coatings.

"Marmix."⁵²⁵ Trademark for a series of multipolymer latices made from monomers including styrene, butadiene, acrylonitrile. Range from soft, rubbery products to the high-styrene reinforcing resinous polymers.

"Marplan."¹⁹⁰ Trademark for isocarboxazid (q.v.).

marsh gas. See methane.

martensite. The chief constituent of hardened carbon tool steels. It is a solution of C or Fe₃C in beta-iron, or an exceedingly fine-grained alpha-iron with C or Fe₃C in atomic or molecular dispersion. Carbon content up to 1%. Easily obtained by quenching small bodies of hypereutectoid steel in cold water. More difficult to obtain in low-carbon steels.

"Marvinol."²⁴⁸ Trademark for polyvinyl chloride thermoplastic resins.

Properties: White powder or pellets. Actual properties vary with selection of stabilizer, plasticizer, pigment, and filler.

Grades: Thirteen types for calendering, molding, extrusion, and coating including high, medium, and low molecular weight resins, plastisol resins and copolymer resins. Also includes rigid, electrical, flexible extrusion and injection molding compounds.

mash. Mixture of malted barley (or other grain) and water used for preparing wort in brewing operations.

Also mixture of grain, etc., prepared for fermentation in distilling, e.g., "sour mash whiskey."

"Masonex."⁹² Trademark for a hemicellulose extract. Properties: Liquid containing 65% solids, 55% carbohydrates. pH 5.5; water-soluble. The spray-dried product is also water-soluble, with 97% solids and 84% carbohydrates (pH 3.7).

Derivation: From wood fibers after mild acid hydrolysis in steam.

Uses: (liquid) Intermediate in furfuryl production; animal feeds; (dried) binder in refractory bricks; tackifier in adhesives.

"Masonite."⁹² Trademark for composition hardboard made by treating wood chips with steam at high pressure, and compressing the resulting fibers into mats from which rigid panels are made by hot-pressing. The fiber is waterproofed with an emulsion having a paraffin base.

masonry cement. A group of special cements more workable and plastic than Portland cement. Some are similar to waterproofed Portland cement while others are Portland cement mixed with hydrated lime, crushed limestone, diatomaceous earth, or granulated slag.

mass. The quantity of matter contained in a particle or body, regardless of its location in the universe. Mass is constant, whereas weight is affected by the distance of a body from the center of the earth, (or of any other planet or satellite, e.g., the moon). At extremely high temperatures, for example, the sun's interior, mass is converted into energy. According to the Einstein equation $E = mc^2$, all forms of energy, such as radiant energy and energy of motion, possess a mass equivalent, even though they have no independent rest mass (photons); thus there is no absolute distinction between mass and energy. See also energy; matter.

mass action, law. See chemical laws (1).

mass conservation law. See chemical laws (4).

mass defect. The difference between the total mass of the constituents of an atomic nucleus (protons and neutrons) taken independently, and the actual mass of the nucleus as a whole. The latter is always slightly less than the sum of the masses of the constituents, the difference being the mass equivalent of the energy of formation (binding energy) of the nucleus. This accounts for the high energy release obtained from nuclear fission. See also fission, nuclear; mass number.

massecuite. A term used in the sugar industry for the mixture of sugar and molasses prior to removal of the molasses.

massicot.

(1) (lead ocher) Natural lead monoxide, PbO . Contains 92.8% lead. Found in United States (Colorado, Idaho, Nevada, and Virginia).

(2) An oxide of lead corresponding to the same formula as litharge (PbO) but having a different physical state. It is a yellow powder formed by the oxidation of a bath of metallic lead at a temperature of about $345^\circ C$ so that the oxide formed is not melted; sp. gr. 9.3, m.p. $600^\circ C$. If the oxide is melted, it is converted into litharge.

mass number. The number of neutrons and protons in the nucleus of an atom. Thus the mass number of normal helium is 4, of carbon 12, of oxygen 16, and of uranium 238. A given nuclide is characterized by

its atomic number, equivalent to the number of protons, which give it its charge and thus determine the kind of element, and the number of neutrons, which make up the remainder of its mass. Helium has two protons and two neutrons, (mass number 4 and atomic number 2). Protons and neutrons each have very close to unit mass, and since the mass change associated with binding the particles together into the nucleus is very small, the mass number is always within one-tenth unit of the atomic weight of the nuclide. See also mass; mass defect; atomic weight.

mass spectrometry. A method of chemical analysis in which ions are passed in a vacuum first through an accelerating electric field and then through a strong magnetic field. This has the effect of separating the ions according to their mass, as they traverse the magnetic field at different velocities (electromagnetic separation). Because of their greater kinetic energy, the heavier ions describe a wider arc than the lighter ones. The ions are collected in appropriate devices and are identified on the basis of their mass.

mastic. (1) A solid, resinous exudation of the tree *Pistachia lentiscus*, of recent geologic origin. Found in the Mediterranean area. Soluble in alcohol and ether; balsamic odor; turpentine taste. Used in chewing gum, varnishes, and to some extent in adhesives and dentistry. (2) A soft, putty-like sealant, often packed in cartridges and applied by a gun with a nozzle of appropriate size, or in bulk for application by a knife or other spreading device. Such mastics often contain bituminous ingredients or polymerized rosin acids, used for laying floor and wall tiles and similar applications.

"Matacil."¹⁸¹ Trademark for 4-dimethylamino methyl methylcarbamate.

material. A nonspecific term used with various shades of meaning in the technical literature. It should not be used as a synonym for substance, but is generally used in the collective expressions "raw materials" and "materials handling." The term "material balance" in chemical engineering denotes the sum of all the substances entering a reaction and all those that leave it in a given time period. "Material" also loosely refers to closely associated mixtures, either of natural origin (petroleum, wood, ores) or man-made (glass, cement, composites). See also substance.

material balance. See material.

materials handling. A general term that includes the methods used for in-plant transportation, distribution, and storage of raw materials and semi-processed products, as by fork-lift trucks, elevators, conveyor systems, pipelines, etc., as well as safe practices for storage and movement of toxic and flammable substances.

matte. A product containing a metal sulfide, as obtained after roasting and fusion of sulfide minerals. Oxides or metals may also be present. Common examples are copper matte and nickel matte.

matter. Anything that has mass or occupies space. (See also mass).

(a) **states.** There are three generally accepted states (phases) in which substances can exist, namely, solid; liquid and gas (vapor). From time to time it has been proposed that specialized forms of matter be regarded as states, such as the vitreous (glassy) state, the colloidal state, and the plasma state; but none of these suggestions has gained substantial acceptance. See phase (1); solid; liquid; gas.

(b) *levels*. Matter is basically composed of particles in the following levels of size and complexity: (1) subatomic (protons, neutrons, electrons); (2) atomic and molecular (less than 10 angstroms); (3) colloidal (from 10 angstroms to 1 micron); (4) microscopic; (5) macroscopic; (6) space or celestial. Levels (1) and (2) are invisible by any means; (3) can be resolved in an electron microscope; (4) in an optical microscope; (5) is visible to the naked eye; (6) requires telescopes for detailed observation. See also particle.

Note. The scanning electron microscope is reported to be capable of resolving particles at level (2). See atom.

mayonnaise. A semiliquid salad dressing composed of vegetable oil, vinegar and egg yolk. It is a typical colloidal emulsion in which the mutually repellent base ingredients are brought together and held in a stable form by the lecithin in egg yolk. See also emulsion.

"Maxad."¹²³ Trademark for magnesium oxide for adsorption application.

"Maxipen."²⁹⁹ Trademark for potassium phenethicillin.

Mayer's reagent. See mercuric potassium iodide.

"M-B-C."⁸⁸ Trademark for a methyl bromide fumigant with chloropicrin added.

Hazard: Toxic by inhalation.

MBMC. Abbreviation for monobutyl-meta-cresol. See tert-butyl-meta-cresol.

MBT. Abbreviation for mercaptobenzothiazole (q.v.).

MBTS. Abbreviation for 2-mercaptobenzothiazyl disulfide. See 2,2'-dithiobisbenzothiazole.

"MBX."¹¹ Trademark for 2,4-dimethyl-6-tert-butyl-phenol liquid. Used as an antioxidant.

mc. Abbreviation for millicurie. See curie.

"MC-3."²⁰⁴ Trademark for a special blend of mild alkalies, complex phosphates, and wetting agents. Especially designed for dairy plant and farm equipment. Sequesters hard water.

MCA. (1) Abbreviation for Manufacturing Chemists' Association, Inc. (q.v.). (2) Abbreviation for monochloroacetic acid. See chloroacetic acid.

"MCC."⁸⁴ Trademark for caustic soda flake. Used in cleaning and sterilizing milk, beer, and beverage bottles.

MCPA (2-methyl-4-chlorophenoxyacetic acid; 4-chloro-2-methylphenoxyacetic acid)
 $\text{CH}_3\text{ClC}_6\text{H}_3\text{OCH}_2\text{COOH}$.

Properties: White crystalline solid; m.p. 118–119°C. Free acid insoluble in water but sodium and amine salts are soluble.

Grades: Emulsifiable concentrates.

Use: Selective herbicide.

MCPB. 4-(2-methyl-4-chlorophenoxy) butyric acid.

Hazard: Toxic by ingestion.

Use: Herbicide.

MCPP. Abbreviation for 2-(2-methyl-4-chlorophenoxy)-propionic acid. See mecoprop.

Md Symbol for mendelevium.

MDA. (1) Abbreviation for metal deactivator (q.v.). (2) Abbreviation for para,para'-methylenedianiline. See para,para'-diaminodiphenylmethane.

"M.D.A."¹³⁸ Trademark for methylene disalicylic acid (q.v.).

MDAC. Abbreviation for 4-methyl-7-diethylaminocoumarin. See 7-diethylamino-4-methylcoumarin.

MDI. Abbreviation for methylene di-para-phenylene isocyanate. See diphenylmethane 4,4'-diisocyanate.

Me Symbol for methyl.

MEA. Abbreviation for monoethanolamine. See ethanolamine.

mecamylamine hydrochloride (methylaminoisocamphane hydrochloride) $\text{C}_{11}\text{H}_{21}\text{N} \cdot \text{HCl}$.

Properties: White crystalline powder; almost odorless; m.p. 245°C with some decomposition; soluble in water, alcohol, chloroform; somewhat soluble in benzene, isopropyl alcohol; insoluble in ether.

Grade: U.S.P.

Use: Medicine.

mecarbam. Generic name for S-[(ethoxycarbonyl)methylcarbamoyl]methyl O,O-diethyl phosphorodithioate.

$(\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{S})\text{SCH}_2\text{CON}(\text{CH}_3)\text{COOC}_2\text{H}_5$.

Properties: Yellow oil; b.p. 144°C (0.02 mm).

Hazard: Highly toxic. A cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

Shipping regulations: Organic phosphate, liquid, n.o.s., (Rail) Poison label (Air) Poison label. Not accepted on passenger planes.

mechlorethamine hydrochloride [methyl-bis-(2-chloroethyl)amine hydrochloride] $\text{CH}_3\text{N}(\text{CH}_2\text{CH}_2\text{Cl})_2 \cdot \text{HCl}$. A nitrogen mustard.

Properties: White, crystalline, hygroscopic powder; nasal irritant and a vesicant; soluble in water; m.p. 108–111°C.

Grade: U.S.P.

Hazard: Highly toxic; vesicant and strongly irritating to mucous membranes.

Use: Medicine.

meclizine hydrochloride $\text{C}_{25}\text{H}_{27}\text{ClN}_2 \cdot 2\text{HCl} \cdot \text{H}_2\text{O}$. (1-para-Chlorobenzhydryl-4-methylbenzylpiperazine dihydrochloride).

Properties: White or yellowish powder or crystals; slight odor; insoluble in water and ether; very soluble in chloroform, pyridine, and acid-alcohol-water mixtures; slightly soluble in dilute acids and alcohol.

Low toxicity.

Grade: U.S.P.

Use: Medicine (antihistamine).

"Mecopex."⁴⁰¹ Trademark for a broad-leaf herbicide containing potassium salt of mecoprop (31.5%).

Hazard: See mecoprop.

mecoprop (2-(4-chloro-2-methylphenoxy)propionic acid; MCPP; CMPP) $\text{ClC}_6\text{H}_3(\text{CH}_3)\text{OCH}(\text{CH}_3)\text{COOH}$.

Properties: Solid; m.p. 93–94°C. Insoluble in water; soluble in alcohol, acetone, and ether.

Hazard: Toxic by ingestion and inhalation; irritant to skin and eyes.

Use: Herbicide.

"Mecostrin."⁴¹² Trademark for dimethyl tubocurarine chloride (q.v.).

"Medi-Calgon."¹⁰⁸ Trademark for a pure white, powdered, sodium hexametaphosphate which has the ability to form a firm coagulum with tissue exudates. Use: Medicine (topical applications).

medicinal chemistry. A subdivision of chemistry which deals with the effects of drugs and pharmaceuticals on the human body and on various infective organisms, and with the synthesis of compounds specifically for certain diseases, such as antimalarials and antihypertensive agents. It also is concerned with immunology, hormone activity, etc.
See also: clinical chemistry:

medlure. Generic name for sec-butyl-4-(or 5)-chloro-2-methylcyclohexanecarboxylate $C_{12}H_{21}ClO_2$.
Properties: Liquid; b.p. 78–79° (0.25 mm). Insoluble in water; soluble in most organic solvents.
Use: Insect attractant.

"Medomin."²¹⁹ Trademark for heptabarbital. See barbiturate.

"Medrol."³²⁷ Trademark for the 6-methyl derivative of prednisolone (q.v.).

medroxyprogesterone acetate (17-hydroxy-6 α -methylpreg-4-ene-3,20-dione 17 acetate) $C_{24}H_{34}O_4$. A hormone derivative.

Properties: White to off-white, odorless crystalline powder; stable in air. Insoluble in water; freely soluble in chloroform; sparingly soluble in alcohol. Melting range 200 to 208°C.
Use: Medicine (injectable contraceptive).

mega-. Prefix meaning 10^6 units (symbol M). E.g., 1 megaton = 1,000,000 tons.

megatomoic acid (*trans*-3-, *cis*-5-tetradecadienoic acid). The active ingredient of the sex attractant in the female carpet beetle. Research is under way on synthesis of this substance to be used as a lure in control of this pest.

megaton. One million tons; usually used in defining the blast effect of a nuclear explosion. A 1-megaton bomb is equivalent in destructive potential to 1 million tons of TNT.

me glumine diatrizoate (methylglucamine diatrizoate; diatrizoate methylglucamine)
 $(CH_3CONH)_2C_6H_4COOH \cdot CH_3NHCH_2(CHOH)_4 \cdot CH_2OH$.

Properties: Available in solution for injection; pH between 6.0 and 7.6.

Grade: U.S.P. (as injection).

Use: Medicine (radiopaque medium).

Note: The iodipamide and iothalamate are also available.

MEK. Abbreviation for methyl ethyl ketone.

"Mekomask."¹⁸⁸ Trademark for an industrial odorant especially effective with methyl ethyl ketone.

"Melafix."⁴⁴⁵ Trademark for chlorine buffer used in chlorination of wool.

"Melaglaze."¹⁷⁵ Trademark for a synthetic modified resin used primarily as a coating to impart superior gloss and enhanced stain resistance to melamine-formaldehyde products.

melamine (cyanurtriamide; 2,4,6-triamino sym-triazine)
 $H_2NCNC(NH_2)NC(NH_2)N$. A cyclic trimer of cyanamide.

Properties: White, monoclinic crystals. Sparingly soluble in water, glycol, glycerol, pyridine; very slightly soluble in ethanol; insoluble in ether, benzene, carbon tetrachloride. Sp. gr. 1.573 (14°C); m.p. 354°C; b.p. sublimes. Low toxicity. Nonflammable.

Derivation: (1) From urea. (2) From cyanamide, di-

cyandiamide, or cyanuric chloride. (3) From ammonia and carbon dioxide (Dutch process).

Method of purification: Recrystallization from water.

Grade: 99% minimum.

Containers: 80-lb bags; fiber drums.

Uses: Melamine resins; organic syntheses; leather tanning.

melamine resin. A type of amino resin (q.v.) made from melamine and formaldehyde. The first step in resin formation is the production of trimethylol melamine, $C_3N_3(NHCH_2OH)_3$, the molecules of which contain a ring with 3 carbon and 3 nitrogen atoms, the $-NHCH_2OH$ groups being attached to the carbon atoms. This molecule can combine further with others of the same kind by a condensation reaction. Excess formaldehyde or melamine can also react with trimethylol melamine or its polymers, providing many possibilities of chain growth and cross-linking. The nature and degree of polymerization depend upon pH, but heat is always needed for curing. Melamine resins are more water- and heat-resistant than urea resins. They may be water-soluble syrups (low m.w.) or insoluble powders (high m.w.) dispersible in water. Widely used as molding compounds with alpha-cellulose, wood flour or mineral powders as fillers, and with coloring materials; also for laminating, boilproof adhesives, increasing wet strength of paper, textile treatment, leather processing, and for dinnerware and decorative plastic items.

Butylated melamine resins are formed by incorporating butyl or other alcohols during resin formation, whereupon the $-NHCH_2OH$ groups convert to $-NHCH_2OC_4H_9$. These resins are soluble in paint and enamel solvents and in surface coatings, often in combination with alkyds. They give exceptional curing speed, hardness, wear resistance, and resistance to solvents, soaps, and foods.

Melamine-acrylic resins are water-soluble and are used for formation of water-base industrial and automotive finishes.

See also urea-formaldehyde resin.

melaniline. See diphenylguanidine.

melanin. A brownish-black pigment that occurs normally in the retina, skin, and hair of higher animals with the exception of albinos. Formed from tyrosine by the action of tyrosinase.

"Melilotine."²²⁷ Trademark for benzodihydropyrene (q.v.).

melissic acid (triacontanoic acid) $CH_3(CH_2)_{28}COOH$. A long-chain fatty acid.

Properties: Crystalline solid; m.p. 94°C; soluble in benzene and hot alcohol; insoluble in water. Combustible; low toxicity.

Derivation: By oxidation of 1-triacontanol; occurs in minor amounts in many plant and insect waxes and in montan wax.

Use: Biochemical research.

melissyl alcohol. See 1-triacontanol and 1-hentriacontanol.

melittin. A polypeptide derived from bee venom that has strong antibacterial activity, especially against *Staphylococcus aureus* 80, which is resistant to penicillin. It inhibits growth of many Gram-positive and Gram-negative bacteria.

"Mellotone."¹⁸⁸ Trademark for 3-hydroxy-2-methyl-1,4-pyrone. Caramel-butterscotch flavor; used in perfumes and flavors for a soft, malt-like effect.

"Melmac."³⁷ Trademark for products molded from melamine-formaldehyde resins.

"Melonal."²²⁷ Trademark for 2,6-dimethyl-5-hepten-1-al (q.v.).

"Melostrength."⁵⁷ Trademark for a melamine-formaldehyde paper resin designed as a pulp additive to improve wet and dry strength properties of paper.

"Meloxine."³²⁷ Trademark for methoxsalen (q.v.).

melphalan (para-di(2-chloroethyl)aminophenylalanine; formerly called sarcolysin)

$(\text{ClCH}_2\text{CH}_2)_2\text{NC}_6\text{H}_4\text{CH}_2\text{CH}(\text{NH}_2)\text{COOH}$. Melphalan is both the USAN name for the acid, and the generic name for the hydrochloride.

Properties: A nitrogen mustard (q.v.). Crystals; m.p. 180°C .

Grade: N.D. (in medicine, for the acid).

Hazard: Strong irritant to eyes and mucous membranes.

Uses: Medicine; insect chemosterilant.

melting point. The melting point or freezing point of a pure substance is the temperature at which its crystals are in equilibrium with the liquid phase at atmospheric pressure. The term "melting point" is used when the equilibrium temperature is approached by heating the solid. Ordinarily melting points refer to temperatures above 0°C , the melting point of ice. The terms melting point and freezing point are often used interchangeably. The number of calories required to convert one mole of pure crystals to the liquid state is called the molar heat of fusion.

"Meltopax."³³⁷ Trademark for a double silicate, containing 55.5–57.5% zirconium oxide, 27–29% silicon dioxide, and 13.5–15.5% sodium oxide. M.p. 2600°F . Used as an ingredient for enamel frits and special glasses.

"Melurac."⁵⁷ Trademark for urea-melamine-formaldehyde condensation products used mainly as adhesives for bonding of veneers for the production of exterior grade plywood.

"Mema."¹⁴⁷ Trademark for a liquid seed disinfectant which contains 11.4% methoxyethylmercury acetate. Hazard: Toxic by ingestion.

membrane, semipermeable. A microporous structure, either natural or synthetic, which acts as a highly efficient filter in the range of molecular dimensions, allowing passage of ions, water and other solvents, and very small molecules, but almost impermeable to macromolecules (proteins) and colloidal particles. The thickness is about 100 Angstrom; the pore diameter is from 8 Angstrom for the walls of tissue cells to 100 Angstrom or more for manufactured membranes. Plant cell wall membranes are proteinaceous substances which function in natural osmosis. Membranes of cellophane, collodion, asbestos fiber, etc. are used in such industrial operations as waste liquor recovery, desalination, and electrolysis. See also osmosis; dialysis.

memtetrahydrophthalic anhydride (methyl norbornene dicarboxylic anhydride).

Properties: Clear, transparent, slightly viscous liquid. Colorless to light yellow.

Hazard: Highly toxic; strong irritant to eyes and skin.

Uses: Curing epoxy resins; electrical laminating and filament winding; intermediate for polyesters, alkyd resins and plasticizers.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

MENA. Abbreviation for the methyl ester of naphthaleneacetic acid. See alpha-naphthaleneacetic acid, methyl ester.

menadione (2-methyl-1,4-naphthoquinone; menaphthone; vitamin K_3) $\text{C}_{10}\text{H}_8\text{CH}_3\text{O}_2$.

Properties: Yellow, crystalline powder; nearly odorless; m.p. $105\text{--}107^\circ\text{C}$; affected by sunlight. Soluble in alcohol, benzene, and vegetable oils; insoluble in water.

Derivation: Oxidation of beta-methylnaphthalene.

Grade: U.S.P.

Hazard: Irritant to skin and mucous membranes, especially alcoholic solution.

Uses: Medicine; fungicides; animal feed additive.

menazon. Generic name for S-[(4,6-diamino-s-triazin-2-yl)methyl]O,O-dimethyl phosphorodithioate $(\text{CH}_3\text{O})_2\text{P}(\text{S})\text{SCH}_2\text{C}_6\text{H}_3\text{NC}(\text{NH}_2)_2\text{NC}(\text{NH}_2)_2\text{N}$.

Properties: Off-white solid; m.p. $160\text{--}162^\circ\text{C}$. Slightly soluble in water and organic solvents.

Hazard: Highly toxic. A cholinesterase inhibitor.

Uses: Acaricide; insecticide.

Shipping regulations: (Rail, Air) Organic phosphate, solid, n.o.s., Poison label. Not accepted on passenger planes.

Mendeleef, D. I. (1834–1907). Born in Siberia, Mendeleef in 1869 made one of the greatest contributions to chemistry of any scientist by establishing the principle of periodicity of the elements. His first Periodic Table was compiled on the basis of arranging the elements in ascending order of atomic weight and grouping them by similarity of properties. So accurate was Mendeleef's thinking that he predicted the existence and atomic weights of several elements that were not actually discovered till years later. The original table has been modified and corrected several times, notably by Moseley, but it has accommodated the discovery of isotopes, rare gases, etc. Its importance in the development of chemical theory can hardly be overestimated. (See Becquerel, Moseley, periodic table).

mendelevium Md Synthetic radioactive element produced in a cyclotron by bombarding einsteinium with alpha particles; atomic number 101. Atomic weight 256; four isotopes; valence 3. Mendelevium decays by spontaneous fission with a half-life of $1\frac{1}{2}$ hours. The heaviest isotope, Md-258, has half-life of 60 days. Md is thought to have chemical properties similar to those of the rare earth thulium. It is made in research quantities only and no uses are reported. See actinide series.

menhaden oil

Properties: Yellowish-brown or reddish-brown drying oil; characteristic odor. Soluble in ether, benzene, naphtha, and carbon disulfide. Sp. gr. 0.927–0.933; saponification value 191–196; iodine value 139–180; refractive index 1.480. Combustible. Nontoxic.

Derivation: By cooking or pressing the body of the menhaden fish.

Method of purification: Filtration and bleaching with fuller's earth.

Grades: Prime crude; brown strained; strained; bleached; winter oil; bleached winter white oil.

Containers: Drums; tank cars.

Hazard: Subject to spontaneous heating.

Uses: Hydrogenated fats for cooking and industrial use (soap, rubber compounding); printing inks; animal feed; margarine; leather dressing; lubricant; paint drier; cleansers; lipstick.

meniscus. The concave curve of a liquid surface in a graduate or narrow tube caused by surface tension. In reading the value (e.g., 5 cc) it is conventional to ignore the higher liquid around the perimeter. In the case of mercury, which does not wet the tube, the meniscus is convex.

menthenediamine (para-menthane-1,8-diamine)
 $(CH_3)_2C(NH_2)CHCH_2CH_2C(CH_3)(NH_2)CH_2CH_2$. A

primary alicyclic diamine; also a tert-alkylamine.

Properties: Clear liquid; terpene odor; boiling range 107–126°C (10 mm); f.p. –45°C; refractive index 1.4794 (25/D); miscible with water and most organic solvents.

Containers: Drums; tank cars.

Hazard: Strong irritant to eyes and skin. Use eye protection.

Uses: Curing agent for epoxy resins; chemical intermediate.

para-menthane hydroperoxide.

Properties: Clear, pale yellow liquid; sp. gr. 0.910–0.925 (15.5/4°C); refractive index 1.460–1.475 (20°C).

Hazard: Strong irritant to skin and eyes; strong oxidizing agent; dangerous in contact with organic materials.

Uses: Catalyst for rubber and polymerization reactions; coatings.

Shipping regulations: (Air) Solution over 60%, not acceptable; not over 60% in non-volatile solvent, Organic Peroxide label; (Rail) Oxidizing material, n.o.s., Yellow label.

para-menthan-3-one. See menthone.

menthol (hexahydrothymol; methylhydroxyisopropylcyclohexane; para-menthan-3-ol; peppermint camphor) $CH_3C_6H_9(C_3H_7)OH$. It may be *l*- (from natural sources) or *dl*- (natural or synthetic).

Properties: White crystals with cooling odor and taste; m.p. 41–43°C (*l*-form); congealing temperature 27–28°C (*dl*-form); specific rotation (25/D) (*l*-menthol) –45 to –51°, (*dl*-menthol) –2 to +2°. Soluble in alcohol, light petroleum solvents, glacial acetic acid, and fixed or volatile oils; slightly soluble in water. Low toxicity. Combustible.

Occurrence: Brazil (natural product); Japan.

Derivation: By freezing from peppermint oil; by synthesis from citronellal, thymol, or turpentine oil.

Grades: Technical; U.S.P.; F.C.C.

Hazard: Moderate irritant to mucous membranes on inhalation.

Uses: Perfumery; cigarettes; liqueurs; flavoring agent; chewing gum; chest rubs; cough drops.

menthol acetic ester. See menthyl acetate.

menthol valerate (menthyl isovalerate)
 $(CH_3)_2CHCH_2COOC_{10}H_{19}$.

Properties: Colorless liquid; mild odor; cooling, faintly bitter taste; sp. gr. 0.907 (15.4°C); insoluble in water; soluble in alcohol, chloroform, ether, and oils.

Derivation: By action of valeric acid on menthol.

Uses: Medicine; flavoring.

menthone (para-menthan-3-one) $C_{10}H_{18}O$.

Properties: Colorless, oily, mobile liquid; slight peppermint odor; slightly soluble in water; soluble in organic solvents. Sp. gr. 0.897 (15°C); b.p. 207°C. Low toxicity. Combustible.

Derivation: A ketone found in oil of peppermint.

Use: Flavoring.

menthyl acetate (menthol acetic ester)
 $C_{10}H_{19}OOCCH_3$.

Properties: Colorless liquid. Menthol-like odor. Slightly soluble in water; miscible with alcohol and ether. B.p. 227 to 228°C; sp. gr. 0.922–0.927; optical rotation –72° 47' to –73° 18'; refractive index 1.447. Low toxicity. Combustible.

Derivation: (a) By Boiling menthol with acetic anhydride in the presence of sodium acetate. (b) Peppermint oil.

Uses: Perfumery; flavoring.

menthyl isovalerate. See menthol valerate.

menthyl salicylate $C_6H_4(OH)COOC_{10}H_{19}$.

Properties: Colorless liquid; miscible with alcohol, ether, chloroform, and fatty oils in all proportions. Insoluble in water; soluble in organic solvents. Combustible. Low toxicity.

Uses: Medicine; sunscreen preparations.

See also homomenthyl salicylate.

"Mentor."⁵¹ Trademark for nonviscous oils of the mineral seal type, used mainly as absorption media in vapor recovery systems, such as those recovering coal-tar solvents and casinghead gasoline.

MEP. Abbreviation for methyl ethyl pyridine.

meperidine hydrochloride $C_{15}H_{21}NO_2HCl$. An addictive drug. Use by prescription only.

meprobamate (2-methyl-2-n-propyl-1,3-propanediol dicarbamate)

$H_2NCOOCH_2C(CH_3)(C_3H_7)CH_2OOCNH_2$.

Properties: White powder; m.p. 103–107°C; characteristic odor and bitter taste; slightly soluble in water and ether; soluble in alcohol and acetone.

Grade: N.F.

Hazard: Central nervous system depressant. Not addictive. Use restricted by law.

Use: Medicine (antianxiety agent).

meq Abbreviation for milliequivalent. See eq.

"Merac."²⁰⁴ Trademark for a liquid, dithiocarbamate rubber accelerator.

meralluride. Methoxyhydroxymercuripropylsuccinylurea ($C_9H_{16}HgN_2O_6$) and theophylline ($C_7H_8N_4O_2 \cdot H_2O$) in approximately molecular proportions.

Properties: White to slightly yellow powder; affected slowly by light; soluble in glacial acetic acid and solutions of alkali hydroxides; slightly soluble in water; moderately soluble in hot water. Saturated solution is acid to litmus.

Grade: U.S.P.

Hazard: Toxic by ingestion.

Use: Medicine.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

merbromin (dibromohydroxymercurifluorescein disodium salt; 2,7-disodiumdibromo-4-hydroxymercurifluorescein) $C_{20}H_8Br_2HgNa_2O_6$.

Properties: Iridescent, green scales or granules; odorless; soluble in water; insoluble in alcohol, acetone, chloroform, or ether. Stable in air.

Derivation: From dibromofluorescein and mercuric acetate.

Grades: Technical; N.F.

Hazard: Toxic by ingestion. Tolerance, 0.05 mg per cubic meter of air.

Use: Medicine (antiseptic).

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

"Mercadium"²⁶⁶ Trademark for calcined coprecipitations of cadmium sulfide and mercury sulfide, with or without barium sulfate; available in concentrated and lithopone forms; colors: orange, red, maroon. Hazard: Toxic by ingestion. Uses: Artists' colors; plastics colorants.

mercaptamine. See 2-aminoethanethiol.

mercaptan. See thiol.

"Mercaptate."⁴⁵⁸ Trademark for mercaptocarboxylate esters of polyols. High boiling, viscous liquids with a sharp, sulfur-like odor. Useful for chemically and physically modifying polymeric systems.

mercaptoacetic acid. See thioglycolic acid.

2-mercaptobenzoic acid. See thiosalicylic acid.

2-mercaptobenzothiazole (MBT)

Properties: Yellowish powder. Distinctive odor (depends on degree of purification). Soluble in dilute caustic, alcohol, acetone, benzene, chloroform; insoluble in water and gasoline. Sp. gr. 1.52; melting range 164–175°C. Low toxicity. Combustible.

Grades: Technical; 97%.

Containers: 1-, 5- and 10-lb fiber cans; 55-lb drums; multiwall paper sacks.

Uses: Vulcanizatoin accelerator for rubber (requires use of stearic acid for full activation); tire treads and carcasses, mechanical specialties, etc.; fungicide; corrosion inhibitor in cutting oils and petroleum products; extreme-pressure additive in greases.

2-mercaptobenzothiazyl disulfide. See 2,2'-dithiobisbenzothiazole.

mercaptoethanol HSCH₂CH₂OH.

Properties: Water-white, mobile liquid with disagreeable odor; sp. gr. 1.1168 (20/20°C); 9.29 lb/gal (20°C); b.p. 157.1°C; vapor pressure 1.0 mm (20°C); viscosity 3.43 cp. (20°C); completely soluble in water, and most organic solvents; flash point 165°F; f.p., sets to a glass below -100°C; refractive index (n_D 20) 1.5011. Combustible.

Containers: Fiber cans; drums; multiwall paper sacks.

Hazard: Moderately toxic by inhalation and ingestion.

Uses: Solvent for dyestuffs; intermediate for producing dyestuffs, pharmaceuticals, rubber chemicals, flotation agents, insecticides, plasticizers, textile assistants and other compounds; water-soluble reducing agent; biochemical reagent.

beta-mercaptoethylamine hydrochloride HS(CH₂)₂NH₂ · HCl.

Properties: Hygroscopic white powder; m.p. 71°C; very soluble in water and ethyl alcohol.

Hazard: Moderately toxic by inhalation and ingestion.

N(2-mercaptoethyl)benzenesulfonamide S-(O,O-diisopropyl phosphorodithioate) (N-(beta-diisopropylidithiophosphorylethyl)benzenesulfonamide)

C₆H₄SO₂NH(CH₂)₂SP(S)[OCH(CH₃)₂]₂. Properties: Colorless liquid, slight odor; sp. gr. 1.25 (22°C). Insoluble in water; soluble in kerosene and xylene.

Hazard: Highly toxic. Cholinesterase inhibitor. Use may be restricted.

Use: Herbicide.

Shipping regulations: Organic phosphate, liquid, n.o.s. (Rail) Poison label. (Air) Poison label. Not accepted on passenger planes.

2-mercapto-4-hydroxypyrimidine. See thiouracil.

2-mercaptoimidazoline. See "NA-22."

beta-mercaptopropionic acid HSCH₂CH₂COOH.

Properties: Clear liquid; sp. gr. 1.218 (21°C); m.p. 16.8°C; b.p. 111°C (15 mm); soluble in water and alcohol.

Uses: Stabilizer; antioxidant; catalyst; chemical intermediate.

6-mercaptapurine (6-MP; 6-purinethiol)

C₄H₄N₄S · H₂O. A sulfur-containing purine base not found in animal nucleoproteins.

Properties: Yellow, crystalline powder; m.p. 308°C (decomposes); nearly odorless; insoluble in water; soluble in hot alcohol and dilute alkali solutions; slightly soluble in dilute H₂SO₄.

Grade: U.S.P.

Use: Medicine (to prevent rejection of kidney transplants).

mercaptosuccinic acid. See thiomalic acid.

2-mercaptothiazoline C₂H₄NSSH. White crystals.

Use: Synthesis of pharmaceuticals.

D-3-mercaptovaline. See penicillamine.

mercerized cotton. See cotton, mercerized.

mercerizing assistant. A compound used to increase the penetration of mercerizing baths. Cresylic acid derivatives, special sulfonated oils, and other wetting agents are typical.

mercuric acetate (mercury acetate) Hg(C₂H₃O₂)₂.

Properties: White, crystalline powder. Soluble in alcohol and water; sensitive to light. Sp. gr. 3.2544.

Hazard: Highly toxic by ingestion, inhalation, and absorption; strong irritant. Tolerance, 0.01 mg per cubic meter of air.

Uses: Medicine; catalyst in organic synthesis; pharmaceuticals.

Shipping regulations: (Rail, Air) Poison label.

mercuric ammonium chloride (mercury ammonium chloride) HgCl₂ · 2NH₄Cl · 2H₂O.

Properties: White powder; soluble in water; slightly soluble in alcohol.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption; strong irritant. Tolerance, 0.05 mg per cubic meter of air.

Uses: Medicine; veterinary medicine.

Shipping regulations: (Rail, Air) Poison label.

See also mercury, ammoniated.

mercuric arsaniolate. See mercury atoxylate.

mercuric arsenate (mercury arsenate) HgHAsO₄.

Properties: Yellow powder. Soluble in hydrochloric acid; slightly soluble in nitric acid; insoluble in water.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption; strong irritant. Tolerance, 0.05 mg per cubic meter of air.

Uses: Medicine; waterproof paints; antifouling paints.

Shipping regulations: (Rail, Air) Poison label.

mercuric barium bromide (barium mercury bromide; mercury barium bromide) HgBr₂ · BaBr₂.

Properties: Colorless, crystalline mass. Very hygroscopic. Soluble in water.

Hazard: Highly toxic by ingestion, inhalation, an'

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

skin absorption; strong irritant. Tolerance, 0.05 mg per cubic meter of air.

Shipping regulations: (Rail, Air) Poison label.

mercuric barium iodide (barium mercury iodide; mercury barium iodide) $\text{HgI}_2 \cdot \text{BaI}_2 \cdot 5\text{H}_2\text{O}$.

Properties: Reddish or yellow, crystalline mass; unstable; deliquescent. Soluble in alcohol and water.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption; strong irritant. Tolerance, 0.05 mg per cubic meter of air.

Uses: Microanalysis (testing for alkaloids); preparing Rohrbach solution.

Shipping regulations: (Rail, Air) Poison label.

mercuric benzoate (mercury benzoate) $\text{Hg}(\text{C}_7\text{H}_5\text{O}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: White crystals; m.p. 165°C ; sensitive to light. Soluble in solutions of sodium chloride and ammonium benzoate; slightly soluble in alcohol and water.

Derivation: By the interaction of a mercuric salt and sodium benzoate.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption; strong irritant. Tolerance, 0.05 mg per cubic meter of air.

Use: Medicine.

Shipping regulations: (Rail, Air) Poison label.

mercuric bromide (mercury bromide) HgBr_2 .

Properties: White, rhombic crystals. Sensitive to light. Soluble in alcohol and ether; sparingly soluble in water. Sp. gr. 6.11; m.p. 235°C ; b.p. 322°C .

Derivation: By adding potassium bromide to a solution of a mercuric salt and crystallizing.

Hazard: Highly toxic by inhalation, ingestion, and skin absorption. Strong irritant. Tolerance, 0.05 mg per cubic meter of air.

Use: Medicine.

Shipping regulations: (Rail, Air) Poison label. Not acceptable on passenger planes.

mercuric chloride (mercury bichloride; mercury chloride, corrosive) HgCl_2 .

Properties: White crystals or powder; odorless. Soluble in water, alcohol, ether, pyridine, glycerine and acetic acid ester. Sp. gr. 5.44 (25°C); 276°C ; b.p. 303°C .

Derivation: (a) Direct combination of chlorine with mercury heated to volatilizing point; (b) by subliming mercuric sulfate with common salt.

Method of purification: Recrystallization and sublimation.

Impurities: Mercurous chloride.

Grades: Technical; crystals; granular; powder; C.P.; N.F.

Containers: 100-lb drums.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. May be fatal! Tolerance, 0.05 mg per cubic meter of air.

Uses: Manufacture of calomel and other mercury compounds; disinfectant; organic synthesis; analytical reagent; metallurgy; tanning; catalyst for vinyl chloride; sterilant for seed potatoes; fungicide, insecticide and wood preservative; embalming fluids; textile printing; dry batteries; photography; process engraving and lithography.

Shipping regulations: (Rail, Air) Poison label. Not acceptable on passenger planes.

mercuric chloride, ammoniated. See mercury, ammoniated.

mercuric cuprous iodide (copper mercury iodide; mercury copper iodide) $\text{HgI}_2 \cdot 2\text{CuI}$.

Properties: Dark red, crystalline powder; sp. gr. 6.12. Insoluble in alcohol and water.

Hazard: Highly toxic. Tolerance, 0.05 mg per cubic meter of air.

Use: Thermoscopy (detecting overheating of machine bearings) by reversible color change.

Shipping regulations: (Rail, Air) Mercury compounds, Poison label.

mercuric cyanate. See mercury fulminate.

mercuric cyanide (mercury cyanide) $\text{Hg}(\text{CN})_2$.

Properties: Colorless, transparent prisms, darkened by light. Soluble in water and alcohol. Sp. gr. 4.018; m.p., decomposes.

Derivation: Interaction of mercuric oxide and an aqueous solution of hydrocyanic acid.

Grades: Technical; C.P.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Uses: Medicine; germicidal soaps; manufacturing cyanogen gas; photography.

Shipping regulations: (Rail, Air) Poison label.

mercuric dichromate. See mercury dichromate.

mercuric dimethyldithiocarbamate $\text{C}_6\text{H}_{12}\text{N}_2\text{S}_4\text{Hg}$. Used in turf fungicides.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s. Poison label.

mercuric dioxysulfate. See mercuric subsulfate.

mercuric fluoride (mercury fluoride) HgF_2 .

Properties: Transparent crystals; sp. gr. 8.95; m.p. 645°C , decomposes; moderately soluble in water and alcohol.

Derivation: Mercuric oxide and hydrofluoric acid.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Strong irritant. Tolerance, 0.05 mg per cubic meter of air.

Use: Synthesis of organic fluorine compounds.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

mercuric iodate (mercury iodate) HgIO_3 .

Properties: White powder. Soluble in hydrochloric acid, hydrobromic acid, hydriodic acid, water (containing sodium chloride or potassium iodide); insoluble in alcohol and water.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Strong irritant. Tolerance, 0.05 mg per cubic meter of air.

Use: Medicine.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

mercuric iodide (mercury iodide, red; mercury iodide, yellow) HgI_2 .

Properties: (a) Red, tetragonal crystals; turn yellow when heated to 150°C , returning to red on cooling; (b) Yellow, rhombic crystals. Soluble in boiling alcohol, and in solutions of sodium thiosulfate or potassium iodide or other hot alkali chloride solutions; almost completely insoluble in water. Sp. gr. (a) 6.2–6.35, (b) 5.91–6.06; m.p. (b) 259°C , b.p. 349°C .

Derivation: (a) By the direct union of mercury and iodine. (b) As a precipitate by adding potassium iodide to a solution of a mercuric salt. Yellow form precipitates from alcoholic solutions.

Grades: Technical; reagent.

Containers: Bottles, drums.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Strong irritant. Tolerance, 0.05 mg per cubic meter of air.

Uses: Medicine; analytical reagents (Nessler's reagent; Mayer's reagent).

Shipping regulations: (Rail, Air) Poison label.

See also mercuric potassium iodide.

mercuric lactate $\text{Hg}(\text{C}_3\text{H}_5\text{O}_2)_2$.

Properties: White crystalline powder; soluble in water; decomposed by heat.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.01 mg per cubic meter of air.

Use: Fungicide.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

mercuric naphthenate (mercury naphthenate)

Properties: Dark amber liquid; soluble in lubricating oils and mineral spirits. Wt/gal 10.4 lbs.

Grades: 25% mercury.

Containers: 80-lb drums.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Uses: Mildew-resistance promoter in paints; anti-knock compound.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

mercuric nitrate (mercury nitrate; mercury pernitrate) $\text{Hg}(\text{NO}_3)_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals or white deliquescent powder. Sp. gr. 4.3; m.p. 79°C ; decomposed by heat. Soluble in water and nitric acid; insoluble in alcohol.

Derivation: By action of hot nitric acid on mercury.

Hazard: Highly toxic. Dangerous fire risk in contact with organic materials. Tolerance, 0.05 mg per cubic meter of air.

Uses: Nitration of aromatic organic compounds; medicine; felt manufacture; mercury fulminate.

Shipping regulations: Nitrates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

mercuric oleate (mercury oleate)

Properties: Yellowish to red liquid, semi-solid or solid mass. Soluble in fixed oils; insoluble in water; slightly soluble in alcohol or ether.

Derivation: By mixing yellow mercuric oxide with oleic acid.

Grades: Technical; pharmaceutical.

Uses: Medicine; antiseptic; antifouling paints.

Shipping regulations: (Rail, Air) Poison label.

mercuric oxide, red (red precipitate; mercury oxide, red) HgO .

Properties: Heavy, bright, orange-red powder. Soluble in dilute hydrochloric and nitric acids; slightly soluble in water, more so after boiling; insoluble in alcohol and ether. Sp. gr. 11.00–11.29; m.p., decomposes.

Derivation: By heating mercurous nitrate.

Grades: Technical; paint; A.C.S. reagent.

Containers: 100-lb drums.

Hazard: Highly toxic. Fire risk in contact with organic materials. Tolerance, 0.05 mg per cubic meter of air.

Uses: Chemicals; paint pigment; perfumery and cosmetics; pharmaceuticals for topical disinfection; ceramics (pigment); batteries, especially for minia-

turized equipment; polishing compounds; analytical reagent; antifouling paints; fungicide.

Shipping regulations: (Rail, Air) Poison label.

mercuric oxide, yellow (mercury oxide, yellow; yellow precipitate) HgO .

Properties: Light, orange-yellow powder; odorless; stable in air but turns dark on exposure to light; finer powder than the red form; sp. gr. 11.03 (27.5°C); m.p., decomposes. Slightly soluble in cold water, more so after boiling; soluble in dilute hydrochloric and nitric acids, potassium iodide solution, concentrated solutions of alkaline-earth chloride, magnesium chloride; insoluble in alcohol.

Derivation: (a) By the action of either potassium hydroxide or sodium hydroxide on mercuric chloride. (b) By the action of sodium carbonate upon mercuric nitrate solution.

Grades: C.P.; technical; N.F.; paint.

Containers: 100-lb drums.

Hazard: Highly toxic. Fire risk in contact with organic materials. Tolerance, 0.05 mg per cubic meter of air.

Uses: Medicine; mercury compounds; see also mercuric oxide, red.

Shipping regulations: (Rail, Air) Poison label.

mercuric oxycyanide $\text{HgO} \cdot \text{Hg}(\text{CN})_2$.

Properties: White crystalline powder; sp. gr. 4.44. Moderately soluble in water.

Hazard: Highly toxic. Detonates on heating; dangerous explosion risk. Tolerance, 0.05 mg per cubic meter of air.

Use: Medicine.

Shipping regulations: (Rail, Air) Consult authorities.

mercuric phosphate (normal mercuric phosphate; neutral mercuric phosphate; trimercuric orthophosphate; mercuric phosphate, tertiary; mercury phosphate) $\text{Hg}_3(\text{PO}_4)_2$.

Properties: Heavy, white or yellowish powder. Soluble in acids; insoluble in alcohol, water.

Hazard: Highly toxic. Tolerance, 0.05 mg per cubic meter of air.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

mercuric potassium cyanide (mercury potassium cyanide) $\text{Hg}(\text{CN})_2 \cdot 2\text{KCN}$.

Properties: Colorless crystals. Soluble in water and alcohol.

Derivation: By mixing mercuric and potassium cyanides and crystallizing.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Use: Silvering glass in mirror manufacture.

Shipping regulations: (Rail, Air) Poison label.

mercuric-potassium iodide (Mayer's reagent; potassium mercuric iodide). See also Nessler's reagent. K_2HgI_4 or $2\text{KI} \cdot \text{HgI}_2$.

Properties: Odorless, yellow crystals, deliquescent in air. Crystallizes with either 1, 2, or 3 molecules of water. The commercial product is the anhydrous form containing about 25.5% mercury. Sp. gr. 4.29. Neutral or alkaline to litmus. Very soluble in water; soluble in alcohol, ether and acetone.

Derivation: (a) Action of hydrochloric acid and potassium iodide on mercuric cyanide or mercuric chloride. (b) Action of potassium iodide on mercuric oxide.

Containers: 1-lb and 5-lb bottles.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Uses: Medicine; chemical analysis.

Shipping regulations: (Rail, Air) Poison label.

mercuric salicylate (salicylated mercury).

Properties: White powder, yellow or pink tinge. A compound of mercury and salicylic acid of somewhat varying composition, mercury replacing both phenolic and carboxylic hydrogen. Contains not less than 54% nor more than 59.5% mercury. Odorless; tasteless. Soluble in solutions of the fixed alkalis or their carbonates, and in warm solutions of the alkali halides; almost insoluble in water and alcohol.

Derivation: By gently heating freshly precipitated yellow mercuric oxide and salicylic acid in presence of water.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Use: Medicine.

Shipping regulations: (Rail, Air) Poison label.

mercuric silver iodide (mercury silver iodide; silver mercury iodide) $\text{HgI}_2 \cdot 2\text{AgI}$.

Properties: Yellow powder; becomes red at 40–50°C. Sp. gr. 6.08; soluble in solutions of potassium cyanide or potassium iodide; insoluble in acids (dilute), and water.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Use: Thermoscopy (detecting overheating in journal bearings).

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

mercuric stearate (mercury stearate) $(\text{C}_{17}\text{H}_{35}\text{CO}_2)_2\text{Hg}$.

Properties: Yellow, granular powder; soluble in fatty oils; slightly soluble in alcohol.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Uses: Medicine; germicide.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

mercuric subsulfate (basic mercuric sulfate; mercuric dioxysulfate) $\text{Hg}(\text{HgO})_2\text{SO}_4$.

Properties: Heavy, lemon-yellow powder or bright-yellow scales. Soluble in dilute acids; very slightly soluble in water, more so in hot water. Sp. gr. 6.444.

Derivation: Addition of water to normal mercuric sulfate.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption.

Use: Medicine.

Shipping regulations: (Rail, Air) Poison label.

mercuric sulfate (mercury persulfate; mercury sulfate) HgSO_4 .

Properties: White, crystalline powder. Soluble in acids; insoluble in alcohol; decomposes in water. Sp. gr. 6.466; m.p., decomposes at red heat.

Derivation: By the action of sulfuric acid on mercury, with subsequent crystallization.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Uses: Medicine; producing calomel and corrosive sublimate; catalyst in the conversion of acetylene to

acetaldehyde; extracting gold and silver from roasted pyrites; galvanic batteries.

Shipping regulations: (Rail, Air) Poison label.

mercuric sulfate, basic. See mercuric subsulfate.

mercuric sulfide, black (mercury sulfide, black) HgS .

Properties: Black powder. Soluble in sodium sulfide solution; insoluble in water, alcohol, and nitric acid. Sp. gr. 7.55–7.70; m.p., sublimes at 446°C; m.p. 583°C.

Derivation: By passing hydrogen sulfide gas into a solution of a mercury salt or the reaction of mercury with sulfur.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Use: Pigment.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

mercuric sulfide, red (vermilion; quicksilver vermilion; Chinese vermilion; red mercury sulfide; artificial cinnabar; red mercury sulfuret) HgS .

Properties: Fine, bright scarlet powder. Insoluble in water and alcohol. Sp. gr. 8.06–8.12; m.p., sublimes at 583°C.

Derivation: By heating mercury and sulfur, with subsequent recovery by sublimation. A precipitated form is known as English vermilion.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Uses: Medicine; pigment.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

mercuric thiocyanate (mercuric sulfocyanate; mercuric sulfocyanide; mercury sulfocyanate; mercury thiocyanate) $\text{Hg}(\text{SCN})_2$.

Properties: White powder. Slightly soluble in alcohol; insoluble in water. M.p., decomposes.

Derivation: By precipitation of mercuric nitrate with ammonium sulfocyanate and subsequent solution in a large amount of hot water and crystallizing.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Uses: Photography; producing "Pharaoh's serpents."

Shipping regulations: (Rail, Air) Poison label.

"Merurochrome."³⁴⁸ Trademark for merbromin (q.v.).

Hazard: Highly toxic by ingestion; but less irritating than iodine to skin and tissue.

Use: General antiseptic, commonly in the form of a 2% aqueous solution.

mercuriol (mercury nucleate).

Composition: Contains 20% mercury.

Properties: Brown powder. Soluble in water; insoluble in alcohol.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption.

Use: Medicine.

Shipping regulations: (Rail, Air) Poison label.

mercurous acetate (mercury proto-acetate; mercury acetate) $\text{Hg}_2\text{C}_2\text{H}_3\text{O}_2$.

Properties: Colorless scales or plates. Decomposed by boiling water and by light into mercury and mercuric acetate. Slightly soluble in water; insoluble in alcohol and ether; soluble in dilute nitric acid.

Derivation: Reaction of sodium acetate with mercurous nitrate solution acidified with nitric acid.

Grade: Technical.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.01 mg per cubic meter of air.

Shipping regulations: (Rail, Air) Poison label.

mercurous acetylide Hg_2C_2 .

Properties: White powder. A salt of acetylene.

Derivation: Reaction of acetylene with aqueous solution of mercurous salts.

Hazard: Severe explosion risk when shocked or heated. Highly toxic.

Shipping regulations: (Rail, Air) Explosive. Not acceptable.

mercurous bromide (mercury bromide) HgBr or Hg_2Br_2 .

Properties: White powder or colorless crystals. Odorless, tasteless. Becomes yellow on heating, returning to white on cooling. Darkens on exposure to light. Soluble in fuming nitric acid (prolonged heating), hot concentrated sulfuric acid, hot ammonium carbonate or ammonium succinate solutions; sparingly soluble in water; insoluble in alcohol and ether. Sp. gr. 7.307; sublimes at 340–350°C; m.p. 405°C.

Derivation: (a) Action of potassium bromide on solution of mercurous nitrate in dilute nitric acid. (b) Sublimation from mixture of mercury and mercuric bromide.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Use: Medicine.

Shipping regulations: (Rail, Air) Poison label.

mercurous chlorate (mercury chlorate) $\text{Hg}_2(\text{ClO}_3)_2$.

Properties: White crystals. Sp. gr. 6.409; m.p. 250°C (decomposes). Soluble in alcohol, water, and acetic acid.

Hazard: Highly toxic. Explodes in contact with organic or combustible materials. Keep away from light.

Shipping regulations: Chlorates, n.o.s. (Rail) Yellow label. (Air) Oxidizer label.

mercurous chloride (mercury monochloride; mercury protochloride; mercury chloride, mild; calomel) Hg_2Cl_2 .

Properties: White, rhombic crystals or crystalline powder. Odorless, stable in air, but darkens on exposure to light. Insoluble in water, ether, alcohol and cold dilute acids. Sp. gr. 6.993; m.p. 302°C; b.p. 384°C. Decomposed by alkalis.

Derivation: By heating mercuric chloride and mercury, with subsequent sublimation.

Grades: Technical; C.P.; N.F.

Hazard: Toxic in large doses; must be removed from body by cathartics.

Uses: Fungicide; electrodes; pharmaceuticals.

Shipping regulations: Not restricted.

mercurous chromate (mercury chromate) Hg_2CrO_4 .

Properties: Brick-red powder. Variable composition. Decomposes on heating. Soluble in nitric acid (conc.); insoluble in alcohol and water.

Hazard: Highly toxic. Moderate fire hazard in contact with organic materials. Tolerance, 0.05 mg per cubic meter of air.

Use: Ceramics (coloring green).

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

mercurous iodide (mercury protoiodide) HgI or Hg_2I_2 .

Properties: Bright yellow powder, becoming greenish on exposure to light due to decomposition into me-

tallic mercury and mercuric iodide. Becomes dark yellow, orange and orange-red on heating. Undergoes same color change in opposite order on cooling. Odorless and tasteless. Soluble in castor oil, liquid ammonia, aqua ammonia; insoluble in water, alcohol, and ether. Sp. gr. 7.6445–7.75; sublimes at 140°C; m.p. 290°C (with partial decomposition).

Derivation: (a) Action of potassium iodide on a mercurous salt. (b) Boiling a solution of mercurous nitrate containing nitric acid with excess of iodine.

Grade: Technical.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

Use: Medicine (external).

Shipping regulations: (Rail, Air) Poison label.

mercurous nitrate, hydrated $\text{HgNO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Short prismatic crystals; effloresces and becomes anhydrous in dry air. Sensitive to light. Soluble in small quantities of warm water (hydrolyzes in larger quantities), water acidified with nitric acid. Sp. gr. 4.785 (3.9°C); m.p. 70°C, decomposes.

Derivation: Action of cold dilute nitric acid upon an excess of mercury and warming slightly.

Hazard: Highly toxic. May be explosive if shocked or heated. Tolerance, 0.05 mg per cubic meter of air.

Uses: Medicine; cosmetics; analytical agent.

Shipping regulations: (Rail, Air) Poison label.

mercurous oxide Hg_2O .

Properties: Black powder; sp. gr. 9.8; decomposes at 100°C; soluble in acids; insoluble in water.

Derivation: Action of sodium hydroxide on mercurous nitrate.

Hazard: Highly toxic. Tolerance, 0.05 mg per cubic meter of air.

Shipping regulations: (Rail, Air) Poison label.

mercurous sulfate Hg_2SO_4 .

Properties: White to yellow crystalline powder; soluble in hot sulfuric acid, dilute nitric acid; almost insoluble in water. Sp. gr. 7.56. Decomposes on heating.

Derivation: (a) Dissolving mercury in sulfuric acid (2.3) and heating gently. (b) Adding sulfuric acid to mercurous nitrate solution.

Hazard: Highly toxic. Tolerance, 0.05 mg per cubic meter of air.

Uses: Chemical (admixed with sulfuric acid as a catalyst, in oxidation of naphthalene to phthalic acid); laboratory batteries (Clark cell, Weston cell).

Shipping regulations: (Rail, Air). Poison label.

mercury (quicksilver; hydrargyrum) Hg Metallic element of atomic number 80, group IIb of the periodic table. Atomic weight 200.59; valences 1, 2. There are 4 stable isotopes and 12 artificially radioactive isotopes.

Properties: Silvery, extremely heavy liquid, sometimes found native. Insoluble in hydrochloric acid; soluble in sulfuric acid upon boiling; readily soluble in nitric acid. Insoluble in water, alcohol, and ether. Soluble in lipids. Extremely high surface tension (480 dynes per cm), giving it unique rheological behavior. High electric conductivity. Sp. gr. 13.59; f.p. –38.85°C; b.p. 356.6°C. Noncombustible.

Chief ore: Cinnabar (q.v.).

Occurrence: Spain, Yugoslavia, Mexico, Italy, Canada, U.S.S.R.

Derivation: By heating cinnabar in air, or with lime, and condensing the vapor.

Method of purification: Distillation. An important proportion of used mercury is recovered by redistillation.

Grades: Technical; virgin; redistilled; A.C.S.

Containers: 1-, 5-, 10-lb bottles; 76-lb flasks.

Hazard: (1) Mercury, metallic: Highly toxic by skin absorption and inhalation of fume or vapor. Tolerance, 0.05 mg per cubic meter of air. Absorbed by respiratory and intestinal tract; accidental intake of small amounts is stated to be harmless (Merck Index). FDA permits zero addition to the 20 micrograms of Hg contained in average daily diet.

(2) All inorganic compounds of Hg are highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter of air.

(3) Most organic compounds of Hg are highly toxic. Inorganic Hg can be converted to methylmercury by bacteria in water. Tolerance (alkyl compounds), 0.01 mg per cubic meter of air; all others, 0.05 mg.

Note: Spillage may be a toxic hazard due to droplet proliferation. Clean-up requires special care.

Uses: Fungicides and bactericides; amalgams; catalyst; electrical apparatus; cells for production of chlorine and caustic soda; instruments (thermometers, barometers, etc.); antifouling paints; mildew-proofing preparations; pulp and paper manufacture; pharmaceuticals; mercury vapor lamps.

mercury, ammoniated (mercuric chloride, ammoniated; ammonobasic mercuric chloride; ammoniated mercury chloride; white precipitate; white precipitate, fusible; aminomercuric chloride; mercury cosmetic) HgNH_2Cl .

Properties: White, pulverulent lumps or powder; earthy, metallic taste; odorless; stable in air; darkens on exposure to light. Soluble in ammonium carbonate and sodium thiosulfate solutions and in warm acids; insoluble in water and alcohol.

Derivation: By precipitating mercuric chloride with ammonium hydroxide in excess.

Grades: U.S.P.; technical.

Containers: 100-lb drums.

Hazard: Highly toxic. Tolerance, 0.05 mg per cubic meter of air.

Use: Medicine (local anti-infective); pharmaceuticals. Shipping regulations: (Rail, Air) Poison label. See also mercuric ammonium chloride.

mercury atoxylate (mercury para-aminophenylarsenate; mercuric arsanilate) $\text{Hg}[\text{OOAs}(\text{OH})\text{C}_6\text{H}_4\text{NH}_2]_2$. Properties: White powder containing 31.8% mercury; very slightly soluble in water. Used as a 10% suspension in olive oil, or as a 5% ointment.

Hazard: Highly toxic. Tolerance, 0.05 mg per cubic meter of air.

Use: Medicine.

Shipping regulations: (Rail, Air) Poison label.

mercury bichloride. Legal label name (Rail) for mercuric chloride.

mercury cell. An electrolytic cell for the production of caustic soda and chlorine from sodium chloride brine. Continuously fed brine is decomposed in one compartment between graphite anodes, where chlorine is liberated, and a mercury cathode, where a sodium amalgam is formed. The amalgam flows continuously or intermittently to a second compartment where it is decomposed with water, forming a caustic solution. The decomposition is usually performed electrolytically by making the amalgam anodic with respect to an iron or graphite cathode. Pure water is supplied to the decomposition compartment at such

a rate as to maintain a constant concentration of caustic in the product. With respect to the diaphragm cell, the mercury cathode cell has the advantages of producing a very pure caustic and, generally, a more concentrated solution (50-70%); it has the disadvantages of a higher operating voltage and lower efficiency (52-55%), and a high capital investment in mercury. Examples of mercury-cathode cells are Castner cell and DeNora cell.

mercury compounds. See corresponding mercurous or mercuric compound, e.g., mercury chlorate, see mercurous chlorate; mercury oxide, see mercuric oxide.

mercury dichromate (mercuric dichromate; mercury bichromate) HgCr_2O_7 .

Properties: Heavy, red, crystalline powder; soluble in acids; insoluble in water.

Hazard: Highly toxic. Tolerance, 0.05 mg per cubic meter of air.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

mercury fulminate (mercuric cyanate) $\text{Hg}(\text{CNO})_2$.

Properties: Gray crystalline powder. Soluble in alcohol, ammonium hydroxide and hot water; slightly soluble in cold water. Sp. gr. 4.42; m.p., explodes.

Derivation: By treating mercury with strong nitric acid and alcohol.

Grade: Technical.

Containers: Canvas bags in stone crocks filled with water; in lots of five pounds in glass bottles.

Hazard: Explodes readily when dry; keep moist till used. An initiating explosive. Highly toxic. Tolerance, 0.05 mg per cubic meter of air.

Uses: Manufacture of caps and detonators for producing explosions of military, industrial and sporting purposes.

Shipping regulations: (Air) Not accepted. Legal label name: fulminate of mercury. (Rail) Consult regulations. Not accepted by express.

mercury selenide HgSe . Sp. gr. 8.266. Sublimes in a vacuum. Insoluble in water. Used as a semiconductor in solar cells, thin-film transistors, infrared detectors, ultrasonic amplifiers.

Hazard: Highly toxic. Tolerance, 0.05 mg per cubic meter of air.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

mercury telluride HgTe . Grade 99.99%. Used as a semiconductor in solar cells, thin-film transistors, infrared detectors, ultrasonic amplifiers.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

"Merginamide."⁴⁵¹ Trademark for a polyamide resin formed by reacting aliphatic polyamides with an alkyl-aryl polycarboxylic acid. It is claimed to impart to epoxy coatings chemical resistance, controlled curing, low viscosity, high gloss retention, and good wetting characteristics.

myricyl alcohol. See 1-triacontanol.

"Merlon."⁵⁶⁷ Trademark for a polycarbonate resin. Transparent, slightly straw-colored resin; sp. gr. 1.2; refractive index 1.587. Rods, tubes, pipes, sheets, film, extrusions and special shapes may be produced by extrusion, thermoforming, injection and blow moldings.

Uses: Electrical and electronic component industries, protective equipment, graphic arts and photographic

film, cable wrapping and protective overlays for other thermoplastic sheeting; missile applications.

"Mermeth."¹²³ Trademark for veterinary sulfamethazine.

merocyanine. See cyanine dye.

"Merox"⁴¹⁶ Proprietary process for extracting easily removed mercaptans and converting the remaining mercaptans in naphthas to disulfides, thereby yielding a product of low mercaptan content. The combination of extraction and sweetening is applicable to gasoline and lighter hydrocarbons, and the sweetening step to many jet fuels and kerosines. It employs caustic soda which is regenerated by blowing with air in the presence of a special catalyst to oxidize the mercaptans to disulfides. Disulfides are decanted from the caustic in the extraction application, while in the sweetening application they remain in the hydrocarbon.

"Merpertine."²⁸ Trademark for a surface-active, compounded anionic wetting, penetrating, and leveling agent used in leather and textile fields.

"Morphos."⁴⁰ Trademark for tributylphosphorotriothioite (q.v.).

"Merpel."²⁸ Trademark for a series of surface-active agents used as dyeing assistants.

"Mersize."⁵⁸ Trademark for paper-sizing agents. "Mersize" TFL 70%, 77% and "Mersize" RM Dry are forms of chemically fortified rosin-based sizes. "Mersize" CD-2 and CD-2 Dry are used in conjunction with typical rosin sizes.

"Mersolite."⁸¹ Trademark for a series of phenyl mercuric compounds. Bactericide and fungicide used in paint, adhesive and agriculture industries.
Hazard: Highly toxic.

"Mer-Sorb."¹²³ Trademark for solid sorbitol, industrial grade.

"Mertaste."¹²³ Trademark for straight ribonucleotides used as food flavoring.

"Merthiolate"¹⁰⁰ Trademark for a 0.1% solution of thiomersal (q.v.) in alcohol. Widely used as general antiseptic.
Hazard: Highly toxic by ingestion; for external use only.

"Mertone" WB-4,⁵⁸ Trademark for a 30% colloidal dispersion of silica in water; used as a precoat for reproduction papers.

"Mesamoll."⁴⁷⁰ Trademark for an alkyl sulfonic ester of phenol and cresol. Used as plasticizer for vinyls and as lubricating agent in urethane foaming machines.

mescaline (3,4,5-trimethoxyphenethylamine) $(\text{CH}_3\text{O})_3\text{C}_6\text{H}_2\text{CH}_2\text{CH}_2\text{NH}_2$. An alkaloid derived from a Mexican cactus.
Properties: Crystals; m.p. 35–36°C; b.p. 180°C; soluble in water, alcohol, chloroform, benzene; nearly insoluble in ether.
Hazard: Toxic by ingestion and inhalation.
Uses: Biochemical and medical research; hallucinogenic drug.

mesitylene (1,3,5-trimethylbenzene; sym-trimethylbenzene) $\text{C}_6\text{H}_3(\text{CH}_3)_3$. Liquid; sp. gr. 0.863; f.p. –52.7°C; b.p. 164.6°C; insoluble in water; soluble in alcohol and ether. Derived from coal tar. Combustible.

Containers: Drums; tank trucks.

Hazard: Toxic by inhalation. Moderate fire hazard. Tolerance, 25 ppm in air.

Uses: Intermediate, including anthraquinone vat dyes; ultraviolet oxidation stabilizers for plastics.

mesityl oxide (isopropylideneacetone; methyl isobutenyl ketone; 4-methyl-3-penten-2-one) $(\text{CH}_3)_2\text{C}:\text{CHCOCH}_3$.

Properties: Oily, colorless liquid. Honey-like odor. Soluble in water, alcohols, and ethers. Sp. gr. 0.8569 (20/20°C); b.p. 130–131°C; vapor pressure 8.7 mm (20°C); flash point 90°F; wt/gal 7.1 lb (20°C); freezing point –46.4°C; viscosity 0.0060 poise (20°C). Autoignition temp. 652°F.

Derivation: Dehydration of acetone or diacetone alcohol.

Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Hazard: Flammable, moderate fire risk. Toxic by ingestion, inhalation, and skin absorption. Tolerance, 25 ppm in air.

Uses: Solvent for cellulose esters and ethers, oils, gums, resins, lacquers, roll-coating inks, stains, ore flotation; paint and varnish-removers; insect repellent.

meso-. A prefix meaning middle or intermediate; specifically:

(1) An optically inactive stereoisomeric form resulting from the presence of an even number of dextro- and levorotatory isomers in a natural substance. This cancels the optical activity and causes formation of an intermediate structure which is its own mirror image. This effect is called internal compensation. Tartaric acid is an example. See also racemization; tartaric acid.

(2) An intermediate hydrated form of an inorganic acid.

(3) Designating a middle position in certain cyclic organic compounds, or

(4) A ring system characterized by a middle position of certain rings.

mesomerism. See resonance. (1).

messenger RNA. See ribonucleic acid.

mesyl chloride. See methanesulfonyl chloride.

Met Symbol for methionine.

meta-. A prefix. For definition of meta-compounds see under ortho-.

metabolism. The chemical transformations occurring in an organism from the time a nutrient substance enters it until it has been utilized and the waste products eliminated. In animals and man, digestion and absorption are primary steps, followed by a complicated series of degradations, syntheses, hydrolyses and oxidations, in which agents such as enzymes (q.v.), bile acids, and hydrochloric acid take part. These transformations are often localized with respect to organs, tissues, and types of cells involved.

Basal metabolism is the rate of total heat production of an individual who is awake, but in complete mental and physical repose, at comfortable temperature, and without having had food for at least 12 hours. Under these conditions, oxidation of stored nutrients provides the sole source of energy expended, and heat is measurable by calorimetry. See also digestion (1).

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

metabolite. An intermediate material produced and used in the processes of a living cell or organism. Metabolites are used for replacement and growth in living tissue, and are also broken down to be a source of energy in the body. Examples are nucleic acids, enzymes, glucose, cholesterol, and many similar substances.

"Meta Bond."⁵²⁶ Trademark for microcrystalline zinc phosphates. Used in the preparation of steel, galvanized steel and aluminum for decorative and protective finishing. Application by spray or immersion.

metaboric acid HBO_2 . White crystals; sp. gr. 2.486; m.p. $236 \pm 1^\circ\text{C}$; slightly soluble in water.

metacetone. See diethylketone.

"Metadelphene."²⁶⁶ Trademark for a commercial grade of N,N-diethyl-meta-toluamide; an insect repellent.

metaformaldehyde. See sym-trioxane.

"Metafos."¹⁶⁴ Trademark for a sodium phosphate glass commonly called sodium hexametaphosphate. A linear polymer containing a minimum of 67% P_2O_5 . See sodium polyphosphate.

metal. An element that forms positive ions when its compounds are in solution and whose oxides form hydroxides rather than acids with water. About 75% of the elements are metals, which occur in every group of the Periodic Table except VIIA and the noble gas group. Most are crystalline solids with metallic luster, conductors of electricity, and have rather high chemical reactivity; many are quite hard and have high physical strength. They also readily form solutions (alloys) with other metals. The presence of very low percentages of other elements (not necessarily metals) profoundly affects the properties of many metals, e.g., carbon in iron. Mercury and cesium are liquid at room temperature. Geologically, metals usually occur in the form of compounds that must be physically or chemically processed to yield the pure metal; common methods are application of heat (smelting), carbon reduction, electrolysis, and reduction with aluminum or magnesium. Metals fall into the following classifications, which are not mutually exclusive (see specific entry for further information):

alkali metals	rare metals
alkaline-earth metals	rare-earth metals
transition metals	actinide metals
noble metals	light metals
platinum metals	heavy metals

"Metalam."²¹³ Trademark for packaging films based on aluminum foil.

"Metalate."²⁴⁴ Trademark for a white crystalline material containing 29.8% total sodium oxide; used in laundry industry.

metal deactivator. A compound added to gasoline to neutralize the catalytic effect of copper in promoting fuel oxidation.

metaldehyde $(\text{CH}_3\text{CHO})_n$. A polymer of acetaldehyde, in which n usually is 4 to 6.

Properties: White prisms; decomposes with partial regeneration of acetaldehyde, when heated above 80°C . Soluble in benzene, chloroform; slightly soluble in alcohol, ether; insoluble in water. Sublimes $112\text{--}115^\circ\text{C}$; m.p. 246°C in sealed tube.

Hazard: Flammable, dangerous fire risk. Toxic; strong irritant to skin and mucous membranes.

Uses: Fuel to replace alcohol; to destroy snails and slugs.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label.

metal dye. See dye, metal.

metal fiber. See fiber.

metal, formed. A light metal such as aluminum or zinc, to which titanium hydride has been added. The latter involves hydrogen to give a blown structure with about the same specific gravity as water.

metallic bond. See bond, chemical.

metallic soap. See soap (2).

"Metalliding."²⁴⁵ A proprietary surface-alloying process in which ions are electrolytically dissolved from a metal anode in a bath of molten fluoride salts and diffuse into the surface of the cathode. The latter may be any of a number of transition metals or rare earths. The alloys are intended for use in space vehicles, and also have potential application in the automotive field.

metallized dye. A soluble dye including any one of a variety of metals chemically combined, applied to wool in an acid bath, by use of sodium chloride to salt out the dye onto the fiber.

metallizing. Coating a plastic, or similar material, with a deposit of metal (usually aluminum) by means of vacuum deposition (q.v.). The thickness of such films may vary from .01 to as much as 3 mils. Metallized plastic films are used for yarns, packaging, stamping foil, labels, etc.

metallocene. An organometallic coordination compound obtained as a cyclopentadienyl derivative of a transition metal or metal halide. The metal is bonded to the cyclopentadienyl ring by electrons moving in orbitals extending above and below the plane of the ring (π bond). There are three types of metallocenes: (a) dicyclopentadienyl-metals with the general formula $(\text{C}_5\text{H}_5)_2\text{M}$; (b) dicyclopentadienyl-metal halides with the general formula $(\text{C}_5\text{H}_5)_2\text{MX}_{1-3}$; (c) monocyclopentadienyl-metal compounds with the general formula $\text{C}_5\text{H}_5\text{MR}_{1-3}$, where R is CO, NO, halide group, alkyl group, etc. Types (a) and (b) are known as molecular sandwiches since the two cyclopentadiene rings lie above and below the plane on which the metal atom is situated.

Most metallocenes are crystalline and those belonging to the first transition series of the periodic table, from vanadium to nickel, have the same melting point, 173°C . The metal complexes are soluble in many organic solvents while the halides are soluble primarily in polar solvents. When the central metal atom is in a stable oxidation state the metallocene is not decomposed by high temperatures, air, water, dilute acids or bases.

Some metallocenes, such as ferrocene, undergo a wide variety of aromatic ring substitution reactions, including Friedel-Crafts acylation, arylation, and sulfonation; a few, such as nickelocene and cobaltocene, are too unstable to be directly substituted.

Derivation: The most important industrial method is the reaction of a cyclopentadienide (for example the sodium salt) with a transition metal halide in an organic solvent.

Uses: Catalysts, polymers, ultraviolet absorbers, reducing agents, free radical scavengers, antiknock agents.

See also ferrocene, cobaltocene, nickelocene, titanocene dichloride, zirconocene dichloride, uranocene.

metalloid. See nonmetal; semiconductor.

metallurgical coke. See coke.

metal, powdered. Metals are produced in powdered form for a variety of uses in several industries. In this form they are the raw materials for powder metallurgy, in which the powders are pressed in molds and heated (sintered) at high temperature. Metal powders range in size from -325 mesh (0.045-0.060 mm "diameter") to +100 mesh, and are available in practically all industrial metals. They are produced by machining, milling, shotting, granulation, atomizing, condensation, reduction, chemical precipitation or electrodeposition. Their properties and purities vary with the method of preparation.

Hazard: Dangerous fire risk, especially as dust. Toxic by inhalation.

Uses: Electric, automotive, machinery, tool and refractory-metal industries; paint pigments; flares and incendiary bombs; brazing materials; calorizing, metal-spraying, metallurgical agents; heat-generating agents; catalysts, etc.

"Metalyne."²⁶⁶ Trademark for a series of distilled methyl esters of tall oil fatty acids.

"Metandren."³⁰⁵ Trademark for methyltestosterone (q.v.).

metanilic acid (meta-sulfanilic acid; meta-aminobenzenesulfonic acid) $C_6H_4(NH_2)SO_3H$.

Properties: Small colorless needles. Soluble in water, alcohol, and ether.

Derivation: By the reduction of metal-nitrobenzenesulfonic acid. Nitrobenzene is sulfonated until the product is soluble in water. The mixture is then poured into water and reduced with iron, made alkaline with lime and the lime salt dissociated with sodium carbonate.

Hazard: Toxic; see aniline.

Uses: Dyes; medicine.

metaphosphoric acid. See phosphoric acid, meta-

metapon A narcotic drug, methyl dihydromorphine. See also narcotic.

metaraminol bitartrate (*l*-meta-hydroxynorephedrine bitartrate; *l*-alpha-(1-aminoethyl)-meta-hydroxybenzyl alcohol bitartrate)

$HOC_6H_4CH(OH)CH(CH_3)NH_2 \cdot C_4H_4O_6$.

Properties: White, practically odorless, crystalline powder; melting range 170-176°C; soluble in water; somewhat soluble in alcohol; insoluble in ether and in chloroform; pH of 5% solution 3.2 and 3.5.

Grade: U.S.P.

Use: Medicine.

"Metasap"¹⁰⁹ Trademark for a series of heavy-metal soaps. Palmitates, stearates and hydroxystearates are used in compounding them.

Uses: Paints, inks, greases, waxes, cosmetics, water repellents, lubricants, stabilizers, pharmaceutical tablets.

"Metasol."¹²¹ Trademark for a series of chemicals used as fungicides, mildewicides, bactericides, slime control agents for pulp and paper mill systems and as preservatives for all types of systems. A recently developed type (J-26) is claimed to be a broad-spectrum antimicrobial agent with a minimum ecological hazard.

"Meta-Systox R."¹⁸¹ Trademark for O,O-dimethyl-S-2-(ethylsulfinyl)ethyl phosphorothioate (q.v.).

metepa. Generic name for tris(methyl-1-aziridinyl) phosphine oxide $(C_3H_5N)_3PO$.

Properties: Amber liquid, amine odor. B.p. 118°C at 1 mm; sp. gr. 1.079. Miscible with water and organic solvents.

Hazard: Toxic by ingestion and skin absorption. Strong irritant to skin.

Uses: Insect chemosterilant; addition products for textile treatments, adhesives, paper and rubber processing; crosslinking agent in polymer systems which contain active hydrogens; monomer.

Shipping regulations: (Solution) (Air) Corrosive label.

meter. The basic unit of length of the metric system. (39.37 inches). Originally defined as one ten-millionth of the distance from the equator to the North Pole. Now defined as 1,650,763.73 wave lengths of the orange-red line of the isotope krypton 86.

"Methac."⁶⁵ Trademark for a series of blends of methyl acetate with methanol in varying proportions. **Hazard:** Toxic by ingestion.

Uses: Lacquer solvents, paint removers, organic synthesis.

"Methacrol."²⁸ Trademark for a series of acrylic resin dispersions used as antisnag and bodying agents for nylon hosiery.

methacrolein (methacrylaldehyde) $CH_2:C(CH_3)CHO$.

Properties: Liquid; sp. gr. 0.8474 (20/20°C); b.p. 68.0°C; flash point 5°F (O.C.); solubility in water at 20°C 5.9% by weight. Shipped with 0.1% hydroquinone as polymerization inhibitor.

Hazard: Flammable, dangerous fire risk. Toxic; strong irritant.

Uses: Copolymers; resins.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

methacrylamide $CH_2:C(CH_3)CONH_2$. Solid; m.p. 110°C. A monomer for acrylic resins.

methacrylate ester. Ester of methacrylic acid having the formula $CH_2:C(CH_3)COOR$, where R is usually methyl, ethyl, isobutyl, or n-butyl-isobutyl (50-50). They are supplied commercially as the polymers. See acrylic resin.

methacrylate resin. See acrylic resin.

methacrylatochromic chloride.

$H_2C:C(CH_3)C(OCrCl_2)OHCrCl_2O$.

Properties: Water-soluble solid.

Derivation: Reaction of methacrylic acid with basic chromic chloride.

Hazard: Probably toxic.

Uses: Water repellent; nonadhesive; insolubilizer for vinyl polymer.

methacrylic acid (monomer) (alpha-methacrylic acid) $CH_2:C(CH_3)COOH$.

Properties: Colorless liquid; m.p. 15-16°C; b.p. 161-162°C; sp. gr. 1.015 (20°C). Flash point 170°F; combustible. Soluble in water, alcohol, ether, most organic solvents. Polymerizes readily to give water-soluble polymers.

Derivation: Reaction of acetone cyanohydrin and dilute sulfuric acid; oxidation of isobutylene.

Grades: 40% Aqueous solution, b.p. 76-78°C (25 mm); crude monomer 85% pure; glacial (98%).

Containers: Carboys; drums; tank cars.

Hazard: Strong irritant to skin.

Uses: Monomer for large-volume resins and polymers; organic synthesis. Many of the polymers are based on esters of the acid, as the methyl, butyl, or isobutyl esters. See acrylic resin.

alpha-methacrylic acid. See methacrylic acid.

beta-methacrylic acid. See crotonic acid.

methacrylonitrile (MAN; "Vistron")

Properties: Clear, colorless liquid; b.p. 90.3°C; f.p. -35.8°C; flash point (Tag O.C.) 55°F; sp. gr. 0.789.

Thermoplastic; resistant to solvents, alkalis, acids.

Hazard: Flammable, dangerous fire risk. Highly toxic by ingestion, inhalation, and skin absorption.

Uses: Vinyl nitrile monomer; copolymer with styrene, butadiene, etc.; elastomers, coatings, plastics.

Shipping regulations: Flammable liquid, n.o.s., (Rail)

Red label. (Air) Flammable Liquid label.

gamma-methacryloxypropyltrimethoxysilane

$\text{CH}_2=\text{C}(\text{CH}_3)\text{COOCH}_2\text{CH}_2\text{CH}_2\text{Si}(\text{OCH}_3)_3$.

Properties: Liquid; sp. gr. 1.045 (25°C); b.p. approx. 80°C (1 mm); refractive index 1.4285 (25°C); flash point 135°F. Soluble in acetone, benzene, ether, methanol, hydrocarbons. Combustible.

Grade: 97% min. purity.

Containers: Up to 55-gal.

Hazard: Moderate fire risk. May be toxic.

Uses: Coupling agent for promotion of resin-glass, resin-metal, and resin-resin bonds; for formulation of adhesives having "built in" primer systems.

methadone hydrochloride (*dl*-6-dimethylamino-4,4-diphenyl-3-heptanone hydrochloride). A synthetic narcotic. $(\text{C}_6\text{H}_5)_2\text{C}(\text{COC}_2\text{H}_5)\text{CH}_2\text{CH}(\text{CH}_3)\text{N}(\text{CH}_3)_2 \cdot \text{HCl}$.

Properties: Crystalline substance with bitter taste; no odor; m.p. 232-235°C; soluble in water, alcohol, and chloroform; practically insoluble in ether and glycerol. pH (1% aqueous solution) 4.5-6.5.

Grade: U.S.P.

Hazard: Toxic. Addictive narcotic. Use restricted.

Use: Medicine (sedative, treating heroin addiction).

methallenestril (beta-ethyl-6-methoxy-alpha, alpha-dimethyl-2-naphthalenepropionic acid)

$\text{CH}_3\text{OC}_{10}\text{H}_7\text{CH}(\text{C}_2\text{H}_5)\text{C}(\text{CH}_3)_2\text{COOH}$.

Properties: Crystals; m.p. 132.5°C. Soluble in ether, vegetable oils.

Use: Medicine.

methallyl acetate. See methylallyl acetate.

methallyl alcohol. See methylallyl alcohol.

beta-methallyl chloride. See beta-methylallyl chloride.

methallylidene diacetate $\text{CH}_2=\text{C}(\text{CH}_3)\text{CH}(\text{OCOCH}_3)_2$.

Properties: Liquid; sp. gr. 1.510 (20/20°C); b.p. 191.0°C; f.p. -15.4°C; flash point 215°F (COC).

Slightly soluble in water. Combustible.

Uses: Chemical intermediate; can provide controlled release of methacrolein in acid solution.

methamphetamine hydrochloride. See amphetamine.

methanal. See formaldehyde.

methanamide. See formamide.

ethanation. A reaction by which methane is formed from the hydrogen, carbon monoxide, and carbon dioxide derived from coal gasification. It requires a catalyst, e.g., nickel, and temperatures in the range of 500°C. In one process the reaction is performed in an adiabatic fixed-bed reactor. See also gasification.

methandrostenolone (17a-methyl-17b-hydroxyandrost-1,4-dien-3-one). An androgenic hormone; anabolic synthetic steroid.

Use: Medicine.

methane (marsh gas; firedamp) CH_4 . The first member of the paraffin (alkane) hydrocarbon series.

Properties: Colorless, odorless, tasteless gas; lighter than air, practically inert toward sulfuric acid, nitric acid, alkalis, and salts but reacts with chlorine and bromine in light (explosively in direct sunlight); flash point -306°F; b.p. -161.6°C; f.p. -182.5°C; autoignition temp. 1000°F; density of vapor 0.554 (0°C) (760 mm, air = 1); critical temperature -82.1°C; critical pressure 672 psia; heating value 1009 Btu/cu ft. Soluble in alcohol, ether; slightly soluble in water. Methane is an asphyxiant gas.

Occurrence: Natural gas and coal gas; from decaying vegetation and other organic matter in swamps and marshes.

Derivation: (1) From natural gas by absorption or adsorption; (2) from coal mines for use as fuel gas;

(3) from a mixture of carbon monoxide and hydrogen (synthesis gas) obtained by reaction of hot coal with steam; the mixed gas is passed over a nickel-based catalyst at high temperature. See methanation. Methane can also be obtained by a nickel-catalyzed reaction of carbon dioxide and hydrogen; (4) anaerobic decomposition of manures and other agricultural wastes.

Containers: High-pressure pipe lines; high-pressure cylinders; as liquid at -260°F; in insulated tank ships.

Grades: Research, 99.99%; C.P., 99%; technical, 95%; Btu grade, must have heating value of 1000 ± 3 Btu/cu ft at 60°F and 30 inches Hg pressure.

Hazard: Severe fire and explosion hazard; forms explosive mixtures with air (5-15% by volume).

Uses: Source of petrochemicals by conversion to hydrogen and carbon monoxide by steam cracking or partial oxidation. Important products are methanol, acetylene, hydrogen cyanide. Chlorination gives carbon tetrachloride, chloroform, methylene chloride, and methyl chloride. In the form of natural gas, methane is used as a fuel, as a source of carbon black, and as the starting material for manufacture of synthetic proteins.

Shipping regulations: (Rail) Red gas label. (Air) Flammable gas label. Not acceptable on passenger planes.

See also natural gas; synthetic natural gas; biogas.

methanecarboxylic acid. See acetic acid.

methanedicarbonic acid. See malonic acid.

methanesulfonic acid $\text{CH}_3\text{SO}_3\text{H}$.

Properties: Liquid at room temperature; sp. gr. 1.4812 (18/4°C); m.p. 17 to 20°C; b.p. 167°C (10 mm); refractive index 1.4317 (16°C). Soluble in water, alcohol, ether. Flash point, none.

Grade: 70%.

Hazard: Corrosive to tissue (eyes, skin and mucous membranes).

Uses: Catalyst in esterification, alkylation, olefin polymerization, peroxidation reactions.

methanesulfonyl chloride (mesyl chloride) $\text{CH}_3\text{SO}_2\text{Cl}$.

Properties: Pale yellow liquid; sp. gr. 1.485 (20/20°C); b.p. 164°C; f.p. -32°C; soluble in most organic solvents; insoluble in water (slowly hydrolyzes).

Containers: 5-gal, 55-gal drums.

Grades: 98%; 99+%.

Hazard: Probably toxic.

Use: Intermediate; flame-resistant products; stabilizer for liquid sulfur trioxide; biological chemicals.

methanethiol (methyl mercaptan) CH_3SH .

Properties: Water-white liquid when below boiling point, or colorless gas; powerful unpleasant odor. F.p. -121°C ; sp. gr. 0.87 (20°C); flash point below 0°C ; b.p. 5.96°C ; slightly soluble in water; soluble in alcohol, ether, petroleum naphtha.

Derivation: Methanol and hydrogen sulfide.

Grade: 98.0% purity.

Containers: 180-lb cylinders; tank cars.

Hazard: Flammable, dangerous fire risk. Highly toxic; strong irritant. Tolerance, 0.5 ppm in air. Explosive limits in air 3.9 to 21.8%.

Uses: Synthesis, especially of methionine, jet fuel additives, fungicides; also as catalyst.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes. Legal label name methyl mercaptan.

methanethiomethane. See dimethyl sulfide.

methanoic acid. See formic acid.

methanol. See methyl alcohol.

"Methasan."⁵⁸ Trademark for zinc dimethyldithiocarbamate (q.v.).

"Methazate."²⁴⁸ Trademark for zinc dimethyldithiocarbamate. White powder or pellets.

Uses: Accelerator for rubber products.

"Methedrine."³⁰¹ Trademark for methamphetamine hydrochloride. See amphetamine.

methenamine. See hexamethylenetetramine.

"Methendic" Anhydride.³¹⁶ Trademark for a mixture of bicyclic unsaturated dibasic anhydrides as a relatively nonvolatile liquid at room temperature.

Properties: Pale amber liquid; color, Gardner, 3-6; sp. gr. at 25°C , 1.2-1.3; (n 27°D) 1.5052; flash point (COC), $275-285^\circ\text{F}$; miscible with acetone, aromatic and aliphatic hydrocarbons in all proportions at room temperature. Combustible. Low toxicity.

Uses: Cross-linking or curing agent for epoxy type resin systems.

methenyl tribromide. See bromoform.

methenyl trichloride. See chloroform.

methiodal sodium. See sodium methiodal.

methionine (2-amino-4-(methylthio)butyric acid)

$\text{CH}_3\text{SCH}_2\text{CH}_2\text{CH}(\text{NH}_2)\text{COOH}$. An optically active essential sulfur-containing amino acid important in biological trans-methylation processes. The levo form is biologically active.

Properties (of DL racemic mixtures): White, crystalline platelets or powder. Faint odor. Soluble in water, dilute acids, and alkalies; very slightly soluble in alcohol; practically insoluble in ether. pH (1% aqueous solution) 5.6-6.1.

Derivation: Hydrolysis of protein; synthesized from hydrogen cyanide, acrolein, and methyl mercaptan.

Containers: Glass vials, to fiber drums.

Grades: N.F.; feed, 98%.

Uses: Pharmaceuticals; feed additive; vegetable oil enrichment; single-cell protein.

methionine hydroxy-analog calcium (DL-alpha-hydroxy-gamma-methylmercaptopbutyric acid, calcium salt; 2-hydroxy-4-methylthiobutyric acid, calcium salt) $(\text{CH}_3\text{SCH}_2\text{CH}_2\text{CHOHCOO})_2\text{Ca}$. Free methionine

hydroxy analog is a metabolite in methionine utilization.

Properties: Free-flowing light tan powder; soluble in water; insoluble in common organic solvents.

Uses: Animal feed; synthesis of pharmaceuticals.

methiotepa. Generic name for tris(2-methyl-1-aziridinyl)-phosphine sulfide.

Hazard: Highly toxic. See metepa.

methocarbamol. (3-(ortho-methoxyphenoxy)-1,2-propanediol 1-carbamate)

$\text{CH}_3\text{OC}_6\text{H}_4\text{OCH}_2\text{CH}(\text{OH})\text{CH}_2\text{OOCNH}_2$.

Properties: M.p. $92-94^\circ\text{C}$; soluble in water, alcohol and propylene glycol.

Grade: N.D.

Use: Medicine.

"Methocel."²³³ Trademark for methylcellulose (q.v.).

"Metholene."²⁴² Trademark for a series of methyl esters of fatty acids, from methyl caproate through methyl stearate.

methotrexate (amethopterin; 4-amino-10-methylfolic acid).

Properties: Orange-brown crystalline powder. Insoluble in water, alcohol, chloroform, ether. Slightly soluble in dilute hydrochloric acid; soluble in dilute solutions of alkali hydroxides and carbonates. Folic acid antagonist.

Grade: U.S.P.

Hazard: Highly toxic in massive dosage.

Use: Medicine; insect chemosterilant; cancer treatment.

"Methoxone."¹⁴⁷ Trademark for MCP acid; available as the sodium salt, amine or ester. Used as a selective weed killer.

Hazard: Moderately toxic.

methoxsalen (8-methoxypsoralen) $\text{C}_{12}\text{H}_8\text{O}_4$, tricyclic.

Properties: White to cream-colored, odorless, crystalline solid. Slightly soluble in alcohol, practically insoluble in water. Combustible.

Use: Suntan accelerator, sunburn protector.

methoxyacetaldehyde. A highly reactive aldehyde derivative available in 77% aqueous solution. Clear, colorless liquid, with odor characteristic of lower aldehydes. Miscible with water and many organic solvents. Resembles butyraldehyde in structure and some properties. Claimed as possible antimicrobial agent, preservative and polymer modifier.

methoxyacetic acid $\text{CH}_3\text{OCH}_2\text{COOH}$.

Properties: Liquid; m.p. (min) 7.7°C ; boiling range (733 mm) (min) $197-198^\circ\text{C}$; sp. gr. ($25/4^\circ\text{C}$) 1.1738; refractive index 1.415 (25°C); flash point 260°F ; acid number (min) 612. Combustible.

Use: Synthesis.

para-methoxyacetophenone (para-acetoanisole; acetanisole; par-acetylanisole) $\text{CH}_3\text{OC}_6\text{H}_4\text{COCH}_3$.

Properties: Crystalline solid with pleasant odor; b.p. 258°C ; congealing point 36.5°C . Soluble in alcohol, ether, fixed oils. Combustible.

Derivation: Interaction of anisole and acetyl chloride in the presence of aluminum chloride and carbon disulfide.

Grades: Technical; F.C.C.

Uses: Perfumery, for floral odors; flavoring.

methoxyacetyl-para-phenetidine

$\text{CH}_3\text{OCH}_2\text{CONHC}_6\text{H}_4\text{OC}_2\text{H}_5$.

Properties: White needles; tasteless but becoming bitter on chewing. Soluble in alcohol, ether, chloro-

form, volatile oils, and boiling water; much less so in cold water. M.p. 98°C.

Derivation: By heating methoxyacetic acid and parphenetidine.

Use: Medicine.

ortho-methoxyaniline. See ortho-anisidine.

para-methoxyaniline. See para-anisidine.

methoxybenzaldehyde. See anisaldehyde.

methoxybenzene. See anisole.

para-methoxybenzoic acid. See anisic acid.

para-methoxybenzyl acetate. See anisyl acetate.

para-methoxybenzyl alcohol. See anisic alcohol.

para-methoxybenzyl formate. See anisyl formate.

2-methoxy-4,6-bis(isopropylamino)-s-triazine (2,4-bis-(isopropylamino)-6-methoxy-s-triazine)
 $\text{CH}_3\text{OC}_3\text{N}_3[\text{NHCH}(\text{CH}_3)_2]_2$. White solid; almost insoluble in water. Used as an herbicide.
 Hazard: Probably toxic.

3-methoxybutanol $\text{CH}_3\text{CH}(\text{OCH}_3)\text{CH}_2\text{CH}_2\text{OH}$.

Properties: Liquid; sp. gr. 0.9229; b.p. 161.1°C; flash point 165°F; vapor pressure (20°C) 0.9 mm; sets to glass at -85°C; soluble in water. Combustible; low toxicity.

Uses: High-boiling lacquer solvent; coupling agent for brake fluids; intermediate for plasticizers, herbicides; film-forming additive in PVA emulsions; solvent for pharmaceuticals.

1-methoxycarbonyl-1-propen-2-yl dimethylphosphate.
 See mevinphos.

methoxychlor (methoxy DDT; DMDT) Generic name for 2,2-Bis (para-methoxyphenyl)-1, 1, 1-trichloroethane; $\text{Cl}_3\text{CCH}(\text{C}_6\text{H}_4\text{OCH}_3)_2$.

Properties: White, crystalline solid; m.p. 89°C; insoluble in water. Not compatible with alkaline materials. Derivation: Reaction of methyl phenyl ether and chloral hydrate.

Containers: Drums.

Hazard: Less toxic than DDT. Tolerance, 10 mg per cubic meter in air.

Use: Insecticide effective against mosquito larvae and house flies. Especially recommended for use in dairy barns.

4-methoxy-3,6-dichlorobenzoic acid. See dicamba.

2-methoxy-3,6-dichlorobenzoic acid, dimethylamine salt.
 See "Banvel" D.

2-(beta-methoxyethoxy)ethanol. See diethylene glycol monomethyl ether.

methoxyethylene. See vinyl methyl ether.

2-methoxyethylmercury acetate

$\text{CH}_3\text{OCH}_2\text{CH}_2\text{HgOOCCH}_3$. A fungicide and disinfectant used in treating seeds.

Hazard: Highly toxic. Tolerance, 0.01 mg per cubic meter of air.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

methoxyethyl oleate $\text{CH}_3\text{OCH}_2\text{CH}_2\text{OOC}_{17}\text{H}_{33}$.

Properties: Oily liquid, mild odor. F.p. below -18°C; sp. gr. 0.898 (25°C); boiling range 180-206°C (4 mm); flash point (open cup) 385°C; viscosity, 8 cp (25°C). Combustible.

Uses: Plasticizer and solvent.

methoxyethyl stearate $\text{CH}_3\text{OCH}_2\text{CH}_2\text{OOC}_{17}\text{H}_{35}$.

Properties: Oily liquid; mild odor; f.p. 19 to 24°C; boiling range 186-205°C (4 mm); flash point (open cup) 378°C; viscosity 9 cp at 25°C. Combustible.

Uses: Plasticizer and solvent.

methoxyflurane. See 2,2-dichloro-1,1-difluoroethyl methyl ether.

3-methoxy-4-hydroxybenzaldehyde. See vanillin.

methoxyhydroxymercuri-propylsuccinyl urea

$\text{C}_9\text{H}_{16}\text{HgN}_2\text{O}_6$. 3-Hydroxymercuri-2-methoxypropyl-carbamoylsuccinamic acid.

Properties: Bitter crystals, m.p. 198.5°C.

Derivation: Made by the mercuriation of allylsuccinyl-urea. See meralluride.

Hazard: Highly toxic.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

4'-methoxy-2-(para-methoxyphenyl)acetophenone. See deoxyanisoin.

2-methoxy-5-methylaniline. See 5-methyl-ortho-anisidine.

4-methoxy-4-methylpentanol-2 ("Pent-Oxol")

$\text{CH}_3\text{C}(\text{CH}_3)(\text{OCH}_3)\text{CH}_2\text{CHOHCH}_3$.

Properties: Liquid. Boiling range 163.8-167°C. Combustible.

Use: Solvent for resin-coating formulation.

4-methoxy-4-methylpentanone-2 ("Pent-Oxone")

$\text{CH}_3\text{C}(\text{CH}_3)(\text{OCH}_3)\text{CH}_2\text{COCH}_3$.

Properties: Water-white liquid; boiling range 147-163°C; flash point 141°F. Combustible.

Derivation: Diacetone alcohol.

Hazard: Moderate fire risk. Irritant to skin and eyes.

Use: Solvent for a variety of resin coatings.

2-methoxy-4-methylphenol. See creosol.

2-methoxynaphthalene. See beta-naphthyl methyl ether.

1-methoxy-4-nitrobenzene. See para-nitroanisole.

methoxyphenamine hydrochloride

$\text{CH}_3\text{OC}_6\text{H}_4\text{CH}_2\text{CH}(\text{CH}_3)\text{NHCH}_3 \cdot \text{HCl}$. 2-(ortho-methoxyphenyl)isopropyl methylamine hydrochloride.

Properties: Crystalline, white powder; odorless and bitter; m.p. 124-128°C; freely soluble in alcohol, chloroform, and water; slightly soluble in ether and benzene; pH (5% solution) 5.3-5.7.

Use: Medicine.

4-methoxyphenol (para-methoxyphenol). See hydroquinone monomethyl ether.

ortho-methoxyphenol. See guaiacol.

3-(ortho-methoxyphenoxy)-1,2-propanediol 1-carbamate. See methocarbamol.

para-methoxyphenylacetic acid (para-methoxy-alpha-toluic acid) $\text{CH}_3\text{OC}_6\text{H}_4\text{CH}_2\text{COOH}$. Off-white to pale yellow flakes; m.p. 85°C.

Uses: Preparation of pharmaceuticals; other organic compounds.

para-methoxyphenylbutanone. See anisylacetone.

methoxypolyethylene glycol. One of a series of compounds with properties similar to the polyethylene glycols of comparable molecular weight. Slightly viscous liquids to soft wax-like solids. Used for manufacture of detergents and emulsifying and dispersing agents through the preparation of the mono-fatty-acid derivatives.

methoxy propanol (monopropylene glycol methyl ether). $\text{CH}_3\text{OCH}_2\text{CH}(\text{OH})\text{CH}_3$.

Properties: Colorless liquid. B.p. 120°C ; flash point 102°F ; specific gravity 0.92 (25°C). Low toxicity. Combustible.

Hazard: Moderate fire risk.

Uses: Antifreeze and coolant for diesel engines.

para-methoxypropenylbenzene. See anethole.

para-methoxypropiophenone $\text{C}_2\text{H}_5\text{COC}_6\text{H}_4\text{OCH}_3$.

Properties: Clear, colorless liquid; distillation range 110 – 140°C (3 mm); refractive index, 1.543 to 1.545 (25°C).

3-methoxypropylamine (3-MPA)

$\text{CH}_3\text{OCH}_2\text{CH}_2\text{CH}_2\text{NH}_2$.

Properties: Colorless liquid; b.p. 119°C ; sp. gr. 0.873 ($20/20^\circ\text{C}$); refractive index ($n_{25/D}$) 1.4153; flash point 80°F (Tag Closed Cup); miscible with water, ethanol, toluene, acetone, carbon tetrachloride, hexane, and ether.

Hazard: Flammable, moderate fire risk. Moderately toxic by ingestion and inhalation.

Uses: Organic intermediate; emulsifier in anionic coatings and wax formulations.

8-methoxypsoralen. See methoxsalen.

para-methoxytoluene. See para-methylanisole.

para-methoxy-alpha-toluic acid. See para-methoxyphenylacetic acid.

methoxytriethylene glycol acetate. See methoxytriglycol acetate.

methoxytriglycol $\text{CH}_3\text{O}[\text{C}_2\text{H}_4\text{O}]_3\text{H}$.

Properties: Colorless liquid. Sp. gr. 1.0494; b.p. 249°C ; f.p. -44°C ; flash point 245°F ; soluble in water. Combustible; low toxicity.

Use: Plasticizer intermediate.

methoxytriglycol acetate (methoxytriethyleneglycol acetate) $\text{CH}_3\text{COO}(\text{C}_2\text{H}_4\text{O})_3\text{CH}_3$.

Properties: Colorless liquid with fruity odor; sp. gr. 1.0940 ($20/20^\circ\text{C}$); 9.2 lb/gal (20°C); b.p. 244.0°C ; flash point 260°F ; combustible; low toxicity. Water-soluble; low volatility.

Uses: Antidusting agent for finely powdered materials, especially as an "antisneeze" for certain dyestuffs.

methyl abietate $\text{C}_{19}\text{H}_{29}\text{COOCH}_3$.

Properties: Colorless to yellow liquid; sp. gr. 1.033–1.043 (20°C); refractive index 1.525–1.535; flash point 360°F ; b.p. 365°C . Miscible with most organic solvents. Combustible; low toxicity.

Containers: Drums; carloads.

Uses: Solvent and plasticizer; lacquers; varnishes; coating compositions.

N-methylacetanilide $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)\text{COCH}_3$.

Properties: Needles or long tablet-like crystals; soluble in hot water and dilute alcohol. B.p. 240 – 250°C ; m.p. 101°C .

Derivation: By heating acetylchloride and methylaniline.

Use: Medicine.

methyl acetate $\text{CH}_3\text{CO}_2\text{CH}_3$.

Properties: Colorless, volatile, liquid; fragrant odor. Miscible with the common hydrocarbon solvents; soluble in water. Sp. gr. 0.92438; f.p. -98.05°C ; b.p. 54.05°C ; flash point 15°F ; refractive index 1.3619 (20°C); wt/gal 7.76 lb (20°C). Autoignition temp., 935°F .

Derivation: By heating methyl alcohol and acetic acid in presence of sulfuric acid and distilling.

Grades: Technical; C.P.

Containers: 5-gal cans; 55-gal drums; tank cars.

Hazard: Highly flammable; dangerous fire and explosion risk. Explosive limits in air 3 to 16%. Tolerance, 200 ppm in air. Moderately toxic by inhalation.

Uses: Paint remover compounds; lacquer solvent; intermediate; synthetic flavoring.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

methylacetic acid. See propionic acid.

methyl acetoacetate $\text{CH}_3\text{COCH}_2\text{CO}_2\text{CH}_3$.

Properties: Colorless liquid; soluble in alcohol; slightly soluble in water; sp. gr. 1.0785 ($20/20^\circ\text{C}$); b.p. 171.7°C ; vapor pressure 0.7 mm (20°C); flash point 158°F (TOC); wt/gal 9.0 lb (20°C); f.p. -31.9°C . Combustible. Low toxicity.

Containers: Carboys; drums; tank cars; trucks.

Uses: Solvent for cellulose ethers; ingredient of solvent mixtures for cellulose esters; organic synthesis.

methyl acetone.

Properties: Water-white, anhydrous liquid, consisting of various mixtures of acetone, methyl acetate, and methyl alcohol. Miscible with hydrocarbons, oils, and water. Flash point near 0°F .

Derivation: A byproduct in the wood-distillation industry; also synthetic.

Grades: Technical (natural and synthetic).

Containers: Drums; tank cars.

Hazard: Highly flammable, dangerous fire risk. Toxic by ingestion.

Uses: Solvent for nitrocellulose, cellulose acetate, rubber, gum, resins; lacquers; paint and varnish removers; extracts; extracting perfumes; dewaxing natural gums.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

methylacetophenone (methyl para-tolyl ketone)

$\text{CH}_3\text{C}_6\text{H}_4\text{COCH}_3$.

Properties: Colorless or pale-yellow liquid; fragrant, coumarin odor. Soluble in 7 parts of 50% alcohol and in most fixed oils. Sp. gr. 1.001–1.004; refractive index 1.533–1.535. Combustible; low toxicity.

Derivation: Action of acetic anhydride on toluene.

Grade: Technical; F.C.C.

Uses: Perfumery; flavoring. See also glycine, (2).

methylacetopyranone. See dehydroacetic acid.

methylacetylene (allylene; propyne) $\text{CH}_3\text{C}\equiv\text{CH}$.

Properties: Colorless liquefied gas; b.p. -23.1°C ; f.p. -101.5°C ; sp. vol. 9.7 cu ft/lb (70°F).

Uses: Specialty fuel; chemical intermediate.

Hazard: Flammable, dangerous fire risk; moderately toxic by inhalation. Tolerance, 1000 ppm in air.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not accepted on passenger planes.

methylacetylene-propadiene, stabilized

Properties: Colorless liquefied gas; sp. gr. (liquid) 0.576 ($15/15^\circ\text{C}$); boiling range -39 to -20°C ; flame temperature in oxygen 5300°F . A mixture containing 60–66.5% methylacetylene and propadiene, balance propane and butane.

Hazard: Flammable, dangerous fire risk; moderately toxic by inhalation. Tolerance, 1000 ppm in air.

Uses: Industrial fuel gas for cutting, welding, brazing, heat treating, metallizing.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes.

See also "Mapp."

methyl acetylricinoleate $C_{17}H_{32}(OCOCH_3)COOCH_3$.

Properties: Pale yellow, low viscosity, oily liquid; mild odor; sp. gr. 0.938 (25/25°C); solidifies at -26°C. Soluble in most organic liquids; insoluble in water. Combustible; low toxicity.

Derivation: Castor oil, methyl alcohol and acetic anhydride.

Containers: Drums; tank cars.

Uses: Plasticizer; lubricant; protective coatings; synthetic rubbers; vinyl compounds.

methyl acetylsalicylate $CH_3COOC_6H_4COOCH_3$.

Properties: White crystals; m.p. 52°C; b.p. 134-136°C (9 mm).

Derivation: By heating methyl salicylate with a slight excess of acetic anhydride, adding alcohol, then water, and separating the precipitate.

Uses: Medicine; synthesis.

methyl acid phosphate. See methylphosphoric acid.

beta-methylacrolein. See crotonaldehyde.

methyl acrylate $CH_2=CHCOOCH_3$.

Properties: Colorless, volatile liquid; b.p. 80.5°C; f.p. -76.5°C; vapor pressure (20°C) 65 mm; sp. gr. (20/20°C) 0.9574; wt/gal 8.0 lb; slightly soluble in water; readily polymerized. Flash point 25°F (TOC).

Derivation: (a) Ethylene cyanohydrin, methanol, and dilute sulfuric acid; (b) Oxo reaction of acetylene, carbon monoxide, and methanol in the presence of nickel or cobalt catalyst; (c) from beta-propiolactone.

Grades: Technical (inhibited).

Containers: Drums; tank cars.

Hazard: Flammable, dangerous fire and explosion risk. Highly toxic by inhalation, ingestion and skin absorption. Tolerance, 10 ppm in air: Irritant to skin and eyes. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Polymers; amphoterics surfactants; vitamin B₁; chemical intermediate.

Shipping regulations: (Air) (inhibited) Flammable Liquid label; (uninhibited) Not acceptable. (Rail) Not listed.

See also acrylate.

beta-methylacrylic acid. See crotonic acid.

methylal (dimethoxymethane; formal)

$CH_3OCH_2OCH_3$.

Properties: Colorless, volatile, liquid; chloroform-like odor; pungent taste; m.p. 104.8°C; sp. gr. 0.86 (20/4°C); b.p. 42.3°C; soluble in water at 20°C to extent of 32 wt %; completely soluble in alcohol, ether, and hydrocarbons; flash point (open cup) 0°F (approx.); autoignition temp. 459°F.

Containers: Glass bottles; steel drums.

Hazard: Flammable, dangerous fire and explosion risk. Moderately toxic by ingestion and inhalation. Tolerance, 1000 ppm in air.

Uses: Solvent; starting material for organic synthesis; perfumes, adhesives and protective coatings; special fuel.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

2-methylalanine. See aminoisobutyric acid.

methyl alcohol (methanol; wood alcohol) CH_3OH . Eighteenth highest volume chemical produced in U.S. (synthetic) (1975).

Properties: Clear, colorless, mobile, highly polar liquid. Miscible with water, alcohol, and ether; sp. gr. 0.7924; f.p. -97.8°C; b.p. 64.5°C; wt/gal 6.59 lb (20°C); refractive index 1.329 (20°C); surface tension 22.6 dynes/cm (20°C); viscosity 0.00593 poise (20°C); vapor pressure 92 mm (20°C); flash point (open cup) 54°F; autoignition temp. 867°F.

Derivation: (a) By high pressure catalytic synthesis from carbon monoxide and hydrogen. (b) Partial oxidation of natural gas hydrocarbons.

Method of purification: Rectification.

Containers: 4000-gal tank cars; tank trucks and barges.

Grades: Technical; C.P. (99.85%); electronic (used to cleanse and dry components); fuel.

Hazard: Flammable, dangerous fire risk. Toxic by ingestion (causes blindness). Tolerance, 200 ppm in air. Explosive limits in air 6-36.5% by volume. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Manufacture of formaldehyde and dimethyl terephthalate; chemical synthesis (methyl amines, methyl chloride, methyl methacrylate, etc.); aviation fuel (for water injection); automotive antifreeze; solvent for nitrocellulose, ethylcellulose, polyvinyl butyral, shellac, rosin, manila resin, dyes; denaturant for ethyl alcohol; dehydrator for natural gas; fuel for utility plants (methyl fuel); feedstock for manufacture of synthetic proteins by continuous fermentation.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Legal label name (Rail) wood alcohol.

methylallyl acetate (methallyl acetate)

$CH_2=C(CH_3)CH_2OOCCH_3$.

Properties: Colorless liquid; sp. gr. 0.9162 (20°C); wt/gal 7.6 lb.

Hazard: Probably flammable and moderately toxic.

Uses: Monomer; preparation of methallyl derivatives.

methylallyl alcohol (methallyl alcohol; 2-methyl-2-propen-1-ol) $H_2C=C(CH_3)CH_2OH$.

Properties: Colorless liquid with pungent odor; sp. gr. 0.8515 (20/4°C); b.p. 115°C; refractive index 1.4255 (25/D); flash point 92°F. Soluble in water, alcohols, esters, ketones, and hydrocarbons.

Grade: 98.5% min purity.

Hazard: Flammable, moderate fire risk. Toxic and irritant to eyes and skin.

Use: Intermediate.

beta-methylallyl chloride (beta-methallyl chloride; 3-chloro-2-methyl-1-propene; MAC)

$CH_2=C(CH_3)CH_2Cl$.

Properties: Colorless to straw-colored volatile liquid with a sharp, penetrating odor; sp. gr. 0.925 (20°C); b.p. 73°C; refractive index (n_D²⁵) 1.427; flash point -3°F (TOC).

Hazard: Flammable, dangerous fire risk. Moderately toxic by ingestion; irritant to eyes and skin. Explosive limits in air, 2.3 to 9.3%.

Uses: Intermediate for production of insecticides, plastics, pharmaceuticals, other organic chemicals; fumigant for grains, tobacco, and soil.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

methylaluminum sesquibromide $(CH_3)_3Al_2Br_3$.

Properties: Cloudy yellow liquid at 25°C; f.p. -4°C; b.p. (extrapolated) 166°C; density 1.514 g/ml (25°C).

Hazard: Ignites spontaneously in air; reacts violently with water. Keep out of contact with air and moisture.

Uses: Catalyst for polymerization of olefins and hydrogenation of aromatics; chemical intermediate.
Shipping regulations: (Rail) Red label. (Air) Not acceptable.

methylaluminum sesquichloride $(\text{CH}_3)_3\text{Al}_2\text{Cl}_3$.

Properties: Colorless liquid at 25°C; f.p. 22.8°C; b.p. (extrapolated) 143.7°C; density 1.1629 g/ml (25°C), 9.705 lb/gal (25°C).

Hazard: Ignites spontaneously in air; reacts violently with water. Keep out of contact with air and moisture.

Uses: Catalyst for polymerization of olefins; catalyst for hydrogenation of aromatics.

Shipping regulations: (Rail), Red label. (Air) Not acceptable.

methylamine (monomethylamine; aminomethane)

CH_3NH_2 .

Properties: Colorless gas. Strong, ammoniacal odor; b.p. -6.79°C; f.p. -92.5°C; flash point (gas) 14°F, (30% solution) 34°F (TOC); soluble in water, alcohol, ether. Autoignition temp. 806°F.

Derivation: Interaction of methanol and ammonia over a catalyst at high temperature. The mono-, di-, and trimethylamines are all produced, and yields are regulated by conditions. They are separated by azeotropic or extractive distillation.

Grade: Technical (anhydrous; 30-40% solutions).

Containers: Steel drums; tank cars; cylinders (anhydrous).

Hazard: (gas and liquid) Flammable, dangerous fire risk. Toxic; strong irritant to tissue. Explosive limits in air, 5 to 21%. Tolerance, 10 ppm in air. Safety data sheet available from Manufacturing Assn., Washington, D.C.

Uses: Intermediate for accelerators, dyes, pharmaceuticals, insecticides, fungicides, surface active agents; tanning; dyeing of acetate textiles; fuel additive; polymerization inhibitor; component of paint removers; solvent; photographic developer; rocket propellant.

Shipping regulations: (Rail) (gas) Red gas label; (solution) Red label. Legal label name monomethylamine. (Air) (gas) Flammable Gas label. Not accepted on passenger planes; (solution) Flammable Liquid label.

methyl ortho-aminobenzoate. See methyl anthranilate.

methylaminoacetic acid. See sarcosine.

methylaminodimethylacetal $(\text{CH}_3\text{O})_2\text{CHCH}_2\text{NHCH}_3$.

Properties: Water-white to slightly yellow, clear liquid having a sharp ammoniacal odor; refractive index 1.406-1.409 (n_D 20); sp. gr. 0.924 (25/25°C). Combustible.

l-methylaminoethanolcatechol. See epinephrine.

para-methylaminoethanolphenol tartrate. See synephrine tartrate.

2-(methylamino)glucose. See N-methylglucosamine.

2-methylaminoheptane $\text{CH}_3(\text{CH}_2)_4\text{CH}(\text{NHCH}_3)\text{CH}_3$.

Oily liquid with a slight amine odor; b.p. 155°C. Somewhat soluble in water. Used in medicine, usually as the hydrochloride.

methyl meta-amino-para-hydroxybenzoate (orthoform) $\text{CH}_3\text{OOCCH}_6\text{H}_3(\text{NH}_2)(\text{OH})$.

Properties: White powder, odorless, tasteless; soluble in alcohol; almost insoluble in water; m.p. 141-143°C.

Use: Medicine.

3-methylaminoisocamphane hydrochloride. See mecamylamine hydrochloride.

2-methylamino-6-methyl-5-heptene. See isometheptene.

N-methyl-para-aminophenol $\text{CH}_3\text{NHC}_6\text{H}_4\text{OH}$.

Properties: Colorless needles. Soluble in water, alcohol and ether. M.p. 87°C. Combustible.

Derivation: (a) Interaction of hydroquinone and methylamine. (b) Methylation of para-aminophenol hydrochloride.

Containers: Glass bottles; fiber drums; multiwall paper sacks.

Hazard: Moderately toxic; eye and skin irritant.

Uses: Organic synthesis; photographic developer.

N-methyl-para-aminophenol sulfate

$\text{HOC}_6\text{H}_4\text{NHCH}_3 \cdot \frac{1}{2}\text{H}_2\text{SO}_4$.

Properties: Colorless needles; m.p. 250-260°C with decomposition; soluble in water and alcohol; insoluble in ether. Discolors in air. Combustible.

Derivation: By methylation of para-aminophenol and conversion of the resulting methylated base by neutralization with sulfuric acid.

Grades: C.P.; photographic.

Containers: Kegs; bottles; barrels; fiber cans.

Hazard: Moderately toxic; eye and skin irritant.

Use: Photographic developer.

methylamyl acetate (methylisobutyl carbinol acetate; sec.-hexyl acetate; 4-methyl-2-pentanol acetate) $\text{CH}_3\text{COOCH}(\text{CH}_3)\text{CH}_2\text{CH}(\text{CH}_3)_2$.

Properties: Colorless liquid. Mild odor. Sp. gr. 0.8598 (20/20°C); b.p. 146.3°C; f.p. -64°C; vapor pressure 3 mm (20°C); flash point 110°F (O.C.); wt/gal 7.1 lb (20°C). Insoluble in water; soluble in alcohol. Combustible.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Moderate fire risk.

Uses: Solvent for nitrocellulose and other lacquers.

methylamyl alcohol (methylisobutyl carbinol; MIBC; 4-methylpentanol-2) $(\text{CH}_3)_2\text{CHCH}_2\text{CH}(\text{CH}_3)\text{OH}$.

Properties: Colorless, stable liquid. Miscible with most common organic solvents; slightly soluble in water. B.p. 131.8°C; sp. gr. 0.8079 (20/20°C); wt/gal 6.72 lb (20°C); sets to a glass below -90°C; refractive index 1.4089 (25°C); vapor pressure 2.8 mm (20°C); flash point 105°F (O.C.). Combustible.

Derivation: From methyl isobutyl ketone.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Moderate fire risk. Explosive limits in air, 1 to 5.5%. Tolerance, 25 ppm in air.

Uses: Solvent for dyestuffs, oils, gums, resins, waxes, nitrocellulose and ethylcellulose; organic synthesis; froth flotation; brake fluids.

methyl-n-amyl carbinol (heptanol-2; 2-methyl-1-pentanol). $\text{CH}_3(\text{CH}_2)_3\text{CHOHCH}_3$.

Properties: Stable colorless liquid; mild odor; miscible with common organic liquids. Sp. gr. 0.8187 (20/20°C); b.p. 160.4°C; vapor pressure 1.0 mm (20°C); flash point 130°F (O.C.). Low toxicity; wt/gal 6.8 lb (20°C). Combustible.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Moderate fire risk.

Uses: Solvent for synthetic resins; frothing agent in ore flotation.

methyl-n-amylketone (2-heptanone)

$\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{COCH}_3$.

Properties: Water-white liquid. Soluble in water; miscible with organic lacquer solvents. Sp. gr. 0.8166 (20/20°C); b.p. 150.6°C; vapor pressure 2.6 mm (20°C); flash point 120°F; autoignition temp. 991°F; refractive index 1.4110 (20°C); wt/gal 6.8 lb (20°C) nitrocellulose-toluene dilution ratio 3.9; f.p. -35°C. Combustible.

Grade: Technical.

Containers: Drums; carloads.

Hazard: Moderate fire risk. Skin irritant; moderately toxic by inhalation; narcotic in high concentrations. Tolerance, 100 ppm in air.

Uses: Solvent for nitrocellulose lacquers; inert reaction medium; synthetic flavoring.

N-methylaniline $C_6H_5NH(CH_3)$.

Properties: Colorless to reddish-brown oily liquid; discolors on standing. Soluble in alcohol, ether, water and chloroform. Sp. gr. 0.991; f.p. -57°C; b.p. 190-191°C. Combustible.

Derivation: By heating methyl iodide with aniline and subsequent distillation.

Grade: Technical.

Containers: Iron drums; tank cars.

Hazard: Toxic by ingestion, inhalation and skin absorption.

Uses: Organic synthesis; solvent; acid acceptor.

alpha-methylanisacetone. (1-[para-methoxyphenyl]-1-penten-3-one) $CH_3OC_6H_4CH:CHCOCH_2CH_3$.

Properties: White to pale yellow solid; sharp odor; stable; m.p. 60°C min. One gram is soluble in 5 ml 95% alcohol. Combustible; low toxicity.

Grade: 99% pure min.

Use: Flavoring.

5-methyl-ortho-anisidine (meta-amino-para-cresol, methyl ether; 2-methoxy-5-methylaniline)

$CH_3C_6H_3(NH_2)OCH_3$.

Properties: White crystals; m.p. 51.5°C; b.p. 235°C. Soluble in alcohol and ether; sparingly soluble in hot water; volatile with steam.

Derivation: 2-Nitro-para-cresol, obtained by the action of nitrous and excess nitric acids upon paratoluidine, is methylated and reduced.

Grade: Technical.

Containers: Drums.

Hazard: Probably toxic. See anisidine.

Use: Dyes.

para-methylanisole (para-cresyl methyl ether; para-methoxytoluene; methyl-para-cresol)

$CH_3C_6H_4OCH_3$.

Properties: Colorless liquid; strong floral odor; sp. gr. 0.966-0.970; refractive index 1.5100-1.5130 (20°C). One part dissolves in 3 parts of 80% alcohol. Combustible.

Grades: F.C.C.; technical.

Uses: Perfumery; flavoring.

1-methylanthrancene. See alpha-methylanthrancene.

alpha-methylanthrancene (1-methylanthrancene) $C_{15}H_{12}$ or $C_6H_4(CH_2)_2C_6H_5$ (a tricyclic aromatic).

Properties: Colorless leaflets. Soluble in alcohol; insoluble in water. Sp. gr. 1.101; b.p. 200°C; m.p. 86°C. Combustible.

Grade: Technical.

Use: Organic synthesis.

methyl anthranilate (methyl ortho-aminobenzoate; neroli oil, artificial) $H_2NC_6H_4CO_2CH_3$.

Properties: Colorless to pale-yellow liquid with bluish fluorescence; grape-type odor; sp. gr. 1.167-1.175 (15°C); refractive index (n_D 20/D) 1.5820-1.5840; b.p.

135°C; congealing point 23.8°C (min); soluble in 5 volumes or more of 60% alcohol; soluble in fixed oils, propylene glycol, volatile oils; slightly soluble in water, mineral oil; insoluble in glycerin. Non-toxic. Combustible.

Derivation: By heating anthranilic acid and methyl alcohol in presence of sulfuric acid, with subsequent distillation. Occurs in many flower oils.

Grades: Technical; F.C.C.

Uses: Flavoring; perfume (cosmetics and pomades).

methylanthraquinone $CH_3C_6H_3(CO)_2C_6H_4$ (tricyclic).

Properties: White needles; soluble in ether and benzene; very slightly soluble in alcohol; insoluble in water. M.p. 177°C; b.p. sublimes. Low toxicity; combustible.

Derivation: By heating anthraquinone and methyl alcohol in presence of sulfuric acid.

Use: Organic synthesis.

methyl apholate. Generic name for 2,2,4,4,6,6-hexahydro-2,2,4,4,6,6-hexakis(2-methyl-1-aziridinyl)-1,3,5,2,4,6-triazatriphosphorine.

$N_3P_3(NCH_2CHCH_3)_6$.

Hazard: Probably toxic.

Use: Insect chemosterilant.

methyl arachidate (methyl eicosanoate)

$CH_3(CH_2)_{18}COOCH_3$. The methyl ester of arachidic acid.

Properties: Waxlike solid; m.p. 45.8°C; b.p. 284°C (100 mm), 216°C (10 mm); refractive index 1.4352 (50°C). Insoluble in water, soluble in alcohol and ether. Low toxicity.

Derivation: Esterification of arachidic acid with methanol and vacuum distillation.

Grade: Purified (99.8%+).

Uses: Special synthesis; intermediate for pure arachidic acid; reference standard for gas chromatography; medical research.

methyl arecaidinate. See arecoline.

methyl azinphos (O,O-dimethyl-S-4-oxo-1,2,3-benzotriazin-3(4H)-yl methyl phosphorodithioate; "Guthion"). $C_{10}H_{12}N_3O_3PS_2$.

Properties: Brown, waxy solid; m.p. 73°C. Slightly soluble in water; soluble in most organic solvents.

Hazard: Highly toxic; cholinesterase inhibitor. Tolerance, 0.2 milligram per cubic meter in air.

Use: Insecticide for fruit. Use may be restricted.

Shipping regulations: (Rail, Air) Organic phosphate, n.o.s., Poison label. Not acceptable on passenger planes.

methyl behenate (methyl docosanoate)

$CH_3(CH_2)_{20}COOCH_3$. The methyl ester of behenic acid.

Properties: Waxlike solid; m.p. 53.2°C; b.p. 215.5°C (3.75 mm); refractive index 1.4262 (80°C). Insoluble in water, soluble in alcohol and ether. Combustible; low toxicity.

Derivation: Esterification of behenic acid with methanol followed by fractional distillation.

Grade: Purified (99.8%+).

Uses: Special synthesis; intermediate for pure behenic acid; biochemical and medical research; reference standard in gas chromatography.

methylbenzaldehydes. See tolyl aldehydes.

methylbenzene. See toluene.

methylbenzethonium chloride

$(CH_3)_3CCH_2C(CH_3)_2C_6H_3(CH_3O)(CH_2)_2O(CH_2)_2N(CH_3)_2(CH_2C_6H_5)Cl \cdot H_2O$.

Benzyl dimethyl(2-[2-(para-1,1,3,3-tetramethylbutyl-cresoxy) ethoxy] ethyl) ammonium chloride. A quaternary ammonium compound.

Properties: Colorless, odorless crystals with bitter taste; m.p. 161–163°C; readily soluble in alcohol, hot benzene, "Cellosolve," chloroform, and water; insoluble in carbon tetrachloride and ether.

Grade: N.F.

Use: Medicine (bactericide).

methyl benzoate (niobe oil) $C_6H_5CO_2CH_3$.

Properties: Liquid of fragrant odor; colorless; oily; sp. gr. 1.085–1.088; refractive index 1.514; f.p. –12.3°C; b.p. 198.6°C. Flash point 181°F. Soluble in 3 parts of 60% alcohol; in most fixed oils; in ether; insoluble in water. Combustible.

Derivation: (a) By heating methyl alcohol and benzoic acid in presence of sulfuric acid. (b) Passing dry hydrogen chloride through a solution of benzoic acid in methanol. (c) Occurs naturally in oils of clove, ylang ylang, tuberose.

Grades: Technical; F.C.C.

Hazard: May be toxic by ingestion.

Uses: Perfumery; solvent for cellulose esters and ethers, resins, rubber; flavoring.

methylbenzoic acid. See ortho-, meta-, and para-toluic acid.

methyl ortho-benzoylbenzoate $C_6H_5COC_6H_4COOCH_3$.

Properties: Colorless liquid. Sp. gr. 1.190 (25°C); refractive index 1.587 (25°C); vapor pressure 4.0 mm (175°C); b.p. 351°C; m.p. 40°C; flash point, 350°F; very slightly soluble in water. Combustible; low toxicity.

Use: Plasticizer.

alpha-methylbenzyl acetate (methylphenylcarbinyl acetate; styrallyl acetate; sec-phenylethyl acetate; phenylmethylcarbinyl acetate) $C_6H_5CH(CH_3)OOCCH_3$.

Properties: Colorless liquid; strong floral odor; sp. gr. 1.023–1.026 (25/25°C); refractive index 1.4935–1.4960 (20°C); flash point 178°F (TCC). Soluble in 70% alcohol, glycerin, and mineral oil; insoluble in water. Combustible; low toxicity.

Grades: 98% min; F.C.C.

Uses: Perfumery; flavoring.

alpha-methylbenzyl alcohol (styrallyl alcohol; phenylmethylcarbinol; 1-phenylethan-1-ol; sec-phenethyl alcohol; methylphenylcarbinol) $C_6H_5CH(CH_3)OH$.

Properties: Colorless liquid; mild floral odor; congeals below room temperature. Sp. gr. 1.009–1.014 (25°C); m.p. 20.7°C; b.p. 204°C; refractive index 1.525–1.529 (20°C); flash point 205°F (COC). Soluble in alcohol, glycerin, mineral oil; slightly soluble in water. Combustible; low toxicity.

Grade: F.C.C.

Use: Perfumery; flavoring; dyes; laboratory reagent.

alpha-methylbenzylamine $C_6H_5CH(CH_3)NH_2$.

Properties: Water-white liquid, mild ammoniacal odor; sp. gr. 0.9535 (20/20°C); refractive index 1.5366 (20°C); b.p. 188.5°C; vapor pressure 0.5 mm (20°C); f.p., sets to a glass below –65°C; flash point, 175°F (COC); soluble in most organic solvents and hydrocarbons; somewhat soluble in water. Combustible; low toxicity.

Uses: Synthesis; emulsifying agent.

alpha-methylbenzyl diethanolamine

$C_6H_5CH(CH_3)N(C_2H_4OH)_2$.

Properties: Dark amber liquid, ammonia-like odor; sp. gr. 1.0812 (20°C); b.p. 244°C (50 mm); flash

point 370°F (O.C.) vapor pressure less than 0.01 mm (20°C); sets to glass at –7°C; moderately soluble in water. Combustible; low toxicity.

Uses: Emulsifying agents, textile specialties, quaternaries.

alpha-methylbenzyl dimethylamine

$C_6H_5CH(CH_3)N(CH_3)_2$.

Properties: Colorless liquid. Sp. gr. 0.9044 (20/20°C); b.p. 195.6°C; vapor pressure 0.6 mm (20°C); f.p., sets to a glass below –70°C; refractive index 1.5024 (20°C); flash point 175°F (O.C.) viscosity 1.85 cp (20°C); slightly soluble in water. Combustible; low toxicity.

Use: Polymerization catalyst.

alpha-methylbenzyl ether

$C_6H_5CH(CH_3)OCH(CH_3)C_6H_5$.

Properties: Straw yellow, mobile liquid with faint odor; sp. gr. 1.0017 (20/20°C); b.p. 286.3°C (760 mm); vapor pressure less than 0.01 mm (20°C); f.p., sets to a glass below –30°C; very slightly soluble in water; flash point 275°F (COC); soluble in most organic solvents. Combustible.

Uses: Solvent; styrenating agent; softener for synthetic rubbers.

methyl-bis(2-chlorethyl)amine hydrochloride. See mechlorethamine hydrochloride.

methyl blue $C_{37}H_{27}N_3O_3S \cdot 2NaSO_3$. Sodium triphenyl-para-rosaniline sulfonate, a dark blue powder or dye used in medicine as an antiseptic and in biological and bacteriological stains.

methyl borate. See trimethyl borate.

methyl bromide (bromomethane) CH_3Br .

Properties: Colorless, transparent, easily liquefied gas, or volatile liquid; burning taste; chloroform-like odor. Miscible with most organic solvents; forms a voluminous crystalline hydrate with cold water. Sp. gr. 1.732 (0°C); b.p. 3.46°C; vapor pressure 1250 mm (20°C); f.p. –94°C; flash point, none; autoignition temp. 998°F in range 10 to 16%. Nonflammable.

Derivation: Action of bromine on methyl alcohol in presence of phosphorus, with subsequent distillation.

Grades: Technical; pure (99.5% min).

Containers: Steel cylinders.

Hazard: Toxic by ingestion, inhalation and skin absorption; strong irritant to skin. Tolerance, 15 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Soil and space fumigant; disinfection of potatoes, tomatoes, and other crops; organic synthesis.

Shipping regulations: (liquid) (Rail, Air) Poison label. Not acceptable on passenger planes; (methyl bromide and ethylene dibromide mixture, liquid), Poison label. Not acceptable on passenger planes; (methyl bromide and nonflammable, nonliquefied compressed gas mixtures, liquid), Poison label. Not acceptable on passenger planes. (Rail) (methyl bromide and chlorpicrin mixture, liquid) Poison label.

methyl bromoacetate $BrCH_2COOCH_3$.

Properties: Colorless to straw-colored liquid; f.p. below –50°C; b.p. 145.0–146.7°C; sp. gr. 1.655 (25/25°C); refractive index 1.456 (25°C); very slightly soluble in water; soluble in methanol, ether.

Hazard: Vapor is strong irritant to eyes.

Uses: Synthesis of weed killers, dyes, vitamins, pharmaceuticals; lachrymator.

2-methyl-1,3-butadiene. See isoprene.

2-methylbutanal. See 2-methylbutyraldehyde.

2-methylbutane. See isopentane.

2-methyl-2-butanethiol (tert-butyl mercaptan). $(\text{CH}_3)_3\text{CSH}(\text{C}_2\text{H}_5)$.

Properties: Boiling range 95–119°C; sp. gr. 0.828 (60/60°F); refractive index 1.438 (20/D); flash point 30°F. Strong, offensive odor.

Grades: 95%.

Containers: Bottles and drums.

Hazard: Flammable, dangerous fire risk.

Use: Odorant; intermediate; bacterial nutrient.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

2-methyl-1-butanol (amyl alcohol, primary, active; sec-butyl carbinol) $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{OH}$. The active alcohol from fusel oil. The synthetic product is a racemic mixture of both dextro- and levorotatory compounds and, therefore, not optically active.

Properties: Colorless liquid; sp. gr. 0.81–0.82 (20°C); f.p., less than –70°C; b.p. 128°C; refractive index (20°C) 1.41. Slightly soluble in water; miscible with alcohol and ether. Flash point 115°F (O.C.). Combustible.

Derivation: Occurs in fusel oil (q.v.); is made synthetically by fractional distillation of the mixed alcohols resulting from the chlorination and alkaline hydrolysis of pentane.

Containers: 1- and 5-gal cans; 55-gal drums.

Hazard: Moderate fire and explosion risk. Moderately toxic by ingestion, inhalation and skin absorption.

Uses: Solvent; organic synthesis (introduction of active amyl group); lubricants; plasticizers, additives for oils and paints.

2-methyl-2-butanol. See tert-amyl alcohol.

3-methyl-1-butanol. See isoamyl alcohol, primary.

3-methyl-2-butanone. See methyl isopropyl ketone.

methylbutanoyl chloride. See isovaleroyl chloride.

2-methyl-1-butene C_5H_{10} or $\text{H}_2\text{C}:\text{C}(\text{CH}_3)\text{CH}_2\text{CH}_3$.

Properties: Colorless, volatile liquid; disagreeable odor; b.p. 31.11°C; refractive index 1.378 (n 20/D); sp. gr. 0.650 (20/20°C); f.p. –137.52°C; flash point below –20°F; soluble in alcohol; insoluble in water.

Derivation: Refinery gas.

Grades: 95%, 99%, and research.

Containers: Bottles, drums.

Hazard: Highly flammable, dangerous fire and explosion risk.

Use: Organic synthesis.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

2-methyl-2-butene. See 3-methyl-2-butene.

3-methyl-1-butene (isopropylethylene; alpha-isoamylene) C_5H_{10} or $\text{H}_2\text{C}:\text{CHCH}(\text{CH}_3)_2$.

Properties: Colorless extremely volatile liquid or gas; disagreeable odor; b.p. 20.1°C; refractive index 1.3643 (n 20/D); sp. gr. 0.6272 (20°C); f.p. –168.5°C; flash point –70°F; soluble in alcohol; insoluble in water.

Derivation: Cracking of petroleum; a component of refinery gas.

Grades: Research; 99% min; technical 95% min.

Containers: Cylinders under pressure.

Hazard: Highly flammable; dangerous fire and explosion risk. Explosive limits 1.6 to 7.7%.

Uses: Organic synthesis; high-octane fuel manufacture.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

3-methyl-2-butene (2-methyl-2-butene; trimethylethylene; beta-isoamylene) C_5H_{10} or $\text{H}_3\text{CCH}:\text{C}(\text{CH}_3)_2$.

Properties: Colorless volatile liquid, disagreeable odor; b.p. 38.51°C; refractive index 1.387 (n 20/D); sp. gr. 0.6623 (20/4°C); f.p. –133.83°C; flash point –50°F; soluble in alcohol; insoluble in water.

Derivation: Cracking of petroleum; a component of refinery gas.

Grades: 90%, 95% (technical), 99% (pure), and research.

Containers: Bottles; drums; tank cars.

Hazard: Highly flammable; dangerous fire and explosion risk.

Uses: Organic synthesis; dental and surgical anesthetic; high octane fuel manufacture.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

cis-2-methyl-2-butenic acid. See angelic acid.

trans-2-methyl-2-butenic acid. See tiglic acid.

2-methyl-1-buten-3-yne. See isopropenylacetylene.

1-methylbutyl alcohol. See 2-pentanol.

N-methylbutylamine $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{NHCH}_3$.

Properties: Liquid; sp. gr. 0.7335; b.p. 91.1°C (760 mm); f.p. –75.0°C. Completely soluble in water; flash point 35°F (TOC).

Hazard: Flammable, dangerous fire risk. Moderate toxicity.

Use: Intermediate.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

methyl butyl ketone (propylacetone; 2-hexanone). $\text{CH}_3\text{COC}_4\text{H}_9$.

Properties: Colorless liquid. B.p. 127.2°C; sp. gr. 0.830 (20/20°C); refractive index 1.4024 (20°C); vapor pressure 10 mm (20°C); soluble in water, alcohol, ether. Flash point 95°F (O.C.).

Grade: Technical.

Hazard: Flammable, moderate fire risk. Explosive limits 1.2 to 8% in air. Irritant to eyes and mucous membranes; narcotic in high concentrations. Tolerance, 100 ppm in air.

Use: Solvent.

2-methyl-6-tert-butylphenol $\text{C}_6\text{H}_3(\text{OH})(\text{CH}_3)(\text{tert-C}_4\text{H}_9)$.

Properties: Crystalline solid; light straw color; m.p. 28°C; sp. gr. 0.9618 (30°C); b.p. 230°C; flash point (open cup) 220°F, soluble in methyl ethyl ketone, ethyl alcohol, benzene, isooctane; insoluble in water. Combustible.

Use: Chemical intermediate.

2-methylbutyl 3-thiol. See sec-isoamyl mercaptan.

2-methyl-4-tert-butylthiophenol (4-tert-butyl-ortho-thiocresol) $(\text{CH}_3)_3\text{CC}_6\text{H}_3(\text{CH}_3)\text{SH}$.

Properties: Water-white liquid; no mercaptan odor; sp. gr. 0.983 (25°C); refractive index (n 25/D) 1.546;

2-methylbutyl 3-thiol. See sec-isoamyl mercaptan.

2-methyl-4-tert-butylthiophenol (4-tert-butyl-ortho-thiocresol) $(\text{CH}_3)_3\text{CC}_6\text{H}_3(\text{CH}_3)\text{SH}$.

Properties: Water-white liquid; no mercaptan odor; sp. gr. 0.983 (25°C); refractive index (n 25/D) 1.546; f.p. –4°C; b.p. 177°C. (100 mm). Soluble in aliphatic and aromatic hydrocarbons; insoluble in water. Combustible.

Use: Chemical intermediate.

methylbutynol $\text{HC}:\text{CCOH}(\text{CH}_3)_2$. 2-Methyl-3-butyne-2-ol.

Properties: Colorless liquid with fragrant odor; b.p. $104\text{--}105^\circ\text{C}$; m.p. 2.6°C ; sp. gr. (20/20°C) 0.8672; refractive index (n 20/D) 1.4211; flash point (TOC) 77°F . Miscible with water; soluble in most organic solvents. Low toxicity.

Grade: Technical, 95% min.

Containers: Drums; tank trucks and tank cars.

Hazard: Flammable, dangerous fire risk.

Uses: Stabilizer in chlorinated solvents; viscosity reducer and stabilizer; electroplating brightener; intermediate.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

2-methylbutyraldehyde (2-methylbutanal)
 $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CHO}$.

Properties: Liquid; sp. gr. 0.8029 (20/4°C); b.p. $92\text{--}93^\circ\text{C}$; refractive index 1.3869 (20°C). Soluble in alcohol and ether; insoluble in water. Combustible.

Use: Flavoring.

3-methylbutyraldehyde. See isovaleraldehyde.

methyl butyrate $\text{CH}_3\text{CH}_2\text{CH}_2\text{COOCH}_3$.

Properties: Colorless liquid. Slightly soluble in water; soluble in alcohol. Sp. gr. 0.898 (20°C); b.p. 102°C ; refractive index (n 20/D) 1.3875. Flash point 57°F (C.C.).

Grade: Technical.

Hazard: Flammable, dangerous fire risk.

Uses: Solvent for ethylcellulose; solvent mixture for nitrocellulose; flavoring.

Shipping regulations: (Rail) Flammable liquids, n.o.s., Red label. (Air) Flammable Liquid label.

2-methylbutyric acid. See isopentanoic acid.

3-methylbutyric acid. See isopentanoic acid.

methyl caprate (methyl decanoate)

$\text{CH}_3(\text{CH}_2)_8\text{COOCH}_3$.

Properties: Colorless liquid; sp. gr. 0.8733 (20/4°C); f.p. -13.3°C ; b.p. 224°C ; 130.6°C (30 mm); refractive index 1.4237 (25°C). Insoluble in water, soluble in alcohol and ether. Combustible; low toxicity.

Derivation: Esterification of capric acid with methanol or alcoholysis of coconut oil; purified by fractional vacuum distillation.

Grades: Technical; 99.8% pure.

Uses: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers.

methyl caproate (methyl hexanoate)

$\text{CH}_3(\text{CH}_2)_5\text{COOCH}_3$. The methyl ester of caproic acid.

Properties: Colorless liquid; sp. gr. 0.8850 (20/4°C); f.p. -71°C ; b.p. 151.2°C , 63.0°C (30 mm); refractive index 1.4054 (n 20/D); insoluble in water; soluble in alcohol and ether. Low toxicity; combustible.

Derivation: Esterification of caproic acid with methanol or alcoholysis of coconut oil.

Grades: Technical; 99.8+%.

Uses: Intermediate for caproic acid detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers; flavoring.

methyl caprylate (methyl octanoate)

$\text{CH}_3(\text{CH}_2)_6\text{COOCH}_3$. The methyl ester of caprylic acid.

Properties: Colorless liquid; sp. gr. 0.8784 (20/4°C); f.p. -37.3°C ; b.p. 192°C (759 mm), 98.3°C (30 mm);

refractive index 1.4152 (25°C). Insoluble in water; soluble in alcohol and ether. Low toxicity; combustible.

Derivation: (a) Esterification of caprylic acid with methanol, (b) alcoholysis of coconut oil.

Grades: Technical; 99.8%.

Containers: 55-gal drums.

Uses: Intermediate for caprylic acid detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers; flavoring.

methyl "Carbitol."²¹⁴ Trademark for diethylene glycol monomethyl ether (q.v.).

methyl "Carbitol" acetate. Trademark for diethylene glycol monomethyl ether acetate (q.v.).

methyl carbonate (dimethyl carbonate) $\text{CO}(\text{OCH}_3)_2$.

Properties: Colorless liquid. Pleasant odor. Miscible with acids and alkalis. Stable in the presence of water. Soluble in most organic solvents; insoluble in water. Sp. gr. 1.0718 (20°C); b.p. 90.6°C ; m.p. -0.5°C .

Derivation: Interaction of phosgene and methyl alcohol.

Grade: Technical.

Hazard: Flammable, dangerous fire risk. Toxic by inhalation; strong irritant.

Uses: Organic synthesis; specialty solvent.

Shipping regulations: (Rail) Flammable Liquid, n.o.s., Red label. (Air) Flammable Liquid label. Legal label name, dimethyl carbonate.

methyl "Cellosolve."²¹⁴ Trademark for ethylene glycol monomethyl ether (q.v.).

methyl "Cellosolve" acetate.²¹⁴ Trademark for ethylene glycol monomethyl ether acetate (q.v.).

methylcellulose (cellulose methyl ether; "Methocel").

Properties: Grayish white, fibrous powder; aqueous suspensions neutral to litmus. Swells in water to a viscous, colloidal solution. Insoluble in alcohol, ether, chloroform, and in water warmer than 123°F . Soluble in glacial acetic acid; unaffected by oils and greases; stable up to about 300°C ; stable to light. Combustible; nontoxic.

Molecular weights may vary from 40,000 to 180,000.

Specifications call for methoxy group content of narrow or wide ranges within 25–33%.

Derivation: From cellulose by conversion to alkali cellulose and then reacting this with methyl chloride, dimethyl sulfate, or methyl alcohol, and dehydrating agents. The proportions of the reacting materials are varied to control the properties of the product, such as water solubility and viscosity of the water solutions.

Grades: U.S.P.; technical; F.C.C.

Containers: Cartons, bags, carloads.

Uses: Protective colloid in water-based paints to prevent flocculation of pigment; film and sheeting; binder in ceramic glazes; leather tanning; dispersing, thickening and sizing agent; adhesive; food additive.

See also cellulose, modified; carboxymethylcellulose; hydroxyethylcellulose.

methylcellulose, propylene glycol ether. See hydroxypropyl methylcellulose.

methyl cerotate (methyl hexacosanoate)

$\text{CH}_3(\text{CH}_2)_{24}\text{COOCH}_3$. The methyl ester of cerotic acid.

Properties: Waxlike solid. Insoluble in water, soluble

in alcohol and ether; m.p. 62.9°C; b.p. 237°C (1.95 mm); refractive index 1.4301 (80°C). Combustible.

Derivation: Esterification of cerotic acid with methanol.

Grade: Purified (99+%).

Uses: Intermediate in special synthesis; medical research; reference standard for gas chromatography.

methyl chloride (chloromethane) CH_3Cl .

Properties: Colorless, compressed gas or liquid. Faintly sweet, ethereal odor; sp. gr. 0.92 (20°C); b.p. -23.7°C; f.p. -97.6°C; flash point below 32°F (O.C.) refractive index 1.3712 (-23.7°C); critical temperature, 143°C; critical pressure 970 psi absolute; autoignition temp. 1170°F; wt/gal 7.68 lb (20°C); slightly soluble in water, by which it is decomposed; soluble in alcohol, chloroform, benzene, carbon tetrachloride, glacial acetic acid. Attacks aluminum, magnesium and zinc.

Derivation: (a) Chlorination of methane; (b) action of hydrochloric acid on methanol, either in vapor or liquid phase.

Grades: Pure (99.5% min), technical, and 2 refrigerator grades.

Containers: 60-, 100-, 300-, 1300-lb cylinders, and in tank cars and tank trucks.

Hazard: Flammable, dangerous fire risk; explosive limits in air 10.7 to 17%. Toxic in high concentrations. Tolerance, 100 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Catalyst carrier in low-temperature polymerization (butyl rubber); tetramethyl lead; silicones; refrigerant; medicine; fluid for thermometric and thermostatic equipment; methylating agent in organic synthesis; such as methylcellulose; extractant and low-temperature solvent; propellant in high-pressure aerosols; herbicide.

Shipping regulations: (Rail) Red gas label. (Air) Flammable Gas label. Not acceptable on passenger planes.

methyl chloroacetate $\text{ClCH}_2\text{COOCH}_3$.

Properties: Colorless liquid with sweet pungent odor; sp. gr. 1.236 (20/4°C); f.p. -32.7°C; b.p. 131°C; refractive index 1.419-1.420 (25/D); slightly soluble in water; miscible with alcohol and ether. Combustible.

Hazard: Toxic by ingestion and inhalation.

Uses: Solvent; intermediate.

See 1,1,1-trichloroethane.

See methyl chloroformate (methyl chlorocarbonate).

ClCOOCH_3 .

Properties: Colorless liquid. Decomposed by hot water. Stable to cold water. Soluble in methyl alcohol, ether, and benzene. Sp. gr. 1.23 (15°C); b.p. 71.4°C; vapor density 3.9 (air = 1). Flash point 54°F. Derivation: Reaction between methyl alcohol and carbonyl chloride.

Grade: Technical (95% min).

Hazard: Highly toxic; corrosive and irritant to skin and eyes. Flammable, dangerous fire risk.

Uses: Military poison gas (lachrymator); organic synthesis; insecticides.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

methylchloromethyl ether $\text{ClCH}_2\text{OCH}_3$.

Properties: Colorless liquid; sp. gr. 1.0625 (10/4°C); f.p. -103.5°C; b.p. 59.5°C; decomposes in water; soluble in alcohol and ether.

Hazard: Flammable; dangerous fire and explosion risk. A known carcinogen.

Shipping regulations: (anhydrous) (Rail) Red label. Not accepted by express. (Air) Not acceptable.

2-methyl-4-chlorophenoxyacetic acid. See MCPA.

4-(2-methyl-4-chlorophenoxy)butyric acid. See 4-MCPB.

2-(2-methyl-4-chlorophenoxy-propionic acid. See mecoprop.

methyl chlorosilane. One of several intermediates in the formation of silicones or siloxanes; they react with hydroxyl groups on many types of surfaces to produce a permanent thin surface film of silicone that imparts water-repellency. Examples are methyl-trichlorosilane, dimethyl-dichlorosilane, and trimethyl-chlorosilane (q.v.).

Hazard: Highly toxic by ingestion and inhalation; strong irritant to skin and eyes.

methyl chlorosulfonate $\text{CH}_3\text{OSO}_2\text{Cl}$.

Properties: Colorless liquid. Pungent odor. Decomposed by water. Soluble in alcohol, carbon tetrachloride, chloroform; insoluble in water. Sp. gr. 1.492 (10°C); b.p. 133-135°C (dec); f.p. -70°C; vapor density 4.5 (air = 1).

Derivation: Interaction of sulfonyl chloride and methyl alcohol.

Containers: Steel bottles.

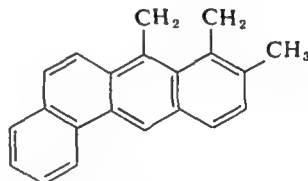

Grade: Technical.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to skin and eyes.

Uses: Organic synthesis; military poison gas.

Shipping regulations: (Rail, Air) Not accepted.

methylcholanthrene. A polynuclear hydrocarbon with formula $\text{C}_{21}\text{H}_{16}$.

Properties: Yellow crystals melting at 180°C. Soluble in benzene; insoluble in water.

Derivation: From bile acids via 1,2-benzanthracene.

Hazard: One of the most powerful carcinogenic agents known.

Uses: Biochemical research.

methyl cinnamate $\text{C}_6\text{H}_5\text{CH}=\text{CHCOOCH}_3$.

Properties: White crystals; strawberry-like odor. Soluble in alcohol and ether, in glycerol, most fixed oils, and mineral oil; insoluble in water. Sp. gr. 1.0415; m.p. 34°C; b.p. 259.6°C. Combustible; low toxicity.

Derivation: By heating methyl alcohol, cinnamic acid and sulfuric acid, with subsequent distillation.

Grades: Technical; F.C.C.

Containers: 1-, 5-, 10-lb bottles; 25-lb tins.

Use: Perfumes; flavoring.

methylcoumarin $\text{C}_{10}\text{H}_8\text{O}_2$.

Properties: White crystals with vanilla flavor; exists as alpha and beta forms; m.p. (alpha) 90°C, (beta) 82°C; both forms are soluble in alcohol. Combustible; low toxicity.

Uses: Perfumes; flavoring.

methyl-para-cresol. See para-methylanisole.

cis-alpha-methylcrotonic acid. See angelic acid.

trans-alpha-methylcrotonic acid. See tiglic acid.

methyl cyanide. See acetonitrile.

methyl cyanoacetate (malonic methyl ester nitrile)
 $\text{CNCH}_2\text{COOCH}_3$.

Properties: Colorless liquid; b.p. 203°C (115°C at 16 mm); f.p. -22.5°C ; sp. gr. 1.1225 ($15/4^\circ\text{C}$) refractive index 1.419–1.420 (n_{20}/D); soluble in water, alcohol and ether. Combustible.

Derivation: Esterification of cyanoacetic acid with methanol; reaction of an alkali cyanide and chloroacetic methyl ester.

Hazard: May be toxic.

Uses: Organic synthesis; pharmaceuticals; dyes.

methyl-2-cyanoacrylate $\text{CH}_2\text{:C(CN)COOCH}_3$.

Properties: Colorless liquid; b.p. $48\text{--}49^\circ\text{C}$ ($2.5\text{--}2.7$ mm); sp. gr. 1.1044 ($27^\circ/4^\circ\text{C}$); viscosity 2.2 cp (25°C).

Uses: Adhesive; dentistry. See also cyanoacrylate adhesives.

methyl cyanoformate CNCOOCH_3 .

Properties: Colorless liquid. Ethereal odor. Decomposed by alkalis and water. Soluble in alcohol, benzene, ether. Sp. gr. (approx) 1.00 (20°C); b.p. 100°C .

Derivation: Methylchloroformate is dissolved in methanol and subjected to the action of (hot) sodium or potassium cyanide.

Hazard: May be toxic.

Use: Organic synthesis.

methylcyclohexane (hexahydrotoluene) $\text{CH}_3\text{C}_6\text{H}_{11}$.

Properties: Colorless liquid; sp. gr. 0.769; b.p. 100.8°C ; f.p. -126.9°C ; refractive index 1.42312; flash point 25°F (C.C.); autoignition temp. 545°F .

Source: Petroleum.

Grades: Technical (95%); 99%, and research.

Containers: Glass bottles; drums.

Hazard: Flammable, dangerous fire risk. Moderately toxic; tolerance 500 ppm. Lower explosive limit 1.2% in air.

Uses: Solvent for cellulose ethers; organic synthesis.

Shipping regulations: (Rail) Flammable liquids, n.o.s., Red label. (Air) Flammable Liquid label.

methylcyclohexanol (hexahydromethyl phenol; hexahydroresol) $\text{CH}_3\text{C}_6\text{H}_{10}\text{OH}$. Ortho-, meta-, and para-forms.

Properties: Colorless, viscous liquid; aromatic, menthol-like odor; b.p. $155\text{--}180^\circ\text{C}$; sp. gr. 0.924; flash point 154°F (C.C.). Combustible.

Derivation: (a) A mixture of three isomeric (ortho, meta and para) cyclic secondary alcohols made by the hydrogenation of cresol; (b) catalytic oxidation of methylcyclohexane.

Grade: Technical.

Containers: Cans; drums.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Tolerance, 50 ppm in air.

Uses: Solvent for cellulose esters and ethers for lacquers; antioxidant for lubricants; blending agent for special textile soaps and detergents.

methylcyclohexanol acetate (heptalin acetate; methyl cyclohexyl acetate). $\text{C}_7\text{H}_{13}\text{OOCCH}_3$.

Properties: Colorless, liquid. Ester-like odor; slower rate of evaporation than amyl acetate. B.p. $176\text{--}193^\circ\text{C}$; sp. gr. 0.941; flash point 147°F (C.C.); toluene dilution ratio 2.5. Combustible.

Derivation: Catalytic hydrogenation and esterification of cresols by means of acetic acid.

Use: Solvent.

methylcyclohexanone $\text{CH}_3\text{C}_6\text{H}_9\text{CO}$.

Properties: Water-white to pale-yellow liquid. Acetone-like odor. A mixture of cyclic ketones. Closely resembles cyclohexanone in physical properties, miscibility, tolerance for nonsolvents, and solvent action. B.p. $160\text{--}170^\circ\text{C}$; sp. gr. 0.925; flash point 138°F . Combustible.

Derivation: By high-temperature, catalytic hydrogenation of cresols or by the dehydrogenation of methylcyclohexanol.

Containers: Cans; drums.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Tolerance (ortho-isomer) 50 ppm in air.

Moderate fire risk.

Uses: Solvent; lacquers.

methylcyclohexanone glyceryl acetal $\text{CH}_3\text{C}_6\text{H}_9\text{O}_2\text{--C}_3\text{H}_5\text{OH}$ (spiro rings).

Properties: Colorless liquid. Sp. gr. 1.074 (20°C); refractive index 1.474 (20°C); b.p. $130\text{--}140^\circ\text{C}$ (20 mm); flash point 200°F . Combustible. Insoluble in water.

Use: Plasticizer.

methylcyclohexanyl oxalate $(\text{CH}_3\text{C}_6\text{H}_{10}\text{OOC})_2$.

Properties: Colorless, odorless, neutral, stable liquid comprising a mixture of isomers. Miscible with most lacquer solvents and diluents.

Hazard: May be toxic.

4-methylcyclohexene-1 $\text{CH}_3\text{C}_6\text{H}_9$.

Properties: Colorless liquid; f.p. -121.1°C ; distillation range 110°C to 117°C ; sp. gr. 0.818 ($60/60^\circ\text{F}$); refractive index 1.450 (20°C); flash point 30°F . Insoluble in water; soluble in alcohol.

Grades: Pure, 99.0 mole%; technical, 95.0 mole%.

Containers: Up to 54-gal drums.

Hazard: Flammable, dangerous fire risk. May be irritant to skin and eyes.

Use: Intermediate.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

6-methyl-3-cyclohexene carboxaldehyde
 $\text{CH}_3\text{CHCH}_2\text{CH:CHCH}_2\text{CHCHO}$.

Properties: Colorless liquid. Sp. r. 0.9484; b.p. 176.4°C ; f.p. -39.0°C ; solubility in water, 0.3% by weight at 20°C . Probably low toxicity.

Use: Intermediate.

N-methyl-5-cyclohexenyl-5-methylbarbituric acid. See hexobarbital.

N-methylcyclohexylamine $\text{C}_6\text{H}_{11}\text{NHCH}_3$.

Properties: Water-white liquid; sp. gr. 0.86 (20°C); soluble in alcohol and ether; slightly soluble in water. Purity 99%; distillation range, $5\text{--}95^\circ\text{C}$ within 2°C , including 149°C , corrected to 760 mm. Combustible. Probably low toxicity.

Uses: Intermediate; solvent; acid acceptor.

methylcyclopentadiene dimer (methyl-1,3-cyclopentadiene) $\text{C}_{12}\text{H}_{16}$.

Properties: Colorless liquid. Sp. gr. 0.9341 ($20/4^\circ\text{C}$); b.p. $78\text{--}183^\circ\text{C}$; flash point 140°F (TOC). Insoluble in water; very soluble in alcohol, benzene and ether. Combustible.

Hazard: Moderate fire risk.

Uses: High-energy fuels; curing agents; plasticizers; resins; surface coatings; pharmaceuticals; dyes.

methylcyclopentadienyl manganese tricarbonyl
 $\text{CH}_3\text{C}_5\text{H}_4\text{Mn(CO)}_3$.

Derivation: Methylcyclopentadiene with manganese carbonyl.

Hazard: Probably toxic and irritant.

Use: Antiknock agent, either alone or admixed with TEL.

methylcyclopentane C_5H_{10} .

Properties: Colorless liquid. Sp. gr. 0.750 (20/4°C); f.p. -142.5°C ; refractive index 1.40983 (20°C); b.p. 72°C (742 mm); flash point below 20°F . Immiscible with water.

Grades: Technical (95%), 99%, and research.

Containers: Glass bottles; cans; steel drums.

Hazard: Flammable, dangerous fire and explosion risk. May be irritant and narcotic.

Uses: Organic synthesis; extractive solvent; azeotropic distillation agent.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Legal label name (Rail) cyclopentane, methyl.

methyl cyclopentenolone. See 2-hydroxy-3-methyl-2-cyclopentene-1-one.

methylcytosine $C_5H_7N_3O$. 5-Methyl-2-oxy-4-aminopyrimidine. A pyrimidine found in deoxyribonucleic acids, nucleotides, and nucleosides. Crystallizes in prisms from water; m.p. 270° (dec).

methyl decanoate. See methyl caprate.

methyl demeton. Generic name for a mixture of O,O-dimethyl O (and S)-(2-ethylthio)ethyl phosphorothioates. Slightly soluble in water; soluble in most organic solvents.

Hazard: Highly toxic. Cholinesterase inhibitor. Use may be restricted. Tolerance, 0.5 mg per cubic meter of air.

Use: Systemic insecticide.

Shipping regulations: Organic phosphate mixture: (Rail, Air) Poison label. Not acceptable on passenger planes.

methyl dichloroacetate $Cl_2CHCOOCH_3$.

Properties: Liquid; sp. gr. 1.3759–1.3839 (20/20°C); refractive index (n 20/D) 1.4374–1.4474; b.p. 143°C . Slightly soluble in water; soluble in ether and alcohol. Flash point 176°F . Combustible.

Grades: 99.0% pure.

Containers: Carboys; drums.

Hazard: Forms corrosive products on hydrolysis. Keep dry.

Use: Organic intermediate.

Shipping regulations: (Air) Corrosive label.

methyldichloroarsine CH_3AsCl_2 .

Properties: A colorless, mobile liquid having an agreeable odor. Decomposed by water. B.p. 136°C ; m.p., -59°C ; sp. gr. 1.838.

Hazard: Highly toxic and irritant.

Uses: Military poison gas; intermediate.

Shipping regulations: (Rail) Poison gas label. (Air) Not acceptable.

methyl 3,4-dichlorocarbanilate. See swep.

methyl N-3,4-dichlorophenylcarbamate. See swep.

methyldichlorosilane CH_3SiHCl_2 .

Properties: Colorless liquid; b.p. 41°C ; sp. gr. 1.10 (27°C); flash point -26°F . Soluble in benzene, ether, heptane.

Derivation: Reaction of methyl chloride with silicon and copper.

Hazard: Highly toxic and flammable; dangerous fire risk.

Use: Manufacture of siloxanes.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. No accepted on passenger planes.

methyl dichlorostearate $C_{17}H_{33}Cl_2COOCH_3$ (approx).

Properties: Light yellow, oily liquid with a slight odor. Completely miscible with most organic solvents; freezing range $+7$ to -5°C ; b.p. decomposes 250°C ; sp. gr. 0.997 (15.5/15.5°C); refractive index 1.4599 (n 25/D); flash point 358°F . Combustible; low toxicity.

Containers: 55-gal steel drums.

Uses: Intermediate; plasticizer extender.

methyldiethanolamine $CH_3N(C_2H_5OH)_2$.

Properties: Colorless liquid with amine-like odor. Miscible with benzene, water. Sp. gr. 1.0418 (20°C); b.p. 247.2°C ; wt/gal 8.7 lb; vapor pressure <0.01 mm (20°C); f.p. -21.0°C ; refractive index 1.4699; flash point 260°F (COC). Combustible; low toxicity. Grade: Technical.

Containers: Glass bottles; cans; drums.

Uses: Intermediate; absorption of acidic gases; catalyst for polyurethane foams; pH control agent.

methyldiethylamine $CH_3N(C_2H_5)_2$.

Properties: Water-white to straw-colored liquid; b.p. 62.5°C ; sp. gr. 0.724 (20°C); has inverse water solubility. Combustible.

Uses: Desalination of brackish water; chemical intermediate; acid neutralizer.

4-methyl-7-(diethylamino)coumarin. See 7-diethylamino-4-methylcoumarin.

6-methyldihydromorphinone hydrochloride. See metopon hydrochloride.

3-methyl-2,5-dihydrothiophene-1,1-dioxide (3-methyl-sultolene) $CH_3C_2H_2SO_2$ (cyclic).

Properties: Solid; m.p. 63°C ; b.p., decomposes. Slightly soluble in water, acetone, and toluene. Combustible.

Uses: Chemical intermediate; catalyst.

methyl 3-(dimethoxyphosphinyloxy)crotonate. See mevinphos.

methyl N,3,7-dimethyl-7-hydroxyoctylden anthranilate. See hydroxycitronellal-methyl anthranilate Schiff base.

Methyl "Dioxitol."¹²⁵ Trademark for diethylene glycol monomethyl ether (q.v.) having an A.S.T.M. distillation range 192 – 196°C .

methyldioxolane (2-methyl-1,3-dioxolane)

Properties: Water-white liquid. Soluble in water.

$\text{OCH}(\text{CH}_3)\text{OCH}_2\text{CH}_2$. Sp. gr. 0.982 (20/20°C); b.p. 81°C . Combustible.

Hazard: Moderately toxic; irritant.

Uses: Extractant and solvent for oils, fats, waxes, dye-stuffs and cellulose derivatives.

methyl diphenyl phosphate (methyl phenyl phosphate) $CH_3OP(O)(OC_6H_5)_2$.

Properties: Clear, oily liquid; sp. gr. 1.225–1.235 (25°C); refractive index (n 20/D) 1.5370; pour point -85°F . Nonflammable.

Containers: Drums; tank cars and trucks.

Use: Ignition control compound.

methyldipropylmethane. See 4-methylheptane.

2-methyl-1,2-di-3-pyridyl-1-propanone. See metyrapone.

methyl docosanoate. See methyl behenate.

methyl dodecanoate. See methyl laurate.

methyl eicosanoate. See methyl arachidate.

methyl elaidate $\text{CH}_3(\text{CH}_2)_7\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOCH}_3$. The methyl ester of elaidic acid (trans-octadec-9-enoic acid).

Properties: Colorless liquid, insoluble in water, soluble in most organic solvents. Sp. gr. 0.8702 (25°C); m.p. < 15°C; b.p. 213.5°C (15 mm); refractive index 1.4462 (25°C). Combustible. Low toxicity.

Derivation: Prepared from oleic acid by elaidinization and esterification.

Use: Pure grade (99+%) used in biochemical research.

methylene. See carbene.

N,N'-methylenebisacrylamide $\text{CH}_2(\text{NHCOCH}:\text{CH}_2)_2$.

Properties: Colorless, crystalline powder; m.p. 185°C;

Hazard: Moderately toxic by ingestion.

Uses: Organic intermediate, cross-linking agent.

4,4'-methylenebis(2-chloroaniline) (3,3'-dichloro-4,4'-diaminodiphenylmethane; para, para'-methylene-bis-(ortho-chloroaniline) $\text{CH}_2(\text{C}_6\text{H}_4\text{ClNH}_2)_2$).

Properties: Tan-colored pellets; sp. gr. 1.44; melting range 99–107°C; soluble in hot methyl ethyl ketone, acetone, esters and aromatic hydrocarbons.

Hazard: Highly toxic. Causes cancer in animals. Tolerance, 0.02 ppm in air. Absorbed by skin.

Use: Curing agent for polyurethanes and epoxy resins.

para,para'-methylenebis(ortho-chloroaniline). See 4,4'-methylenebis(2-chloroaniline).

2,2'-methylenebis(4-chlorophenol). See dichlorophene.

4,4'-methylenebis(2,6-di-tert-butylphenol)

$[(\text{C}_6\text{H}_3)_2\text{C}_6\text{H}_2(\text{OH})_2\text{CH}_2$. A sterically hindered bisphenol.

Properties: Light yellow powder; m.p. 155°C; b.p. 217°C (1 mm); sp. gr. 0.99 (20°C). Insoluble in water and 1.0 N sodium hydroxide. Combustible.

Uses: Oxidation inhibitor and antiwear agent for motor oils, aviation piston engine oils, industrial oils; antioxidant for rubbers, resins, adhesives.

3,3'-methylenebis(4-hydroxycoumarin). See bishydroxycoumarin.

methylenebis(phenylene isocyanate). See diphenylmethane diisocyanate.

2,2'-methylenebis(3,4,6-trichlorophenol). See hexachlorophene.

methylene blue (methylthionine chloride) $\text{C}_{16}\text{H}_{18}\text{N}_3\text{SCl} \cdot 3\text{H}_2\text{O}$ (medicinal); $(\text{C}_{16}\text{H}_{18}\text{N}_3\text{SCl})_2 \cdot \text{ZnCl}_2 \cdot \text{H}_2\text{O}$ (dye).

Properties: Dark green crystals or powder with bronze-like luster; odorless or slight odor; stable in air. Soluble in water, alcohol, chloroform. Water solutions are deep blue.

Derivation: By oxidation of para-aminodimethylaniline with ferric chloride in the presence of hydrogen sulfide. The dye is the zinc chloride double salt of the chloride; the medicinal product is the hydrochloride of the base.

Grades: U.S.P.; technical.

Containers: Bottles; drums.

Hazard: Moderately toxic by ingestion.

Uses: Dyeing cotton and wool; biological and bacteriological stains; reagent in oxidation-reduction titrations in volumetric analysis; indicator.

methylene bromide (dibromomethane) CH_2Br_2 .

Properties: Clear, colorless liquid; sp. gr. 2.47; solidifies –52°C; b.p. 97°C; slightly soluble in water;

miscible with alcohol, ether, chloroform and acetone.

Low toxicity. Nonflammable.

Containers: 5-gal carboys.

Uses: Organic synthesis; solvent.

methylene chloride (methylene dichloride; dichloromethane) CH_2Cl_2 .

Properties: Colorless, volatile liquid; penetrating ether-like odor. Soluble in alcohol and ether; slightly soluble in water. Sp. gr. 1.335 (15/4°C); f.p. –97°C; b.p. 40.1°C; 11.07 lb/gal (20°C); refractive index (n_D 20) 1.4244; viscosity (20°C) 0.430 cp. Nonflammable and nonexplosive in air. Autoignition temp. 1224°F.

Derivation: Chlorination of methyl chloride and subsequent distillation.

Containers: Glass bottles; 55-gal drums; tank trucks; tank cars.

Hazard: Moderately toxic by inhalation, ingestion and skin absorption. Irritant to eyes. Tolerance, 250 ppm in air.

Uses: Paint removers; propellant for aerosol sprays; solvent degreasing; plastics processing; blowing agent in foams; solvent extraction.

methylene chlorobromide. See bromochloromethane.

4,4'-methylenedianiline. See para,para'-diaminodiphenylmethane.

methylene dichloride. See methylene chloride.

3,4-methylenedioxybenzaldehyde. See piperonal.

1,2-(methylenedioxy-4-[2-(octylsulfinyl)propyl]benzene. See sulfoxide.

3,4-methylenedioxypropylbenzene (dihydrosafrole)

$\text{C}_3\text{H}_7\text{C}_6\text{H}_3\text{O}_2\text{CH}_2$.

Properties: Colorless liquid. Sp. gr. 1.065 (25/25°C); somewhat soluble in alcohol. Combustible.

Uses: Essential oil compositions.

methylene-di-para-phenylene isocyanate. See diphenylmethane-4,4'-diisocyanate.

5,5'-methylenedisalicylic acid $\text{CH}_2[\text{C}_6\text{H}_3(\text{OH})\text{COOH}]_2$.

Properties: Nonhygroscopic, light tan, coarse powder, stable in air (darkens in light); tends to decarboxylate at very high temperatures. Combustible; low toxicity.

Uses: Alkyd resins and modified phenolic compositions for paints and varnishes; intermediate for dyestuffs and printing ink.

methylene glutaronitrile (acrylonitrile dimer; 2,4-dicyanobutene-1) $\text{NCC}_2\text{H}_4\text{C}(\text{CH}_3)\text{CN}$.

Properties: Colorless liquid; b.p. 103°C (5 mm); f.p. –9.6°C; refractive index (n_D 25) 1.4505; sp. gr. 0.9756 (25/4°C). Slightly soluble in water; insoluble in aliphatic and alicyclic hydrocarbons; soluble in aromatic hydrocarbons and polar organic solvents.

Derivation: From acrylonitrile by catalytic dimerization.

Hazard: Probably toxic.

Uses: Vinyl monomer for polymerization and copolymerization; intermediate in making fibers and pharmaceuticals.

methylene iodide (diiodomethane) CH_2I_2 .

Properties: Yellow liquid. Soluble in alcohol and ether; insoluble in water. Sp. gr. 3.33; m.p. 6°C; b.p. 180°C (decomp.).

Containers: Steel drums; glass bottles.

Hazard: May be irritant and narcotic in high concentrations.

Uses: Separating mixtures of minerals; organic synthesis.

5-methylene-2-norbornene. A copolymer in EPDM elastomers.

methylene succinic acid. See itaconic acid.

methylene-para-toluidine. See formaldehyde-para-toluidine.

methyl ester. Any of a group of fatty esters derived from coconut and other vegetable oils, tallow, etc.; alkyl groups range from C_8 to C_{18} , in varying percentages. Used as lubricants for metal-cutting fluids, high-temperature grinding, cold-rolling of steel.

N-methylethanolamine $CH_3NHC_2H_4OH$.

Properties: Liquid; sp. gr. 0.9414; b.p. $159.5^\circ C$; vapor pressure 0.7 mm ($20^\circ C$); f.p. $-4.5^\circ C$; flash point $165^\circ F$; soluble in water. Combustible; low toxicity.

Containers: Cans; drums.

Uses: Textile chemicals; pharmaceuticals.

methyl ether. See dimethyl ether.

4-methyl-7-ethoxycoumarin

$C_2H_5OC_6H_4C(CH_3):CHC(O)O$.

Properties: White solid with a walnut odor; m.p. $113-114^\circ C$. Slightly soluble in alcohol.

Uses: Perfumery; flavoring.

2-(1-methylethoxy)phenol methylcarbamate

$(CH_3)_2CHOC_6H_4OOCNHC_2H_5$.

Properties: White, odorless crystalline powder; m.p. $91^\circ C$; soluble in most polar solvents; very slightly soluble in water. Unstable in highly alkaline media; stable under normal conditions.

Hazard: Toxic by ingestion and inhalation. Tolerance, 0.5 mg per cubic meter of air.

Use: Insecticide.

methylethylcarbinol. See sec-butyl alcohol.

methylethylcellulose. The methyl ether of ethylcellulose in which both methyl and ethyl groups are attached to anhydroglucose units by ether linkages.

Properties: White to pale cream-colored fibrous solid or powder. Practically odorless; disperses in cold water to form aqueous solutions which undergo a reversible transformation from sol to gel upon heating and cooling, respectively. Combustible; nontoxic.

Grades: Technical; F.C.C.

Uses: Emulsifier; stabilizer; foaming agent.

See also cellulose, modified.

methyl ethyl diketone. See acetyl propionyl.

2-methyl-2-ethyl-1,3-dioxolane

$(CH_3)(C_2H_5)COCH_2CH_2O$.

Properties: Colorless liquid. Sp. gr. 0.9392; b.p. $117.6^\circ C$; f.p. $-81.96^\circ C$; flash point $74^\circ F$ (O.C.); solubility in water 2.2% by weight.

Hazard: Flammable, dangerous fire risk.

Use: Solvent.

Shipping regulations: Flammable liquid, n.o.s. (Rail) Red label. (Air) Flammable Liquid label.

sym-methylethylethylene. See 2-pentene.

methylethylglyoxal. See acetyl propionyl.

methylethylhydantoin formaldehyde resin. A reaction product of 5,5-methylethylhydantoin,

$NHCONHCOC(CH_3)_2C_6H_4$, and formaldehyde. Clear,

pale solid resin; softening point (B & R) $85^\circ C$; sp.

gr. 1.30; pH (10% aqueous solution) 6.5-7.5. See "Dantoin" 7.

methyl ethyl ketone (ethyl methyl ketone; 2-butanone; MEK) $CH_3COC_2H_5$.

Properties: Colorless liquid; acetone-like odor; b.p. $79.6^\circ C$; sp. gr. 0.8255 ($0/4^\circ C$), 0.80° ($20/4^\circ C$), and 0.7997 ($25/4^\circ C$); refractive index 1.379 ($20^\circ C$); sp. heat 0.549 cal/g; f.p. $-86.4^\circ C$; viscosity 0.40 cp ($25^\circ C$); solubility in water 22.6 wt %; solubility of water 9.9 wt %; flash point (TOC) $24^\circ F$; 6.71 lb/gal ($20^\circ C$). Autoignition temp. $960^\circ F$. Soluble in benzene, alcohol, and ether; miscible with oils.

Derivation: (a) From mixed n-butylenes and sulfuric acid to cause hydrolysis, followed by distillation to separate sec-butyl alcohol, which is dehydrogenated; (b) by controlled oxidation of butane.

Grade: Technical.

Containers: Drums; tank cars.

Uses: Solvent in nitrocellulose coatings and vinyl films; "Glyptal" resins; paint removers; cements and adhesives; organic synthesis; manufacture of smokeless powder; cleaning fluids; printing; catalyst carrier; lube oil dewaxing; acrylic coatings. Note: Does not dissolve cellulose acetate and most waxes.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 2 to 10%. Tolerance, 200 ppm in air. Narcotic by inhalation. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Legal label name, ethyl methyl ketone.

methyl ethyl ketone peroxide (ethyl methyl ketone peroxide) $C_5H_{10}O_4$.

Properties: Colorless liquid; strong oxidizing agent.

Hazard: Strong irritant to skin and tissue. Fire risk in contact with organic materials. Tolerance, 1 mg per cubic meter of air.

Uses: Manufacture of acrylic resins; hardening agent for fiber glass reinforced plastics.

Shipping regulations: (Rail) Peroxides, organic, liquid, Yellow label. (Air) (with not more than 60% by weight of peroxide in dimethyl phthalate). Organic Peroxide label; (with more than 60% by weight of peroxide), Not acceptable.

2-methyl-5-ethylpyridine (MEP; aldehydine; aldehyde collidine; 5-ethyl-2-picoline) $CH_3C_5H_5NC_2H_5$.

Properties: Colorless liquid; sharp penetrating odor; sp. gr. 0.921 ($20/20^\circ$); b.p. $178.3^\circ C$; f.p. $-70.3^\circ C$; flash point $165^\circ F$ (COC); refractive index (n $20/D$) 1.4970; slightly soluble in water. Combustible.

Derivation: Paraldehyde is treated with ammonia under high pressure and in the presence of ammonium acetate as a catalyst. Picolines and other substituted pyridines are byproducts.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Strong irritant to tissue.

Uses: Nicotinic acid and nicotinamide; vinyl pyridines for copolymers; intermediates for germicides and textile finishes; corrosion inhibitor for chlorinated solvents.

Shipping regulations: (Air) Corrosive label.

methyl eugenol. Generic name for 4-allyl-1,2-dimethoxybenzene (4-allyl veratrole; 1,2-dimethoxy-4-allylbenzene; eugenyl methyl ether) $(CH_3O)_2C_6H_3CH_2CH:CH_2$.

Properties: Colorless to pale yellow liquid; b.p. $91-95^\circ C$ (0.3 mm); sp. gr. 1.032-1.036 ($25^\circ C$). Insoluble

in water; soluble in most organic solvents. Combustible; low toxicity.

Grade: Technical; F.C.C.

Containers: 25-lb cans.

Uses: Insect attractant; flavoring.

methyl fluoride. Legal label name (Air) for fluoromethane (q.v.).

N-methylformanilide $C_6H_5H(CH_3)CHO$.

Properties: Colorless to light yellow liquid; refractive index 1.5570–1.5600 (n 25/D); distillation range 127–131°C (16 mm).

Grade: 95% min.

Containers: 30-, 55-gal steel drums.

Hazard: May be toxic.

Use: Organic synthesis.

methyl formate $HCOOCH_3$.

Properties: Colorless liquid; agreeable odor. Saponified by water or alkaline solutions. Soluble in water, alcohol and ether. Sp. gr. 0.950–0.980 (20/20°C); f.p. –99.8°C; b.p. 31.8°C; flash point –2°F; wt/gal 8.03 lbs (68°F); refractive index 1.3431 (20°C); auto-ignition temp. 853°F.

Derivation: By heating methyl alcohol with sodium formate and hydrochloric acid, with subsequent distillation.

Grades: Technical; refined; F.C.C.

Containers: Drums; tank cars.

Hazard: Flammable, dangerous fire and explosion risk. Explosive limits in air 5.9 to 20%. Tolerance 100 ppm in air. Moderately toxic and irritant.

Uses: Organic synthesis; cellulose acetate solvent; military poison gases; fumigant; larvicides.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

methyl fuel. A proposed auxiliary fuel for automotive equipment, electric power production, fuel cells, etc. A mixture of methyl alcohol and alcohols of up to four carbon atoms, it is made by catalytic treatment of synthesis gas derived from coal. It is stated to have a research octane number of 130 and can be blended with gasoline up to 20% by volume. Its combustion products contain less polluting components than No. 5 fuel oil. See also methyl alcohol.

2-methylfuran $C_4H_3OCH_3$.

Properties: Colorless liquid; ether-like odor; f.p. –88.68°C; b.p. 63.2–65.6°C; sp. gr. 0.913 (20/4°C); refractive index: 1.4320 (20/D); flash point –22°F. Insoluble in water, 0.3 g/100 g water. Infinitely miscible with most organic solvents. Forms a binary azeotrope with methanol, a ternary azeotrope with methanol-water.

Containers: 1-, 5-, 55-gal containers; shipped with 0.01% hydroquinone as oxidation inhibitor.

Hazard: Highly flammable, dangerous fire and explosion risk. Moderately toxic and irritant.

Use: Chemical intermediate.

Shipping regulations: (Rail) Flammable liquids, n.o.s., Red label. (Air) Flammable Liquid label.

N-methylfurfurylamine $C_5H_7OCH_2NHCH_3$. Colorless to light yellow; refractive index 1.4700–1.4720 (25°C); distilling range 144–153°C. Combustible.

Use: Intermediate.

methyl 2-furoate (methyl pyromucate) $C_5H_7OCO_2CH_3$.

Properties: Colorless liquid turning yellow in light. Pleasant odor. Insoluble in water; soluble in alcohol and ether. Sp. gr. 1.1739 (15 15°C); b.p. 181.3°C (corr); refractive index 1.4860 (20°C D). Combustible.

Derivation: By esterification of furoic acid.

Uses: Solvent; organic synthesis.

methyl gallate. (methyl 3,4,5-trihydroxybenzoate). $C_6H_2CO_2CH_3(CH_3)_3$. White crystalline powder. Used as industrial antioxidant. Shipped in polyethylene-lined fiber drums.

N-methylglucamine $CH_2OH(CHOH)_4CH_2NHCH_3$.

Properties: White crystals; m.p. 128°C. Soluble in water; slightly soluble in alcohol.

Preparation: From glucose and methylamine.

Uses: Detergents, pharmaceuticals, dyes.

methyl-alpha-D-glucopyranoside. See methyl glucoside.

N-methyl-L-glucosamine (2-methylaminoglucose). A hexosamine found in streptomycin.

Properties (of hydrochloride): Crystals with m.p. 160–163°C. Freely soluble in water. Exhibits mutarotation in solution.

Derivation: Hydrolysis of streptomycin.

Use: Medicine.

methyl glucoside (methyl alpha-d-glycopyranoside) $CH_2OHCH(CHOH)_4CHOOCH_3$.

Properties: Odorless, white crystals. M.p. 168°C; b.p. 200°C (0.2 mm); specific optical rotation (aqueous solution) +158.9° (20°C); sp. gr. (30/4°C) 1.46. Soluble in water and 80% alcohol; slightly soluble in methanol; insoluble in ether. Combustible, low toxicity.

Derivation: (a) By treating dextrose with methanol in the presence of hydrochloric acid or cation exchange resin; (b) enzymatic synthesis from yeast.

Grade: Technical.

Containers: 100-lb multiwall paper bags.

Uses: Plasticizer for phenolic, amine, and alkyd resins; nonionic surfactants.

methyl glycoll. See sarcosine.

methyl glycol. See propylene glycol.

methylglyoxalidine. See lysidine.

methyl group. The simplest alkyl group, CH_3 , formed by dropping a hydrogen atom from methane (CH_4). It occurs at both ends of paraffinic molecules having two or more carbon atoms in the chain, as well as in many other organic compounds. See also alkyl.

4-methylguaicol. See creosol.

N-methyl-N-glynylglycine. See creatine.

methyl heneicosanoate $CH_3(CH_2)_{19}COOCH_3$. The methyl ester of heneicosanoic acid.

Properties: White waxlike solid. Insoluble in water, soluble in alcohol and ether. M.p. 48–9°C; b.p. 207°C (3.75 mm). Combustible.

Grades: Purified 96%, 99.5%.

Uses: Intermediate in organic synthesis; medical research.

methyl heptadecanoate (methyl margarate)

$CH_3(CH_2)_{13}COOCH_3$. The methyl ester of heptadecanoic acid (margaric acid).

Properties: White waxlike solid. Insoluble in water, soluble in alcohol and ether. M.p. 29°C; b.p. 184–7°C; 130°C (1 mm). Combustible.

Grades: Purified 96%, 99.5%.

Uses: Intermediate in organic synthesis; medical research.

2-methylheptane $(\text{CH}_3)_2\text{CH}(\text{CH}_2)_4\text{CH}_3$. See isooctane.

3-methylheptane $\text{C}_2\text{H}_5\text{CH}(\text{CH}_3)(\text{CH}_2)_3\text{CH}_3$.

Properties: Colorless liquid; f.p. -120.5°C ; b.p. 118.9°C ; sp. gr. 0.70582 ($20/4^\circ\text{C}$); refractive index 1.39849 (n_{D}^{20}).

Grades: 99%, 95%.

Hazard: Flammable, dangerous fire risk.

Uses: Calibration; organic synthesis.

Shipping regulations: (Rail, Air) Flammable liquids, n.o.s., Flammable Liquid label.

1-methylheptane (methylidipropylmethane) C_8H_{18} or $\text{CH}_3(\text{CH}_2)_2\text{CHCH}_2(\text{CH}_2)_2\text{CH}_3$.

Properties: Colorless liquid. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.7161; b.p. 122.2°C . Grades: Technical.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis.

Shipping regulations: (Rail, Air) Flammable liquids, n.o.s., Flammable Liquid label.

3-methyl-1,4,6-heptatriene. See butadiene dimers.

methylheptenone (6-methyl-5-heptene-2-one)

$(\text{CH}_3)_2\text{C}=\text{CH}(\text{CH}_2)_2\text{COCH}_3$. Constituent of lemon-grass oil and many other essential oils.

Properties: Colorless liquid; insoluble in water but miscible with alcohol or ether. Sp. gr. 0.860 (20°C); f.p. -67.1°C ; b.p. $173-174^\circ\text{C}$. Combustible; low toxicity.

Derivation: From oil of lemon grass or by controlled oxidation of corresponding secondary alcohol.

Containers: 25-lb cans.

Uses: Organic synthesis; inexpensive perfumes; flavoring.

methyl heptene carbonate (methyl 2-octynoate)

$\text{CH}_3(\text{CH}_2)_4\text{C}\equiv\text{CCOOCH}_3$.

Properties: Colorless liquid; strong violet-type odor. Sp. gr. 0.919-0.923; refractive index 1.446-1.450 (20°C). Soluble in most fixed oils and mineral oil. Soluble in 5 parts of 70% alcohol. Combustible; low toxicity.

Derivation: From heptaldehyde.

Grades: Technical; F.C.C.

Containers: Bottles; cans.

Uses: Perfumery; flavoring.

2-(1-methylheptyl)-4,6-dinitrophenyl crotonate. See dinocap.

methyl hexacosanoate. See methyl cerotate.

methyl hexadecanoate. See methyl palmitate.

methylhexamine. See 4-methyl-2-hexylamine.

2-methylhexane (ethylisobutylmethane; isoheptane)

$(\text{CH}_3)_2\text{CH}(\text{CH}_2)_2\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid. Soluble in alcohol; insoluble in water. Sp. gr. 0.6789; b.p. 90.0°C ; f.p. -118.5°C ; refractive index 1.38498 (20°C). Flash point below 0°F . Grade: Technical.

Containers: Glass bottles; tins; drums.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 1 to 6%.

Use: Organic synthesis.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

3-methylhexane $\text{H}_3\text{CCH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid; b.p. 92°C ; sp. gr. 0.692 ($60/60^\circ\text{F}$); refractive index 1.388 (n_{D}^{20}); flash point 25°F .

Grades: Technical 95%.

Containers: Bottles and 5-gal drums.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 1 to 6%.

Uses: Organic synthesis; oil extender solvent.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

methylhexaneamine. See 4-methyl-2-hexylamine.

methyl hexanoate. See methyl caproate.

5-methyl-2-hexanone. See methyl isoamyl ketone.

1-methyl-2-hexylamine. See 2-aminoheptane.

methyl hexyl ketone (2-octanone) $\text{CH}_3\text{COC}_6\text{H}_{13}$.

Properties: Colorless liquid with pleasant odor; camphor taste; sp. gr. 0.82 ($20/4^\circ\text{C}$) m.p. 20.9°C ; b.p. 173.5°C ; distillation range $166-173^\circ\text{C}$; flash point 160°F ; refractive index 1.416 (20°C); insoluble in water; soluble in alcohol, hydrocarbons, ether, esters, etc. Combustible; low toxicity.

Preparation: By distilling sodium ricinoleate with caustic soda.

Containers: Glass bottles; tins; drums.

Uses: Perfumes; high-boiling solvent, especially for epoxy resin coatings; leather finishes; flavoring; odorant; antiblushing agent for nitrocellulose lacquers.

methylhydrazine (monomethylhydrazine; MMH)

CH_3NHNH_2 .

Properties: Colorless hygroscopic liquid; ammonia-like odor; sp. gr. 0.874 (25°); f.p. -52.4°C ; b.p. 87.5°C . Soluble in water; soluble in alcohol and ether. Flash point below 80°F .

Hazard: Vapors explode at high temperatures. Flammable, dangerous fire risk.

Uses: Missile propellant; intermediate; solvent.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

methyl hydrogen sulfate. See methylsulfuric acid.

methyl para-hydroxybenzoate. See methyl paraben.

methylhydroxybutanone (3-methyl-3-hydroxy-2-butanone) $(\text{CH}_3)_2\text{COHCOCH}_3$.

Properties: Clear, colorless liquid with sweet, camphor-like odor; b.p. 140.3°C ; freezing point -86.5°C ; sp. gr. ($20/20^\circ\text{C}$) 0.9553; refractive index (n_{D}^{20}) 1.4153; miscible with water, acetone, benzene, mineral spirits. Combustible; low toxicity.

Uses: Specialty solvent; chemical intermediate; flavor formulations.

methyl 3-hydroxy-alpha-crotonate dimethyl phosphate. See mevinphos.

methylhydroxyisopropylcyclohexane. See menthol.

methyl 12-hydroxystearate $\text{C}_{17}\text{H}_{34}\text{OHCOOCH}_3$.

Properties: White, waxy solid in the form of short flat rods; m.p. 48°C ; acid value 4; saponification value 177; iodine value 5; insoluble in water, limited solubility in organic solvents. Combustible; low toxicity.

Uses: Adhesives; inks; cosmetics; greases.

2-methylimidazole (2MZ) $\text{CHCHNC}(\text{CH}_3)\text{NH}$. Solid; m.p. $142-143^\circ\text{C}$.

Uses: Dyeing auxiliary for acrylic fibers; plastic foams.

3-methylindole. See skatole.

methyl iodide (iodomethane) CH_3I .

Properties: Colorless liquid; turns brown on exposure to light; sp. gr. 2.24-2.27 ($25/25^\circ\text{C}$); f.p. -66.1°C ; b.p. 42°C ; refractive index 1.526-1.527 (25°C). Sol-

uble in alcohol and ether; slightly soluble in water. Nonflammable.

Derivation: Interaction of methyl alcohol, sodium iodide and sulfuric acid, with subsequent distillation.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Narcotic; irritant to skin. Tolerance, 5 ppm in air.

Uses: Medicine; organic synthesis; microscopy; testing for pyridine.

methylionone (irone) $C_{14}H_{22}O$.

Properties: Colorless to amber-yellow liquid; floral odor.

Grades: Several isomers are available, as alpha, beta, delta, gamma, and mixtures. The constants are approximately: Sp. gr. 0.926–0.939; refractive index 1.501–1.504; b.p. 144°C (16 mm); soluble in alcohol; insoluble in water. Nontoxic.

Derivation: Oil of orris.

Containers: Cans; drums.

Uses: Perfumery; flavoring.

See also alpha-isomethylionone.

methyl isoamyl ketone (5-methyl-2-hexanone; MIAK) $CH_3COC_2H_4CH(CH_3)_2$.

Properties: Colorless, stable liquid; pleasant odor. Sp. gr. 0.8132 (20/20°C); refractive index 1.4062 (n 20/D); b.p. 144°C; f.p. –73.9°C; wt/gal 6.77 lb; flash pt. 110°F (open cup). Slightly soluble in water; miscible with most organic solvents. Combustible.

Grade: 97.5%.

Containers: Drums; tank cars.

Hazard: Moderate fire risk. Tolerance, 100 ppm in air.

Uses: Solvent for nitrocellulose, cellulose acetate butyrate, acrylics, and vinyl copolymers.

methyl isobutenyl ketone. See mesityl oxide.

methylisobutyl carbinol. (MIBC) See methylamyl alcohol.

methylisobutyl carbinol acetate. See methylamyl acetate.

methyl isobutyl ketone (hexone; 4-methyl-2-pentanone; MIKB) $(CH_3)_2CHCH_2COCH_3$.

Properties: Colorless, stable liquid. Pleasant odor. Slightly soluble in water; miscible with most organic solvents. Sp. gr. 0.8042 (20/20°C); b.p. 115.8°C; f.p. –80.4°C; wt/gal 6.68 lbs (20°C); vapor pressure 15.7 mm (20°C); refractive index 1.3959 (20°C). Flash point 73°F. Autoignition temp. 860°F.

Derivation: Mild hydrogenation of mesityl oxide.

Grades: Technical, 98.5%.

Containers: Cans; drums; tank cars.

Hazard: Avoid ingestion and inhalation. Flammable, dangerous fire risk. Explosive limits in air 1.4 to 7.5%. Tolerance, 100 ppm in air.

Uses: Solvent for paints, varnishes, nitrocellulose lacquers; manufacture of methyl amyl alcohol; extraction processes, including extraction of uranium from fission products; organic synthesis; denaturant for alcohol.

Shipping regulations: (Air) Flammable Liquid label.

Note: Use restricted in some states due to possible toxicity.

methyl isocyanate CH_3NCO . Colorless liquid; sp. gr. 0.9599 (20/20°C); b.p. 39.1°C; reacts with water; flash point less than 20°F.

Hazard: Flammable, dangerous fire risk. Highly toxic. Tolerance, 0.02 ppm in air.

Use: Intermediate.

Shipping regulations: (Air) Poison label. Not acceptable on passenger planes.

methylisoeugenol (propenyl guaiacol)

$CH_3CH:CHC_6H_3(OCH_3)_2$.

Properties: Colorless to light-yellowish liquid, with spicy odor. Sp. gr. 1.050–1.053; b.p. 262–264°C; refractive index 1.566–1.569. Soluble in 2 parts of 70% alcohol; almost insoluble in mineral oil; insoluble in glycerol. Combustible; low toxicity.

Grades: Technical; F.C.C.

Containers: Glass bottles; drums.

Uses: Perfumery, flavoring agent.

methyl isonicotinate $C_5NH_4COOCH_3$.

Properties: Clear amber to red liquid; mild odor; sp. gr. 1.15 (20/20°C).

Hazard: May be toxic.

Use: Intermediate for synthesis of isonicotinic acid hydrazide.

1-methyl-4-isopropenylcyclohexan-3-ol. See isopulegol.

methyl isopropenyl ketone $CH_3COC(CH_3):CH_2$.

Properties: Colorless liquid; sp. gr. 0.854 (20°C); pleasant odor and sweet taste; polymerizes readily.

Hazard: Flammable, dangerous fire risk.

Use: Plastics.

Shipping regulations: (inhibited) (Rail) Red label. (Air) Flammable Liquid label. (uninhibited). (Air) Not acceptable.

methyl isopropyl ketone (3-methyl-2-butanone)

$CH_3COCH(CH_3)_2$.

Properties: Colorless liquid; b.p. 93°C; f.p. –92°C; refractive index (n 16/D) 1.38788; sp. gr. 0.815 (15/4°C); very slightly soluble in water; soluble in alcohol, ether.

Derivation: Synthetic; also by fermentation.

Hazard: May be flammable.

Use: Solvent for nitrocellulose lacquers. See also ketones.

2-methyl-5-isopropylphenol. See carvacrol.

5-methyl-2-isopropylphenol. See thymol.

methyl-para-isopropylphenyl propyl aldehyde. See cyclamen aldehyde.

methyl lactate $CH_3CHOHCOOCH_3$.

Properties: Colorless liquid. Miscible with most organic liquid, water. B.p. 144.8°C; f.p. (approx) –66°C; refractive index 1.4156 (20°C); flash point 125°F (closed cup); autoignition temp. 725°F; wt. gal 9 lb (68°F). Combustible.

Grade: Technical.

Containers: Cans; steel drums.

Hazard: Moderate fire risk.

Uses: Solvent for cellulose acetate, nitrocellulose, cellulose acetobutyrate, cellulose acetopropionate; lacquers; stains.

methylactonitrile. See acetone cyanohydrin.

methyl laurate (methyl dodecanoate)

$CH_3(CH_2)_{10}COOCH_3$. The methyl ester of lauric acid.

Properties: Water-white liquid; sp. gr. 0.8702 (20 4°C); m.p. 4.8°C; b.p. 262°C (766 mm), 160°C (30 mm); refractive index 1.4301 (25°C). Insoluble in water; non-corrosive. Combustible; low toxicity.

Derivation: From coconut oil.

Method of purification: Vacuum fractional distillation.

Grades: 69, 74, 90, 96, 99.8%.

Containers: Cans; drums; tank cars.

Uses: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, textiles; flavoring.

methyl lauroleate $\text{CH}_3\text{CH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOCH}_3$. The methyl ester of lauroleic acid.

Properties: Colorless liquid; insoluble in water; soluble in common organic solvents. Combustible; low toxicity.

Grades: Purified product, 99.5%.

Uses: In medical research, organic synthesis and as a reference standard for gas chromatography.

methyl lignocerate (methyl tetracosanoate)

$\text{CH}_3(\text{CH}_2)_{22}\text{COOCH}_3$. The methyl ester of lignoceric acid.

Properties: Waxlike solid. Insoluble in water, soluble in alcohol and ether; m.p. 57.8°C ; b.p. 232°C (3.75 mm); refractive index 1.4283 (80°C). Combustible; low toxicity.

Derivation: Esterification of lignoceric acid with methanol followed by vacuum distillation.

Grades: Purified (99.8%+).

Uses: Intermediate in special synthesis; medical research; reference standard in gas chromatography.

methyl linoleate

$\text{CH}_3(\text{CH}_2)_4\text{CH}:\text{CHCH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOCH}_3$. The methyl ester of linoleic acid (cis, cis-octadec-9,12-dienoic acid).

Properties: Colorless oil, insoluble in water; soluble in alcohol and ether. Sp. gr. 0.8886 ($18/4^\circ\text{C}$); f.p. -35°C ; b.p. 212°C (16 mm); refractive index 1.4593 (25°C). Combustible. Low toxicity.

Derivation: Urea fractionation and vacuum distillation of methyl esters of safflower oil.

Grades: Technical; purified (99+ %).

Uses: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, textiles; reference standard in gas chromatography; biochemical research.

methyl linolenate

$\text{CH}_3\text{CH}_2\text{CH}:\text{CHCH}_2\text{CH}:\text{CHCH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOCH}_3$. The methyl ester of linolenic acid (cis, cis, cis-octadec-9,12,15-trienoic acid).

Properties: Colorless liquid; insoluble in water; soluble in alcohol and ether. Sp. gr. 0.892 ($20/4^\circ\text{C}$); m.p. less than 15°C ; b.p. 207°C (14 mm); refractive index 1.4709 (n 20/D). Combustible. Low toxicity.

Derivation: Esterification and vacuum fractional distillation.

Uses: Organic synthesis; biochemical research.

methyl lithium CH_3Li . Commercially available as a 5% solution in ether. Used in Grignard-type reactions.

Hazard: Flammable, dangerous fire and explosion risk.

Shipping regulations: Not listed. Consult authorities.

methylmagnesium bromide CH_3MgBr . Available in solution in ether.

Derivation: Reaction of magnesium and methylbromide.

Containers: Glass bottles; 5- and 55-gal drums.

Hazard: Flammable, dangerous fire and explosion risk.

Uses: Alkylating agent in organic synthesis; Grignard reagent.

Shipping regulations: (Rail) (conc. not over 40%) Red label. (Air) (all conc.) Not acceptable.

methylmagnesium chloride CH_3MgCl . Available as a solution in tetrahydrofuran.

Containers: Up to 55-gallon drums.

Hazard: Flammable, dangerous fire and explosion risk. Uses: Alkylating agent in organic synthesis; Grignard reagent.

Shipping regulations: Not listed, but see methylmagnesium bromide.

methylmagnesium iodide CH_3MgI . Available as solution in ether.

Derivation: Reaction of magnesium and methyl iodide.

Containers: Glass bottles; 5- and 55-gal drums.

Hazard: Flammable, dangerous fire and explosion risk.

Uses: Alkylating agent in organic synthesis; Grignard reagent.

Shipping regulations: Not listed, but see methylmagnesium bromide.

methylmaleic acid. See citraconic acid.

methylmaleic anhydride. See citraconic anhydride.

methyl margarate. See methyl heptadecanoate.

methyl mercaptan. Legal label name for methanethiol (q.v.).

methylmercury acetate $\text{CH}_3\text{HgOOCCH}_3$.

Hazard: Highly toxic by ingestion; absorbed by skin.

Tolerance, 0.01 mg per cubic meter of air.

Use: Seed disinfectant.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

methylmercury cyanide (methylmercury nitrile)

CH_3HgCN .

Properties: Crystals; m.p. 95°C . Soluble in water and organic solvents.

Hazard: Highly toxic by ingestion; absorbed by skin. Tolerance, 0.01 mg per cubic meter of air.

Uses: Fungicide; seed disinfectant.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

methylmercury dicyandiamide. See cyano (methylmercuri) guanidine.

methylmercury 2,3-dihydroxypropylmercaptide

$\text{CH}_3\text{HgSCH}_2\text{CHOHCH}_2\text{OH}$.

Hazard: Highly toxic by ingestion; absorbed by skin.

Tolerance, 0.01 mg per cubic meter of air.

Uses: Seed disinfectant.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

methylmercury 8-hydroxyquinolate. See methylmercury quinolinolate.

methylmercury quinolinolate (methylmercury 8-hydroxyquinolate; methylmercury oxyquinolinolate)

$\text{C}_9\text{H}_6\text{NOHgCH}_3$.

Properties: Yellow crystals; m.p. $133\text{--}137^\circ\text{C}$.

Hazard: Highly toxic. Tolerance, 0.01 mg per cubic meter of air.

Use: Seed disinfectant.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

methyl methacrylate $\text{CH}_2:\text{C}(\text{CH}_3)\text{COOCH}_3$. Acrylic resin monomer.

Properties: Colorless, volatile liquid; b.p. 101°C ; f.p. -48.2°C ; sp. gr. ($25/25^\circ\text{C}$) 0.940; flash point (open cup) 50°F ; autoignition temp. 790°F , slightly soluble in water; soluble in most organic solvents. Readily polymerized by light, heat, ionizing radiation, and catalysts. Can be copolymerized with other methacrylate esters and many other monomers. Low toxicity.

Derivation: Acetone cyanohydrin, methanol, and dilute sulfuric acid.

Grade: Technical (inhibited).

Containers: 440-lb drums; tank cars and trucks.

Hazard: Flammable, dangerous fire risk. Explosive limits in air, 2.1 to 12.5%. Tolerance, 100 ppm in air.

Uses: Monomer for polymethacrylate resins; impregnation of concrete. See also acrylic resin.

Shipping regulations: (inhibited) (Rail) Red label; (Air) Flammable Liquid label. (uninhibited) (Air) Not acceptable.

methylmethane. See ethane.

N-methyl methyl anthranilate. See dimethyl anthranilate.

7-methyl-3-methylene-1,6-octadiene. See myrcene.

methylmorphine. See codeine.

N-methyl morpholine $\text{CH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{NCH}_3$.

Properties: Water-white liquid with ammonia odor. Forms constant-boiling mixture with 25% water and boiling at 97°C. Miscible with benzene, water. Sp. gr. 0.921 (20/20°C); b.p. 115.4°C; f.p. -66°C; flash point 75°F (TOC).

Grade: Technical.

Containers: Glass bottles; tins; drums.

Hazard: Flammable, dangerous fire risk. Moderately toxic; skin irritant.

Uses: Catalyst in polyurethane foams; extraction solvent; stabilizing agent for chlorinated hydrocarbons; self-polishing waxes; oil emulsions; corrosion inhibitors; pharmaceuticals.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

methyl myristate (methyl tetradecanoate)

$\text{CH}_3(\text{CH}_2)_{12}\text{COOCH}_3$. The methyl ester of myristic acid.

Properties: Colorless liquid; m.p. 17.8°C; b.p. 186.8°C (30 mm), 157.5°C (1 mm); refractive index 1.4351 (25°C). Insoluble in water. Combustible; low toxicity.

Derivation: (a) Esterification of myristic acid with methanol, (b) alcoholysis of coconut oil with methanol.

Method of purification: Vacuum fractional distillation.

Grades: Technical (93%); purified (99.8+ %).

Containers: 55-gal drums.

Uses: Intermediate for myristic acid detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers, textiles, animal feeds; standard for gas chromatography; flavoring.

methyl myristoleate

$\text{CH}_3(\text{CH}_2)_7\text{CH}=\text{CH}(\text{CH}_2)_7\text{COOCH}_3$. The methyl ester of myristoleic acid (cis-tetradec-9-enoic acid).

Properties: Colorless liquid; insoluble in water; soluble in alcohol and ether. B.p. 108.9°C (1 mm). Combustible; low toxicity.

Uses: Purified product used in medical research and organic synthesis.

alpha-methylnaphthalene $\text{C}_{10}\text{H}_7\text{CH}_3$.

Properties: Colorless liquid. Sp. gr. 1.025; f.p. -32°C; b.p. 240-243°C; refractive index 1.6140 (25°C); insoluble in water; soluble in alcohol and ether. Autoignition temp. 984°F. Combustible.

Derivation: From coal tar.

Hazard: Moderate fire risk. Probably toxic.

Uses: Organic synthesis.

beta-methylnaphthalene $\text{C}_{10}\text{H}_7\text{CH}_3$.

Properties: Solid; sp. gr. 0.994 (40/4°C); b.p. 241-242°C; m.p. 34°C; refractive index 1.6015 (25°C); insoluble in water; soluble in alcohol and ether.

Combustible.

Derivation: From coal tar.

Grades: Technical, 95% min.

Containers: 1-, 5-, 55-gal drums.

Uses: Organic synthesis; insecticides.

2-methylnaphthioquinone. See menadione.

methylnaphthylidodecyldimethylammonium chloride $\text{C}_{10}\text{H}_7\text{HC}_2\text{C}_{12}\text{H}_{25}(\text{CH}_3)_2\text{NCl}$. Quaternary ammonium salt.

Properties: White to slightly yellow crystalline powder with mild odor and taste. M.p. 159-160°C; density 5 lb/gal; soluble in cold water, lower alcohols, glycerin, and acetone; pH of 5% sol. 8.9.

Grade: Min. purity 97%.

Use: Germicide.

methyl naphthyl ether. See beta-naphthyl methyl ether.

methyl nitrate CH_3NO_3 .

Properties: Colorless liquid. B.p. 66°C (explodes); sp. gr. 1.217 (15°C); slightly soluble in water; soluble in alcohol and ether.

Derivation: By reaction of nitric acid and methanol in the presence of urea.

Hazard: Explodes when heated; severe hazard when exposed to heat or shock. Narcotic in high concentrations.

Use: Rocket propellant.

Shipping regulations: Not listed. Consult authorities.

methyl nitrite CH_3NO_2 . A gas; b.p. -12°C; f.p. -17°C. Sp. gr. 0.991 at 15°C.

Hazard: Severe explosion risk when shocked or heated; narcotic in high concentrations.

Uses: Synthesis of nitrile and nitroso esters.

Shipping regulations: (Rail) Not listed. (Air) Flammable Gas label. Not acceptable on passenger planes.

methylnitrobenzene. See nitrotoluene.

4-methyl-2-nitrophenol. See 2-nitro-para-cresol.

methyl-4-nitrosoperfluorobutyrate. A monomer for a nitroso ester terpolymer; prepared by reacting methyl nitrite with perfluorosuccinic and perfluoroglutaric anhydrides. The reaction is exothermic and gives high conversion to liquid nitrile esters, which yield nitroso esters of pyrolysis or photolysis.

N-methyl-N-nitroso-para-toluenesulfonamide

$\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{N}(\text{NO})\text{CH}_3$.

Properties: Fine yellow crystals; m.p. 56-59°C soluble in ether and most organic solvents; insoluble in water.

Use: Reagent for the preparation of diazomethane.

methyl nonadecanoate $\text{CH}_3(\text{CH}_2)_{17}\text{COOCH}_3$. The methyl ester of nonadecanoic acid.

Properties: White waxy solid; m.p. 39.5°C; b.p. 190.5°C (3.75 mm); insoluble in water; soluble in alcohol and ether. Combustible. Low toxicity.

Grades: Purified 96%, 99.5%.

Uses: Intermediate in organic synthesis; medical research.

2-methylnonane (isodecane) $(\text{CH}_3)_2\text{CH}(\text{CH}_2)_7\text{CH}_3$.

Properties: Colorless liquid; sp. gr. 0.728; f.p. -74.7°C; b.p. 167°C. Combustible. Low toxicity.

- methyl nonanoate (methyl pelargonate)** $\text{CH}_3(\text{CH}_2)_7\text{COOCH}_3$. The methyl ester of pelargonic acid.
Properties: Colorless liquid with fruity odor; f.p. -35°C ; b.p. 213.5°C ; sp. gr. 0.877 (18°C); refractive index 1.4302 (25°C). Insoluble in water; soluble in alcohol and ether. Combustible. Low toxicity.
Derivation: Esterification of nonanoic (pelargonic) acid with methanol followed by fractional distillation.
Grade: Purified (96+%).
Uses: Perfumes; flavors; reference standard for gas chromatography; intermediate in organic synthesis; medical research.
- methyl 2-nonenoate** $\text{CH}_3(\text{CH}_2)_7\text{CH}=\text{CHCOOCH}_3$. Colorless to slightly yellow liquid with strong violet-leaf odor; sp. gr. 0.893–0.898 ($25/25^\circ\text{C}$); refractive index 1.4400–1.4440. Stable; soluble in alcohol. Combustible. Low toxicity.
Use: Perfumes.
- methyl nonylacetaldehyde** (aldehyde C-12 MNA; methylundecanal) $\text{CH}_3(\text{CH}_2)_8\text{CH}(\text{CH}_3)\text{CHO}$.
Properties: Colorless liquid; fruity odor. Soluble in 3 volumes of 80% alcohol; in fixed oils, mineral oil. Sp. gr. 0.824–0.828; refractive index 1.432–1.435 (20°C). Combustible. Low toxicity.
Grades: Technical; F.C.C. (as methylundecanal).
Uses: Perfumery; flavoring.
- methyl nonyl ketone** (2-undecanone) $\text{CH}_3\text{COC}_9\text{H}_{19}$.
Properties: Oily liquid, strong odor. Soluble in 2 parts of 70% alcohol. Sp. gr. 0.822–0.826; b.p. 225°C ; refractive index 1.429–1.433. Flash point 192°F . Combustible. Low toxicity.
Derivation: Oil of rue; also made synthetically.
Uses: Perfumery; flavoring.
- methyl norbornene dicarboxylic anhydride**. Legal label name for memtetrahydrophthalic anhydride (q.v.).
- methyl octadecanoate**. See methyl stearate.
- methyl 2-octynoate**. See methyl heptene carbonate.
- methylolacrylamide**. Available in 60% aqueous solution.
Uses: Intermediate for copolymerization of vinyl acetate and acrylic acid; polymers for coatings, varnishes, adhesives; crease-proof and wrinkle-resistant fabrics; permanent-press textiles by irradiation bonding.
- methylol dimethylhydantoin** (dimethylhydantoin formaldehyde; DMHF) $(\text{CH}_3)_2\text{CN}(\text{CH}_2\text{OH})\text{CONHCO}$.
Properties: White, odorless crystalline solid; m.p. 110 – 117°C ; soluble in water, methanol, acetone; insoluble in hydrocarbons.
Uses: Textile and paper finishing; source of formaldehyde. See also dimethylhydantoinformaldehyde resin.
- methyl oleate** $\text{CH}_3(\text{CH}_2)_7\text{CH}=\text{CH}(\text{CH}_2)_7\text{COOCH}_3$. The methyl ester of oleic acid (cis-octadec-9-enoic acid).
Properties: Clear to amber liquid. Faint fatty odor. Soluble in alcohols and most organic solvents; insoluble in water; sp. gr. 0.8739 (20°C); f.p. -19.9°C ; b.p. 218.5°C (20 mm); refractive index 1.4521 (20°C). Combustible; low toxicity.
Derivation: Esterification of oleic acid; vacuum fractional distillation; solvent crystallization.
Grades: Technical; purified 99+%.
Uses: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, textile treatment; plasticizers for duplicating inks, rubbers, waxes, etc.; biochemical research; chromatographic reference standard.
- methylol imidazolidone** $\text{C}_3\text{H}_4\text{N}_2(\text{O})\text{CH}_2\text{OH}$.
Properties: Straw-colored to water white clear liquid; mild odor. Density 10 lb/gal (60°F).
Use: Wash and wear fabrics.
- methylol riboflavin**. A mixture of methylol derivatives of riboflavin (q.v.) exhibiting the same activity.
Properties: Orange to yellow hygroscopic powder; nearly odorless; soluble in water; nearly insoluble in alcohol, benzene, chloroform, and ether. Dextrorotatory. Dry powder is unstable and on standing loses biological activity by liberation of formaldehyde.
Derivation: Action of formaldehyde on riboflavin in weakly alkaline solutions.
Uses: Nutrition; medicine.
- methylol urea** $\text{H}_2\text{NCONHCH}_2\text{OH}$.
Properties: Colorless crystals; m.p. 11°C ; soluble in water and methanol; insoluble in ether; capable of polymerization to synthetic resin.
Derivation: Combination of urea and formaldehyde, in the presence of salts or alkaline catalysts.
Containers: Fiber cans and drums.
Uses: Urea-formaldehyde resins; molding adhesives; treating textiles and wood. See A-stage resin; urea-formaldehyde resin.
- "Methylon."**²⁴⁵ Trademark for resinous compositions made from condensation products of substituted aromatic hydrocarbons and aldehydes used in the surface coating and protective arts.
- methyl orange** (para-(para-dimethylamino phenylazo)-benzene sulfonate of sodium; Helianthine B; orange III, gold orange; tropeolin D) $(\text{CH}_3)_2\text{NC}_6\text{H}_4\text{N}=\text{NC}_6\text{H}_4\text{SO}_3\text{Na}$.
Properties: Orange-yellow powder; soluble in water, insoluble in alcohol. C.I. 13025.
Use: Acid-base indicator, red in acid, yellow-orange in alkaline, pH range 3.1–4.4
See indicator.
- methyl-orthophosphoric acid**. See methylphosphoric acid.
- methyl oxide**. See dimethyl ether.
- Methyl "Oxitol."**¹²⁵ Trademark for ethylene glycol monomethyl ether (q.v.) whose A.S.T.M. distillation range is 123.5 – 125.5°C .
- methyl palmitate** (methyl hexadecanoate) $\text{CH}_3(\text{CH}_2)_{14}\text{COOCH}_3$. The methyl ester of palmitic acid.
Properties: Colorless liquid; m.p. 29.5°C ; b.p. 211.5°C (30 mm), 180.5°C (10 mm); refractive index 1.4310 (45°C). Insoluble in water, soluble in alcohol and ether. Combustible. Low toxicity.
Derivation: Esterification of palmitic acid with methanol or alcoholysis of palm oil. Vacuum distillation.
Grades: 80%; pure (99.8%).
Uses: Intermediate for detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers; animal feeds; medical research.
- methylparaben** (methyl para-hydroxybenzoate) $\text{CH}_3\text{OOC}_6\text{H}_4\text{OH}$.
Properties: Colorless crystals, or white crystalline powder; m.p. 125 – 128°C ; odorless or faint characteristic odor; slight burning taste; almost insoluble in water; soluble in alcohol, ether; slightly soluble in benzene and in carbon tetrachloride. Low toxicity.
Grades: U.S.P.; F.C.C.
Hazard: Use in foods restricted to 0.1%.
Uses: Medicine; food additive (preservative); antimicrobial agent.

methylparafynol. See 3-methyl-1-pentyn-3-ol.

methyl parathion (O,O-dimethyl O-para-nitrophenylphosphorothioate) $(\text{CH}_3\text{O})_2\text{P}(\text{SO})\text{OC}_6\text{H}_4\text{NO}_2$. The methyl homolog of parathion (q.v.).

Properties: White crystalline solid; m.p. 35–36°C; sp. gr. 1.358 (20/4°C); refractive index 1.5515 (35°C). Slightly soluble in water; miscible in all proportions with acids and alcohols, esters and ketones. Slowly decomposed by acid solutions, rapidly in dilute alkalis. The commercial product is a tan liquid (xylene solution) with pungent odor; decomposes violently at 248°F. It is not classed as a "hard" insecticide, but is relatively biodegradable.

Forms available: Emulsifiable concentrates; wettable powders; dusts; technical (80%); liquid solution; encapsulated.

Hazard: Highly toxic by skin absorption, inhalation and ingestion. Cholinesterase inhibitor. Explosion risk when heated. Use may be restricted. Tolerance, 0.2 mg per cubic meter of air. Approved by EPA as substitute for some uses of DDT.

Uses: Insecticide, especially for cotton; also permissible for some food crops.

Shipping regulations: (liquid) (Rail, Air) Poison label. Not acceptable on passenger planes; content of mixtures must be less than 2%. For details, consult regulations.

Note: An encapsulated form (water suspension of polyamide microcapsules containing methyl parathion) is approved by EPA for cotton, corn, alfalfa. It provides slow, uniform release of the pesticide by diffusion through the pores of the capsule.

methyl PCT. See O,O-dimethyl phosphorochloridothioate.

methyl pelargonate. See methyl nonanoate.

methyl pentadecanoate $\text{CH}_3(\text{CH}_2)_{13}\text{COOCH}_3$. The methyl ester of pentadecanoic acid.

Properties: Colorless liquid. Insoluble in water; soluble in alcohol and ether. Sp. gr. 0.8618 (25/4°C); m.p. 18.5°C; b.p. 199°C (30 mm); index of refraction 1.4374 (25°C). Combustible.

Grades: Reagent; 96% and 99.5%.

Uses: Intermediate in organic synthesis; reagent; medical research.

methylpentadiene C_6H_{10} . Numerous isomers are possible. Commercially available mixture contains 2- and 4-methyl-1,3-pentadiene.

Properties: Colorless liquid. Sp. gr. 0.7184 (20/4°C); b.p. 75–77°C; flash point –30°F; reactive with halogens, hydrohalogens, sulfur dioxide and maleic anhydride.

Hazard: Highly flammable; dangerous fire risk.

Uses: Organic synthesis; alkyl and other polymers.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

2-methylpentaldehyde $\text{C}_5\text{H}_8\text{CH}(\text{CH}_3)\text{CHO}$.

Properties: Colorless liquid. Sp. gr. 0.8092; b.p. 118.3°C; f.p. –100°C; solubility in water 0.42% by weight; flash point 68°F. (O.C.).

Hazard: Flammable dangerous fire risk. Strong irritant to skin and mucous membranes.

Uses: Intermediates for dyes, resins, pharmaceuticals.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

2-methylpentane (dimethylpropylmethane)

$\text{CH}_3(\text{CH}_2)_2\text{CH}(\text{CH}_3)_2$.

Properties: Colorless liquid; f.p. –153°C; b.p. 60°C;

refractive index 1.372 (20°C); sp. gr. 0.658 (60/60°F); flash point –10°F; autoignition temp. 583°F.

Grades: 95%; 99%; research.

Containers: 1-gal bottles; 5-gal drums.

Hazard: Flammable, dangerous fire risk; reacts vigorously with oxidizing materials.

Uses: Organic synthesis; solvent.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

3-methylpentane (diethylmethylmethane) C_6H_{14} or $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid. Soluble in alcohol; insoluble in water; slightly soluble in ether. Sp. gr. 0.6645 (20/4°C); b.p. 64.0°C; refractive index 1.37662 (20°C); flash point below 20°F.

Grades: Technical (95%); 99%; research.

Hazard: Flammable, dangerous fire risk.

Uses: Organic synthesis; solvent.

Shipping regulations: See 2-methylpentane.

2-methyl-1,3-pentenediol

$\text{C}_2\text{H}_5\text{CH}(\text{OH})\text{CH}(\text{CH}_3)\text{CH}_2\text{OH}$.

Properties: Colorless liquid. Sp. gr. 0.9745; b.p. 220.3°C; f.p. –30°C; infinitely soluble in water.

Low toxicity. Combustible.

Uses: Solvent; coupling agent.

See also hexylene glycol, a mixture of isomers.

2-methyl-2,4-pentenediol

$\text{CH}_3\text{CHOHCH}_2\text{COH}(\text{CH}_3)\text{CH}_3$.

Properties: Colorless liquid. Completely miscible with water and most organic solvents including lower aliphatic hydrocarbons. Sp. gr. 0.9235 (20/20°C); b.p. 197.1°C; viscosity 34 cp (20°C); vapor pressure 10.8 mm (95.2°C); 334 mm (169.7°C); flash point 201°F (open cup); wt/gal 7.59 lb (20°C). Low toxicity. Combustible.

Uses: Coupling agent; chemical synthesis.

See also hexylene glycol, a mixture of isomers.

4-methyl-2,4-pentenediol. See 2-methyl-2,4-pentenediol.

2-methylpentanoic acid. $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}(\text{CH}_3)\text{COOH}$.

Properties: Water-white liquid; sp. gr. 0.9242 (20/20°C); b.p. 196.4°C; vapor pressure 0.02 mm (20°C); f.p. sets to glass below –85°C. Flash point 225°F. Solubility in water 1.3% by wt (20°C); solubility of water in, 2.9% by wt (20°C). Combustible.

Uses: Plasticizers, vinyl stabilizers; metallic salts; alkyd resins.

4-methylpentanoic acid $(\text{CH}_3)_2\text{CH}(\text{CH}_2)_2\text{COOH}$.

Properties: Colorless liquid; b.p. 197°C; sp. gr. 0.921 (20/4°C); density 7.66 lb/gal (20°C). Soluble in all proportions in alcohol, benzene, and acetone. Low solubility in water. Combustible.

Use: Intermediate for plasticizers, pharmaceuticals, and perfumes.

2-methyl-1-pentanol $\text{C}_5\text{H}_{11}\text{CH}(\text{CH}_3)\text{CH}_2\text{OH}$.

Properties: Colorless liquid. Sp. gr. 0.8252; b.p. 148.0°C; vapor pressure 1.1 mm (20°C); solubility in water 0.31% by weight; flash point 135°F. (O.C.). Combustible.

Hazard: Moderate fire risk.

Uses: Solvent; intermediate.

4-methyl-2-pentanol. See methylamyl alcohol.

4-methyl-2-pentanol acetate. See methylamyl acetate.

3-methyl-3-pentanol carbamate. See emyleamate.

4-methyl-2-pentanone. See methyl isobutyl ketone.

2-methyl-1-pentene (1-methyl-1-propylethylene) $\text{CH}_2=\text{C}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid; sp. gr. 0.6820 (20/4°C); b.p. 62.2°C; f.p. -135°C; refractive index 1.3925 (n 20/D); flash point -15°F; soluble in alcohol, acetone, ether, petroleum, coal-tar solvents; insoluble in water. Low toxicity.

Grades: 95%; 99%; research.

Hazard: Flammable, dangerous fire risk.

Uses: Organic synthesis; flavors; perfumes; medicines; dyes; oils; resins.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

4-methyl-1-pentene $\text{H}_2\text{C}=\text{CHCH}_2\text{CH}(\text{CH}_3)\text{CH}_3$.

Properties: Colorless liquid; f.p. -244.7°F; b.p. 128.4°F; sp. gr. 0.6640 (20/4°C); refractive index 1.3826 (n 20/D); flash point -25°F. Low toxicity.

Grades: 95%; 99%; research.

Containers: Gallon bottles; drums.

Hazard: Same as for 2-methyl-1-pentene.

Uses: Organic synthesis; monomer for plastics used in automobiles, electronic components, and laboratory ware.

Shipping regulations: See 2-methyl-1-pentene.

4-methyl-2-pentene cis, trans, mixture (1-isopropyl-2-methylethylene) $\text{CH}_3\text{CH}=\text{CHCH}(\text{CH}_3)_2$.

Properties: Colorless liquid; sp. gr. 0.670 (20/4°C); b.p. (mixture) 131°F; (cis) 133.2°F; (trans) 137.1°F; refractive index 1.388 (n 20/D); flash point -20°F; soluble in alcohol, acetone, ether, petroleum, coal-tar solvents; insoluble in water.

Containers: Up to 5-gal bottles.

Hazard: Highly flammable; dangerous fire risk.

Use: Organic synthesis.

Shipping regulations: See 2-methyl-1-pentene.

4-methyl-3-penten-2-one. See mesityl oxide.**3-methyl-1-pentyn-3-ol (meparfynol; methylparafynol; methyl pentynol)** $\text{HC}\equiv\text{CCOH}(\text{CH}_3)\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid; b.p. 121.4°C; f.p. -30.6°C; sp. gr. 0.8721 (20/20°C); refractive index (n 20/D) 1.4318; flash point 101°F (TOC). Moderately soluble in water; miscible with acetone, benzene, carbon tetrachloride, ethyl acetate. Combustible.

Grades: High purity, 98.5%; technical, 95.0% min; pharmaceutical.

Hazard: Toxic in high concentrations. Moderate fire risk.

Uses: Stabilizer in chlorinated solvents; viscosity reducer; electroplating brightener; intermediate in syntheses of hypnotics and isoprenoid chemicals; solvent for polyamide resins; acid inhibitor; prevention of hydrogen embrittlement; medicine (soporific and anesthetic).

methylphenethylamine. See amphetamine.**methyl phenylacetate** $\text{C}_6\text{H}_5\text{CH}_2\text{COOCH}_3$.

Properties: Colorless liquid; honey-like odor. Soluble in 5 parts of 60% alcohol, in fixed oils; insoluble in water. Sp. gr. 1.062-1.066 (25°C); refractive index 1.506-1.509 (20°C); b.p. 218°. Low toxicity. Combustible.

Containers: 25-lb cans.

Grades: Technical; F.C.C.

Uses: Perfumery; flavors for tobacco; flavoring.

methylphenylcarbinol. See alpha-methylbenzyl alcohol.**methylphenylcarbonyl acetate.** See alpha-methylbenzyl acetate.**methylphenyldichlorosilane** $\text{CH}_3(\text{C}_6\text{H}_5)_2\text{SiCl}_2$.

Properties: Colorless liquid; b.p. 82°C (13 mm),

205°C; refractive index 1.5199 (25°C); sp. gr. 1.19; soluble in benzene, ether, methanol. Flash point 83°F.

Derivation: From chlorobenzene Grignard reagent and methyltrichlorosilane, or from benzene and methyl-dichlorosilane.

Hazard: Toxic and irritant. Flammable, moderate fire risk; reacts strongly with oxidizing materials.

Use: Manufacture of silicones.

methyl phenyl ether. See anisole.**4-methyl-1-phenyl-2-pentanone (benzyl isobutyl ketone)** $\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{O})\text{CH}_2\text{CH}(\text{CH}_3)_2$. Combustible; low toxicity. Used in flavoring.**methyl phenyl phosphate.** See methyl diphenyl phosphate.**2-methyl-2-phenylpropane.** See tert-butyl-benzene.**3-methyl-1-phenyl-2-pyrazolin-5-one (3-methyl-1-phenyl-5-pyrazolone; 1-phenyl-3-methyl-5-pyrazolone)** $\text{C}_6\text{H}_5\text{NN}=\text{C}(\text{CH}_3)\text{CH}_2\text{CO}$.

Properties: White powder or crystals; soluble in water; slightly soluble in alcohol or benzene; insoluble in ether; b.p. 287°C (205 mm); m.p. 127°C; vapor pressure < 0.01 mm (20°C).

Derivation: By condensation of phenylhydrazine with ethylacetoacetate.

Uses: Intermediate for dyes and drugs; sensitive reagent for detection of cyanide.

methylphloroglucinol (2,4,6-trihydroxytoluene) $\text{C}_6\text{H}_2(\text{OH})_3\text{CH}_3$.

Properties: Cream to light tan; fine crystals; odorless; m.p. 210-214°C; soluble in water, alcohol, and ether; insoluble in benzene. Combustible.

Uses: Reactive coupling agent; dye and plastic intermediate.

methylphosphonic acid $\text{CH}_3\text{PO}(\text{OH})_2$. White solid; m.p. 103-104°C.

Containers: 55-gal drums; tank trucks.

Use: Organic synthesis.

methylphosphoric acid (methyl orthophosphoric acid; methyl acid phosphate) $\text{CH}_3\text{H}_2\text{PO}_4$.

Properties: Pale straw-colored liquid; sp. gr. 1.42 (25°C); can be neutralized with alkalis or amines to give water-soluble salts. Combustible.

Purity: 97% (remainder orthophosphoric acid and methyl alcohol).

Containers: Glass bottles; 1-, 5- and 10-gal tins; 55-gal steel drums.

Uses: Textile and paper processing compounds; catalysts in urea-resin formation; polymerizing agent for resin and oils; rust remover; soldering flux; chemical intermediate.

methyl phthalyl ethyl glycolate $\text{C}_2\text{H}_5\text{OOCCH}_2\text{OOC}-\text{C}_6\text{H}_4\text{COOCH}_3$.

Properties: Colorless liquid with slight characteristic odor; sp. gr. 1.217-1.227. Flash point 375°F. Combustible. Low toxicity. Miscible with most organic solvents; very slightly soluble in water.

Uses: Plasticizer; solvent.

methyl picrate. See trinitroanisole.**N-methylpiperazine** $\text{CH}_3\text{NCH}_2\text{CH}_2\text{NHCH}_2\text{CH}_2$.

Properties: Colorless liquid; sp. gr. 0.9038; b.p. 138.0°C; f.p. -6.4°C; hygroscopic; amine-like odor. Flash point 108°F. Combustible.

Hazard: Moderate fire risk.

Uses: Intermediate for pharmaceuticals, surface agents, synthetic fibers.

2-methylpiperidine (2-pipecoline) $C_5H_{10}NCH_3$.

Properties: Colorless liquid; b.p. 118.2°C; f.p. -4.2°C; sp. gr. 0.8401 (20/20°C); refractive index 1.4457 (n_D 20/D); soluble in water in all proportions at 20°C. Combustible.

1-methyl-4-piperidinol $CH_3C_5H_9NOH$.

Properties: Colorless to light amber, oily liquid with amine-like odor. Crystals may be present, or material may be solid, but will melt on warming; refractive index (n_D 25/D) 1.4757-1.4777; congealing temperature 27.5°C min. Combustible.

Use: Organic synthesis.

3(2-methylpiperidino)propyl 3,4-dichlorobenzoate. See piperalin.

methylprednisolone $C_{22}H_{30}O_5$. A steroid.

Properties: White, odorless, crystalline powder; m.p. 240°C with decomposition; sparingly soluble in alcohol; slightly soluble in acetone; insoluble in water.

Grade: N.F.

Use: Medicine (hormone).

2-methylpropane. See isobutane.

2-methylpropanenitrile. See isobutyronitrile.

2-methyl-1-propanethiol (isobutyl mercaptan).

$(CH_3)_2CHCH_2SH$.

Properties: Liquid, boiling 85-95°C; unpleasant odor; sp. gr. 0.8363 (60/60°F); flash point 15°F.

Grade: 95%.

Containers: Tank cars.

Hazard: Flammable, dangerous fire risk; toxic.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

2-methyl-2-propanethiol (tert-butyl mercaptan).

$(CH_3)_3CSH$.

Properties: Colorless liquid with strong skunk odor; sp. gr. 0.79-0.82 (60/60°F); distillation range 62-67°C; refractive index (20/D) 1.422; flash point -15°F; wt./gal 6.71 lb.

Containers: 1-qt cans; 1-, 5-, 54-gal drums; tank cars. Hazard: Flammable, dangerous fire risk. Highly toxic. Tolerance, 0.5 ppm in air.

Use: Intermediate; gas odorant for detecting leaks.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Legal label name butyl mercaptan.

2-methyl-1-propanol. See isobutyl alcohol.

2-methyl-2-propanol. See tert-butyl alcohol.

2-methylpropanoyl chloride. See isobutyryl chloride.

2-methylpropene. See isobutene.

2-methyl-2-propen-1-ol. See methylallyl alcohol.

methyl propionate $CH_3CH_2COOCH_3$.

Properties: Colorless liquid. Soluble in most organic solvents; somewhat soluble in water. Sp. gr. 0.937 (4°C); refractive index 1.3769 (n_D 20/D); boiling range 78.0-79.5°C; autoignition temp. 876°F; flash point 28°F (C.C.); wt. gal 7.58 lb. Low toxicity.

Grade: Technical.

Containers: 55-gal drums; tank cars.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 2.5 to 13%.

Uses: Solvent for cellulose nitrate; solvent mixtures for cellulose derivatives; lacquers, paints, varnishes; coating compositions; flavoring.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

2-methylpropionic acid. See isobutyric acid.

methylpropylbenzene. See cymene.

methyl propyl carbinol. See 2-pentanol.

methylpropylcarbinolurethane. See hedonal.

methyl propyl ketone (ethyl acetone, 2-pentanone; MPK) $CH_3COC_3H_7$.

Properties: Water-white liquid. The commercial material consists of a mixture of methyl propyl and diethyl ketones in the approximate ratio of 3 to 1 and contains at least 97% of these ketones, the balance being sec-amyl alcohol. Soluble in alcohol and ether; slightly soluble in water. Sp. gr. 0.809 (20/20°C); f.p. -77.5°C; b.p. 101.7°C; refractive index 1.3895 (20°C); viscosity 0.473 centipoise (25°C); flash point 45°F. Autoignition temp. 941°F.

Grade: Technical.

Containers: Glass bottles; tins; steel drums.

Hazard: Flammable, dangerous fire risk. Moderately toxic. Tolerance, 200 ppm in air. Explosive limits in air 1.6 to 8.2%.

Uses: Solvent; substitute for diethyl ketone; flavoring.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

2-methyl-2-n-propyl-1,3-propanediol dicarbamate. See meprobamate.

methylpyridine. See picoline.

methyl pyromucate. See methyl 2-furoate.

N-methylpyrrole $C_4H_4NCH_3$.

Properties: Colorless liquid; b.p. 112°C; f.p. -57°C; density 0.914 (20°C); refractive index 1.4898 (n_D 17/D); flash point 61°F; insoluble in water; soluble in alcohol.

Grade: 98% min. purity.

Containers: Steel drums; cans.

Hazard: Flammable, dangerous fire risk.

Use: Organic synthesis.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

N-methylpyrrolidine $CH_3NCH_2CH_2CH_2CH_3$.

Properties: Colorless liquid, ammonia-like odor; refractive index 1.4200 to 1.4230 (25°C); b.p. 80.5°C; f.p. -90°C; sp. gr. 0.805; flash point 7°F.

Hazard: Flammable, dangerous fire risk. Irritant to skin and eyes.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

N-methyl-2-pyrrolidone $CH_3NCH_2CH_2CH_2CO$.

Properties: Colorless liquid with mild amine odor; sp. gr. 1.027; f.p. -24°C; b.p. 202°C; flash point 204°F; miscible in all proportions with water; various organic solvents, castor oil. Combustible.

Derivation: High-pressure synthesis from acetylene and formaldehyde.

Uses: Solvent for resins, acetylene, etc; pigment dispersant; petroleum processing; spinning agent for polyvinyl chloride; intermediate.

Note: A proprietary adaptation of this solvent to clean-up of vinyl chloride reaction vessels is available under trademark of "M-Pyrol."

alpha-methylquinoline. See quinaldine.

gamma-methylquinoline. See lepidine.

2-methylquinone. See toluquinone.

6-methyl-2,3-quinoxalinedithiol cyclic carbonate (6-methyl-2-oxo-1,3-dithio(4,5-b)quinoxaline)
 $C_{10}H_6N_2S_2O$.

Properties: Yellow crystalline powder; m.p. 172°C; insoluble in water; slightly soluble in acetone and alcohol; soluble in organic solvents.

Hazard: Toxic by ingestion and inhalation.

Uses: Acaricide; insecticide; fungicide.

methyl red $(CH_3)_2NC_6H_4NNC_6H_4COOH$. para-Dimethylaminoazobenzenecarboxylic acid. C. I. 13020.

Properties: Dark-red powder or violet crystals; m.p. 180°C; insoluble in water; soluble in alcohol, ether, glacial acetic acid.

Use: Acid-base indicator in the range pH 4.2–6.2 (red to yellow).

See indicator.

methylresorcinol. See orcin.

methyl ricinoleate

$CH_3(CH_2)_5CH(OH)CH_2CH:CH(CH_2)_7COOCH_3$.

The methyl ester of ricinoleic acid.

Properties: Colorless liquid, insoluble in water; soluble in alcohol and ether. Sp. gr. 0.9236 (22/4°C); f.p. -4.5°C; b.p. 245°C (10 mm); refractive index 1.4628. Combustible; low toxicity.

Derivation: Esterification of ricinoleic acid or alcoholysis of castor oil; purification by vacuum distillation.

Grades: Technical; purified (99+%).

Containers: 5-gal cans; 55-gal drums.

Uses: Plasticizer; lubricant; cutting oil additive; wetting agent.

methylrosaniline chloride. See methyl violet.

methyl salicylate (gaultheria oil; wintergreen oil; betula oil; sweet-birch oil) $C_6H_4OHCOOCH_3$.

Properties: Yellow to red liquid; odor of wintergreen; refractive index 1.535–1.538; sp. gr. 1.180–1.185; f.p. -8.3°C; flash point 214°F; autoignition temp. 850°F; b.p. 222.2°C; natural oil optically inactive; synthetic oil, angular rotation not more than -1.5°; soluble in 7 parts of 70% alcohol; soluble in ether and in glacial acetic acid; sparingly soluble in water. Combustible.

Derivation: By heating methanol and salicylic acid in presence of sulfuric acid, or by distillation from leaves of Gaultheria procumbens or bark of Betula lenta.

Method of purification: Rectification.

Grades: Technical; U.S.P.; F.C.C.

Containers: Bottles; drums.

Hazard: Toxic by ingestion. Use in foods restricted by FDA.

Uses: Flavor in foods, beverages, pharmaceuticals; odorant; perfumery; UV-absorber in sunburn lotions.

"Methyl Selenac."⁶⁹ Trademark for selenium dimethyl-dithiocarbamate $[(CH_3)_2NC(S)S]_2Se$.

Properties: Yellow powder, sp. gr. $1.58 \pm .03$; melting range 140–172°C; slightly soluble in carbon disulfide, benzene, chloroform; insoluble in water, dilute caustic, gasoline.

Uses: Vulcanizing agent.

methyl silicone. See dimethyl silicone. See also silicone and siloxane.

methyl stearate (methyl octadecanoate)

$CH_3(CH_2)_{16}COOCH_3$. The methyl ester of stearic acid.

Properties: Semisolid or liquid; m.p. 37.8°C; b.p.

234.5°C (30 mm), 204.5°C (10 mm); flash point 307°F; refractive index 1.4328 (50°C). Insoluble in water; soluble in ether and alcohol. Combustible.

Derivation: Esterification of stearic acid with methanol or alcoholysis of stearin with methanol.

Method of purification: Vacuum fraction distillation.

Impurities: Most technical methyl stearate is 55% stearate and 45% methyl palmitate.

Grades: Distilled; pressed; technical; pure (99.8+%).

Containers: Cans; drums.

Uses: Intermediate for stearic acid detergents, emulsifiers, wetting agents, stabilizers, resins, lubricants, plasticizers and textiles; biochemical and medical research.

alpha-methylstyrene $C_6H_5C(CH_3):CH_2$.

Properties: Colorless liquid, subject to polymerization by heat or catalysts; b.p. 165.38°C; f.p. -23.21°C; sp. gr. 0.9062 (25/25°C); viscosity 0.940 cp (20°C); flash point 129°F; autoignition temp. 1065°F; refractive index 1.5359 (25/25°C); insoluble in water. A polymerization inhibitor such as tert-butyl catechol is usually present in commercial quantities. Combustible.

Derivation: From benzene and propylene by use of aluminum chloride and hydrogen chloride to yield cumene which is then dehydrogenated.

Containers: Glass bottles; steel drums.

Hazard: Moderately toxic. Avoid inhalation and skin contact. Moderate fire risk. Explosive limits in air 1.9 to 6.1%. Tolerance, 100 ppm in air.

Use: Polymerization monomer, especially for polyesters.

methyl styryl ketone. See benzylidene acetone.

methylsuccinic acid. See pyrotartaric acid.

methyl sulfate. See dimethyl sulfate.

methyl sulfide. Legal label name (Rail) for dimethyl sulfide, q.v.

3-methylsulfolane. See 3-methyltetrahydrothiophene-1,1-dioxide.

3-methylsulfolene. See 3-methyl-2,5-dihydrothiophene-1,1-dioxide.

methyl sulfoxide. See dimethyl sulfoxide.

methylsulfuric acid (acid methyl sulfate; methyl hydrogen sulfate) CH_3OSO_3H or CH_3HSO_4 .

Properties: Oily liquid. Soluble in anhydrous ether; slightly soluble in alcohol, water. B.p. 188°C; sp. gr. 1.352; f.p. -27°C.

Derivation: Interaction of methyl alcohol and chlorosulfonic acid.

Uses: Sulfonating agent; specialty solvent.

N-methyltaurine. Available in commercial quantities as an aqueous solution of the sodium salt, sodium N-methyltaurate, or $CH_3NHCH_2CH_2SO_3Na$.

Properties (of solution): Clear, light-colored liquid, about 34–36% sodium salt, sp. gr. 1.21 (25/4°C). At freezing point (-28°C average) becomes a suspension of white crystals.

Uses: Intermediate for detergents, dyestuffs, pharmaceuticals, and other organics.

methyltestosterone $C_{20}H_{30}O_2$. A synthetic androgenic steroid.

Properties: White or creamy white crystals or crystalline powder; odorless; stable in air; slightly hygroscopic; affected by light; m.p. 163–168°C. Soluble in alcohol, methanol, ether, and other organic solvents; insoluble in water.

Derivation: By organic synthesis.

Grade: N.F.

Use: Medicine (hormone).

methyl tetracosanoate. See methyl lignocerate.

methyl tetradecanoate. See methyl myristate.

2-methyltetrahydrofuran $C_4H_7CH_3$.

Properties: Colorless liquid; ether-like odor; b.p. 80.2°C; f.p. -136°C; sp. gr. 0.854 (20/4°C); refractive index 1.4025 (25/D); flash point 12°F (TOC). Solubility in water 15.1 g/100 g water (25°C). Solubility in water increases with a decrease in temperature. Infinitely soluble in most organic solvents.

Containers: 1-, 5-, and 55-gal drums.

Hazard: Flammable, dangerous fire risk. May be toxic.

Uses: Chemical intermediate; reaction solvent.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

3-methyltetrahydrothiophene-1,1-dioxide (3-methylsulfolane) $CH_3C_4H_7SO_2$.

Properties: Colorless liquid; sp. gr. 1.194 (20/4°C); m.p. 0°C; b.p. 276°C; flash point 325°F. Completely soluble in water, acetone and toluene. Combustible; low toxicity.

Containers: Up to 54-gal drums.

Uses: Solvent and extractive medium.

methyl 2-thienyl ketone. See 2-acetylthiophene.

meta-(methylthio)aniline $H_2NC_6H_4SCH_3$.

Properties: Pale yellow oil. Sp. gr. 1.140 (25°C); b.p. 163-165°C (16 mm); f.p. -3.0°C. Insoluble in water; soluble in alcohol, benzene, acetic acid. Combustible.

Hazard: Probably toxic. See aniline.

Use: Pharmaceutical intermediate.

4-(methylthio)-3,5-dimethylphenyl N-methylcarbamate [(4-methylthio)-3,5-xylyl methylcarbamate]

$CH_3S(CH_3)_2C_6H_2OOCNHCH_3$. Solid; m.p. 121°C.

Insoluble in water; soluble in alcohol and acetone.

Hazard: May be toxic.

Use: Pesticide.

methylthionine chloride. See methylene blue.

methyltin. See organotin compound.

methyl para-toluate $CH_3C_6H_4COOCH_3$.

Properties: White crystalline solid; f.p. 34°C; sp. gr. 1.058 (25/15.6°C).

Use: Organic synthesis.

methyl para-toluenesulfonate $CH_3C_6H_4SO_3CH_3$.

Properties: White damp crystals; solidification point 24°C; b.p. 157°C (8 mm); decomposes 262°C. A vesicant material. Insoluble in water; soluble in alcohol and benzene.

Grade: 97% min.

Hazard: Highly toxic by inhalation; strong irritant to skin and eyes.

Uses: Accelerator; methylating agent; catalyst for alkyd resins.

methyl para-tolyl ketone. See methyl acetophenone.

methyltrichlorosilane CH_3SiCl_3 .

Properties: Colorless liquid. B.p. 66.4°C; sp. gr. 1.270 (25/25°C); refractive index (n_D 25/D) 1.4085; flash point 8°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: By Grignard reaction of silicon tetrachloride and methylmagnesium chloride.

Hazard: Highly toxic; strong irritant. Flammable, dangerous fire risk. May form explosive mixtures with air.

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

Use: Intermediate for silicones.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

methyl tricosanoate $CH_3(CH_2)_{21}COOCH_3$. The methyl ester of tricosanoic acid.

Properties: White waxlike solid. Insoluble in water, soluble in alcohol and ether. M.p. 55-56°C. Combustible.

Grades: Purified 96% and 99.5%.

Uses: Intermediate in organic synthesis; medical research.

methyl tridecanoate $CH_3(CH_2)_{11}COOCH_3$. The methyl ester of tridecanoic acid.

Properties: Colorless liquid. Insoluble in water, soluble in alcohol and ether; m.p. 5.5°C; b.p. 130-132°C (4 mm); refractive index 1.4327 (25°C). Combustible; low toxicity.

Derivation: Esterification of tridecanoic acid with methanol followed by fractional distillation.

Grades: Purified 96% and 99.5%.

Uses: Intermediate in organic synthesis; medical research; reference standard in gas chromatography.

methyl trimethylolmethane. See trimethylol ethane.

"Methyl Trithion."¹ Trademark for an insecticide-acaricide containing various percentages of S-(para-chlorophenylthio)methyl O,O-dimethyl phosphorodithioate. Available as liquid or powder.

Hazard: Probably toxic.

"Methyl Tuads."⁶⁹ Trademark for tetramethylthiuram disulfide, $[(CH_3)_2NC(S)S]_2$.

Uses: Vulcanizing agent and primary accelerator in natural, nitrile and butyl rubbers and in SBR. As secondary accelerator in natural and nitrile rubbers and SBR. Used in coated fabrics, extruded and molded goods, steam hose. Increases heat resistance.

beta-methylumbelliferone (7-hydroxy-4-methylcoumarin; BMU) $C_{10}H_8O_3$.

Properties: White to light tan powder; m.p. 186-188°C; soluble in concentrated sulfuric acid; partly soluble in ethanol, isopropanol, 5% aqueous sodium carbonate solution; very slightly soluble in water; very dilute aqueous alkaline solutions give a bright blue-white fluorescence in daylight or ultraviolet light.

Grade: Technical.

Containers: Fiber drums.

Uses: Optical bleach in soaps, starches, and laundry products; suntan lotions.

2-methylundecanal. See methylundecanal.

methyl undecanoate $CH_3(CH_2)_9COOCH_3$. The methyl ester of undecanoic acid.

Properties: Colorless liquid. Insoluble in water, soluble in alcohol and ether; b.p. 123°C (10 mm); refractive index 1.4270 (25/4°C). Combustible; low toxicity.

Derivation: Esterification of undecanoic acid with methanol followed by fractional distillation.

Grades: Purified 96%; 99.5%.

Uses: Organic intermediate for synthesis; flavoring; medical research.

5-methyluracil. See thymine.

methylvinylchlorosilane $(CH_3)(C_2H_5)SiCl_2$.

Properties: Colorless liquid; b.p. 92°C; sp. gr. 1.08 (25°C); refractive index 1.4270 (25°C); flash point

40°F. Soluble in benzene, ether; reacts with methanol and water.

Derivation: From methylchlorosilane and acetylene or vinyl chloride.

Hazard: Highly toxic and irritant. Flammable, dangerous fire risk.

Uses: Manufacture of silicones, as coupling agents.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

methyl vinyl ether. See vinyl methyl ether.

methyl vinyl ketone. Legal label name for vinyl methyl ketone (q.v.).

2-methyl-5-vinylpyridine $\text{CH}_3\text{C}_5\text{H}_3\text{NCH}:\text{CH}_2$.

Properties: Clear to faintly opalescent liquid; sp. gr. 0.978–0.982 (20/20°C); b.p. 181°C; refractive index 1.5400–1.5454 (20°C); f.p. (anhydrous) –14.3°C; flash point 165°F (TOC). Combustible.

Containers: Drum, tank trucks; tank cars.

Uses: Monomer for resins; oil additive; ore flotation agent; dye acceptor.

methyl violet (crystal violet; gentian violet; methylrosaniline chloride). A confusing series of names for closely related and overlapping derivatives of pararosaniline, a triphenylmethane type of dye. Gentian violet is the U.S.P. name for the medicinal product. Uses: Medicine (topical use only as antiallergen and specific bactericide); acid-base indicator; denaturant for alcohol; biological stain; dye for textiles; pigments.

methyl yellow. See dimethylaminoazobenzene.

"Methyl Zimate."⁶⁹ Trademark for zinc dimethyldithiocarbamate, $[(\text{CH}_3)_2\text{NC}(\text{S})\text{S}]_2\text{Zn}$.

Uses: Ultra-accelerator for natural and synthetic rubbers.

methy prylon (3,3-diethyl-5-methyl-2,4-piperidinedione) $\text{C}_5\text{NH}_4(\text{O})_2(\text{C}_2\text{H}_5)_2(\text{CH}_3)$.

Properties: Nearly white, crystalline powder; slight characteristic odor; bitter taste; melting range 74–77°C; soluble in water; very soluble in alcohol, in chloroform, in ether, and benzene.

Grade: N.F.

Use: Medicine.

"Met-L-KYL."⁵⁴⁸ Trademark for a dry chemical which extinguishes fires caused by pyrophoric liquids such as triethylaluminum and adsorbs the spilled metal alkyl to prevent reignition.

"Met-L-X."⁵⁴⁸ Trademark for a dry chemical based on sodium chloride, approved for use on sodium, potassium, sodium potassium alloy, and magnesium fires.

"Metol."¹³⁴ Trademark for methyl-para-aminophenol sulfate (q.v.).

"Metopirone."³⁰⁵ Trademark for metyrapone (q.v.).

metopon hydrochloride (6-methyldihydromorphinone hydrochloride) $\text{C}_{18}\text{H}_{21}\text{O}_3\text{N} \cdot \text{HCl}$. A morphine derivative.

Properties: White, odorless, crystalline powder; very soluble in water; sparingly soluble in alcohol; insoluble in benzene.

Hazard: Highly toxic. See alkaloid; narcotic. Prescription only.

Use: Medicine (sedative).

"Metso."²⁰¹ Trademark for a series of detergents which include the pentahydrate of sodium metasilicate, hydrated sodium sesquisilicate; and technical

anhydrous sodium orthosilicate. Available in lump and powder forms.

"Metubine Iodide."¹⁰⁰ Trademark for dimethyl-tubocurarine iodide.

"Metycaine."¹⁰⁰ Trademark for piperocaine hydrochloride, U.S.P.

metyrapone. (USAN) (2-methyl-1,2-di-3-pyridyl-1-propanone) $\text{C}_5\text{H}_4\text{NC}(\text{O})\text{C}(\text{CH}_3)_2\text{C}_5\text{H}_4\text{N}$.

Properties: White to light amber, fine crystalline powder, having a characteristic odor. Darkens on exposure to light. Soluble in methanol and chloroform. Forms water-soluble salts with acids.

Grade: U.S.P.

Use: Medicine (also as ditartrate).

MeV. Abbreviation for million electron-volts.

mevinphos (2-carbomethoxy-1-methylvinyl dimethyl phosphate) $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{OC}(\text{CH}_3):\text{CHCOOCH}_3$. Generic name for methyl 3-hydroxy-alpha-crotonate dimethyl phosphate.

Properties: Liquid; b.p. 99–103°C (0.03 mm). Slightly soluble in oils; miscible with water and benzene.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Use may be restricted.

Uses: Systemic insecticide and acaricide.

Shipping regulations: Organic phosphate, liquid, (Rail, Air) Poison label. Not acceptable on passenger planes.

MFC. Abbreviation of miracle fruit concentrate. See sweetener, nonnutritive.

Mg Symbol for magnesium.

mg Abbreviation of milligram (q.v.).

"MGN."¹⁹² Trademark for methylene glutaronitrile.

MH. See maleic hydrazide.

"MH-30."²⁴⁸ Trademark for a 30% solution of maleic hydrazide (q.v.).

"MHA."⁵⁸ Trademark for methionine hydroxy analog, calcium salt (q.v.).

MHD. See magnetohydrodynamics.

MIAC. See methyl isoamyl ketone.

miazine. See pyrimidine.

MIBC. Abbreviation for methylisobutyl carbinol. See methylamyl alcohol.

MIBK. Abbreviation for methyl isobutyl ketone (q.v.).

mica. Any of several silicates of varying chemical composition but with similar physical properties and crystal structure. All characteristically cleave into thin sheets, which are flexible and elastic. Synthetic mica is available. It has electrical and mechanical properties superior to those of natural mica; it is also water-free.

Properties: Soft, translucent solid. Sp. gr. 2.6–3.2; Mohs hardness 2.8–3.2 refractive index 1.56–1.60; dielectric constant 6.5–8.7; noncombustible; heat-resistant to 600°C; colorless to slight red (ruby); brown to greenish yellow (amber).

Derivation: From muscovite (ruby mica), phlogopite (amber mica), and pegmatite. Synthetic single crystals are "grown" electrothermally.

Occurrence: U.S., Canada, Madagascar, India, So. Africa, So. America, U.S.S.R.

Forms: Block, sheet, powder; single crystals.

Containers: Bags; carloads.

Grades: Dry-ground; wet-ground.

Hazard (dust): Irritant by inhalation; may be damaging to lungs. Tolerance, 20 million particles per cubic meter in air.

Uses: Electrical equipment; vacuum tubes; incandescent lamps; dusting agent; lubricant; windows in high-temperature equipment; filler in exterior paints; cosmetics; glass and ceramic flux; roofing; rubber; mold-release agent; specialty paper for insulation and filtration; wallpaper and wallboard joint cement; oil-well drilling muds.

"Micabond."²⁸¹ Trademark for an electrical insulation material consisting primarily of mica with electrical insulating binders.

Forms: Tape; tubing; segments; plate; fabricated parts. Uses: Motors; insulation against heat.

"Mica-Flex."¹¹⁶ Trademark for a flexible electrical insulation containing a large percentage of mica; used mainly on high voltage motor and generator coils.

"Micarta."³⁹⁸ Trademark for a group of laminated plastics composed of paper or fabric made from cellulose, glass, asbestos, or synthetic fibers bonded with phenolic or melamine resins and cured at elevated temperature and pressure.

Uses: Plating barrels; rayon-manufacturing equipment; pickling tanks; electrical and thermal insulation; oil-handling equipment; steel rolling-mill bearings; chemical-handling valve bodies; paper-mill suction box covers and equipment.

"Micatex."²³⁶ Trademark for mica prepared for addition to drilling fluids to reduce water loss to the formation and for overcoming mild losses of circulation. An effective seal is formed over mildly permeable formations when the mud in which it is entrained forces the material against the formation. Will not disintegrate appreciably, nor will it corrode or abrade slush-pump liners or other metal or moving parts of the mud system.

micelle. An electrically charged colloidal particle, usually organic in nature, composed of aggregates of large molecules, e.g., in soaps and surfactants. The term is also applied to the casein complex in milk. See also colloid chemistry.

Michler's hydrol. See tetramethyldiaminobenzhydrol.

Michler's ketone. See tetramethyldiaminobenzophenone.

micro- Prefix meaning 10^{-6} unit (symbol μ). E.g., 1 microgram = 0.000001 gram. See also micron.

microanalysis. See microchemistry.

"Microballoon."⁵⁷² Trademark for hollow, finely divided, hole-free, low-density particles of synthetic resins or similar film-forming materials. Glass is one of the materials used.

Uses: To form a protecting layer of the tiny spheres over liquid surfaces, such as oils in big tanks, to reduce evaporation; to separate helium from natural gas because of the wide difference in relative rates of diffusion through the spheres; as an extender in plastics to achieve low density.

"Micro-Cel."²⁴⁷ Trademark for a group of finely divided hydrated synthetic calcium silicates.

Properties: White to light gray color range dependent on grade. Density (apparent) 5-10 lb/cu ft; pH 7-10; absorption (water) 300-600%. Noncombustible.

Uses: Inert extenders; absorbents; bulking agents; pesticide-carrier.

microchemistry. A branch of analytical chemistry that involves procedures that require handling of very small quantities of materials. Specifically, it refers to carrying out various chemical operations (weighting, purification, quantitative and qualitative analysis) on samples ranging from 0.1 to 10 milligrams; this often involves use of a microscope, and still more often of chromatography (q.v.). See also microscopy, chemical.

"Micro-Cote."⁹⁸ Trademark for a micromesh grade of attapulgite; used as an anticaking agent, especially for ammonium nitrate, ammonium sulfate and other fertilizers.

microcrystalline structure. A form in which a number of high-polymeric substances have been prepared and on which active research is continuing. They include cellulose (see "Avicel"), chrysotile asbestos, amylose (starch), collagen, and nylon. On the microscopic level, these substances are composed of colloidal microcrystals connected by molecular chains. The process involves breaking up the network of microcrystals (by acid hydrolysis in the case of cellulose) and separating them by mechanical agitation. The size range of the microcrystals is from 2.5 to 500 nanometers (millimicrons). The products form extremely stable gels which have a number of commercial use possibilities. Petroleum-derived waxes of high molecular weight have been available in microcrystalline form for many years. Chlorophyll has a naturally microcrystalline structure. See also cellulose; wax, microcrystalline.

microcurie. See curie.

microencapsulation. Enclosure of a material in capsules ranging from 20 to 150 microns in diameter and composed of polymeric substances such as polyamides, or in some cases of gelatin, which act as semipermeable membranes. Enzymes are immobilized in this way until they reach the desired site in an enzymatic process. A growing list of applications of this slow-release technique includes fertilizers, nutrients for fish culture, pesticides, pharmaceuticals, insect sex attractants, deodorants, etc.

"Microfined."⁴⁴³ Trademark for finely ground and dispersed anthraquinone vat pastes.

"Microgel."⁹³ Trademark for a neutral agricultural fungicide. The blue powder assays 52% copper.

microgram (μ g). One millionth (10^{-6}) gram.

"Microlith."⁴⁴³ Trademark for organic pigment stir-in dispersions compatible with a broad range of organic solvents and polymers.

"Micro-Mag."⁴⁸¹ Trademark for refined lime and lime admixtures.

"Micromet."¹⁰⁸ Trademark for a specially formulated phosphate glass, slowly soluble in water, and used to inhibit scale, corrosion, and red water in water systems and air conditioning systems.

micrometer (μ m). One millionth (10^{-6}) meter, or 1 micron (10,000 Angstrom units).

micron (μ). See micrometer.

"Micronex."¹¹³ Trademark for series of pelleted impingement carbon blacks produced from natural gas.

Grades available are Standard Micronex (medium processing channel); Micronex W-6 (easy processing channel). Available in 25- and 50-lb bags and hopper cars. See also carbon blacks.

"Micronized" Stearates.⁷⁴ Trademark for stearates that have been specially processed to fine particle size providing a greatly increased surface area. Available as calcium-precipitated, calcium-densified and zinc U.S.P.

micronutrient. See trace element.

microorganism. A living organism of microscopic size generally considered to include bacteria, molds (actinomycetes), and fungi, but excluding viruses. See also bacteria.

"Micro-Pen."⁵³⁰ Trademark for special coated procaine penicillin G.

microscopy, chemical. Use of a microscope primarily for study of physical structure and identification of materials. This is especially useful in forensic chemistry (q.v.) and police laboratories. Many types of microscopes are used in industry; most important are the optical, ultra-, polarizing, stereoscopic, electron, and x-ray microscopes. Organic dyes of various types are used to stain samples for precise identification.

"Microsol."⁴⁴³ Trademark for aqueous pigment dispersions for spin-coloring of regenerated cellulose fibers.

"Micro-Sorb."⁹⁸ Trademark for a microfine attapulgite clay. Available in two grades: RVM and LVM. Uses: Pharmaceutical preparations, pressure-sensitive copy paper, cosmetics, and polishing compounds.

"Microthene."¹⁹² Trademark for a group of coating materials.

Grades: Regular, powdered polyethylene resins and to coat large, irregular shaped objects; F, microfine polyolefins for coating specialty papers.

microwave spectroscopy. A type of absorption spectroscopy used in instrumental chemical analysis which involves use of that portion of the electromagnetic spectrum having wavelengths in the range between the far infrared and the radiofrequencies, i.e., between 1 millimeter and 30 centimeters. Substances to be analyzed are usually in the gaseous state. Klystron tubes are used as microwave source.

middle oil. A fraction distilled from coal tar. See coal tar.

middlings. The granular part of the interior of the wheat berry obtained in the process of milling. This product, when reduced by grinding to the desired fineness, produces the finest quality of flour.

Midgley, Thomas, Jr. (1889-1944). American chemist and inventor. One of the most creative and brilliant chemists of his era, Midgley's early work was in the field of rubber chemistry and technology, especially in the development of synthetic and substitute rubbers, which were being introduced in the 1930's. He worked with Kettering at General Electric and then became vice-president of Ethyl Corporation, as well as of the Ohio State University Research Foundation. His innovative genius was responsible for the development of organic lead compounds for anti-knock gasoline and later for the discovery of fluorocarbon refrigerants, on which he did the basic research. He was recipient of many of chemistry's

highest honors, including the Nichols Medal, the Perkin Medal and the Priestley Medal.

migration area. A term used in nuclear technology as a measure of the moderation or slowing down of neutrons. It is one sixth of the mean square distance a neutron travels before thermal capture.

mike. Term adopted by the American Standards Association for a microinch, or 10^{-6} inch.

"Mikrovan."⁵¹ Trademark for microcrystalline waxes in a broad selection of melting points and hardnesses.

mil One thousandth (0.001) inch. Used chiefly in reference to surface coatings, metal sheet, films, cable covers, friction tape, etc.

mildew preventive. A compound used to prevent the growth of parasitic fungi, usually stain-producing, on such organic materials as textiles, leather, paper, farinaceous products, etc. Compounds used widely employed include cresols, phenols, benzoic acid, formaldehyde and organic derivatives or salts of copper, zinc and mercury.

"Milezyme" P.²¹² Trademark for an enzyme system standardized for protease activity for use in feeding all classes of livestock.

milk. A heterogeneous system composed (for cows' milk) of about 87% water, 3.8% emulsified particles of fat and fatty acids, 3% casein, 5% sugar (lactose), serum proteins, calcium, phosphorus, potassium, iron, magnesium, copper, and several vitamins. The fat particles are from 6 to 10 micrometers in diameter, much larger than colloidal size; they are coated with an adsorbed layer of protein (protective colloid), which maintains the emulsion. The casein is closely associated with the calcium, forming micelles of calcium caseinate which are of colloidal dimensions. The white color of milk is largely due to light scattering by these particles, and to some extent by the fat particles, rather than to the presence of a pigment. The casein complex coagulates (a) when high temperature or bacteria convert the lactose to lactic acid, as in souring, or (b) when acid or certain enzymes (rennet) are intentionally added. The serum proteins lactalbumin and lactoglobulin are also colloiddally dispersed. The lactose and mineral salts are in true molecular solution. Thus milk is a complex system exhibiting several levels of dispersion, from the molecular through colloidal and into the microscopic size range. Important processes applied to milk on an industrial scale include pasteurization, homogenization, coagulation, dehydration, and condensation (see specific entries). The milks of animals other than cows show considerable variations in composition, especially fat and protein content. See also colloid chemistry; emulsion; casein.

milk of lime (lime water). Calcium hydroxide suspended in water.

milk of magnesia (magnesia magma). A white, opaque, more or less viscous suspension of magnesium hydroxide in water from which varying proportions of water usually separate on standing.

Grade: U.S.P.

Use: Medicine (laxative).

milk sugar. See lactose.

milli- Prefix meaning 10^{-3} unit, or 1/1000th part.

millicurie. See curie.

milligram (mg). One-thousandth gram (10^{-3} gram).

milliequivalent (meq). One-thousandth of the equivalent weight of a substance.

milliliter (ml). One thousandth liter; the volume occupied by one gram of pure water at 4°C and 760 mm pressure. One milliliter (ml) equals 1.000027 cubic centimeters (cc).

millimeter (mm). One-thousandth meter; about 0.03937 inch.

millimicron (mμ). One-thousandth micron; 10 angstrom units; 1 billionth meter; 1 nanometer.

"Millitrox."²⁸⁸ Trademark for wet-milled zircon (q.v.).

"Milorganite." Trademark for an activated sludge marketed in dry granular form by the Milwaukee sewage disposal plant. Contains 5–10% moisture, 6.5–7.5% ammonia, 2.5–3.5% available phosphoric acid, 3–4% total phosphoric acid.
Use: Fertilizer.

Milori blue. Any of a number of the varieties of iron blue pigments. See iron blues.

"Miltown." Trademark for meprobamate (q.v.).

"Milvex."²⁵⁹ Trademark for a group of specialty nylon resins said to differ from conventional nylons in the following ways: (1) Highly water-resistant (dimensionally stable); (2) clarity, as opposed to the opacity of existing types; (3) adhesion to metals, glass, and other smooth surfaces; (4) tensile strength (up to 7500 psi) and elongation (up to 600%); (5) high flexibility and internal plasticization.

mineral. A loose and inexact term that may be defined chemically as any element, inorganic compound or mixture occurring or originating in the earth's crust and atmosphere, including all metals and nonmetals (except carbon), their compounds and ores. Inorganic gases (H_2 , O_2 , N_2 , CO_2 , Cl_2) are regarded as minerals. The term has long been used by biologists to indicate the nonliving "kingdom" of nature. Carbon-rich substances and mixtures, such as coal, petroleum, asphalt and non-vegetable waxes, often loosely called minerals, are organic materials that are not original components of the earth's crust, and thus are not true minerals. The term was illogically used by early chemists to describe a variety of substances; many of these uses are obsolescent, but a few persist, e.g.:

mineral acid: any of the major inorganic acids (sulfuric, nitric, hydrochloric)

mineral black: inorganic black pigments

mineral blue: varieties of blue pigments

mineral dust: industrial dust; nuisance dust

mineral green: copper carbonate

mineral oil: a liquid petroleum derivative

mineral pitch: asphalt

mineral red: iron oxide red

mineral rubber: blown asphalt

mineral spirits: a grade of naphtha

mineral water: natural spring water containing sulfur, iron, etc.

mineral wax: a wax found in the earth (ozocerite), or derived from petroleum

mineral wool: fibers made by blowing air or steam through slag.

(2) As used by nutritionists the term refers to such components of foods as iron, copper, phosphorus, calcium, iodine, selenium, fluorine and trace micro-nutrients.

minium Pb_3O_4 . Natural red oxide of lead. Found in Colorado, Idaho, Utah, Wisconsin. See also lead oxide, red.

"Minol."⁷⁹ Trademark for series of steam-distilled pine oil used in disinfectants; cleaning compounds; insecticides; paint and varnish; textile processing.

"Min-U-Gel."⁹⁸ Trademark for colloidal attapulgite clay. Available in various grades. Forms stable gel solutions in presence of electrolytes, such as saturated salt solutions.

Uses: Adhesives, cosmetics, paints, pharmaceuticals, suspension fertilizers and pesticide formulations.

"Min-U-Sil."⁴³⁶ Trademark for high-purity, crystalline silica in uniform micron sizes, 5, 10, 15 and 30. Uses: Filler in epoxy resin formulations, silicone rubber, solid polyurethane and other elastomers; industrial and latex paints; ceramic applications; high-temperature insulation products.

"Miokon Sodium."³²⁹ Trademark for sodium diprotrizoate (q.v.), a water-soluble x-ray contrast medium.

MIPA. Abbreviation for monoisopropanolamine. See isopropanolamine.

mipaflox. See N,N'-diisopropylidiamidophosphoryl fluoride.

miracle fruit concentrate (MFC). See sweetener, non-nutritive.

"Mira-Cleer."⁴⁹² Trademark for a group of starches used as a nongelling food thickener.

"Miradon."³²¹ Trademark for a brand of anisindione (q.v.).

"Mira-Film."⁴⁹² Trademark for a series of acetate esters of corn starch used as warp size for synthetic yarns.

"Mirasol."²²³ Trademark for a series of alkyd type resins. Epoxy resin esters are also marketed under this name. Available in all modifications including drying oils, semi-drying oils, non-drying oils, natural and phenolic resins.

Uses: Air-drying and baking finishes including architectural, lacquer, wrinkle, hammer and other industrial enamels; also printing inks and textile finishes.

"Miravar."²²¹ Trademark for a group of oleoresinous varnishes.

Uses: Industrial finishes and wrinkle enamels.

mirbane oil. See nitrobenzene.

"Mirrex."⁴⁸² Trademark for a calendered, unplasticized PVC film. Available in film or sheeting for a wide range of packaging applications.

mirror-image molecules. See optical isomerism; enantiomorph; chiral.

misch metal. The primary commercial form of mixed rare-earth metals (95%), prepared by the electrolysis of fused rare earth chloride mixtures. Sp. gr. about 6.67; m.p. about 1200°F. Form: Waffle-like plates weighing 40 to 60 lb packed in oiled paper, immersed in oil, or coated with vinyl paint.

Hazard: Flammable, dangerous fire risk.

Uses: Lighter flints; ferrous and non-ferrous alloys; cast iron; aluminum, nickel, magnesium and copper alloys; getter in vacuum tubes.

Shipping regulations: (Rail) Flammable solids, n.o.s., Yellow label. (Air) Flammable Solid label.

miscibility. The ability or tendency of one liquid to mix or blend uniformly with another. Alcohol is miscible with water; gasoline and water are immiscible. See also solubility, often used in the same sense in reference to liquids.

"Mist."⁸⁴ Trademark for a wettable rubbermakers' grade of sulfur.

"Mistron."³⁸ Trademark for ultra-fine particle size magnesium silicates available in a variety of grades. See also talc.

miticide. A substance which kills mites, small animals of the spider class, among them the European red mite and the common red spider which infest fruit trees.

mitochondria. Particles of cytoplasm (q.v.) found in most respiring cells. They synthesize most of the cell's adenosine triphosphate and are the chief energy sources of living cells. They are highly plastic, mobile structures which may fragment or fuse together at random. Many enzymes, especially those involved in converting food-derived energy into a form usable by the cell, are located in the mitochondria, and DNA molecules have also been found there. Yeast is a particularly rich source of mitochondria for research purposes.

mitosis. The division of a cell nucleus to produce two new cells, each having the same chemical and genetic constitution as the parent cell. The deoxyribose (nucleic acid) component of the chromosomes is present in duplicate in the original nucleus. The amount of nucleic acid is doubled just before cell division begins; subsequent events (called phases) permit separation of the products of replication to form the new nuclei. Each half-chromosome carries the identical nucleic acids of the original chromosome. See also cell (1).

"Mitox."²⁵³ Trademark for para-chlorobenzyl para-chlorophenyl sulfide. Used as a specific miticide or acaricide.

mixed acid (nitrating acid). A mixture of sulfuric and nitric acids used for nitrating, e.g., in the manufacture of explosives, plastics, etc. Consists of 36% nitric acid and 61% sulfuric acid.

Hazard: Causes severe burns; highly toxic and irritant by ingestion and inhalation. May cause nitrous gas poisoning; spillage may cause fire or liberate dangerous gas. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes. Legal label name, Nitrating acid.

mixing. Effecting a uniform dispersion of liquid, semi-solid, or solid ingredients of a mixture by means of mechanical agitation. Thin liquids and slurries are blended by means of impellers, i.e., rotating rods at the end of which blades of various shapes and sizes are attached. Also called dispersers, these are widely used in the paint industry, though roller mills and ball mills are also employed. Viscous liquids require the use of revolving paddles of various shapes, as in the food and candy industries; thick mixtures involving volatile solvents are blended in closed containers provided with a rotating shaft equipped with fin-like projections (sometimes called churns), used in preparing organic cements. Mixing of thick plastic

masses containing no solvent is done in kneaders, either open or enclosed. The open type is comprised of a metal trough in which an agitating device of various designs revolves slowly. The enclosed type is typified by the Banbury mixer, in which oppositely turning involuted rotors provide the blending action. These can handle batches up to 1000 pounds of material and are used in the rubber and plastics industries. Particulate solids can be effectively blended in tumbling barrels or similar devices.

mixture. A heterogeneous blend of elements or compounds, which may or may not be uniformly dispersed. The components or phases (q.v.) of a mixture are not chemically combined and can be separated by mechanical means, i.e., by gravity, by distillation, by freezing, by melting, etc. All solutions are uniformly dispersed mixtures. Examples are air, milk, gasoline, petroleum, glass, cement, alloys. See also compound; solution; homogeneous; heterogeneous.

MKP. Abbreviation for monopotassium phosphate. See potassium phosphate, monobasic.

ml Abbreviation for milliliter (q.v.).

MLA. Abbreviation for mixed lead alkyls (q.v.).

mm Abbreviation for millimeter (q.v.).

MMH. Abbreviation for monomethylhydrazine. See methylhydrazine.

Mn Symbol for manganese.

Mo Symbol for molybdenum.

"Mobilcer."³³¹ Trademark for a group of wax emulsions.

Uses: Sizes for paper, paperboard, particle board, textiles and cordage; binders in ceramics; carriers for pesticides; coating of fruits and vegetables; plasticizing of laundry starch; treatment of nursery stock; end-checking treatments for timber and lumber; in the manufacture of foam rubber and polymeric latex products; curing of concrete.

mobility. The ease with which a liquid moves or flows. Hydrocarbon liquids (nonpolar), which have low viscosity, surface tension and specific gravity, respond more readily to an applied force than does water (a polar liquid). For this reason fires involving hydrocarbon liquids should be extinguished with foam rather than with a direct stream of water.

"Mobil-Kote."³³¹ Trademark for a group of wax based blends with resins, polymers and copolymers. **Uses:** Improved gloss and barrier coatings for paper packaging, folding cartons, and corrugated cartons.

"Mobilpar."³³¹ Trademark for a group of emulsified, or emulsifiable petroleum products. **Uses:** Lubrication of textile fibers; plasticizers for starch formulas in the textile industry; softeners and wetting-out agents in the paper and textile industries; foam control agents in aqueous processes.

"Moca."²⁸ Trademark for 4,4'-methylenbis(2-chloroaniline) (q.v.).

modacrylic fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of less than 85% but at least 35% by weight of acrylonitrile units, $-\text{CH}_2\text{CH}(\text{CN})-$ (Federal Trade Commission). Other chemicals such as vinyl chloride are incorporated as modifiers. Characterized by moderate tenacity, low water absorption, and resistance to combustion. Self-extinguishing.

Uses: Deep pile and fleece fabrics; industrial filters; carpets; underwear; blends with other fibers. See also fiber; acrylonitrile.

"Mod-Epoxy."⁵⁸ Trademark for modifier for epoxy resins. Reduces viscosity of liquid epoxy resins, accelerates cure; improves strength, electrical and adhesive characteristics. Used in tool and die manufacture; electric potting compounds; encapsulations; adhesives; surface coatings and body solders.

moderator. A substance of low atomic weight such as beryllium, carbon (graphite), deuterium (in heavy water) or ordinary water, which is capable of reducing the speed of neutrons but which has little tendency toward neutron absorption. The neutrons lose speed when they collide with the atomic nuclei of the moderator. Moderators are used in nuclear reactors, since slow neutrons are most likely to produce fission. A typical graphite-moderated reactor may contain 50 tons of uranium for 472 tons of graphite. Reactors in the U.S. are cooled and moderated with light water.

"Modiril."²⁹⁹ Trademark for rescinnamine (q.v.).

"Modicol" VD.³⁰⁹ Trademark for a modified sodium polyacrylate solution; used as a thickener. See acrylates.

modification. A chemical reaction in which some or all of the substituent radicals of a high polymer are replaced by other chemical entities, resulting in a marked change in one or more properties of the polymer without destroying its structural identity. Cellulose, for example, can be modified by substitution of its hydroxyl groups by carboxyl or alkyl radicals along the carbon chain. These reactions are usually not stoichiometric. Their products have many properties foreign to the original cellulose, e.g., water solubility, high viscosity, gel and film-forming ability. Other polymeric substances that can undergo modification are rubber, starches, polyacrylonitrile, and some other synthetic resins. See also cellulose, modified.

"Modulan."⁴⁹³ Trademark for a specially prepared acetylated lanolin. An anhydrous, practically odorless, pale yellow unctuous solid; soluble in mineral oil.

Uses: Hypoallergenic cosmetics.

modulus of elasticity (elastic modulus). A coefficient of elasticity representing the ratio of strain to stress as a material is deformed under dynamic load. It is a measure of the softness or stiffness of the material (Young's modulus). Typical values of Young's modulus for a stress of 100,000 lb/sq in. are carbon steels 300, copper 170, soda-lime glass 100, polystyrene 5, graphite 1.

"Modx."⁹⁴ Trademark for a blend of an inorganic acetate with N,N'-diphenylethylenediamine. A rubber accelerator.

moellon degreas. See degreas.

"Mogul."²⁷⁵ Trademark for channel carbon blacks; used for inks, paints, paper, and plastics.

mohair. A natural fiber similar to wool obtained from angora goats. Used in fabrics for outer clothing, draperies, upholstery. Combustible. Tenacity 14 grams per denier.

Mohr's salt. See ferrous-ammonium sulfate.

Mohs scale. A scale of hardness of minerals, running from 1 to 10, with talc the softest and diamond the hardest. Each mineral in the scale with scratch all those below it. The steps are not of equal value; the difference in hardness between 9 and 10 is much greater than between 1 and 2.

Diamond	10	Apatite	5
Corundum	9	Fluorite	4
Topaz	8	Calcite	3
Quartz	7	Gypsum	2
Orthoclase (Feldspar)	6	Talc	1

A recent addition is 11 (fused zirconia).

moiety. An indefinite portion of a sample.

molal. A concentration in which the amount of solute is stated in moles and the amount of solvent in kilograms. The unit of molality is moles of solute per kilogram of solvent and is designated by a small m; 1 mole of NaCl in 1 kg of water is a 1 molal concentration.

Note: Do not confuse with molar (q.v.).

molar. A concentration in which one molecular weight in grams (one mole) of a substance is dissolved in one liter of solution. Molarity is indicated by an italic capital M. Molar quantities are proportional to the molecular weights of the substances.

molasses. The thick liquid left after sucrose has been removed from the mother liquor in sugar manufacture. Blackstrap molasses is the syrup from which no more sugar can be obtained economically. It contains about sucrose 20%, reducing sugars 20%, ash 10%, organic nonsugars 20%, water 20%. Combustible. Nontoxic.

Uses: Feed; food; raw material for various alcohols, acetone, citric acid, and yeast propagation. Sodium glutamate is made from Steffens molasses, a waste liquor from beet sugar manufacture.

See also fermentation.

molding. Forming a plastic or rubber article in a desired shape by application of heat and pressure, either in a negative cavity, usually of metal, or in contact with a contoured metal or phenolic resin surface. For details see injection molding; blow molding; compression molding.

molding powder. A mixture in granular or pelleted form of a plastic base material together with necessary modifying ingredients (filler, plasticizer, pigment, etc.). Such mixtures are normally prepared by resin manufacturers and sold as such to processors ready for use in injection molding or extrusion operations.

molding sand. See foundry sand.

mole. The amount of pure substance containing the same number of chemical units as there are atoms in exactly 12 grams of carbon-12 [i.e., 6.023×10^{23}]. This involves the acceptance of two dictates—the scale of atomic masses and the magnitude of the gram. Both have been established by international agreement. Formerly, the connotation of "mole" was "gram molecular weight." Current usage tends to apply the term "mole" to an amount containing Avogadro's number of whatever units are being considered. Thus it is possible to have a mole of atoms, ions, radicals, electrons, or quanta. This usage makes unnecessary such terms as "gram-atom," "gram-formula weight," etc. All stoichiometry essentially is based on the eval-

uation of the number of moles of substance. The most common involves the measurement of mass. Thus 25.000 grams of H_2O will contain $25.000/18.015$ moles of H_2O ; 25.000 grams of sodium will contain $25.000/22.990$ moles of sodium. The convenient measurements on gases are pressure, volume, and temperature. Use of the ideal gas law constant R allows direct calculation of the number of moles: $n = (P \times V) / (R \times T)$. T is the absolute temperature; R must be chosen in units appropriate for P , V , and T . The acceptance of Avogadro's law is inherent in this calculation; so too are approximations of the ideal gas. See also Avogadro's law. William F. Kieffer.

molecular biology. A subdivision of biology that approaches the subject of life at the level of molecular size. This applies to phenomena occurring within the cell nucleus, where the chromosomes and genes are located. These structures, which determine heredity, are in turn composed of nucleic acids (q.v.), which direct the selection and assembly of amino acids in the dividing chromosomes. Much of the essential mechanism of life can be understood by study of specific protein molecules (DNA and RNA) and their effect on the amino acid composition of the genes. See also genetic code; deoxyribonucleic acid; recombinant DNA.

molecular distillation (high vacuum distillation). Distillation at low pressures of the order of 0.001 mm. A molecular distillation is distinguished by the fact that the distance from the surface of the liquid being vaporized to the condenser is less than the mean free path (the average distance traveled by a molecule between collisions) of the vapor at the operating pressure and temperature. This distance is usually of the order of magnitude of a few inches. This process is useful in separation of extremely high boiling and heat-sensitive materials such as glycerides and some vitamins.

molecular formula. See formula, chemical.

molecular rearrangement. See rearrangement.

molecular sandwich (sandwich molecule). See metallo-cene.

molecular sieve. A group of adsorptive desiccants which are crystalline aluminosilicate materials, chemically similar to clays and feldspars and belonging to a class of minerals known as zeolites (q.v.). The outstanding characteristic of these materials is their ability to undergo dehydration with little or no change in crystal structure. The dehydrated crystals are interlaced with regularly spaced channels of molecular dimensions. This network of uniform pores comprises almost 50 per cent of the total volume of crystals.

The empty cavities in activated "molecular sieve" crystals have a strong tendency to recapture the water molecules that have been driven off. This tendency is so strong that if no water is present they will accept any material that can get into the cavity. However, only those molecules that are small enough to pass through the pores of the crystal can enter the cavities and be adsorbed on the interior surface. This sieving or screening action, which makes it possible to separate smaller molecules from larger ones, is the most unusual characteristic of molecular sieves. They are used in many fields of technology: to dry gases and liquids; for selective molecular separations based on size and polar properties; as ion-exchangers; as catalysts; as chemical carriers; in gas chromatography; and in the petroleum industry

to remove normal paraffins from distillates. See also zeolite; gel filtration.

molecular weight. The sum of the atomic weights of the atoms in a molecule. That of methane (CH_4) is 16.032, the atomic weights being $C = 12$, $H = 1.008$. The chemical formula used in such a calculation must be the true molecular formula of the substance designated. For example, the molecular formula of oxygen is O_2 , and its molecular weight is 32 (atomic weight of $O = 16$). For ozone the molecular formula is O_3 , and the molecular weight is 48. The true molecular weight of a gas or vapor is found by measuring the volume of a given weight and then calculating the weight of 22.4 liters at $0^\circ C$ and 760 mm. The molecular weight of many complex organic molecules runs as high as a million or more (proteins and high polymers). See also Avogadro; atomic weight; mole.

molecule. Molecules are chemical units composed of one or more atoms. The simplest molecules contain one atom each; for example, helium atoms (one atom per molecule) are identical with helium molecules. Oxygen molecules (O_2) are composed of two atoms, and ozone (O_3) of three. Molecules may contain several different sorts of atoms. Water (H_2O) contains two different kinds, hydrogen and oxygen, and dimethyl amine [CH_3] $_2$ NH has three kinds. Molecules of many common gases [hydrogen (H_2), oxygen (O_2), nitrogen (N_2), and chlorine (Cl_2)] consist of two atoms each. The atoms of a molecule are held together by chemical bonds. Molecules vary in size from less than 1 to more than 500 millimicrons. The latter are called macromolecules (q.v.). See also bond, chemical; atom.

"Molox"⁴¹⁶ Proprietary process employing molecular sieves to separate normal paraffins from mixtures with isoparaffins and other types of hydrocarbons. Products consist of a normal paraffin stream of high purity and a second stream containing the remaining hydrocarbons in the original mixture. The normal paraffins are excellent components of jet fuels or as raw materials for further chemical synthesis. The denormalized stream, if within the gasoline boiling range, will have higher antiknock quality than the original mixture containing the normal paraffins. The present commercial application is in producing normal paraffins for conversion into "soft" detergent alkylates.

"Moli-Spray."⁴⁵⁶ Trademark for a suspension of finely divided molybdenum disulfide powder. Forms a fast drying, adhesive film on all surfaces. Containers: 16-oz aerosol can.

molten salt. See fused salt.

"Molytropren."⁴⁷⁰ Trademark for urethane polyester and polyether foams.

"Moly."⁶⁷ Trademark for a series of molybdenum-containing compounds used for seed treatment as a foliar spray, fertilizer additive and for similar related uses.

molybdate chrome orange. See molybdate orange.

molybdate orange (molybdenum orange; molybdate chrome orange). A solid solution of lead chromate, lead molybdate, and lead sulfate.

Properties: Fine dark orange or light red powder.

Derivation: By adding solutions of sodium chromate, sodium molybdate and sodium sulfate to a lead nitrate solution under carefully controlled conditions and filtering off the precipitate.

Containers: Barrels.

Hazard: Toxic by ingestion.

Uses: Pigment in printing inks, paints, plastics.

molybdenite (molybdenum glance) MoS_2 . Natural molybdenum sulfide found in igneous rocks and metallic veins.

Properties: Color, bluish-lead gray; stream gray-black; luster metallic; one perfect cleavage; greasy feel; Mohs hardness 1-1.5; sp. gr. 4.6-4.8. Similar in appearance to graphite. Soluble in sulfuric and strong nitric acids.

Occurrence: Colorado, Utah, New Mexico; Chile.

Use: Principal ore of molybdenum.

molybdenite concentrate. Commercial molybdenite ore after the first processing operations. Contains about 90% molybdenum disulfide along with quartz, feldspar, water, and processing oil.

molybdenum Mo Metallic element of atomic number 42, in group VIB of the periodic table. Atomic weight 95.94; valences 2,3,4,5,6. Seven stable isotopes.

Properties: Gray metal or black powder. Does not occur free in nature (see molybdenite). A necessary trace element in plant nutrition. Insoluble in hydrochloric or hydrofluoric acid, ammonia, sodium hydroxide, or dilute sulfuric acid; soluble in hot concentrated sulfuric or nitric acids; insoluble in water. Sp. gr. 10.2; m.p. 2610°C; b.p. 5560°C; high strength at very high temperatures. Nontoxic. Oxidizes rapidly above 1000°F in air at sea level, but is stable in upper atmosphere.

Derivation: By aluminothermic, hydrogen, or electric furnace reduction of molybdenum trioxide or ammonium molybdate.

Forms available: Ingots, rods, wire, powder; ingots (from powder); high ductility sheets; concentrates; also as large single crystals.

Purity: Rods and wire 99.9%; powder 99.9%.

Containers: (powder) Drums.

Hazard: Flammable in form of dust or powder. Tolerance of Mo compounds: insoluble, 10 mg per cubic meter of air; soluble, 5 mg per cubic meter of air.

Uses: Alloying agent in steels and cast iron; high-temperature alloys; tool steels; pigments for printing inks, paints, and ceramics; catalyst; solid lubricants; missile and aircraft parts; reactor vessels; cermets; die-casting copperbase alloys; special batteries.

See also ferromolybdenum; heteromolybdates.

molybdenum acetylacetonate $\text{Mo}(\text{C}_5\text{H}_7\text{O}_2)$. Crystalline powder. Slightly soluble in water. Resistant to hydrolysis. A chelating nonionizing compound.

Uses: Catalyst for polymerization of ethylene and formation of polyurethane foam.

molybdenum aluminide. A cermet which can be flame-sprayed.

molybdenum anhydride. See molybdenum trioxide.

molybdenum anhydride. See molybdenum trioxide.

molybdenum boride. Several borides are known: Mo_2B , m.p. 2000°C; Mo_3B_2 , m.p. 2070°C; MoB (ordinary and β -forms) m.p. 2180°C; Mo_2B_3 , m.p. 1600°C (transforms to MoB).

Derivation: By heating molybdenum powder and boron to 1500-1600°C in hydrogen.

Uses: Brazes to join molybdenum, tungsten, tantalum and niobium parts, especially electronic components; corrosion and abrasion-resistant parts; cutting tools; refractory cermets.

molybdenum carbonyl. See molybdenum hexacarbonyl.

molybdenum dioxide MoO_2 .

Properties: Lead-gray, nonvolatile powder; insoluble in hydrochloric and hydrofluoric acids and alkalis; sparingly soluble in sulfuric acid; sp. gr. about 6.4.

Derivation: Reduction of molybdenum trioxide or molybdates by hydrogen; partial oxidation of metallic molybdenum.

Hazard: Tolerance, 10 mg per cubic meter of air.

molybdenum diselenide MoSe_2 . Available as a 40-micron powder. Used as a solid lubricant.

molybdenum disilicide MoSi_2 . A cermet.

Properties: Dark gray, crystalline powder; sp. gr. 6.31 (20°C); m.p. 1870-2030°C. Not affected by air up to 3000°F; not attacked by most inorganic acids, including aqua regia, but very soluble in hydrofluoric and nitric acids. Has high stress-rupture strength.

Derivation: By fusion of hydrogen-reduced molybdenum with silicon.

Forms: Cylinders; lumps; granules; powder; whiskers. May be coated on materials by vapor deposition and by flame spraying.

Grades: 98.5%; 99.5%; mesh size-200 and -325.

Hazard: Tolerance, 5 mg per cubic meter of air.

Uses: Electrical resistors; protective coatings at high temperatures; engine parts in space vehicles (molybdenum coated with molybdenum disilicide).

molybdenum disulfide (molybdic sulfide, molybdenum sulfide) MoS_2 . See also molybdenite.

Properties: Black, crystalline powder; sp. gr. 4.80; m.p. 1185°C; soluble in aqua regia, sulfuric acid (conc); insoluble in water. Mohs hardness 1; coefficient of friction .02-.06.

Hazard: Tolerance, 5 mg per cubic meter of air.

Derivation: Purification of molybdenite; reaction of sulfur or hydrogen sulfide on molybdenum trioxide.

Uses: Lubricants in greases, oil dispersions, resin-bonded films, dry powders, etc., especially at extreme pressures and high vacua; hydrogenation catalyst.

molybdenum ditelluride MoTe_2 . Available as a 40-micron powder. Used as a solid lubricant.

molybdenum glance. See molybdenite.

molybdenum hexacarbonyl (molybdenum carbonyl) $\text{Mo}(\text{CO})_6$.

Properties: White shiny crystals; decomposes at 150°C without melting; sp. gr. 1.96; b.p. about 155°C; vapor pressure at 20°C about 0.1 mm; at 101°C about 43 mm; insoluble in water; soluble in ceresin, paraffin oil, benzene, aminoanthraquinone; slightly soluble in ether and other organic solvents.

Derivation: From molybdenum pentachloride by reaction with zinc dust and carbon monoxide in ether at high pressures.

Hazard: Toxic. Above 150°C, decomposes to evolve carbon monoxide. Tolerance, 5 mg per cubic meter of air.

Uses: Plating molybdenum, i.e., molybdenum mirrors; intermediate.

molybdenum hexafluoride MoF_6 .

Properties: White crystalline compound; m.p. 17.5°C; b.p. 35°C; sp. gr. (liq.) about 2.5. Reacts readily with water.

Derivation: Direct action of fluorine on molybdenum metal.

Hazard: Toxic; strong irritant. Tolerance, 5 mg per cubic meter of air.

Uses: Separation of molybdenum isotopes.

molybdenum lake. See phosphomolybdic pigment.

molybdenum metaphosphate $\text{Mo}(\text{PO}_3)_6$. Yellow powder; sp. gr. 3.28 (0°C); insoluble in water, in most acids. Slightly soluble in hot aqua regia.

molybdenum naphthalene. Dark purple, viscous liquid; soluble in most hydrocarbons; catalyst for commercial production of propylene oxide using hydroperoxides.

Hazard: Tolerance, 5 mg per cubic meter of air.

molybdenum orange. See molybdate orange.

molybdenum III oxide. See molybdenum sesquioxide.

molybdenum oxides. See molybdenum sesquioxide; molybdenum dioxide; molybdenum trioxide.

molybdenum pentachloride MoCl_5 .

Properties: Green-black solid; dark red as liquid or vapor; m.p. 194°C ; b.p. 268°C ; sp. gr. 2.9. Hygroscopic, reacting with water and air; soluble in dry ether, dry alcohol, and other organic solvents.

Derivation: Direct action of chlorine on finely divided molybdenum metal.

Containers: Inert gas-filled glass bottles.

Hazard: Toxic and irritant. Tolerance, 5 mg per cubic meter in air.

Uses: Chlorination catalyst; vapor-deposited molybdenum coatings; component of fire-retardant resins; brazing and soldering flux; intermediate for organometallic compounds, e.g., molybdenum hexacarbonyl.

molybdenum sesquioxide (dimolybdenum trioxide, molybdenum III oxide) Mo_2O_3 . Known only in the hydrated form, $\text{Mo}(\text{OH})_3$, although commonly assigned the formula Mo_2O_3 . A compound formed by a dry reaction of molybdenum and oxygen which approximates the composition of the sesquioxide is probably a mixture of molybdenum and molybdenum dioxide.

Properties: Gray-black powder; slightly soluble in acids; insoluble in alkalis and water.

Derivation: Zinc reduction of acid solutions of molybdic acids and molybdates; electrolytic deposition from acid solutions of molybdates.

Hazard: Tolerance, 10 mg per cubic meter of air.

Uses: Catalyst in organic synthesis; decoration and protection for metal articles; feed additive.

molybdenum silicide. Alloy of 60% molybdenum, 30% silicon, and 10% iron, used as means of introducing molybdenum into steel.

molybdenum sulfide. See molybdenum disulfide.

molybdenum trioxide (molybdenum anhydride; molybdic oxide; molybdic acid anhydride) MoO_3 .

Properties: White powder at room temp.; yellow at elevated temperatures; sp. gr. 4.69; m.p. 795°C ; sublimes starting at 700°C . Sparingly soluble in water; very soluble in excess alkali with formation of nitric lybdates; soluble in concentrated mixtures of nitric and hydrochloric acids or nitric and sulfuric acids. Two hydrates are known: $\text{MoO}_3 \cdot \text{H}_2\text{O}$ and $\text{MoO}_3 \cdot 2\text{H}_2\text{O}$. Readily combines with acids and bases to form a series of polymeric compounds.

Derivation: Roasting of molybdenite; by ignition of the metal, the sulfides, the lower oxides, and of molybdic acids.

Purification: Sublimation.

Grades: Technical; pure; reagent, A.C.S.

Containers: Drums; carload lots.

Hazard: Tolerance, 5 mg per cubic meter of air.

Uses: Source of molybdenum compounds; agriculture; analytical chemistry; manufacture of metallic molybdenum; introduction of molybdenum in alloys; corrosion inhibitor; ceramic glazes; enamels; pigments; catalyst in petroleum industry; medicine.

molybdic acid. Molybdic acid of commerce is either an ammonium molybdate (molybdic acid 85%) or molybdenum trioxide. The use of the term interchangeably for these compounds has caused confusion. Solutions of molybdic acid are very complex chemically since they show a great tendency to polymerize.

molybdic acid, anhydride. See molybdenum trioxide.

molybdic oxide. See molybdenum trioxide.

molybdic sulfide. See molybdenum disulfide.

molybdophosphates. See heteromolybdates.

12-molybdophosphoric acid. See phosphomolybdic acid.

molybdosilicates. See heteromolybdates.

12-molybdosilicic acid (silicomolybdic acid)

$\text{H}_4\text{SiMo}_{12}\text{O}_{40} \cdot x\text{H}_2\text{O}$ where x is usually 6-8.

Properties: Yellow crystalline powder; sp. gr. 2.82. Soluble in water, ethyl alcohol, acetone; insoluble in benzene and cyclohexane. Decomposes in strongly basic solutions. Thermally stable.

Grade: Reagent.

Hazard: Strong oxidizing agent in aqueous solution.

Tolerance, 5 mg per cubic meter in air.

Uses: Catalysts; reagents; photography; precipitants and ion exchangers in atomic energy; additives in plating processes; imparting water resistance to plastics, adhesives, and cement.

See also heteromolybdates.

"Moly-Gro."⁴³³ Trademark for molybdenum compounds used to correct molybdenum deficiency in soils and crops.

"Molykote."¹⁴⁹ Trademark for lubricants used in friction problems which involve galling, welding and siezing. Also used for similar mating materials; freeing, high starting friction; and rubber to metal. Available as powders, greases, dispersions, sticks and bonded lubricant coatings.

"Molynamel."⁷²⁸⁹ Trademark for resin-bonded molybdenum disulfide lubricating enamels.

"Molsulfide."⁶⁷ Trademark for molybdenum disulfide (q.v.).

"Monacide."⁴⁰⁵ Trademark for a series of insecticides containing 5% DDVP.

"Monamids."⁴⁰⁵ Trademark for a group of dialkylolamides which include various grades of coconut fatty acid monoethanolamide, coconut fatty acid monopropanolamide, lauric acid monoethanolamide, lauric acid monoisopropanolamide, and stearic acid monoethanolamide.

"Monamines."⁴⁰⁵ Trademark for a group of dialkylolamides used as detergent, detergent additives, foam boosters, wetters, emulsifiers, dispersing agents, thickeners and conditioners.

"Monamulse."⁴⁰⁵ Trademark for a series of compounded emulsifiers for paints, plastics, graphic arts, agricultural sprays and other fields.

"Monaquats."⁴⁰⁵ Trademark for quaternary ammonium compounds based on 1-ethyl hydroxy-2-alkyl imidazolines.

"Monaquests."⁴⁰⁵ Trademark for a series of ethylene diaminetetraacetic acid and (hydroxyethyl)ethylene-diaminetriacetic acid sequestering agents.

"Monastral."²⁸ Trademark for a group of quinacridone colorants, chiefly red, maroon, blue, and violet. Excellent covering power, lightfastness and chemical resistance. Used in lacquers, paints, plastics, rubber. Stable at high temperatures.

"Monastrip."⁴⁰⁵ Trademark for a solvent-stripper for uncured and cured epoxy, polyester, and silicone rubber casting and encapsulating compounds.

"Monaterics."⁴⁰⁵ Trademark for a special group of substituted imidazolines classified as amphoteric surfactants. Excellent wetting, emulsifying, penetrating and spreading properties in systems requiring broad pH ranges.

monatomic. See diatomic.

"Monawets."⁴⁰⁵ Trademark for a group of surfactants of di-octyl, di-hexyl, di-isobutyl and di-tridecyl sulfosuccinates known for their wetting, spreading, penetrating and emulsifying power.

monazite. A natural phosphate of the rare earth metals, principally the cerium and lanthanide metals, usually with some thorium. Yttrium, calcium, iron, and silica are frequently present. Monazite sand is the crude natural material and is usually purified from other minerals before entering commerce.

Properties: Color yellowish to reddish brown; luster vitreous to resinous; streak white; Mohs hardness 5-5.5; sp. gr. 4.9-5.3.

Occurrence: North Carolina, South Carolina, Idaho, Colorado, Montana, Florida; Brazil; India; Australia; Canada.

Uses: Source of thorium, cerium, and other rare-earth metals and compounds.

"Monazolines."⁴⁰⁵ Trademark for a series of cationic imidazolines useful as emulsifiers, antistatic agents, water displacers and corrosion inhibitors in agricultural sprays, acid and solvent cleaners, cosmetic and water-oil systems.

Mond process. Mixed ores obtained from roasting crude ores are heated from 50-80°C in a stream of producer gas. Oxides other than nickel are reduced to the metallic state while nickel forms nickel carbonyl [Ni(CO)₄] which passes off as a vapor. The vapor is subsequently resolved into carbon monoxide and free nickel.

"Mondur."⁵⁶⁷ Trademark for a series of isocyanates.

CB-60 and CB-75. Polyisocyanates.

HX. Hexamethylene diisocyanate.

O. Octadecyl isocyanate.

P. Phenyl isocyanate.

S and SH. Stabilized polyisocyanate adduct.

TM. Triphenylmethane triisocyanate.

Uses: Surface coatings, adhesives, chemical intermediate, hydrophobic agent to increase water repellency of textiles, leather and paper products.

"Monel."²⁸¹ Trademark for a large group of corrosion-resistant alloys of predominantly nickel and copper and very small percentages of carbon, manganese, iron, sulfur, and silicon. Some also contain a small percentage of aluminum, titanium, and cobalt.

Have good corrosion-resisting properties. Used in electronics industry.

"Monex."²⁴⁸ Trademark for tetramethylthiuram monosulfide (q.v.).

mono-. Prefix denoting one; see under specific compound; e.g., monochloroacetic acid, see chloroacetic acid. Only a few of the many possible cross references from mono-compounds are given here. (See below).

mono acid F. See 2-naphthol-7-sulfonic acid.

monoanhydrosorbitol. See sorbitan.

monoazo dye. See azo dye.

monobasic. Descriptive of acids having one displaceable hydrogen atom per molecule; acids having two, three or more displaceable H atoms are called dibasic, tribasic, and polybasic, respectively. See also acid.

"Monobel."²³ Trademark for intimate mixtures of "Amberlite" cation and anion exchange resins.

Use: Complete removal of ionizable impurities from water and other solutions in a one-step treatment.

"Monobel."²⁸ Trademark for a low-velocity permissible dynamite furnished in six grades based upon velocity and cartridge count. For mining coal where lump coal is a factor.

monobenzene (para-benzoyloxyphenol; monobenzyl ether of hydroquinone) C₆H₅CH₂OC₆H₄OH. See also hydroquinone benzyl ethers.

Properties: White, odorless, crystalline powder; little taste; melting range 115-118°C; soluble in alcohol and acetone; insoluble in water.

Grade: N.F.

Use: Medicine.

monocalcium phosphate. See calcium phosphate, monobasic.

monochloroacetic acid. Legal label name (Rail) for chloroacetic acid (q.v.).

monochloroacetone. Legal label name (Rail) for chloroacetone (q.v.).

monochlorobenzene. See chlorobenzene.

monochlorodifluoromethane. Legal label name (Rail) for chlorodifluoromethane (q.v.).

monochloropentafluoroethane. Legal label name (Rail) for chloropentafluoroethane (q.v.).

monochlorophenol. See chlorophenol.

monochlorotetrafluoroethane. Legal label name (Rail) for chlorotetrafluoroethane (q.v.).

monochlorotriazinyl dye. A fiber-reactive dye for cellulose fibers. See dye, fiber-reactive.

monochlorotrifluoromethane. Legal label name (Rail) for chlorotrifluoromethane (q.v.).

"Monochrome."³⁰⁷ (U.S.A.). Trademark for a series of mordant dyestuffs. Used for the dyeing of wool. Characterized by good fastness properties.

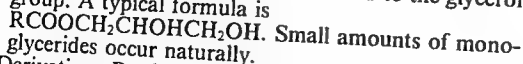

monoethanolamine. See ethanolamine.

monoethylamine. Legal label name (Rail) for ethylamine (q.v.).

monofilament. A single, continuous strand of glass or synthetic fiber as extruded from a spinneret. See filament.

"Monofrax."⁴⁴² Trademark for a line of fused-cast refractories.

monoglyceride. A glycerol ester of fatty acids in which only one acid group is attached to the glycerol group. A typical formula is

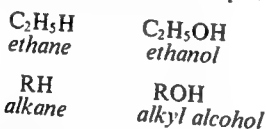

Derivation: Produced synthetically by the alcoholysis of fats with glycerol, yielding a mixture of mono-, di-, and triglycerides which is predominantly monoglycerides.

Uses: Emulsifiers; cosmetics; lubricants.

See glycerol monostearate, glycerol monolaurate, etc.

monohydric alcohol. An alcohol in which a hydroxyl group ($-\text{OH}$) has replaced one of the hydrogen atoms of a hydrocarbon; for example:

There are a number of classifications analogous to those of hydrocarbons: (1) paraffinic or simple alcohols, whose formula may be represented as $\text{C}_n\text{H}_{2n+1}$; (2) olefinic or fatty alcohols, which contain one or more double bonds; (3) alicyclic alcohols, closed ring structures which may or may not contain a double bond, e.g., cyclohexanol; (4) aromatic alcohols, in which the hydroxyl group is attached to a benzene nucleus, as in phenol; (5) heterocyclic alcohols, based on the pentagonal furan ring; and (6) polycyclic alcohols of high molecular weight, known collectively as sterols. Any of these types that contain 12 or more carbon atoms are semisolid to solid, and have a wax-like consistency; the others are colorless liquids.

Monohydric alcohols are also classified as primary, secondary, or tertiary, on the basis of the number of alkyl (methyl) groups substituted for the hydrogen atoms on the central or methanol carbon atom. See also primary.

monomer (momer). A molecule or compound usually containing carbon and of relatively low molecular weight and simple structure, which is capable of conversion to polymers, synthetic resins or elastomers by combination with itself or other similar molecules or compounds. Thus, styrene is the monomer from which polystyrene resins are produced; vinyl chloride is the monomer of polyvinyl chloride. Other common monomers are methyl methacrylate; adipic acid and hexamethylenediamine.

monomethylamine. Legal label name (Rail) for methylamine (q.v.).

monomolecular film. See film.

"Monopentek."¹³⁸ Trademark for monopentaerythritol. See pentaerythritol.

"Monoplas."²⁶³ Trademark for a group of monomeric phthalates used as plasticizers.

"Monoplex."²³ Trademark for monomeric liquid plasticizers for polyvinyl chloride and other high polymers. Primarily esters, but also some epoxides which impart heat and light stability.

Uses: Plasticizers, stabilizers, processing aids.

"Monopole oil."³⁰⁹ Trademark for a double sulfonated castor oil used as a textile auxiliary.

monopropellant. A propellant which combines fuel and oxidizer in one compound or mixture. Gunpowder is an example of a solid monopropellant. Liquid monopropellants, for rockets, include: methyl nitrate; nitromethane; a mixture of hydrocarbons with tetranitromethane; a mixture of methyl nitrate and methanol. See also rocket fuel.

monosaccharide. Any of several simple sugars having the formula $\text{C}_6\text{H}_{12}\text{O}_6$; the best-known are glucose, fructose and galactose. Monosaccharides combine to form more complex sugars known as oligo- and polysaccharides.

monosodium glutamate. See sodium glutamate.

monostearin. See glycerol monostearate.

monosulfonic acid F. See 2-naphthol-7-sulfonic acid.

"Monosulph."³⁰⁹ Trademark for straight sulfated castor oil for defoaming and leveling. Used to improve flow characteristics of coating formulations.

"Monotan."³⁰⁹ Trademark for a series of synthetic tanning compounds of the aminoplast resin type.

"Mono-Thiurad."⁵⁸ Trademark for bis(dimethylthiocarbamyl)sulfide (q.v.).

montan wax (lignite wax).

Properties: White, hard earth wax; crude product, dark brown; m.p. $80-90^\circ\text{C}$. Soluble in carbon tetrachloride, benzene, and chloroform; insoluble in water. Combustible; nontoxic.

Derivation: By countercurrent extraction of lignite. American and German lignite are usual sources.

Method of purification: Distillation with superheated steam.

Grades: Crude; refined.

Uses: Substitute for carnauba and beeswax; shoe and furniture polishes; phonograph records; roofing paints; rendering paints waterproof; adhesive pastes; electric insulating compositions; paper-sizing compositions; carbon papers; wire coating; sun-crack preventive in rubber products.

"Montar."⁵⁸ Trademark for a series of related brown to black synthetic resins; softening point, $120-250^\circ\text{C}$. Used to impart fire resistance.

montmorillonite. A type of clay whose composition is approximately $\text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2 \cdot \text{H}_2\text{O}$. One of the major components of bentonite (q.v.).

monuron. Generic name for 3-(para-chlorophenyl)-1,1-dimethylurea (CMU) $\text{ClC}_6\text{H}_4\text{NHCON}(\text{CH}_3)_2$.

Properties: White, crystalline, odorless solid; m.p. 175°C . Very low solubility in water and hydrocarbon solvents. Slightly soluble in oils. Stable toward oxidation and moisture.

Hazard: Moderately toxic by ingestion.

Use: Herbicide.

"Mo-Permalloy."¹⁵⁵ Trademark for a magnetic alloy. **Properties:** Density, 8.72 gm/cm^3 ; tensile strength, 85,000 psi.

Used in laminated cores for high quality communication inductors, transformers and magnetic field detectors.

mordant. A substance capable of binding a dye to a textile fiber. The mordant forms an insoluble lake (q.v.) in the fiber, the color depending on the metal of the mordant. The most important mordants are trivalent chromium complexes, metallic hydroxides.

tannic acid, etc. Mordants are used with acid dyes, basic dyes, direct dyes, and sulfur dyes. Premetalized dyes contain chromium in the dye molecule. A mordant dye is a dye requiring use of a mordant to be effective. See also dye, fiber-reactive.

"Mordantine."¹⁶⁵ Trademark for liquid antimony lactate containing 11% available antimony oxide. Recommended as a replacement for technical tartar emetic. See "Antilac."

mordanting assistant. A chemical such as lactic, oxalic and sulfuric acids, tartrates, etc., used in conjunction with mordants to bring about a gradual decomposition of the latter, and to assist in producing a uniform deposition of the actual mordant upon and within textile materials.

mordant rouge (red liquor; red acetate). A solution used in dyeing and calico printing. It is made by dissolving aluminum hydroxide in acetic acid, giving aluminum acetate, or by decomposing lead or calcium acetates with aluminum sulfate or alum.

"Morecrop."¹³⁹ Trademark for a dolomitic, hydrated lime having a neutralizing value reported as 104% in terms of calcium carbonate; used for adjusting soil pH and furnishing the elements magnesium and calcium.

"Morestan."¹⁸¹ Trademark for 6-methyl-2,3-quinoxalinedithiol cyclic carbonate (q.v.).

"Morflex."²⁹⁹ Trademark for specialty plasticizers (including phthalates, adipates, azelates, sebacates, trimellitates, triacetin and polymeric) for vinyl compounds.

morin (2',3,4',5,7-pentahydroxyflavone) $C_{15}H_{10}O_7 \cdot 2H_2O$. One of the two coloring principles of yellow Brazil-wood. (See brasilin.)

Properties: Colorless needles; m.p. 299°C (dec). Soluble in boiling alcohol, alkaline solutions; slightly soluble in water. Low toxicity. Combustible.

Uses: Mordant dye; analytical reagent; indicator.

"Morlex."²¹⁴ Trademark for corrosion inhibitors used for steam boilers and steam heating systems. For example: Corrosion Inhibitor A. A mixture of 91% morpholine in water.

"Moroc."²⁴⁴ Trademark for a silicate binder, containing $Na_2O \cdot 4SiO_2 \cdot 2H_2O$ plus organic compounds.

Uses: Sand core and mold binder for foundries, cured with carbon dioxide.

"Morpasol."¹⁷⁰ Trademark for a nonaqueous dispersion of polyvinyl chloride resins in plasticizers plus heat-and-light stabilizers, fillers, colors and other special-purpose chemicals. Resin articles are solvated by the plasticizer when heated to 350°F and fuse into a homogeneous solid plastic without loss of weight. The cured plastisol is abrasion resistant, fire-proof, grease-proof, water-proof, freeze resistant and electrically insulating. Viscosity is adjusted for use in rotary casting and slush molding, reverse roller coating, knife coating, cold dipping, flow coating, hot dipping, etc.

morphine $C_{17}H_{19}NO_3 \cdot H_2O$.

Properties: White crystalline alkaloid. Slightly soluble in water, alcohol and ether. M.p. 254°C; b.p. (vacuum) 191°C; sp. gr. 1.31.

Derivation: From opium by extraction and crystallization. Opium contains about 10% morphine.

Containers: Cans (100 oz.).

Hazard: Narcotic, habit-forming drug; sale restricted by law in U.S.

Uses: Medicine (in form of acetate, hydrochloride, tartrate, and other soluble salts).

para-morphine. See thebaine.

morphine benzyl ether hydrochloride. See peronine.

morpholine (tetrahydro-1,4-oxazine)

Properties: Colorless, hygroscopic liquid, amine-like odor. A mild base. Soluble in water and organic solvents. B.p. 128.9°C; f.p. -4.9°C; sp. gr. (20/20°C) 1.002; wt/gal (20°C) 8.34 lb; vapor pressure (20°C) 6.6 mm; viscosity (20°C) 2.23 cp; flash point (open cup) 100°F; autoignition temp. 590°F.

Derivation: By reaction of ethylene oxide and ammonia. Grades: Technical; 98%.

Containers: Drums; tank cars.

Hazard: Moderately toxic by ingestion and inhalation; irritant to skin; absorbed by skin. Tolerance, 20 ppm in air. Flammable, moderate fire risk.

Uses: Rubber accelerator; solvent; organic synthesis; additive to boiler water; waxes and polishes; optical brightener for detergents; corrosion inhibitor, preservation of book paper.

morpholine borane $C_4H_8ONH \cdot BH_3$. White needle-shaped crystalline compound that melts at 93°C. Soluble in hot water, alcohol; insoluble in carbon tetrachloride.

Uses: Reducing agent for aldehydes and ketones. Useful in acid media where sodium borohydride is ineffectual because of its instability in acid.

morpholine ethanol (N-hydroxyethylmorpholine)

Properties: Colorless liquid; miscible with water; sp. gr. 1.0724; b.p. 225.5°C; flash point 210°F. Combustible; low toxicity.

6-(N-morpholino)-4,4-diphenyl-3-heptanone hydrochloride $C_{19}H_{23}ONCH(CH_3)CH_2C(C_6H_5)_2COC_2H_5 \cdot HCl$.

Properties: M.p. 225°C (dec); (free base melts at 76°C); soluble in water, alcohol, methanol, chloroform; insoluble in acetone, benzene, ethyl acetate.

Use: Medicine.

2-(morpholiniothio)benzothiazole (N-oxydiethylene-2-benzothiazolesulfenamide) $C_{11}H_{12}N_2OS_2$.

Properties: Buff to brown flakes with sweet odor; m.p. 80°C min; sp. gr. 1.34 (25°C). Insoluble in water; soluble in benzene, acetone, methanol.

Use: Delayed action vulcanization accelerator.

morphothion. Generic name for O,O-dimethyl S-(morpholinocarbonylmethyl) phosphorodithioate $(CH_3O)_2P(S)SCH_2C(O)NCH_2CH_2OCH_2CH_2$.

Properties: Colorless solid; m.p. 65°C. Soluble in acetone, dioxane, and acetonitrile.

Hazard: Highly toxic. Cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

Shipping regulations: (Rail, Air) Organic phosphate, solid, n.o.s. Poison label. Not acceptable on passenger planes.

"Morosodren."⁴⁰¹ Trademark for a fungicide concentrate containing methylmercury dicyandiamide (2.2%).

Hazard: May be toxic by ingestion.

mortar. (1) A mixture of cement, lime, sand and water. See cement. (2) A hollow ceramic receptacle used by pharmacists for preparing mixtures.

mortar, metallic. A mixture of powdered metal and other ingredients that have been mixed with water. Lead, tungsten and depleted uranium have been used as the metal component. These mortars resist weathering, mild acids and alkalis, intense radiation and extreme temperature variation. Used in space technology.

morzid. Generic name for bis(1-aziridinyl)-morpholinophosphine sulfide.
 $\text{CH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{NP}(\text{NCH}_2\text{CH}_2)_2\text{S}$. Used as an insect chemosterilant.

Moseley, Henry (1887-1915). A British chemist, Moseley studied under Rutherford and brilliantly developed the application of X-ray spectra to study of atomic structure; his discoveries resulted in a more accurate positioning of elements in the Periodic Table by closer determination of atomic numbers. Tragically for the development of science, Moseley was killed in action at Gallipoli in 1915.

"Moskene."²²⁷ Trademark for 1,1,3,3,5-pentamethyl-4,6-dinitroindane (q.v.).

Mössbauer effect. A nuclear phenomenon discovered in 1957. Defined as the elastic (recoil-free) emission of a gamma particle by the nucleus of a radioactive isotope and the subsequent absorption (resonance scattering) of the particle by another atomic nucleus. Occurs in crystalline solids and glasses, but not in liquids. Examples of gamma-emitting isotopes are: iron 57, nickel 61, zinc 67, tin 119. The Mössbauer effect is used to obtain information on isomer shift, on vibrational properties and atomic motions in a solid, and on location of atoms within a complex molecule.

mother. (1) A mold or bacterial complex containing enzymes which promote fermentation, as in manufacture of vinegar from cider or of cultured dairy products from milk.

(2) A substance secreted by epithelial cells of the oyster. See nacre.

(3) A mother liquor is a concentrated solution from which the product is obtained by evaporation and/or crystallization, e.g., in sugar manufacture.

motor octane. See octane number.

mountain blue (copper blue).

Derivation: The mineral azurite, in ground form.

Use: Paint pigment.

6-MP. Abbreviation for 6-mercaptopurine.

MPA. Abbreviation for multipurpose additive.

"M-P-A."²⁰² Trademark for a colloidal thixotropic agent used in paints, inks and lacquers to prevent pigment settling and excess film flow. Dispersed paste available in mineral spirits, xylene or toluene.

3-MPA. Abbreviation for 3-methoxypropylamine.

MPC black. Abbreviation for medium processing channel black. See carbon black.

MPK. Abbreviation for methyl propyl ketone (q.v.).

"MPS-500."⁶² Trademark for a stabilized chlorinated ester of a fatty acid. A viscous, light yellow liquid recommended as a low-cost plasticizer for polyvinyl chloride formulations.

"MpT."²⁶⁶ Trademark for a technical grade (96%) of methyl para-toluate (q.v.).

"M-Pyrol."³⁰⁷ Trademark for a solvent, N-methyl-2-pyrrolidone (q.v.). Claimed to be effective cleaner of vinyl chloride reaction equipment.

"M-S."²⁴¹ Trademark for microspherical silica alumina; used as a cracking catalyst.

MSG. Abbreviation for monosodium glutamate. See sodium glutamate.

MSP. Abbreviation for monosodium phosphate. See sodium phosphate, monobasic.

MT black. Abbreviation for medium thermal black.

"M & T Catalysts."²⁸⁸ Trademark for a series of one-shot catalysts for urethane foams.

MTD. Abbreviation for meta-tolylene diamine. See toluene-2,4-diamine.

mucic acid (saccharolactic acid; galactaric acid; tetrahydroxyadipic acid) $\text{HOOC}(\text{CHOH})_4\text{COOH}$.

Properties: White crystalline powder; m.p. about 210°C (dec); soluble in water; insoluble in alcohol. Combustible; low toxicity.

Derivation: Oxidation of lactose or similar carbohydrates with nitric acid.

Uses: Substitute for tartaric acid; sequesterant for metal ions (calcium, iron); retards hardening of concrete; intermediate for synthesis of heterocyclic compounds (pyrroles).

mucilage. A plant product obtained from seeds, roots or other parts of plants by extraction with either hot or cold water. Mucilages give slippery or gelatinous solutions, e.g., those from guar bean, linseed, locust bean and related leguminous plant seeds. Generally plant mucilages are insoluble in alcohol, but some are partly soluble in water and partly soluble in alcohol. From various types of salt-water algae the so-called seaweed mucilages, such as agar, algin and carrageenin (sometimes referred to as algal polysaccharides) may be obtained by extraction with hot water. Mucilages are closely related to gums, and the distinction between them is not always clear. See also adhesives; gum, natural.

mucopolysaccharide. A polysaccharide composed of alternate units of uronic acids (q.v.) and amino sugars (in which a hydroxyl group is replaced with an amino group, which in turn may be N-substituted by other groups). The mucopolysaccharides act as structural support for connective tissue and mucous membranes of animal organisms.

mud, drilling. See drilling fluid.

"Mullfrax."²⁸⁰ Trademark for refractory products made from mullite produced in electric furnaces.

Use: Construction materials for furnaces and kilns.

mullite $3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$. A stable form of aluminum silicate formed by heating other aluminum silicates (such as cyanite, sillimanite, and andalusite) to high temperatures; also found in nature.

Properties: Colorless crystals; sp. gr. 3.15; m.p. 1810°C; insoluble in water.

Containers: 50-lb bags.

Uses: Refractories; glass. See also aluminum silicate.

"Mulram."⁴⁵⁵ Trademark for a ramming mix with a fused mullite base, and a use limit up to 3200°F. Available in several grain sizes. Used as a refractory where resistance to metal or slag penetration is needed.

"Multiflex MM."²⁴⁴ Trademark for ultrafine calcium carbonate. Used in paints, plastics, and inks.

"Multimet."²¹⁴ Trademark for a high-temperature alloy composed of approximately equal parts of iron, nickel, cobalt and chromium. Used for applications involving high stress up to 1500°F and moderate stress to 2000°F.

multiple proportions law. See chemical laws (3).

"Multisorb" A.R.³²⁹ Trademark for a grade of manganese dioxide used as a solid absorbent for SO₂ and NO₂ in analytical chemistry.

"Multi-Sperse."¹⁴¹ Trademark for stir-in pulps of yellows, oranges, reds, blues, greens, violets and black compatible with all types of latex paints, including acrylic, butadiene-styrene types and polyvinyl acetate.

"Multiwax."⁴⁵ Trademark for refined microcrystalline wax obtained from crude petroleum. Composed primarily of alkylated naphthenes and isoparaffins with small amounts of normal paraffins.

"Multranil 176."⁵⁶⁷ Trademark for a polymer which in the solid form is similar in appearance to SBR rubber. A base resin of a two-component system which when mixed with the proper curing agents forms a versatile adhesive.

"Multrathane."⁵⁶⁷ Trademark for series of compounds used mainly in formulations for solid urethane elastomers. Some are also used in the formulations of spandex fibers, urethane coatings and adhesives.

"Multron."⁵⁶⁷ Trademark for a series of polyesters used in the formulation of solderable urethane wire coatings, surface coatings, urethane foams, and adhesives.

municipal waste. See sewage sludge; urban waste.

Muntz metal. An alloy containing about 60% copper and 40% zinc; a low percentage of lead is sometimes added for free-cutting. It is classified as a brass, and is used primarily for condenser tube plates and other electrical applications. It is formed by hot-working, but is not amenable to cold-working. See also brass.

"Murano."²⁷⁰ Trademark for a synthetic nacreous pigment which has twin inherent colors, one being observed by reflected light and the second by transmitted light, the two colors being complementary. The pigment particles consist of a lead compound in the thin, plate-like crystals. The twin colors are usually seen simultaneously, since part of the light reaches the eye by direct reflection from the surface of the crystals and part of the light is reflected from within the crystal layer and is transmitted through the intervening crystals. (See also nacreous pigment.)

Use: To produce a play of colors when coated on surfaces or incorporated in transparent plastics or plastic film.

muriatic acid. Obsolete name for hydrochloric acid. The related term muriate, indicating presence of chlorine in an inorganic compound, is also obsolete.

muscone. See musk.

muscovite (white mica; potassium mica; isinglass $KAl_2(AlSi_3O_{10})(OH)_2$). A natural hydrous potassium aluminum silicate of the mica group (q.v.).

musk
Properties: An unctuous brownish semi-liquid when

fresh; dried, in grains or lumps with color resembling dried blood. Strong characteristic odor providing an animal note to products in which it is used, which has become increasingly popular. The odor-bearing constituent is muscone or muskone, $CH_3C_{15}H_{27}O$, a 15-carbon ring with ketone oxygen.

Derivation: Natural: Secretion from preputial follicles of the musk deer. Synthetic: (a) ketones and lactones with 15- or 16-carbon rings, structurally resembling the odoriferous principles of natural musk, civet, and musky-type plants. Among these are ambrettolide, civetone, muskone, exaltolide. (b) Nitrated compounds, usually nitrated tert-butyl-toluenes or xylenes or related compounds. The three most commonly used in perfumery are musk ambrette, musk ketone, and musk xylene.

Uses: Cosmetics and perfumery (fixative); fragrances; mothproofing agent.

mustard gas. Legal label name for dichlorodiethyl sulfide (q.v.).

mustard oil, artificial. See allyl isothiocyanate.

mustard oil. Any of several organic compounds having the formula $R-N=C=S$, in which R is an alkyl or aryl radical, —NCS an isothiocyanate group. Its best known member is allyl isothiocyanate (q.v.), the characteristic ingredient of mustard oils. See also nitrogen mustard.

Hazard: Highly toxic and irritant to mucous membranes.

mutagenic agent. (1) Any of a number of chemical compounds able to induce mutations in DNA and in living cells. The alkyl mustards, as well as dimethyl sulfate, diethyl sulfate, and ethylmethane sulfonate, comprise a group of so-called alkylating agents, reacting with the nitrogen atoms of guanine, a constituent of both RNA and DNA. This reaction affects the guanine molecule in such a way as ultimately to induce a mutation in DNA by depurination. Nitrous oxide can deaminate both guanine and cytosine. If DNA having transforming activity is exposed to such deamination conditions, it is slowly deactivated. Nitrous oxide also produces mutants in whole cells, whole bacteriophage, some viruses, and in DNA having transforming ability.

(2) Ionizing radiation.

"MV33."⁵⁰⁷ Trademark for a vitreous refractory mulite; used in ceramics. Impervious to gas; compressive strength, 150,000 psi; max. service temperature 3200°F; hardness (Mohs) 9. Fabricated by casting.

MVE. Abbreviation for methyl vinyl ether. See vinyl methyl ether.

m.w. Abbreviation for molecular weight.

"MX."²⁶⁰ Trademark for fiber-bonded abrasives.

Properties: High tensile strength and resistance to impact and heat shock; unusually resilient.

Uses: For finishing and polishing flutes of taps, drill end mills, reamers, etc.; removing burrs from milling and drilling operations; breaking edges of cast aluminum parts, etc.; cleaning cast iron molds; removing flash from molded plastics.

"Mycifradin" Sulfate.³²⁷ Trademark for neomycin sulfate (q.v.).

"Mycoban."²⁹⁹ Trademark for sodium and calcium propionates. These salts inhibit the growth of many fungi and of some microorganisms, particularly Ba-

cillus mesentericus, for commercially significant periods of time. Used in many industries, particularly to inhibit mold and rope in bakery products.

"Mycostatin."⁴¹² Trademark for nystatin (q.v.).

"Mydel" 550.²³³ Trademark for a water-soluble acrylamide-type paper resin; used to improve the strength properties of chemical and groundwood pulps.

myelin. A unique, sheathlike structure which encloses major nerve trunks, somewhat like insulation around a wire. It is comprised of about 80% lipid, the balance being madeup of proteins, polysaccharides, salts, and water. The lipid fraction is composed of sphingolipids and glycerophosphates, which in turn contain long-chain fatty acids. It has a low concentration of polyunsaturated lipids and high concentrations of long-chain sphingolipids. Its composition is essentially constant in different species of animals, and also as between adults and infants. The breakdown of the lipid structure of myelin is a characteristic of multiple sclerosis.

"Mylar."²⁸ Trademark for a polyester film. Seven available types used for electrical, industrial, and packaging purposes.
Forms: Roll and sheet.

"Mylase."¹⁷³ Trademark for a fungal amylase enzyme.

"Myleran."³⁰¹ Trademark for busulfan (q.v.).

myoglobin. A protein-iron-porphyrin molecule similar to hemoglobin. The chief difference is that myoglobin complexes one heme group per molecule, whereas hemoglobin complexes 4 heme groups. See also heme.

myo-inositol. See inositol.

myokinase. An enzyme found in muscle and other tissues that catalyzes the reaction $2 \text{ ADP} \rightleftharpoons \text{ATP} + \text{AMP}$.

myrcene (7-methyl-3-methylene-1,6-octadiene) $\text{C}_{10}\text{H}_{16}$. A triply unsaturated aliphatic hydrocarbon found in oil of bay, verbena, hops, and others.

Properties: Yellow, oily liquid; pleasant odor; b.p. 167°C ; sp. gr. of 81% myrcene 0.806 ($15.5/15.5^\circ\text{C}$); refractive index of 81% myrcene 1.471 (20°C). Insoluble in water; soluble in alcohol, chloroform, ether, glacial acetic acid. Combustible; low toxicity.
Uses: Preparation of perfume chemicals; flavoring.

"Myrcene 85."²⁹⁶ Trademark for a special grade of the triply unsaturated aliphatic hydrocarbon, $\text{C}_{10}\text{H}_{16}$, 7-methyl-3-methylene-1,6-octadiene. Minimum purity 75%. Balance mainly *l*-limonene.

myrcia oil (bay oil; bayleaf oil).

Properties: Essential oil; yellow color, becoming brown on exposure to air; pleasant clove-like odor; pungent, spicy taste; phenol content 50–65%. Sp. gr. 0.950–0.990 ($25/25^\circ\text{C}$), going as low as 0.939 for poor-quality oils; optical rotation 0 to -3° ; refractive index 1.507–1.516 (20°C). Soluble in alcohol and glacial acetic acid. Combustible; nontoxic.

Derivation: By distillation of the leaves of *Pimenta racemosa* (*Pimenta acris*). Found in West Indies, Virgin Islands, and Puerto Rico.

Containers: Drums.
Uses: Bay rum; perfumes; flavors.

myricyl alcohol. See 1-triacontanol and 1-hentriacontanol.

myricyl palmitate $\text{C}_{30}\text{H}_{61} \cdot \text{C}_{16}\text{H}_{31}\text{O}_2$ (approx). A wax ester found in beeswax.

myristic acid (tetradecanoic acid) $\text{CH}_3(\text{CH}_2)_{12}\text{COOH}$. Properties: Oily, white crystalline solid. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.8739 (80°C); b.p. 326.2°C ; 204.3°C (20 mm); m.p. 54.4°C ; refractive index 1.4310 (n_{D}^{60}). Combustible; nontoxic.

Derivation: Fractional distillation of coconut acid.

Containers: Bags; tank cars.

Grades: Technical; 99.8%; F.C.C.

Uses: Soaps, cosmetics; synthesis of esters for flavors and perfumes; component of food-grade additives.

myristica oil. N.F. name for nutmeg oil.

myristin (glyceryl trimyristate) $\text{C}_3\text{H}_7(\text{OOCCH}_2\text{CH}_2)_3$. A triglyceride occurring, usually to a small extent, in natural fatty oils.

myristoleic acid (cis-tetradec-9-enoic acid) $\text{CH}_3(\text{CH}_2)_3\text{CH}=\text{CH}(\text{CH}_2)_7\text{COOH}$. Colorless liquid; m.p. -4°C . Found in fat of some seeds and in fish oil.

myristoyl peroxide $(\text{C}_{13}\text{H}_{27}\text{CO})_2\text{O}_2$.

Properties: Soft granules; 90% peroxide.

Hazard: Oxidizing material, dangerous fire and explosion risk.

Use: Catalyst for vinyl type monomers.

Shipping regulations: (Air) Peroxides, organic, solid, n.o.s., Organic Peroxide label.

myristyl alcohol (1-tetradecanol) $\text{C}_{14}\text{H}_{29}\text{OH}$.

Properties: White solid; sp. gr. 0.8355 at $20/20^\circ\text{C}$; b.p. 264.1°C , (20 mm) 171.5°C ; m.p. 38°C ; flash point 285°F ; wt 7.0 lb/gal (20°C). Insoluble in water; soluble in ether; partially soluble in ethyl alcohol.

Combustible. Low toxicity.

Grade: Technical.

Containers: Cans; drums; tanks.

Uses: Organic synthesis; plasticizers; anti-foam agent; intermediate; perfume fixative for soaps and cosmetics; wetting agents and detergents; ointments and suppositories; shampoos, toothpaste; specialty cleaning preparations.

myristyl chloride. See tetradecyl chloride.

myristyldimethylamine $\text{CH}_3(\text{CH}_2)_{13}\text{N}(\text{CH}_3)_2$. A liquid cationic detergent.

Uses: Corrosion inhibitor, acid-stable.

myristyldimethylbenzylammonium chloride

$\text{C}_{14}\text{H}_{29}(\text{CH}_3)_2\text{C}_6\text{H}_5\text{CH}_2\text{NCl}$. A quaternary ammonia compound. Free flowing powder; used as a surfactant and detergent.

myristyl lactate. See "Ceraphyl" 50.

myristyl mercaptan. See tetradecyl thiol.

myrrh. The resin of *Commiphora myrrha* or other species of myrrh. Partly soluble in water and partly in alcohol and ether. Combustible; low toxicity.

Habitat: East Africa and Arabia.

Uses: Dentrifices; perfumery; pharmaceuticals; odorant.

N

N (1) Symbol for nitrogen (q.v.). The names of certain compounds (such as N,N-dibutyl urea) contain this symbol as an indication that the group or groups appearing next in the name (i.e., the butyl groups in the example cited) are joined to the nitrogen atoms in the molecule. The molecular formula is N_2 . (2) Mathematical symbol for Avogadro's Number.

N Abbreviation for normal solution. See normal (2).

n Symbol for refractive index; nD^{20} is refractive index under standard conditions of temperature and wavelength (sodium D line).

n- Abbreviation for normal. See normal (1).

Na Symbol for sodium.

"NA-22."²⁸ Trademark for 2-mercaptoimidazoline
 $\text{CH}_2\text{CH}_2\text{NC}(\text{SH})\text{NH}$.

Properties: A white powder; sp. gr. 1.42; m.p. not lower than 195°C.

Use: To accelerate vulcanization of neoprene.

nabam (disodium ethylenebisdithiocarbamate)
 $\text{NaSSCNHCH}_2\text{CH}_2\text{NHCSSNa}$.

Properties: Colorless crystals when pure; easily soluble in water.

Derivation: Addition of carbon disulfide to an alcoholic solution of ethylenediamine followed by neutralization with sodium hydroxide; or by reaction of ethylenediamine with carbon disulfide in aqueous sodium hydroxide.

Grades: 19% aqueous solution.

Hazard: Toxic and irritant to skin and mucous membranes; narcotic in high concentrations. Use may be restricted.

Uses: Plant fungicide; starting material for derivatives that are also pesticides.

"Nabor."²⁴³ Trademark for basic dyes intended especially for dyeing acrylic fibers.

NAC. Abbreviation for National Agricultural Chemicals Association (q.v.).

"Nacan."²⁴³ Trademark for meta-nitrobenzenesulfonic acid, sodium salt.

"Naccogene."²⁴³ Trademark for azoic compositions.

"Nacconate."²⁴¹ Trademark for a group of diisocyanates.

Containers: 5- and 55-gal special lined drums.

Uses: In preparation of flexible, semi-rigid, and rigid urethane foams; elastomers; protective coatings, adhesives; spandex-type fibers, and textile finishes.

"Nacconol."²⁴³ Trademark for a group of technical biodegradable linear alkyl sulfonate detergents. See alkyl sulfonate, linear.

Uses: Industrial cleaners, specialty compounding; air entrainment; emulsion polymerization; textile scouring agent; detergent intermediate.

"Naccosol" A.²⁴³ Trademark for a sulfonated alkylated aromatic compound, primarily a wetting agent.

"Naccotan" A.²⁴³ Trademark for an alkyl aryl sodium sulfonate. Used in the retanning of chrome-tanned leather; useful in the dispersion of thick slurries.

"Naccuffix."²⁴³ Trademark for a copper organocomplex for fixing direct dyes on cellulose fibers.

"Nacelan."²⁴³ Trademark for water-insoluble dyes dispersed in water and forming solid solutions in synthetic fibers.

nacre (mother of pearl). A form of calcium carbonate secreted by the epithelial cells in the mantle of the oyster. The crystals are bonded by conchiolin ($\text{C}_{32}\text{H}_{98}\text{N}_2\text{O}_{11}$); the layers built up by excretion form pearls.

nacreous pigment. A pigment containing guanine crystals obtained from fish scales or skin, which gives a pearly, lustrous effect. Produces a pearly luster. May be applied as surface coatings, as in simulated pearls, or incorporated in plastics. The pigment particle is generally a very thin platelet of high index of refraction. The crystals are readily oriented into parallel layers because of their shape. Being transparent, each crystal reflects only part of the incident light reaching it, and transmits the remainder to the crystals below. The nacreous effect is obtained from the simultaneous reflection of light from the many parallel microscopic layers.

"Nacromer."²⁷⁰ Trademark for synthetic nacreous pigments, consisting of lead salts crystallized in the form of extremely thin plates and suspended in a suitable liquid vehicle.

NAD. See nicotinamide adenine dinucleotide.

"Nadic Methyl Anhydride."¹⁷⁵ Trademark for methylbicyclo[2.2.1]heptene-2,3-dicarboxylic anhydride isomers. $\text{C}_{10}\text{H}_{16}\text{O}_3$.

Properties: Colorless to light-yellow viscous liquid; viscosity 175–225 cp (25°C); refractive index 1.500–1.506 (n 20/D); sp. gr. 1.200–1.250 (20/20°C). Miscible in all proportions with acetone, benzene, naphtha, and xylene.

Uses: Curing agent for epoxy resins; intermediate for polyesters, alkyd resins, and plasticizers; electrical laminating and filament-winding.

"Nadone."²⁴³ Trademark for cyclohexanone (q.v.).

NADP. See nicotinamide adenine dinucleotide phosphate.

"Nafion."²⁸ Trademark for a perfluorosulfonic acid membrane used in manufacture of chlorine and caustic soda. It is a chemically stable ion-exchange resin.

NaK (sodium-potassium alloy).

Properties: Soft silvery solid or liquid; must be kept away from air and moisture. The liquid forms come

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

under the class name potassium (or sodium), metallic liquid alloy.

Grades: (a) 78% K, 22% Na; m.p. -11°C ; b.p. 784°C ; density 0.847 g/cc (100°C); (b) 56% K, 44% Na; m.p. 19°C ; b.p. 825°C ; density 0.886 g/cc (100°C).

Containers: Stainless steel cans (3, 10, 25, 200 lbs); small glass ampules.

Hazard: Ignites in air; explodes in presence of moisture, oxygen, halogens, acids. Store under kerosene. Use dry salt or soda ash to extinguish, *not* water, foam or carbontetrachloride.

Uses: Heat exchange fluid; electric conductor; for organic synthesis and catalysis.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes. Legal label name, sodium-potassium alloy.

"Nalan."²⁸ Trademark for durable water repellents used in textile industry.

"Nalcamine."¹⁸² Trademark for a group of organic amines.

"Nalco."¹⁸² Trademark for a broad class of chemicals, organic or otherwise, employed in the treatment of water and hydrocarbons; also paper-making chemicals, cleaning compounds, combustion aids, weed and brush controls, lubricating and antilubricating compositions, apparatus, pumps and mechanisms for proportioning chemicals.

"Nalcolyte" 671.¹⁸² Trademark for a synthetic high polymer used for clarifying industrial plant water and municipal water supplies. A coagulant behaving as a polyelectrolyte (q.v.). Effective at concentration of less than 1 ppm; also used in still lower concentrations as a filter aid.

naled. Generic name for 1,2-dibromo-2,2-dichloroethyl dimethyl phosphate.

$(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{OC}(\text{Br})\text{HCBr}(\text{Cl})_2$.

Properties: Pure compound is a solid; m.p. 26°C . Technical compound is a moderately volatile liquid; b.p. 110°C (0.5 mm). Insoluble in water; slightly soluble in aliphatic solvents; very soluble in aromatic solvents. Hydrolyzes in water.

Hazard: Cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

Shipping regulations: Organic phosphate, liquid, n.o.s. (Rail) Poison label. (Air) Poison label. Not acceptable on passenger planes.

"Nalgene."⁵⁵⁹ Trademark for plastic laboratory ware for industry, research, and education. Made of polypropylene, polyethylene, "Teflon" FEP, polyallomer and polycarbonate.

nalidixic acid (USAN). 1-Ethyl-7-methyl-1,8-naphthyridin-4-one-3-carboxylic acid. Listed in N.D. An antibacterial compound used in medicine.

"Nalkylene."⁵⁴⁴ Trademark for biodegradable detergent alkylates made from straight-chain hydrocarbons. Available in molecular-weight ranges to replace linear alkylbenzenes sulfonate readily with SO_3 or oleum by batch or continuous processes to form low-viscosity "soft" sulfonic acid; neutralization gives soft LAS slurries.

"Nalline."¹²¹ Trademark for nalorphine (q.v.).

nalorphine (N-allylnormorphine). The allyl ($-\text{CH}_2-\text{CH}=\text{CH}_2$) derivative of morphine. It is able to "antagonize" or neutralize most of the effects of narcotic drugs (morphine, codeine), but not those of other

types of depressants. Nalorphine is used as a biochemical research tool for studying the mechanism of narcotic action; also as an antidote for acute morphine poisoning. See also narcotic.

"Nalquat."¹⁸² Trademark for a group of organic quaternary salts.

NaMBT. See sodium MBT.

"Nankor."²³³ Trademark for a group of organophosphorus compounds.

nano-. Prefix meaning 10^{-9} unit (symbol n). 1 ng = 1 nanogram = 0.00000001 gram; 1 nanometer = 1 millimicron.

"Nanograde."³²⁹ Trademark for a grade of chemical purity. Impurities guaranteed to be no more than ten parts per trillion.

nanometer (nm). One billionth (10^{-9}) meter, equal to 1 millimicron.

"Nap-All."⁴⁸⁰ Trademark for liquid naphthenates of calcium, cobalt, copper, iron, lead, manganese, and zinc.

Uses: Drier for paint and printing inks.

napalm. An aluminum soap of a mixture of oleic, naphthenic and coconut fatty acids.

Properties: Granular powder; mixed with gasoline, it forms a sticky gel that is stable from -40° to 100°C .

Hazard: Flammable, dangerous fire risk.

Uses: Flame throwers and fire bombs; gasoline storage.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

naphtha

(1) *petroleum* (petroleum ether). A generic term applied to refined, partly refined, or unrefined, petroleum products and liquid products of natural gas not less than 10 percent of which distil below 347°F (175°C), and not less than 95 percent of which distil below 464°F (240°C) when subjected to distillation in accordance with the Standard Method of Test for Distillation of Gasoline, Naphtha, Kerosine, and Similar Petroleum Products (ASTM D 86). F.p. -73°C ; b.p. $30-60^{\circ}\text{C}$; flash point -57°F ; autoignition temp. 550°F ; sp. gr. 0.6.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 1 to 6%.

Uses: Source (by various cracking processes) of gasoline, special naphthas, petroleum chemicals, especially ethylene. Cracking for ethylene also produces propylene, butadiene, pyrolysis gasoline and fuel oil; source of synthetic natural gas (q.v.).

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

(a) *V. M. & P* (Varnish makers and Painters); (petroleum spirits; petroleum thinner.

Any of a number of narrow-boiling-range fractions of petroleum with boiling points of about 200 to 400°F , according to the specific use; distillation range 246 to 290°F ; sp. gr. 0.7543; density 6.280 lb/gal; pour point below -70°F ; flash point 57°F (TCC).

Hazard: Flammable, dangerous fire risk.

Uses: Thinners in paints and varnish.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

(b) *blending*. A petroleum fraction with volatility similar to the higher boiling fractions of gasoline. It is used primarily in blending with natural gasoline to produce a finished gasoline of specified volatility.

(c) *cleaners*. A dry-cleaning fluid derived from petroleum and similar to Stoddard solvent (q.v.), but not necessarily meeting all its specifications. Flash point 100°F.

(2) *coal-tar*

(a) *heavy* (high-flash naphtha)

Properties: Deep amber to dark red liquid; a mixture of xylene and higher homologs; sp. gr. 0.885–0.970; b.p. 160–220°C (about 90% at 200°C); flash point 100°F; evaporation 303 minutes.

Derivation: From coal-tar by fractional distillation.

Containers: Drums; tank cars.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Moderate fire risk. Tolerance, 100 ppm in air.

Uses: Coumarone resins; solvent for asphalts, road tars, pitches, etc.; cleansing compositions; process engraving and lithography; rubber cements (solvent); naphtha soaps; mfg. of ethylene and acetic acid.

(b) *solvent* (160° benzol).

Properties: A mixture of small percentages of benzene and toluene with xylene and higher homologs from coal-tar. (a) Crude: dark straw-colored liquid. (b) Refined: water-white liquid. Sp. gr. (a) 0.862–0.892, (b) 0.862–0.872; b.p. (a) about 160°C (80%), (b) about 160°C (90%); flash point (a) and (b) about 78°F.

Derivation: From coal-tar by fractional distillation.

Grades: Dark straw; water-white.

Containers: Drums; tank cars.

Hazard: Flammable, dangerous fire risk.

Uses: Solvent; xylene; cumene; nitrated, for incorporation in dynamite.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

naphthacene (tetracene; rubene) $C_{18}H_{12}$. The molecule consists of four fused benzene rings.

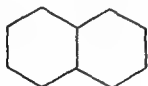

Properties: Orange solid; sp. gr. 1.35; m.p. about 350°C; not easily soluble; slight green fluorescence in daylight.

Occurrence: In commercial anthracene and coal tar.

Hazard: Explodes when shocked; reacts with oxidizing materials.

Uses: Organic synthesis.

naphthalene (tar camphor) $C_{10}H_8$.

Properties: White crystalline, volatile flakes; strong coal-tar odor. Soluble in benzene, absolute alcohol and ether; insoluble in water. Sp. gr. 1.145 (20/4°C); m.p. 80.2°C; b.p. 217.96°C; flash point 176°F. Sublimes at room temperature. Autoignition temp. 579°F. Combustible.

Derivation: (a) From coal-tar oils boiling between 200 to 250°C (middle oil) by crystallization and distillation. (b) From petroleum fractions after various catalytic processing operations.

Grades: By melting point, 74°C min (crude) to above 79°C (refined); scintillation (80–81°C).

Forms: Flakes, cubes, spheres, powder.

Containers: Cans; drums; tank cars.

Hazard: Toxic by inhalation. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C. Tolerance, 10 ppm in air.

Uses: Intermediate (phthalic anhydride, naphthol,

“Tertralin,” “Decalin,” chlorinated naphthalenes, naphthyl and naphthol derivatives, dyes; moth repellent; fungicide; explosives; cutting fluid; lubricant; *synthetic resins*; *synthetic tanning*; *preservative*; solvent; textile chemicals; emulsion breakers; scintillation counters.

Shipping regulations: (Air) Crude or refined: Flammable Solid label.

alpha-naphthaleneacetic acid (1-naphthylacetic acid) $C_{10}H_7CH_2COOH$.

Properties: White crystals, odorless; m.p. 132–135°C.

Soluble in acetone, ether, and chloroform; slightly soluble in water and alcohol.

Grades: Usually supplied in dilute form, either as a powder or liquid solution ready for use.

Containers: Powder; fiber cans or multiwall paper sacks; solution: glass bottles and carboys.

Hazard: Moderately toxic; skin irritant.

Uses: Inducing rooting of plant cuttings; spraying apple trees to prevent early drop.

alpha-naphthaleneacetic acid, methyl ester (MENA). $C_{10}H_7CH_2COOCH_3$. A plant growth regulator or hormone, used for delaying sprouting of potatoes, weed control, thinning of peaches, etc.

naphthalene, chlorinated. See chlorinated naphthalene.

naphthalenediamine. See naphthylenediamine.

1,5-naphthalene diisocyanate $C_{10}H_6(NCO)_2$. White to light yellow crystalline solid; m.p. 127–131°C.

Hazard: Toxic and irritant.

Use: Manufacture of polyurethane solid elastomers.

naphthalene-1,5-disulfonic acid (Armstrong's acid) $C_{10}H_6(SO_3H)_2$.

Properties: White crystalline solid; soluble in water.

Derivation: Sulfonation of naphthalene with fuming sulfuric acid at low temperature and separation from the 1,6 isomer. Combustible.

Hazard: May be toxic.

Uses: Intermediate for dyes.

naphthalene-2,7-disulfonic acid $C_{10}H_6(SO_3H)_2$.

Properties: White crystalline solid; soluble in water. Combustible.

Derivation: Sulfonation of naphthalene at high temperature and separation from 2,6-isomer.

Hazard: May be toxic.

Use: Intermediate for dyes.

alpha-naphthalenesulfonic acid $C_{10}H_7SO_3H \cdot H_2O$.

Properties: Deliquescent crystals; soluble in water, alcohol, and ether. M.p. 90°C. Combustible.

Derivation: Interaction of naphthalene and sulfuric acid.

Hazard: May be toxic.

Uses: Starting point in the manufacture of alpha-naphthol, alpha-naphtholsulfonic acid, alpha-naphthylaminesulfonic acid; solvent (sodium salt) for phenol in the manufacture of disinfectant soaps.

beta-naphthalenesulfonic acid $C_{10}H_7SO_3H$ or $C_{10}H_7SO_3H \cdot H_2O$.

Properties: Non-deliquescent, white plates; m.p. 124–125°C. Soluble in water, alcohol, and ether. Combustible.

Derivation: Sulfonation of naphthalene.

Hazard: May be toxic.

Uses: Starting point in the manufacture of beta-naphthol, beta-naphtholsulfonic acid, beta-naphthylaminesulfonic acid; etc.

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

2-naphthalenethiol. See "RPA."

1,3,6-naphthalenetrisulfonic acid, trisodium salt $C_{10}H_5(SO_3Na)_3$. Fine buff crystals. Used as a diazo type stabilizer.

1,8-naphthalic acid anhydride $C_{12}H_6O_3$. Light tan powder; m.p. 268–270°C; used for dyestuffs; organic synthesis in general.

"Naphthanil."²⁸ Trademark for a series of dye bases. Prior to coupling the bases must first be diazotized to form the diazo salt. Widely used on cotton and rayon textiles. Also represents a series of diazo pigments.

naphtha, petroleum. See naphtha (1).

naphtha, solvent. See naphtha (2b).

naphtha, V.M.&P. See naphtha (1a).

naphthene. See cycloparaffin. The term naphthene is misleading and obsolescent.

naphthenic acid. Any of a group of saturated higher fatty acids derived from the gas-oil fraction of petroleum by extraction with caustic soda solution and subsequent acidification. Gulf and West-coast crudes are relatively high in these acids. The commercial grade is a mixture, usually of dark color and unpleasant odor; corrosive to metals. The chief use of naphthenic acids is in the production of metallic naphthenates for paint driers and cellulose preservatives. Other uses are as solvents, detergents, rubber reclaiming agent, etc.

naphthionic acid (1-aminonaphthalene-4-sulfonic acid; 1-naphthylamine-4-sulfonic acid; 4-amino-1-naphthalenesulfonic acid) $C_{10}H_6(NH_2)SO_3H$. Properties: White crystals or powder. Soluble in water; slightly soluble in alcohol and ether. Derivation: Heating equimolar amounts of alpha-naphthylamine and concentrated sulfuric acid.

alpha-naphthol (1-naphthol; 1-hydroxynaphthalene) $C_{10}H_7OH$. Properties: Colorless or yellow prisms or powder; disagreeable taste. Soluble in benzene, alcohol and ether; insoluble in water. Sp. gr. 1.224 (4°C), 1.0954 (95/4°C); m.p. 96°C; b.p. 278°C; volatile in steam; sublimes; refractive index 1.6206 (98.7°C). Combustible.

Derivation: By fusing sodium alpha-naphthalene sulfonate with caustic soda. The melt is decomposed with hydrochloric acid and distilled.

Uses: Dyes; organic synthesis; synthetic perfumes.

beta-naphthol (2-naphthol; 2-hydroxynaphthalene) $C_{10}H_7OH$. Properties: White, lustrous, bulky leaflets, or white powder; darkens with age; faint phenol-like odor; stable in air but darkens on exposure to sunlight; sp. gr. 1.217; m.p. 121.6°C; b.p. 285°C; flash point 307°F. Soluble in alcohol, ether, chloroform, glycerol, oils and alkaline solutions; insoluble in water. Combustible.

Derivation: By fusing sodium beta-naphthalene sulfonate with caustic soda. The product is distilled in vacuo and then sublimed.

Grades: Technical; sublimed; resublimed.

Uses: Dyes; pigments, antioxidants for rubber, fats, oils; insecticides; synthesis of fungicides, pharmaceuticals, perfumes.

naphthol AS. See beta-hydroxynaphthoic anilide.

beta-naphthol benzoate. See benzonaphthol.

3-naphthol-2-carboxylic acid. See 3-hydroxy-2-naphthoic acid.

1-naphthol-3,6-disulfonic acid $C_{10}H_5(SO_3H)_2OH$.

Derivation: Fusion of sodium naphthalene-1,3,6-trisulfonate with caustic soda, or by diazotization of 1-naphthylamine-3,6-disulfonic acid and treatment with sulfuric acid.

Hazard: May be toxic.

Use: Dye intermediate.

1-naphthol-4,8-disulfonic acid (Schoelkopf's acid) $C_{10}H_5OH(SO_3H)_2$.

Properties: Colorless crystals.

Derivation: Decomposition of 1-naphthylamine-4,8-disulfonic acid by diazotization and acidifying with heat.

Hazard: May be toxic.

Use: Dye intermediate.

2-naphthol-3,6-disulfonic acid (R acid; beta-naphtholdisulfonic acid) $C_{10}H_5(OH)(SO_3H)_2$.

Properties: Deliquescent, colorless, silky needles; soluble in water, alcohol and ether.

Derivation: By heating beta-naphthol with sulfuric acid (98%), dissolving the melt in water and adding salt.

Grades: Technical, with varying amounts of 2-naphthol-6-sulfonic acid. The common article of trade is the disodium salt, an odorless, gray powder.

Hazard: Probably toxic.

Uses: Manufacturing azo dyes for textiles. The disodium salt is used as a reagent in the detection of nitrogen dioxide in the air.

2-naphthol-3,6-disulfonic acid, disodium salt (R salt). See 2-naphthol-3,6-disulfonic acid.

2-naphthol-6,8-disulfonic acid, potassium salt (G salt) $C_{10}H_5OH(SO_3K)_2$.

Properties: White needles, dry or in paste. Very soluble in water.

Derivation: Sulfonating beta-naphthol in oleum, diluting in water and salting out with potassium sulfate.

Hazard: Probably toxic.

Use: Azo dyes for textiles and lakes.

Naphthol Green B. A dye used in crystallizing solar salt; it increases the evaporation rate by added absorption of energy; 5 ppm is said to increase salt production from 15 to 20%.

beta-naphthol methyl ether. See beta-naphthyl methyl ether.

beta-naphthol sodium. See sodium beta-naphtholate.

1-naphthol-4-sulfonic acid (NW acid; Neville and Winther's acid; alpha-naphtholsulfonic acid) $C_{10}H_6(OH)SO_3H$.

Properties: Transparent plates. Soluble in water. M.p. 170°C.

Derivation: From the sodium salt of naphthionic acid by hydrolyzing the amino group.

Grades: Technical. Also commonly handled as the sodium salt, an odorless cream to light tan, dry-ground powder.

Hazard: May be toxic.

Use: Dyes.

1-naphthol-5-sulfonic acid (L acid; alpha-naphtholsulfonic acid) $C_{10}H_6(OH)SO_3H$.

Properties: White solid. Soluble in water.

Derivation: (a) From naphthalene-1,5-disulfonic acid by fusion with caustic soda. (b) From 1-naphthyl-

amine-5-sulfonic acid by diazotizing and boiling the diazo solution with dilute sulfuric acid.

Grades: Technical. See also 1-naphthol-5-sulfonic acid, sodium salt.

Hazard: May be toxic.

Use: Dyes.

2-naphthol-1-sulfonic acid (beta-naphtholsulfonic acid) $C_{10}H_6(OH)SO_3H$.

Properties: White crystalline solid; soluble in water.

Derivation: By sulfonating beta-naphthol with 2 to 2.5 parts of 90 to 92% sulfuric acid at about 40°C.

Hazard: May be toxic.

Use: Intermediate for Tobias acid.

2-naphthol-6-sulfonic acid (Schaeffer's acid; beta-naphtholsulfonic acid) $C_{10}H_6(OH)SO_3H$.

Properties: White leaflets; soluble in water and alcohol. M.p. 122°C.

Derivation: By sulfonation of beta-naphthol and separation from the crocein acid formed simultaneously.

Grades: Technical. Also commonly sold as the sodium salt, a cream to light tan, dry ground powder with faint naphthol odor.

Hazard: May be toxic.

Use: Dyes.

2-naphthol-7-sulfonic acid (Cassella's acid; mono-sulfonic acid F; Facid; mono acid F; beta-naphtholsulfonic acid) $C_{10}H_6(OH)(SO_3H)$.

Properties: White crystals; soluble in water and alcohol; m.p. 89°C.

Derivation: By fusion of naphthalene-2,7-disulfonic acid with caustic soda or by heating the acid with an aqueous solution of caustic soda in an autoclave.

Grades: Technical. Also sold as the sodium salt, F salt.

Containers: Fiber drums.

Hazard: May be toxic.

Use: Intermediate for dyes and pigments.

2-naphthol-8-sulfonic acid. See crocein acid.

alpha-naphtholsulfonic acids. See 1-naphthol-4-sulfonic acid and 1-naphthol-5-sulfonic acid.

beta-naphtholsulfonic acids. See 2-naphthol-1-sulfonic acid, 2-naphthol-6-sulfonic acid, 2-naphthol-7-sulfonic acid, and crocein acid.

1-naphthol-4-sulfonic acid, sodium salt. See 1-naphthol-4-sulfonic acid.

1-naphthol-5-sulfonic acid, sodium salt (L-acid salt) $C_{10}H_6(OH)(SO_3Na)$.

Properties: Gray to light tan dry powder. Odorless.

Containers: 175 lb fiber drums.

2-naphthol-6-sulfonic acid, sodium salt. See 2-naphthol-6-sulfonic acid.

2-naphthol-7-sulfonic acid, sodium salt. See 2-naphthol-7-sulfonic acid.

1,2-naphthoquinone (beta-naphthoquinone) $C_{10}H_6O_2$.

Properties: Orange-red crystals; m.p. 120°C (dec). Soluble in water, ether, benzene, alcohol.

Hazard: Moderately toxic and irritant.

Uses: Chemical reagent and intermediate.

1,4-naphthoquinone (alpha-naphthoquinone) $C_{10}H_6O_2$.

Properties: Greenish yellow powder, odor like benzoquinone; m.p. 123–126°C; sublimes at 100°C; very slightly soluble in water; soluble in ethyl alcohol.

ethyl ether, chloroform, benzene, and acetic acid. Combustible.

Hazard: Moderately toxic and irritant.

Uses: Polymerization regulator for rubber and polyester resins; synthesis of dyes and pharmaceuticals; fungicide; algicide.

naphthoquinone oxime. See 1-nitroso-2-naphthol; 2-nitroso-1-naphthol.

1,2-naphthoquinone-4-sulfonic acid (beta-naphthoquinone-4-sulfonic acid) $C_{10}H_5(O)_2SO_3H$.

Derivation: Oxidation with nitric acid of 2-amino-1-naphthol-4-sulfonic acid or 1-amino-2-naphthol-4-sulfonic acid.

Hazard: May be toxic.

Uses: Dye intermediate; identification of sulfonamide derivatives.

naphthoresorcinol. See 1,3-dihydroxynaphthalene.

1,8-naphthosultam-2,4-disulfonic acid (sultam acid)

$C_{10}H_4(SO_3H)_2NHSO_2$. (The $-NHSO_2-$ group forms a third ring by attachment at the 1,8 positions.)

Properties: White solid; soluble in water; slightly soluble in alcohol.

Derivation: Oleum sulfonation of 1-naphthylamine-8-sulfonic acid or 1-naphthylamine-4,8-disulfonic acid.

Hazard: May be toxic.

Use: Intermediate for 8-amino-1-naphthol-5,7-disulfonic acid (Chicago acid).

beta-naphthoxyacetic acid (2-naphthoxyacetic acid) $C_{10}H_7OCH_2COOH$. A plant hormone.

Properties: Crystals; m.p. 156°C. Soluble in water, alcohol, acetic acid.

1-naphthylacetic acid. See naphthaleneacetic acid.

alpha-naphthylamine $C_{10}H_7NH_2$.

Properties: White crystals becoming red on exposure to air. Soluble in alcohol and ether; slightly soluble in water. Sp. gr. 1.13; m.p. 50°C; b.p. 301°C. Combustible. Flash point 315°C.

Derivation: Reduction of alpha-nitro-naphthalene with iron and hydrochloric acid. The mass is then mixed with milk of lime and distilled.

Method of purification: Crystallization.

Hazard: Toxic, especially if containing the beta isomer. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Dyes and dye intermediates; agricultural chemicals.

Shipping regulations: (Air) Poison label.

beta-naphthylamine $C_{10}H_7NH_2$.

Properties: White to reddish lustrous leaflets. Soluble in hot water, alcohol, ether, and benzene. Commercial: m.p. 109.5°C; sp. gr. 1.061 (98/4°C); b.p. 306°C. Combustible.

Derivation: From beta-naphthol by heating in an autoclave with ammonium sulfite and ammonia.

Method of purification: Distillation.

Hazard: Toxic by ingestion, inhalation, and skin absorption. A carcinogen; must conform to strict safety regulations. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

1-naphthylamine-3,8-disulfonic acid (epsilon acid)

$C_{10}H_4(NH_2)(SO_3H)_2$.

Properties: White crystalline scales; soluble in hot water.

Derivation: Naphthalene-1,5- and 1,6-sulfonic acids are nitrated and reduced, resulting in 1-naphthylamine-3,8- and 4,8-disulfonic acids. The separation is

effected by crystallizing out the acid sodium salts of 1-naphthylamine-3,8-disulfonic acid.

Use: Dyes.

1-naphthylamine-4,8-disulfonic acid. See derivation under 1-naphthylamine-3,8-disulfonic acid.

2-naphthylamine-3,6-disulfonic acid (amino R acid) $C_{10}H_7(NH_2)(SO_3H)_2$.

2-naphthylamine-4,8-disulfonic acid (C acid; Cassella acid; 3-amino-1,5-naphthalenedisulfonic acid) $C_{10}H_7(NH_2)(SO_3H)_2$.

Properties: White crystalline solid; soluble in water (slightly).

Derivation: Reduction of 2-nitronaphthalene-4,8-disulfonic acid.

Method of purification: Recrystallization of sodium salt from water.

Hazard: May be toxic.

Use: Dyestuffs.

2-naphthylamine-5,7-disulfonic acid (amono-J acid; 6-amino-1,3-naphthalenedisulfonic acid) $C_{10}H_7(NH_2)(SO_3H)_2$.

Properties: Crystallizes in white lustrous leaflets from water and in long needles from hydrochloric acid solutions.

Derivation: By sulfonation of either 2-naphthylamine-5-sulfonic acid or 2-naphthylamine-7-sulfonic acid.

Hazard: May be toxic.

Use: Dyes.

2-naphthylamine-6,8-disulfonic acid (amino-G acid; 7-amino-1,3-naphthalenedisulfonic acid) $C_{10}H_7(NH_2)(SO_3H)_2$.

Properties: White crystalline solid; soluble in water.

Derivation: (a) From G acid by heating sodium salt with ammonia and sodium bisulfite solution in an autoclave under pressure. (b) Sulfonation by beta-naphthylamine.

Hazard: May be toxic.

Use: Dyes.

alpha-naphthylamine hydrochloride $C_{10}H_7NH_2 \cdot HCl$.

Properties: White to gray, crystalline powder; soluble in water, alcohol, and ether.

Derivation: By the action of hydrochloric acid on alpha-naphthylamine.

Hazard: May be toxic.

Uses: Dyes; organic synthesis.

1-naphthylamine-4-sulfonic acid. See naphthionic acid.

1-naphthylamine-5-sulfonic acid (Laurent's acid; L acid; 5-amino-1-naphthalenesulfonic acid) $C_{10}H_6NH_2(SO_3H)$.

Properties: Anhydrous, white or pinkish crystalline needles; greenish fluorescence in dilute aqueous solution. Soluble in water.

Derivation: (a) From alpha-naphthylamine by sulfonation with oleum. (b) From alpha-naphthalenesulfonic acid by nitration, reduction and separation from 1-naphthylamine-8-sulfonic acid also formed.

Hazard: May be toxic.

Use: Azo dyes.

1-naphthylamine-6 and 7-sulfonic acid (Cleve's acid; 5- and 8-amino-2-naphthalenesulfonic acids) $C_{10}H_6NH_2SO_3H$.

Properties: Colorless needles; not very soluble in water. M.p. (1,6-) over $330^\circ C$.

Derivation: Sulfonation, nitration, reduction and either separation of the combined 1,6 and 1,7 acids or separating by different concentrations and salting out.

Method of purification: Recrystallization.

Grades: Technical; either mixture of 1,6 plus 1,7 acids or each separate.

Hazard: May be toxic.

Uses: Azo and diazo dyes.

1-naphthylamine-8-sulfonic acid (peri acid; S acid; Schoenkopf's acid; 8-amino-1-naphthalenesulfonic acid) $C_{10}H_6NH_2SO_3H$.

Properties: White needles; slightly soluble in water.

Derivation: Together with 1-naphthylamine-5-sulfonic acid by sulfonating naphthalene, nitrating, reducing and separating the combined precipitated acids with soda ash. The insoluble 1,8 sodium salt is filtered off from the 1,5 sodium salt solution and transposed into free acid with hydrochloric acid.

Grade: Technical, with less than 1% 1,5 acid.

Hazard: May be toxic.

Use: Mostly as phenyl-1-naphthylamine-8-sulfonic acid for azo dyes.

2-naphthylamine-1-sulfonic acid (Tobias acid; 2-amino-1-naphthalenesulfonic acid) $C_{10}H_6(NH_2)(SO_3H)$.

Properties: Crystallizes in white needles. Soluble in hot water.

Derivation: Sodium 2-naphthol-1-sulfonate (from beta-naphthol and sulfuric acid at $40^\circ C$) is heated with ammonium hydrogen sulfite and ammonia in an autoclave at from 100 to $150^\circ C$.

Method of purification: Precipitation from dilute solution of sodium salt.

Hazard: May be toxic.

Use: Intermediate for dyes, pigments, J-acid and optical brighteners.

2-naphthylamine-6-sulfonic acid (Broenner's acid; 6-amino-2-naphthalenesulfonic acid) $C_{10}H_6(NH_2)SO_3H$.

Properties: Colorless needles; soluble in boiling water.

Derivation: By heating sodium 2-naphthol-6-sulfonate with concentrated ammonia in an autoclave at $180^\circ C$.

Grades: Technical. Also commonly sold in the form of the sodium salt, an odorless, light gray to pink powder.

Containers: Fiber drums.

Hazard: May be toxic.

Use: Intermediate for dyes and pigments.

2-naphthylamine-7-sulfonic acid (Cassella's acid F; Bayer's acid; F acid; delta acid) $C_{10}H_6(NH_2)SO_3H$.

Properties: Colorless crystals; soluble in water, alcohol, and ether.

Derivation: (Cassella's acid F.) By heating sodium 2-naphthol-7-sulfonate with aqueous ammonia and ammonium acid sulfite in an autoclave.

Hazard: May be toxic.

Use: Dyes.

2-naphthylamine-8-sulfonic acid (Badische acid). Similar to other naphthylaminesulfonic acids.

1-naphthylamine-3,6,8-trisulfonic acid (Koch's acid; 8-amino-1,3,6-naphthalenetrisulfonic acid) $C_{10}H_4(NH_2)(SO_3H)_3$.

Properties: White solid; soluble in water (slightly).

Derivation: Naphthalene is sulfonated to naphthalene-1,3,6-trisulfonic acid using oleum; and this trisulfonic acid is nitrated cold and then reduced with iron.

Hazard: May be toxic.

Use: Dyes.

1-naphthylamine-4,6,8-trisulfonic acid. See "Osmon." beta-naphthyl benzoate. See benzonaphthol.

ortho-2-naphthyl meta, N-dimethylthiocarbamate. See tolnaftate.

naphthylenediamine (diaminonaphthalene; naphthalene-diamine) $C_{10}H_6(NH_2)_2$. There are eight isomers. The following properties are those of the 1,5 isomer.

Properties: Colorless crystals; m.p. $190^\circ C$; b.p., sublimes. Soluble in alcohol and hot water; very sparingly soluble in cold water. Combustible.

Derivation: (a) By the reduction of alpha-dinitronaphthalene. (b) By heating dihydroxynaphthalene with aqueous ammonia.

Use: Organic synthesis.

N-alpha-naphthylethylenediamine dihydrochloride

$C_{10}H_7NHCH_2CH_2NH_2 \cdot 2HCl$. Colorless crystals; soluble in water. Used as reagent for the quantitative determination of sulfa drugs; for the detection of nitrogen dioxide in air.

beta-naphthyl ethyl ether (nerolin) $C_{10}H_7OC_2H_5$.

Properties: White crystals; orange-blossom odor; congealing pt. $35^\circ C$; soluble in 5 parts of 95% alcohol. Combustible.

Derivation: Interaction of beta-naphthol and ethyl alcohol in presence of sulfuric acid.

Uses: Perfumes; soaps; flavoring.

1-naphthyl N-methylcarbamate. See carbaryl.

alpha-naphthylmethyl chloride. See 1-chloromethylnaphthylene.

beta-naphthyl methyl ether (beta-naphthol methyl ether; 2-methoxynaphthalene; methyl naphthyl ether) $C_{10}H_7OCH_3$.

Properties: White, crystalline scales; soluble in alcohol and ether; insoluble in water. M.p. $72^\circ C$; b.p. $274^\circ C$. Combustible.

Derivation: (a) By heating beta-naphthol and methyl alcohol in presence of sulfuric acid. (b) By methylating beta-naphthol with dimethyl sulfate.

Use: Perfumery (soaps).

alpha-naphthylphenyloxazole (NPO; ANPO; 2-(1-naphthyl)-5-phenyloxazole) $C_{19}H_{13}NO$.

Properties: Fluorescent yellow needles; m.p. $104-106^\circ C$.

Grade: Scintillation.

Containers: 100-g bottles.

Use: Scintillation counter or wave length shifter in solution scintillators.

N-1-naphthylphthalamic acid $C_{10}H_7NHCOC_6H_4COOH$.

Properties: Crystalline solid; m.p. $185^\circ C$; almost insoluble in water; slightly soluble in acetone, benzene, and ethanol; not stable in solutions above pH 9.5 nor at temperatures in excess of $180^\circ C$; noncorrosive; combustible; low toxicity. Do not store near seeds or fertilizers.

Use: Selective, pre-emergence herbicide.

alpha-naphthylthiourea (ANTU) $C_{10}H_7NHCSNH_2$.

Properties: Odorless gray powder; m.p. $198^\circ C$. Insoluble in water and only very slightly soluble in most organic solvents.

Derivation: From alpha-naphthylthiocarbamide and alkali or ammonium thiocyanate.

Containers: Fiber cans.

Hazard: Toxic by ingestion.

Use: Rodenticide.

Shipping regulations: (Air) Poison label. Legal label name, antu.

naphite. See trinitronaphthalene.

Naples yellow. See lead antimonate.

"Napon."⁵³ Trademark for a starch derivative containing both hydrophilic and hydrophobic groups. Uses: Emulsifying agent.

narceine $C_{23}H_{27}O_8N \cdot 3H_2O$.

Properties: White, silky crystals; bitter taste; odorless. Soluble in alcohol and boiling water; less soluble in cold water; insoluble in ether. M.p. $150-160^\circ C$ (commercial), $170-171^\circ C$ (pure base).

Derivation: Occurs in opium. May be obtained from narcotine.

Use: Medicine.

narcosine. See noscapine.

narcotic. (1) A natural, semisynthetic, or synthetic nitrogen-containing heterocyclic drug that characteristically effects sleep (coma) and relief of pain, but also may result in addiction, i.e., a biochemical situation in which the body tissues become so adapted to the drug that they can no longer function normally without it. Natural narcotics are the plant products morphine and codeine (constituents of opium), both of which are alkaloids (q.v.). Opium is obtained from the seed of the oriental poppy, *Papaver somniferens*. Semisynthetic narcotics are modifications of the morphine molecule, e.g., diacetylmorphine (heroin), ethylmorphine ("Dionin"), and methyldihydromorphine (metopon).

Synthetic narcotics are meperidine, methadone, and phenazocine. (There are other addictive agents that are not narcotics). The sale of narcotics is strictly controlled by law in the United States.

(2) Inducing sleep or coma. Many chemicals that are not narcotics in sense (1) have this property (chloroform, barbiturates, benzene, etc.).

l-alpha-narcotine. See noscapine.

naringin (naringenin-7-rhamnoglucoside; naringenin-7-rutinoside; aurantiin) $C_{27}H_{32}O_{14}$.

Properties: A flavanone glycoside (bioflavonoid). Crystals; m.p. $171^\circ C$; bitter taste. Soluble in acetone, alcohol, warm acetic acid.

Source: Extracted from flowers and rind of grapefruit and immature fruit.

Containers: Fiber drums.

Uses: Beverages; sweetener research.

nascent. Descriptive of the abnormally active condition of an element, for example, the atomic oxygen released from hydrogen peroxide and sulfur atoms evolved from thiuramsulfide accelerators. The term is now obsolescent.

"Natac."²⁸⁵ Trademark for a resin acid; density 1.075-1.085, odorless, used as tackifier, bloom retarder, and processing acid. Neutral cure rate.

National Agricultural Chemicals Association (NAC).

An organization of chemical manufacturers concerned with the safety aspects of pesticides. Its Pesticide Safety Team Network can be called upon to decontaminate accidental spills of the more toxic pesticides.

"National" Boronated Graphites.²¹⁴ Trademark for a series of nuclear grades of graphite with unique characteristics of the combination of neutron absorption with heat dissipation, accomplished by dispersing boron as boron carbide particles in graphite. Safe to handle before and after exposure. See also graphite.

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

Uses: Moderators, reflectors, thermal columns, shielding, control rods, fuel elements, crucibles, and molds.

"Natox."¹ Trademark for sodium oxalate. $\text{Na}_2\text{C}_2\text{O}_4$.

Uses: Wallboard cement; insulating materials; tanning of kid skin; fireworks.

natrium. The Latin name for sodium; hence the symbol Na in chemical nomenclature.

natrolite $\text{Na}_2\text{Al}_2\text{Si}_3\text{O}_{10} \cdot 2\text{H}_2\text{O}$. A mineral of the zeolite group. See zeolite.

Properties: Colorless or white to gray, yellow, greenish or red; sp. gr. 2.2-2.25; Mohs hardness 5-5.5.

natron. A complex salt found in dry lake beds of Egypt. Originally an ingredient of ceramic glazes. It has the percentage composition: sodium carbonate, 4.9; sodium bicarbonate, 12.6; sodium chloride, 30.6; sodium sulfate, 20.6; silica, 10; calcium carbonate, 2; magnesium carbonate, 1.9; alumina, 0.7; iron oxide, 0.3; water, 4.7, and organic matter, 11.7.

"**Natron 86.**"⁵³ Trademark for a cationic polyelectrolyte.

Uses: Water purification; clarification of paper mill effluents; removal of colored waste and other solids from water.

"**Natrosol.**"²⁶⁶ Trademark for hydroxyethylcellulose.

"**Natsyn.**"²⁶⁵ Trademark for a series of cis-1,4-polyisoprene synthetic rubbers essentially duplicating the chemical structure of natural rubber.

Natta catalyst. A stereospecific catalyst (q.v.) made from titanium chloride and aluminum alkyl or similar materials by a special process which includes grinding the materials together to produce an active catalyst surface. See also Ziegler catalyst.

natural. Descriptive of a substance or mixture which occurs in nature; the opposite of synthetic or man-made. Elements from 1 to 92 are natural substances that may occur in either the free or combined state. The transuranium elements and all artificial isotopes of other elements are synthetic. Many mixtures occur naturally, e.g., petroleum, wood, metallic ores, natural gas; others are man-made combinations of natural compounds, e.g., glass, cement, paper. Such materials may be considered to be semisynthetic (q.v.). The term "synthetic natural" is often applied to synthesized compounds that are identical with the natural substance; for example, synthetic natural gas and synthetic natural rubber. The term "natural product" is defined as any organic compound formed by living organisms; "natural gasoline" has a specialized meaning (see under gasoline). See also synthesis; natural gas.

natural gas. A mixture of low-molecular weight hydrocarbons obtained in petroleum-bearing regions throughout the world. Its composition is 85% methane, 10% ethane, the balance being made up of propane, butane, and nitrogen. In the U.S. it occurs chiefly in the southwestern states and Alaska. Natural gas is classed as a simple asphyxiant. It should not be confused with natural gasoline. About 3% of the natural gas consumed in the U.S. is used as feedstocks by the chemical industries.

Properties: Colorless flammable gas or liquid; almost odorless; autoignition temperature 900-1100°F. Heating value 1000 Btu per cu ft. A warning odor is added to household fuel gas as a safety precaution.

Containers: As gas, in pipelines; as liquid (LNG) in ocean tankers, barges, tank trucks, pipelines.

Hazard: Flammable, dangerous fire and explosion risk. Explosive limits in air, 3.8 to 17%.

Uses: Fuel and cooking gas; ammonia synthesis; petrochemical feedstocks; carbon black manufacture (channel process); experimental auto fuel.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes. Legal label name Liquefied petroleum gas.

See also liquefied petroleum gas; synthetic natural gas.

natural gasoline. See under gasoline.

"**Naturetin.**"⁴¹² Trademark for bendroflumethiazide.

"**Naugapol.**"²⁴⁸ Trademark for a series of butadiene-styrene copolymers which have received special processing for minimum water-soluble salts and low ash content. Included are "Naugapol K" series which are masterbatches of high styrene resin ("Kralac" A-EP) and "Naugapol" elastomers. Uses include wire and cable insulation, mechanical goods, adhesives, and cements. The "K" series are used for shoe soles, floor tile and wire and cable insulation.

"**Naugatex.**"²⁴⁸ Trademark for a series of synthetic latices.

"**Naugawhite.**"²⁴⁸ Trademark for an alkylated phenol antioxidant.

Uses: General-purpose antioxidant for rubber and latex in foam sponge, tire carcass, refrigerator gaskets, footwear, proofing, wire insulation and sundries.

naval stores. Historically, the pitch and rosin used on wooden ships. The term now includes all products derived from pine wood and stumps, including rosin, turpentine, pine oils, tall oil and its derivatives.

"**Navane.**"²⁹⁹ Trademark for the *cis* isomer of *N,N*-dimethyl-9 [3-(4-methyl-1-piperazinyl) propylidene]thioxanthene-2-sulfonamide. An antipsychotic drug (thiothixene) said to be as effective as most of the phenothiazines. Approved by FDA.

"**Naxol.**"²⁴³ Trademark for cyclohexanol (q.v.).

"**Naxonate**" **Hydrotropes.**⁵³⁶ Trademark for products used to obtain uniform, clear, and mobile synthetic detergent formulations. Some examples of the chemicals used in solutions and powders are: sodium, potassium, and ammonium salts of xylenesulfonate, toluenesulfonate, and benzenesulfonate.

Nb Symbol for niobium.

NBA. Abbreviation for N-bromoacetamide.

"**NBC.**"²⁸ Designation for nickel dibutylthiocarbamate (q.v.).

NBR. Abbreviation for nitrile-butadiene rubber.

NBS. Abbreviation for N-bromosuccinimide.

NC. Abbreviation for nitrocellulose.

NCS. Abbreviation for N-chlorosuccinimide.

Nd Symbol for neodymium.

NDGA. Abbreviation for nordihydroguaiaretic acid.

"**N-Dure.**"¹⁹⁷ Trademark for a heavy liquid solution containing urea and formaldehyde; used to manufacture solid fertilizer compositions in which the nitrogen is slowly available to growing plants.

Ne Symbol for neon.

"**Neantine.**"²²⁷ Trademark for diethyl phthalate (q.v.).

"Neatex."¹⁵² Trademark for various grades of neatsfoot oil (q.v.).

neatsfoot oil

Properties: A fixed, pale yellow oil with a peculiar odor. Soluble in alcohol, ether, chloroform, and kerosine. Sp. gr. 0.916; saponification value 194–199; flash point 470°F; autoignition temp. 828°F; iodine value 70. Combustible. Low toxicity.

Derivation: By boiling in water the shinbones and feet (deprived of hoofs) of cattle and separating the oil from the fat obtained.

Grades: 15°; 20°; 30°; 40°F cold test (the temperature in °F at which stearin separates).

Containers: Tins; drums.

Hazard: Subject to spontaneous heating.

Uses: Leather industry for fat-liquoring and softening; lubricant; oiling wool.

neburon. Generic name for 1-n-butyl-3-(3,4-dichlorophenyl)-1-methylurea (q.v.).

"Nectadon."¹²³ Trademark for noscapine (q.v.).

"Neelium."⁴¹ Trademark for a synthetic rubber coating of the neoprene type which can be applied in films up to 20 mils. It is supplied in a two-package system of liquid and accelerator.

"Neetol."²⁴⁴ Trademark for a series of alkaline oils, based primarily on neatsfoot oil.

Use: Leather industry (referred to as mayonnaise type fat-liquor).

"Negatan."¹⁰⁰ Trademark for negatol (q.v.).

negatol. A condensation product of meta-cresolsulfonic acid with formaldehyde. A polymerized dihydroxydimethyldiphenylmethanedisulfonic acid. It is dispersible in water forming colloidal solutions which are very acidic. The pH of a 5% dispersion is about 1.0.

Use: Medicine.

"NegGram."¹⁶² Trademark for nalidixic acid (q.v.).

"Neguvon."¹⁸¹ Trademark for trichlorfon (q.v.).

"Nekal."³⁰⁷ Trademark for a series of wetting and dispersing agents.

"Nelio."⁴²⁰ Trademark for a series of pine products (rosin, pinene, turpentine, etc.) characterized by extreme purity and uniformity.

"Nemafume."⁸⁸ Trademark for 1,2-dibromo-3-chloropropane; 99% purity.

"Nemagon."¹²⁵ Trademark for a soil fumigant containing 95% 1,2-dibromo-3-chloropropane.

Hazard: Toxic by inhalation and skin absorption. Irritant to skin and eyes. Moderate fire risk.

nematocide. An agent which is destructive to nematodes (roundworms or threadworms).

"Nembutal."³ Trademark for pentobarbital, calcium or sodium. See barbiturate.

neo-

(1) A prefix meaning new and designating a compound related in some way to an older one.

(2) A prefix indicating a hydrocarbon in which at least one carbon atom is connected directly to four other carbon atoms; as, neopentane, neohexane.

"Neobee."⁵⁵⁵ Trademark for series of cosmetic and pharmaceutical grades of synthetic oils derived from natural fatty products.

"Neobon."⁴¹ Trademark for a synthetic rubber coating of the neoprene type for protection against corrosion. It is supplied in a two-package system of liquid and accelerator.

"Neochel."²⁸⁸ Trademark for a wetting agent used in copper plating. A liquid replacement for Rochelle salt with proprietary additives.

"NeoCoat."²⁰⁴ Trademark for a self-curling liquid neoprene maintenance coating for steel, concrete, and wood surfaces. Resistant to corrosive atmospheric conditions, splash and spill of chemicals, and to abrasion.

"NeoCryl."⁵¹⁶ Trademark for acrylic polymers and copolymers.

Uses: Protective and decorative coatings in the leather, floor polish, paper, paint, textile and adhesive fields.

neodecanoic acid $C_9H_{19}COOH$. Clear, colorless liquid in 97% purity; available commercially. Its derivatives are especially effective as paint driers and are being widely used. Applications as plasticizers and lubricants are also possible.

"Neodol 25."¹²⁵ Trademark for a C_{12} – C_{15} linear, primary alcohol.

Uses: Manufacture of biodegradable surfactants, dispersants, solvents, emulsifiers, and chemical intermediates.

neodymia. See neodymium oxide.

neodymium Nd Metallic element having atomic number 60; group IIIB of the periodic table; atomic weight 144.24; valence 3. A rare-earth element of the lanthanide (cerium) group. There are 7 isotopes.

Properties: Soft, malleable, yellowish metal; tarnishes easily; sp. gr. 7.0; m.p. 1024°C; b.p. about 3030°C; ignites to oxide (200–400°C); liberates hydrogen from water; soluble in dilute acids. High electrical resistivity; paramagnetic. Readily cut and machined. Store under mineral oil or inert gas to prevent tarnish and corrosion.

Derivation: Monazite, bastnasite, allanite. Ores are cracked by heating with sulfuric acid.

Forms available: Ingots, rods, sheet, powder to 99.9+ % purity.

Hazard: (Salts) Irritant to eyes and abraded skin.

Uses: Neodymium salts; electronics; alloys; colored glass, especially in astronomical lenses and lasers; to increase heat resistance of magnesium; metallurgical research; yttrium-garnet laser dope.

See also didymium.

neodymium acetate $Nd(C_2H_3O_2)_3 \cdot xH_2O$. Pink powder, soluble in water.

neodymium ammonium nitrate

$Nd(NO_3)_3 \cdot 2NH_4NO_3 \cdot 4H_2O$. Pink crystals, soluble in water. Technical grade contains 75% neodymium salt. Principal impurities praseodymium and samarium.

neodymium carbonate $Nd(CO_3)_3 \cdot xH_2O$. Pink powder, insoluble in water; soluble in acids. Grades 75%, 95%, and 99% neodymium salt.

neodymium chloride (a) $NdCl_3$; (b) $NdCl_3 \cdot 6H_2O$.

Properties: (a) Violet crystals; sp. gr. 4.134 (25°C); m.p. 784°C; b.p. 1600°C. Very soluble in water, soluble in alcohol; insoluble in ether and chloroform. (b) Red crystals; m.p. 124°C; loses $6H_2O$ at 160°C. Very soluble in water and alcohol.

Grades: 75%, 95%, 99% and 99.9%.

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

neodymium fluoride NdF_3 .

Properties: Pink powder; m.p. 1410°C ; b.p. 2300°C . Insoluble in water.

Grades: 65%, 75%, 99% and 99.9%.

Hazard: Toxic and irritant.

neodymium nitrate $\text{Nd}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$.

Properties: Pink crystals; very soluble in water; soluble in alcohol and in acetone.

Grades: 75%, 95%, 99% and 99.9%.

Hazard: Toxic; possible explosion risk.

neodymium oxalate $\text{Nd}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$.

Properties: Pink powder; insoluble in water; slightly soluble in acids.

Grades: 75%, 95% and 99%.

neodymium oxide (neodymia) Nd_2O_3 .

Properties: Pure product a blue-gray powder; technical grade a brown powder; sp. gr. 7.24; m.p. approx. 1900°C . Insoluble in water; soluble in acids. Hygroscopic; absorbs carbon dioxide from the air.

Grades: 65%, 75%, 85%, 95%, 99% and 99.9% oxide.

Uses (65%): To counteract color of iron in glass. (Purified grades): Ceramic capacitors; coloring glass; catalysts; refractories; carbon arc-light electrodes.

neodymium sulfate $\text{Nd}(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Properties: Pink crystals; sp. gr. 2.85; m.p. 1176°C ; soluble in cold water; sparingly soluble in hot water.

Grades: 75%, 99% and 99.9%.

Uses: Decolorizing glass; coloring glass used in glass blowers and welders' goggles, tableware, etc.

"Neo-Fat."¹⁵ Trademark for a series of fatty acids produced by fractional crystallization and distillation processes. See phenylstearic acid.

"Neoflex."¹²⁵ Trademark for a series of linear primary alcohols, from C_6 through C_{11} , including blends.

Properties: (C_7): Colorless liquid; sp. gr. 0.8217 (25°C); distillation range $174\text{--}182^\circ\text{C}$. Low toxicity.

Hazard: Combustible, moderate fire risk.

Uses: Solvent; reaction intermediate; esterifying agent.

"Neofinish."¹⁵⁹ Trademark for a fatty-based ester derivative used as non-ionic softener for all fibers.

"Neofolione."²²⁷ Trademark for methyl 2-nonenolate (q.v.).

neohexane (2,2-dimethylbutane) C_6H_{14} or $\text{C}_2\text{H}_5\text{C}(\text{CH}_3)_3$.

Properties: Colorless volatile liquid; b.p. 49.7°C ; refractive index 1.3659 (25°C); sp. gr. 0.6570 (25°C); freezing point -99.7°C ; flash point -54°F ; octane rating 100+; autoignition temp. 797°F . Low toxicity.

Derivation: By the thermal or catalytic union (alkylation) of ethylene and isobutane, both recovered from refinery gases.

Grades: 95%, 99%, research.

Hazard: Highly flammable; dangerous fire and explosion risk; lower explosion limit 3%.

Uses: Component of high-octane motor and aviation fuels; intermediate for agricultural chemicals.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

"Neolan."⁴⁴¹ Trademark for metal-complex dyes for wool and polyamide fibers.

"NeoLine."²⁰⁴ Trademark for a liquid neoprene, externally catalyzed, for coating immersed surfaces of steel and concrete. Applied by brush, spray or roller for heat curing or air curing.

"Neolite."²⁶⁵ Trademark for a vinyl shoe-soling material.

"Neolith."⁴³⁴ Trademark for pellet-type; free-flowing dustfree litharge; designed for ease of handling. Used in the ceramic industry.

"Neolyn."²⁶⁶ Trademark for a series of soft-to-medium hard modifying rosin-derived alkyd resins. Used in adhesives, lacquers, organosols, plastisols, and floor tile. Available in solution and/or solid forms of various grades.

neomycin sulfate. The sulfate salt of neomycin.

Properties: White to slightly yellow crystals or powder; odorless or practically odorless; hygroscopic. Solutions are dextrorotatory. Very soluble in water, very slightly soluble in alcohol and insoluble in acetone, chloroform and ether.

Grades: U.S.P.; commercial.

Use: Medicine (antibiotic); cosmetic, textile, paper industries; feed supplement; food additive.

neon Ne Inert element of atomic number 10, noble gas group of the periodic system. Atomic weight 20.179. Three stable isotopes.

Properties: Colorless, odorless, tasteless gas; does not form compounds, but ionizes in electric discharge tubes. Liquefies at -245.92°C ; f.p. -248.6°C ; sp. gr. 0.6964 (air = 1); sp. vol. 11.96 cu ft/lb (70°F , 1 atm).

Noncombustible; nontoxic. Slightly soluble in water. Derivation: By fractional distillation of liquid air. It constitutes 0.0012% of normal air.

Grades: Technical; highest purity.

Containers: Technical, steel cylinders; H.P., hermetically sealed glass flasks.

Uses: (Gas) Luminescent electric tubes and photoelectric bulbs; electronic industry; in lasers. (Liquid) cryogenic research.

Shipping regulations: (Gas) (Rail) Green label. (Air)

Nonflammable Gas label. (Liquid, nonpressurized)

(Air) Not acceptable. (Liquid, low-pressure) (Air)

No label required; not acceptable on passenger

planes. (Liquid, pressurized) (Air) Nonflammable Gas

label; not acceptable on passenger planes.

neonicotine. See anabasine.

"Neonyl." Trademark for neutral dyeing dyes for polyamide fibers.

neopentane (2,2-dimethylpropane; tetramethylmethane) C_5H_{12} or $\text{C}(\text{CH}_3)_4$. Present in small amounts in natural gas.

Properties: Colorless gas or very volatile liquid; b.p. 9.5°C ; sp. gr. 0.591 ($20/4^\circ\text{C}$); f.p. $\geq 17^\circ\text{C}$; soluble in alcohol; insoluble in water. Flash point -85°F . Autoignition temp. 842°F ; explosive limits in air, 1.4 to 7.5%.

Grades: Technical 95%, pure 99%, research 99.9%.

Containers: Cylinders under low pressure.

Hazard: Highly flammable; dangerous fire and explosion risk.

Uses: Research; butyl rubber.

neopentanoic acid. See trimethylacetic acid.

neopentyl glycol (2,2-dimethyl-1,3-propanediol) $\text{HOCH}_2\text{C}(\text{CH}_3)_2\text{CH}_2\text{OH}$.

Properties: White, crystalline solid; boiling range, 95% between $204\text{--}208^\circ\text{C}$; m.p. $120\text{--}130^\circ\text{C}$; sp. gr. 1.066 ($25/4^\circ\text{C}$).

Containers: Drums; carloads.

Uses: Polyester foams; insect repellent.

neoprene (polychloroprene). $(\text{C}_4\text{H}_5\text{Cl})_n$. A synthetic elastomer available in solid form, as a latex, or as a flexible foam. Vulcanized with metallic oxides rather than sulfur. Sp. gr. 1.23; resistant to oils, oxygen,

ozone, corona discharge, and electric current. Combustible, but less so than natural rubber. An isocyanate-modified form has high flame resistance.

Uses: (Solid) mechanical rubber products; lining oil-loading hose and reaction equipment; adhesive cement; binder for rocket fuels; coatings for electric wiring; gaskets and seals. (Liquid) Specialty items made by dipping or electrophoresis from the latex. (Foam) Adhesive tape to replace metal fasteners for automotive accessories; seat cushions; carpet backing; sealant.

"NeoPrime"²⁰⁴ Trademark for chlorinated rubber base primers; bonding agent for neoprene coatings.

"Neoprontosil."¹⁶² Trademark for azosulfamide (q.v.).

neopyrithiamine. See pyrithiamine.

"NeoRez."⁵¹⁶ Trademark for polystyrene copolymer emulsions and urethane prepolymers.

Uses: Floor polish, textile and paper fields, leather finishes, adhesives and protective coatings.

"Neo-Silvol."³³⁰ Trademark for colloidal silver iodide (q.v.).

"Neosol"¹²⁵ Trademark for ethyl alcohol based on a formulation approved by the Bureau of Internal Revenue.

"Neo Spectra."¹³³ Trademark for a series of impingement carbon blacks for automotive enamels.

neostigmine bromide (3-dimethylcarbamoxymethyl-trimethylammonium bromide)
(CH₃)₂NCOOC₆H₄N(CH₃)₃Br.

Properties: White, crystalline powder; odorless; bitter taste; m.p. 167°C (dec); very soluble in water; soluble in alcohol; insoluble in ether.

Grade: U.S.P.

Use: Medicine.

"Neo-Synephrine" Hydrochloride.¹⁶² Trademark for phenylephrine hydrochloride (q.v.).

"Neotex."¹³³ Trademark for furnace carbon blacks used in rubber, printing inks and protective coatings. Characterized by low structure and low oil absorption.

Containers: 25- and 50-lb bags; hopper cars.

"Neo-Tone Sour."²⁴⁴ Trademark for a laundry sour of the iron-removing type, consisting chiefly of fluorine compounds and complex phosphates.

Hazard: Probably toxic.

"Neotran."²³³ Trademark for insecticidal preparations with di-(4-chlorophenoxy)methane as active ingredient.

Hazard: Probably toxic.

neotridecanoic acid C₁₂H₂₅COOH. Colorless liquid of 97% purity. Suggested for plasticizers, lubricants, paint driers, fungicides, cosmetics, alkyd resins.

"NeoVac."⁵¹⁶ Trademark for a series of polymer and copolymer emulsions used in textiles, adhesives, papercoatings and plastic starches.

"Neowet."¹¹⁹ Trademark for a complex polyethylene ether non-ionic wetting agent.

Uses: General wetting purposes, particularly useful with enzymatic desizing agents; scouring all types of textile fabrics; good for use with resin finishes.

"Neozone."²⁸ Trademark for a group of rubber antioxidants.

A. N-Phenyl-alpha-naphthylamine.

D. N-Phenyl-beta-naphthylamine.

C. Fusion of "Neozone" A and toluene-2,4-diamine.

"Neozymes."¹⁵⁹ Trademark for a series of pancreatic and bacterial enzymes, proteolytic and amylolytic activity for low and high temperatures, continuous or batch desizing.

Grades: Regular, HT, 3-LC and 5-LC, available in powder and liquid form.

Uses: Desizing fabrics coated with starch or gelatin.

nephelite (nepheline) (Na,K)(Al,Si)₃O₈. Essentially a silicate of sodium, found in silica-poor igneous rocks. Properties: Colorless, white, yellowish; luster vitreous to greasy; hardness 5.5-6; sp. gr. 2.55-2.65.

Occurrence: U.S.S.R.; Ontario; Norway; South Africa; Maine, Arkansas, New Jersey.

Uses: Ceramic and glass manufacture; enamels; source of potash and aluminum (U.S.S.R.).

nephelometry. Photometric analytical techniques for measuring the light scattered by finely divided particles of a substance in suspension. It is used to estimate the extent of turbidity in such products as beer and wine, in which colloiddally dispersed particles are present.

"Nepinol."⁴²⁰ Trademark for a commercial grade of pine oil.

"Nepoxide."⁴¹ Trademark for a coating of the epoxy type which exhibits excellent adhesive properties and resistance to general chemicals and solvents. Can be deposited in high film thickness.

neptunium Np A radioactive transuranic element, having atomic number 93, first formed by bombarding uranium with high-speed deuterons. Atomic weight 237.0482. Valences 3,4,5,6. Sp. gr. 20.45. Neptunium 237, the longest-lived of the 11 isotopes, has been found naturally in extremely small amounts in uranium ores. It is produced in weighable amounts as a by-product in the production of plutonium.

Metallic neptunium is obtained by first preparing neptunium trifluoride, which is reduced with barium vapor at 1200°C. It is a silvery white metal; m.p. 640°C. Neptunium is similar chemically to uranium; it forms such intermetallic compounds as NpAl₃ and NpBe₁₃, as well as NpC, NpSi₂, NpN, NpF₃, NpF₆, NpF₄, NpO₂, Np₂O₃, etc. Soluble in HCl; strong reducing agent.

Neptunium 237 is used in neutron detection instruments.

neptunium dioxide NpO₂.

Properties: Dark olive, free-flowing powder.

Derivation: Neptunium oxalate is precipitated from solutions containing nitric acid and neptunium. The neptunium oxalate is calcined at 500-550°C, producing neptunium dioxide.

Uses: Fabrication by powder metallurgy into target elements to be irradiated to produce plutonium 238.

nerol (cis-3,7-dimethyl-2,6-octadien-1-ol)

(CH₃)₂C:CH(CH₃)₂:C(CH₃)₂:CHCH₂:OH. The *cis* isomer of geraniol.

Properties: Colorless liquid; rose-neroli odor; combustible.

Derivation: Iodization of geraniol with hydriodic acid, followed by treatment with alcoholic soda.

Containers: Glass bottles; drums.

Uses: Perfumery; flavoring.

nerolidol (3,7,11-trimethyl-1,6,10-dodecatrien-3-ol)
 $(\text{CH}_3)_2\text{C}:\text{CH}(\text{CH}_2)_2\text{C}(\text{CH}_3):\text{CH}(\text{CH}_2)_2\text{C}(\text{CH}_3)\cdot$
 $(\text{OH})\text{CH}:\text{CH}_2$.

A sesquiterpene alcohol.

Properties: Straw-colored liquid with an odor similar to rose and apple. Sp. gr. 0.878; refractive index 1.480-1.482; angular rotation (natural) +11 to +14°; (synthetic) optically inactive; stable in air; soluble in alcohol and most fixed oils; insoluble in glycerol. Combustible; nontoxic.

Derivation: Occurs naturally in Peru balsam and oils of orange flower, neroli, sweet orange, and ylang ylang. Also made synthetically.

Grade: F.C.C.

Containers: Up to 55-gal drums.

Uses: Perfumery; flavoring.

nerolin. See beta-naphthyl ethyl ether.

neroli oil (orange flower oil).

Properties: Essential oil; pale yellow, fluorescent liquid becoming brownish red on exposure to light; pleasant odor; bitter aromatic taste; sp. gr. 0.863-0.880 (25/25°C); optical rotation +1.5° to +9.1° (25°C). Soluble in an equal volume of alcohol. Combustible; nontoxic.

Chief known constituent: Limonene, linalool, methyl anthranilate, geraniol, linalyl acetate.

Derivation: Distilled from the flower of *Citrus aurantium* L. Also synthetically. See methyl anthranilate.

Grade: N.F.

Uses: Perfumery; flavoring.

"Nerosol."³⁴² Trademark for a blend of sesquiterpene alcohols used in perfumery.

nerve gas (nerve poison). One of several toxic chemical warfare agents developed in Germany during World War II. They are organic derivatives of phosphoric acid (principally, alkyl phosphates, fluorophosphates, and thiophosphates). They inhibit the enzyme cholinesterase and cause acetylcholine poisoning and cessation of nerve transmission. They are colorless, odorless, tasteless liquids of low volatility, and are absorbed rapidly through the eyes, lungs, or skin; they are lethally toxic to higher animals and man. Atropine sulfate is used in the treatment of nerve gas poisoning. The principal German nerve gases were sarin, soman, tabun (q.v.). Many modern pesticides have the same general structure. See also insecticide; parathion.

Note: Manufacture of nerve gases for military use has been discontinued in U.S.

"Nesol."⁴²⁰ Trademark for a commercial dipentene consisting essentially of monocyclic terpene hydrocarbons.

Nessler's reagent. Solution of mercuric iodide in potassium iodide, used in detecting the presence of ammonia, particularly in very small amounts.

Hazard: Highly toxic.

"Neto."⁴⁹² Trademark for a dual acid-enzyme converted product with a dextrose equivalent of approximately 42. Has a maltose content three times that of an acid-converted corn syrup of the same degree of conversion. Used in confections.

Neuberg blue. A mixture of copper blue (powdered azurite) and an iron blue (Prussian blue). It can be more easily ground in oil than pure copper blue.

neurine $\text{CH}_2:\text{CHN}(\text{CH}_3)_3\text{OH}$ (trimethylvinylammonium hydroxide). A poisonous ptomaine formed during putrefaction by the dehydration of choline.

Properties: Syrupy liquid; fishy odor; absorbs carbon dioxide from the air; soluble in water and alcohol.

Hazard: Highly toxic.

Use: Biochemical research.

"Neustrene."⁴⁷³ Trademark for a group of refined glycerides.

"Neutralite."¹⁸⁴ Trademark for calcite granules of approximately 98% CaCO_3 (16-50 mesh) used to neutralize low pH waters.

neutralization. The reaction between hydrogen ion from an acid and hydroxyl ion from a base to produce water, or in nonaqueous solvents, the reaction between the positive and negative ions of the solvent to produce solvent and another salt-like compound.

neutral oil. A lubricating oil of medium or low viscosity obtained by distillation and dewaxing of crude petroleum or its cracking products.

neutral red (toluylene red)

$(\text{CH}_3)_2\text{NC}_6\text{H}_3\text{N}_2\text{C}_6\text{H}_2\text{CH}_2\text{NH}_2 \cdot \text{HCl}$ (tricyclic). 3-Amino-7-(dimethylamino)-2-methylphenazine monohydrochloride. C.I. No. 50040.

Properties: Green powder; dissolves in water or alcohol to give red color.

Use: Acid-base indicator in the range pH 6.8-8.0 (red in acid, yellow brown in alkali). See indicator.

"Neu-Tri."²³³ Trademark for a grade of trichloroethylene for specific industrial applications.

"Neutrol."²¹⁷ Trademark for an acid-activated clay used as decolorizing adsorbent for vegetable and animal fats and oils. See also "Filtrol."

"Neutroleum."¹⁸⁸ Trademark for an all-purpose deodorizing agent.

"Neutrolox."²⁰⁴ Trademark for a high-grade ammonium chloride used in textile finishing plants.

Uses: To neutralize textiles containing caustic soda from mercerizing, scouring, or bleaching operations.

neutron. Discovered by Chadwick in 1932, the neutron is a fundamental particle of matter having a mass of 1.009 but no electric charge. It is a constituent of the nucleus of all elements except hydrogen, the number of neutrons present being the difference between the mass number and the atomic number of the element. Neutrons may be liberated from the nucleus by fission (q.v.) of uranium-235, plutonium, and a few other elements, each nucleus yielding an average of 2.5 neutrons; they can also be produced by bombardment of other elements, e.g. beryllium, with positively charged particles.

Free neutrons are radioactive and have tremendous penetrating power as a result of their electrical neutrality; hence they have a highly damaging effect on living tissue, requiring the use of shielding (q.v.) of all equipment in which they are produced. Neutrons directly emitted from atomic nuclei are termed "fast"; it is these that bring about the chain reaction in the atomic bomb. In a nuclear power reactor, where a less rapid reaction is desired, the energy of fast neutrons is partially absorbed by the moderator (q.v.), and the neutrons so retarded are called "slow" or thermal. See also electron; proton; fission.

Uses: Nuclear fission; manufacture of plutonium and radioactive isotopes; cancer therapy; activation analysis.

neutron activation analysis. A type of nondestructive testing which utilizes a stream of neutrons produced by a nuclear reactor or other source. The sample is

be analyzed is bombarded by the neutrons, which activate the elements composing it; the measurement of their radioactivity and its various energy levels provides an index of chemical composition. This method is used successfully for on-site analysis of concrete, and may be applied also to other crystalline materials.

"Neutronyx."³²⁸ Trademark for a group of nonionic detergents composed of alkylphenol polyglycol ethers containing ethylene oxide, or of polyethylene glycol fatty acid esters. "Neutronyx" S-60 and S-30 are anionics, the ammonium and sodium salts of a sulfated alkylphenol polyglycol ether.

Uses: Detergents; wetting, emulsifying, dispersing agents.

"Neutroscents."¹⁸⁸ Trademark for a series of perfumes designed particularly to cover objectionable odors; available in water-soluble form for sprays, air-conditioning apparatus, and other dispersion devices. Also available in a highly concentrated form.

"Nevillac."²¹ Trademark for a series of (alkyl) hydroxy resins. Used in adhesives, lacquers, paper coatings, special inks and varnishes.

Neville and Winther's acid. See 1-naphthol-4-sulfonic acid.

"Nevindene."²¹ Trademark for high-melting coumarone-indene resins of extreme hardness used for dental compounds, fast-drying varnishes, rotogravure inks, aluminum paints and insulating compounds.

"Nevinol."²¹ Trademark for a plasticizing and solvent oil used as a stable plasticizer for resins and gums; also used in fly paper, adhesives, inks, aluminum pastes, water-proofing compounds, and rubber-resin finishes.

Newtonian flow. See liquid, Newtonian.

"NFB."⁵⁸ Trademark for nonfuming aluminum bright dip bath based on phosphorus.

Ni Symbol for nickel.

"Niacet."²¹⁴ Trademark for various metallic acetate salts, including aluminum formoacetate, copper acetate, potassium acetate, sodium acetate, sodium diacetate, zinc acetate and "Niaproof" aluminum acetate (q.v.).

"Niacide."⁵⁵ Trademark for fungicidal products containing dimethyl dithiocarbamates used mainly for scab control.

niacin (nicotinic acid; pyridine-3-carboxylic acid)

C_5H_4NCOOH . The antipellagra vitamin, essential to many animals for growth and health. In man, niacin is believed necessary along with other vitamins for the prevention and cure of pellagra. It functions in protein and carbohydrate metabolism. As a component of two important enzymes, coenzyme I and coenzyme II, it functions in glycolysis and tissue respiration.

Properties: Colorless needles; odorless; m.p. 236°C; sublimes above melting point; sour taste; soluble in water and alcohol; insoluble in most lipid solvents; quite stable to heat and oxidation. Sp. gr. 1.473. A vasodilator in high concentrations.

Units: Amounts of niacin are expressed in milligrams. Sources: Food sources; meat, fish, milk, whole grains, yeast. Commercial sources: synthetic niacin is made by oxidation of nicotine, quinoline, or 2-methyl-5-

ethylpyridine (from ammonia and formaldehyde or acetaldehyde).

Containers: Glass vials, bottles, fiber cans and drums. Grades: N.F.; F.C.C.; blended with soy flour (animal feeds).

Uses: Medicine (cholesterol-lowering agent); nutrition; feeds; enriched flours; dietary supplement.

See also niacinamide.

niacinamide (nicotinamide; nicotinic acid amide)

$C_5H_4NCONH_2$. Same biological function as niacin. Properties: Colorless needles; m.p. 129°C; sp. gr. 1.40. Very soluble in water, ethyl alcohol, and glycerol; bitter taste.

Sources: Synthetic made by conversion of niacin to the amide.

Grades: U.S.P.; F.C.C.

Containers: 50-kilogram drums.

Uses: Medicine; dietary supplement.

Also commercially available as the hydrochloride.

niacinamide ascorbate. A complex of ascorbic acid and niacinamide.

Properties: Lemon-yellow powder; odorless or with a very slight odor. May gradually darken upon exposure to air. Soluble in water and alcohol; sparingly soluble in glycerin; practically insoluble in benzene.

Grade: F.C.C.

Use: Dietary supplement.

"Niagathal."⁶² Trademark for tetrachlorophthalic anhydride.

"Niagra."⁴³³ Trademark for iron powders.

"Nial."¹⁵⁵ Trademark for a nickel-base thermocouple alloy, wherein the negative thermal E.M.F. with reference to pure platinum is obtained by adding manganese, aluminum, and silicon. Low percentages of iron, cobalt, zirconium and magnesium are added to control both the E.F.M. and type of oxide.

Properties: Magnetic, m.p. 2550°F; sp. gr. 8.47 g/cc; sp. heat at 20°C, 0.12 cal/gm; tensile strength, 83,000 psi.

nialamide $C_5H_4NCO(NH)_2(CH_2)_2CONHCH_2C_6H_5$. Designated chemically as 1-(2-benzylcarbonyl)ethyl-2-isonicotinoylhydrazine. It is a white, crystalline powder of low solubility in water and good solubility in slightly acid solutions. It is stable in crystalline form, suspension and solution. Used in medicine as an amine oxidase inhibitor.

"Nialk."⁶² Trademark for chlorine, caustic soda, caustic potash, carbonate of potash, paradichlorobenzene and trichloroethylene.

"Niaproof."²¹⁴ Trademark for a water-repellent compound. Substantially a soluble basic aluminum acetate salt.

Uses: Source of aluminum ion for water-repellent finishes for textile, paper, and leather products, particularly in processes using wax or soap emulsions.

"Niax."²¹⁴ Trademark for a polyurethane foam preparation packaged in two units: (1) the resin base and (2) the expander or catalyst (see "Niax" ES).

"Nibrite."¹¹⁴ Trademark for barrel nickel-plating additive.

nicarbazin. Equimolar complex of 4,4'-dinitrocarbanilide and 2-hydroxy-4,6-dimethylpyrimidine. Forms crystals, decomposes at 265–275°C; insoluble in water. used as a coccidiostat.

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

niccolite (arsenical nickel) NiAs . An ore of nickel.

Properties: Pale copper-red mineral with dark tarnish, metallic luster. Contains 43.9% nickel; soluble in concentrated nitric acid. Sp. gr. 7.3–7.67; hardness 5–5.5.

Hazard: Highly toxic by inhalation of dust.

"Nichrome."¹⁵⁰ Trademark for an alloy containing 60% nickel, 24% iron, 16% chromium, 0.1% carbon. It is used principally for electric resistance purposes. It also offers good resistance to mine and sea waters and moist sulfurous atmospheres.

nickel Ni Metallic element of atomic number 28, group VIII of the Periodic Table. Atomic weight 58.71; valences 2, 4. Five stable isotopes.

Properties: Malleable, silvery metal; readily fabricated by hot- and cold-working; takes high polish; excellent resistance to corrosion. Sp. gr. 8.908; m.p. 1455°C; b.p. 2900°C; electrical resistivity (20°C) 6.844 microhm-cm. Attacked slightly by hydrochloric and sulfuric acids, somewhat more by nitric; highly resistant to strong alkalis. Low toxicity.

Occurrence: As pentlandite in Ontario and garnierite in New Caledonia; Cuba; Norway; U.S.S.R.

Derivation: Nickel ores are of two types: sulfide and oxide, the former accounting for 2/3 of the world's consumption. Sulfide ores are refined by flotation and roasting to sintered nickel oxide, and either sold as such or reduced to metal, which is cast into anodes and refined electrolytically or by the carbonyl process (see Mond process). Oxide ores are treated by hydrometallurgical refining, e.g., leaching with ammonia. Much secondary nickel is recovered from scrap.

Grades: Electrolytic; ingot; pellets; shot; sponge; powder; high-purity strip; single crystals (wire 2 × .05–.005 in.).

Hazard: Flammable and toxic as dust or powder. Tolerance, 1 mg per cubic meter of air (metal and soluble compounds).

Uses: Alloys (low-alloy steels, stainless steel, copper and brass, permanent magnets, electrical resistance alloys); electroplated protective coatings; electroformed coatings; alkaline storage battery; fuel cell electrodes; ceramics; catalyst for methanation of fuel gases and hydrogenation of vegetable oils.

Shipping regulations: (Rail) Nickel catalyst, finely divided, spent or activated, Yellow label. (Air) dry or wet with less than 40% water, Not acceptable; wet with not less than 40% water, Flammable Solid label; not acceptable on passenger planes.

See also Raney's nickel.

nickel acetate $\text{Ni}(\text{OOCCH}_3)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Green, monoclinic crystals. Effloresces somewhat in air. Sp. gr. 1.74; decomposes on heating to 250°C. Soluble in water and alcohol.

Derivation: By heating nickel hydroxide with acetic acid in the presence of metallic nickel.

Containers: Drums; truckloads.

Uses: Textiles (mordant); catalyst.

nickel aluminide. A cermet that can be flame-sprayed.

nickel ammonium chloride (ammonium nickel chloride) (a) $\text{NiCl}_2 \cdot \text{NH}_4\text{Cl}$; (b) $\text{NiCl}_2 \cdot \text{NH}_4\text{Cl} \cdot 6\text{H}_2\text{O}$.

Properties: (a) Yellow powder; (b) green crystals; sp. gr. 1.65. Soluble in water; deliquescent.

Hazard: See under nickel.

Uses: Electroplating; dyeing (mordant).

nickel ammonium sulfate. (nickel salts, double; ammonium nickel sulfate) $\text{NiSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$.

Properties: Green crystals; decomposed by heat. Sol-

uble in water; less in ammonium sulfate solution; insoluble in alcohol. Sp. gr. 1.929.

Derivation: An aqueous solution of nickel sulfate is acidified with sulfuric acid; then an aqueous solution of ammonium sulfate is added. On concentrating, crystals of the double sulfate separate out.

Hazard: See under nickel.

Use: Nickel electrolyte for electroplating.

nickel arsenate (nickelous arsenate) $\text{Ni}_3(\text{AsO}_4)_2 \cdot 8\text{H}_2\text{O}$.

Properties: Yellow-green powder; soluble in acids; insoluble in water. Sp. gr. 4.98.

Hazard: Highly toxic.

Use: Catalyst (hardening fats used in soap).

Shipping regulations: Arsenates, n.o.s. (Rail, Air) Poison label.

nickel bromide (nickelous bromide) (a) NiBr_2 ; (b) $\text{NiBr}_2 \cdot 3\text{H}_2\text{O}$.

Properties: (a) Brownish-yellow solid or yellow, lustrous scales; sp. gr. 5.098; m.p. 963°C. (b) Deliquescent, greenish scales; loses $3\text{H}_2\text{O}$ at 300°C. Soluble in water, alcohol, ether, and ammonium hydroxide.

Derivation: Bromination of nickel powder or nickel carbonyl.

Hazard: See under nickel.

nickel carbonate, basic. Uncertain composition, approximately $\text{NiCO}_3 \cdot 2\text{Ni}(\text{OH})_2 \cdot 4\text{H}_2\text{O}$.

Properties: Light green crystals or brown powder. Sp. gr. 2.6. Insoluble in water, soluble in ammonia and dilute acids.

Derivation: (1) In nature as the mineral zaraitite. (2) Synthetically, by addition of soda ash to a solution of nickel sulfate.

Containers: Drums; bags; truckloads.

Hazard: See under nickel.

Uses: Electroplating; preparation of nickel catalysts; ceramic colors and glazes.

nickel carbonyl (nickel tetracarbonyl) $\text{Ni}(\text{CO})_4$. A zerovalent compound. The four carbonyl groups form a tetrahedral arrangement and are linked covalently to the metal through the carbons.

Properties: Colorless liquid. Soluble in alcohol and many organic solvents; soluble in concentrated nitric acid; insoluble in water. Sp. gr. 1.3185; f.p. -25°C; b.p. 43°C; vapor pressure, 400 mm at 25.8°C.

Derivation: By passing carbon monoxide gas over finely divided nickel.

Grade: Technical.

Containers: Iron cylinders pressurized with carbon monoxide.

Hazard: Highly toxic by inhalation. Flammable, dangerous fire risk. Tolerance, 0.001 ppm in air. A carcinogenic agent.

Uses: Production of high-purity nickel powder by Mond process (q.v.); continuous nickel coatings on steel and other metals.

Shipping regulations: (Rail) Red label. Not accepted by express. (Air) Not acceptable.

nickel chloride (nickelous chloride) (a) NiCl_2 (b) $\text{NiCl}_2 \cdot 6\text{H}_2\text{O}$.

Properties: (a) Brown scales; deliquescent. (b) Green scales; deliquescent. Soluble in water, alcohol and ammonium hydroxide. (a) Sp. gr. 3.55; m.p. 1001°C. Nonflammable.

Derivation: Action of hydrochloric acid on nickel.

Uses: Electroplated nickel coatings; reagent chemical.

nickel cyanide $\text{Ni}(\text{CN})_2 \cdot 4\text{H}_2\text{O}$.

Properties: Apple-green plates or powder. Soluble in ammonium hydroxide and potassium cyanide solu-

tion; insoluble in water and acids. M.p., loses $4\text{H}_2\text{O}$ at 200°C ; b.p. decomposes.
 Derivation: By adding potassium cyanide to a solution of a nickel salt.
 Hazard: Highly toxic.
 Uses: Metallurgy, electroplating.
 Shipping regulations: (Rail, Air) Poison label.

nickel dibutyldithiocarbamate $\text{Ni}[\text{SC}(\text{S})\text{N}(\text{C}_4\text{H}_9)_2]_2$.
 Properties: Dark green flakes; sp. gr. 1.26; m.p. 86°C min.
 Uses: Antioxidant for synthetic rubbers.

nickel formate $(\text{HCOO})_2\text{Ni} \cdot 2\text{H}_2\text{O}$.
 Properties: Green crystals; sp. gr. 2.15; soluble in water.
 Derivation: (a) Reaction of sodium formate and nickel sulfate; (b) dissolving nickel hydroxide in formic acid.
 Containers: Bags; truck loads.
 Hazard: See under nickel.
 Use: Production of nickel catalysts.

nickel hydroxide. See nickelous hydroxide; nickelic hydroxide.

nickelic hydroxide $\text{Ni}(\text{OH})_3$.
 Properties: Black powder; m.p. decomposes.
 Derivation: By adding a hypochlorite to a solution of a nickel salt.
 Use: Nickel salts.

nickelic oxide (nickel peroxide; nickel sesquioxide; black nickel oxide) Ni_2O_3 .
 Properties: Gray-black powder; soluble in acids; insoluble in water. Sp. gr. 4.84; m.p., is reduced to NiO at 600°C .
 Derivation: By gentle heating of the nitrate or chlorate.
 Containers: Barrels.
 Hazard: See under nickel.
 Use: Storage batteries.

nickel iodide (nickelous iodide) NiI_2 or $\text{NiI}_2 \cdot 6\text{H}_2\text{O}$ (loses water at 43°C).
 Properties: Black, crystalline powder or blue-green crystals. Hygroscopic. Sublimes at 797°C without melting. Soluble in alcohol, water; sp. gr. 5.834.
 Derivation: Direct combination of nickel and I_2 .
 Hazard: Toxic by ingestion. See under nickel.

nickel-iron alloy. See iron-nickel alloy.

"Nickel-Lume."²⁸⁸ Trademark for a bright nickel electroplating process. Materials used are nickel sulfate, nickel chloride, boric acid and organic addition agents.

nickel matte. See matte.

nickel nitrate (nickelous nitrate) $\text{Ni}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.
 Properties: Green, deliquescent crystals. Soluble in water, ammonium hydroxide and alcohol. Sp. gr. 2.065; m.p. 55°C ; b.p. 136.7°C .
 Derivation: By the action of nitric acid on nickel, or on nickel oxide.
 Grades: Technical; reagent.
 Containers: Drums; bags; truck loads.
 Hazard: Dangerous fire risk; strong oxidizing agent.
 Tolerance (as Ni), 1 mg per cubic meter of air.
 Uses: Nickel plating; preparation of nickel catalysts; manufacture of brown ceramic colors.
 Shipping regulations: (Rail) Nitrates, n.o.s., Yellow label. (Air) Nitrates, n.o.s., Oxidizer label.
nickel nitrate, ammoniated (nickel nitrate tetrammine) $\text{Ni}(\text{NO}_3)_2 \cdot 4\text{NH}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Green crystals. Soluble in water; insoluble in alcohol; decomposes in air.

Derivation: By adding ammonium hydroxide to a nitric acid solution of nickel oxide, with subsequent crystallization.

Hazard: See nickel nitrate.

Use: Nickel plating.

Shipping regulations: See nickel nitrate.

nickelocene (dicyclopentadienylnickel) $(\text{C}_5\text{H}_5)_2\text{Ni}$.
 Properties: Dark green crystals; m.p. $171\text{--}173^\circ\text{C}$; soluble in most organic solvents; insoluble in water; decomposes in acetone, alcohol and ether; highly reactive compound which decomposes rapidly in air.
 Containers: Supplied in an inert atmosphere in bottles and steel containers.

Hazard: Toxic by inhalation or skin contact.

Uses: Catalyst; antiknock agent for fuels; complexing agent.

See also metallocene.

nickelous arsenate. See nickel arsenate.

nickelous bromide. See nickel bromide.

nickelous chloride. See nickel chloride.

nickelous hydroxide (nickel hydroxide) $\text{Ni}(\text{OH})_2$.
 Properties: Fine green powder; sp. gr. 4.15; m.p. (dec) 230°C . Very slightly soluble in water; soluble in acids and ammonium hydroxide.
 Derivation: By adding caustic soda to a solution of nickelous salt.
 Hazard: See under nickel.
 Use: Nickel salts.

nickelous iodide. See nickel iodide.

nickelous nitrate. See nickel nitrate.

nickelous phosphate. See nickel phosphate.

nickel oxide (nickelous oxide; nickel protoxide; green nickel oxide) NiO .
 Properties: Green powder, becoming yellow; soluble in acids and ammonium hydroxide; insoluble in water and caustic solutions. Sp. gr. 6.6–6.8; absorbs oxygen at 400°C forming Ni_2O_3 which is reduced to NiO at 600°C .
 Derivation: By heating nickel above 400°C in presence of oxygen.
 Hazard: See under nickel.
 Uses: Nickel salts; porcelain painting; fuel cell electrodes.

nickel oxide, black. See nickelic oxide.

nickel oxide, green. See nickel oxide.

nickel peroxide. See nickelic oxide.

nickel phosphate (nickelous phosphate; trinickelous orthophosphate) $\text{Ni}_3(\text{PO}_4)_2 \cdot 7\text{H}_2\text{O}$.
 Properties: Light-green powder. Soluble in acids, ammonium hydroxide; insoluble in water.
 Use: Electroplating.

nickel potassium sulfate (potassium nickel sulfate) $\text{NiSO}_4 \cdot \text{K}_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$.
 Properties: Blue-green crystals. Soluble in water. Sp. gr. 2.124.

nickel protoxide. See nickel oxide.

nickel-rhodium. Alloys containing nickel and from 25–80% of rhodium; but sometimes also some platinum, iridium, palladium, molybdenum, tungsten, copper, iron, or cobalt.
 Uses: Electrodes; chemical apparatus; reflectors.

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

nickel salt, double. See nickel ammonium sulfate.

nickel salt, single. See nickel sulfate.

nickel sesquioxide. See nickelic oxide.

nickel silver. Nonferrous alloy of nickel, copper and zinc having a silver appearance.

Uses: Etching, enameling, silver-plating and chromium-plating.

nickel stannate $\text{NiSnO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Light colored crystalline powder; approx. temperature of dehydration 120°C .

Hazard: Highly toxic by ingestion and inhalation. Tolerance, 1 mg per cubic meter of air.

Use: Additive in ceramic capacitors.

nickel sulfate (nickel salts, single; blue salt) (a) NiSO_4 ; (b) $\text{NiSO}_4 \cdot 6\text{H}_2\text{O}$; (c) $\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: (a) Yellow-green crystals; (b) blue or emerald green crystals; (c) green crystals. All the sulfates are soluble in water; (b) and (c) are soluble in alcohol; (a) is insoluble in alcohol and ether. Sp. gr. (a) 3.68, (b) 2.031, (c) 1.98; m.p. (a) 840°C (loses SO_3); (b) and (c) lose $6\text{H}_2\text{O}$ at 103°C .

Derivation: Action of sulfuric acid on nickel.

Grades: Technical; C.P.; single crystals.

Containers: Bags; carloads.

Hazard: Tolerance, 1 mg per cubic meter of air.

Uses: Manufacture of nickel ammonium sulfate; nickel catalysts; nickel plating; mordant in dyeing and printing textiles; coatings; ceramics.

nickel tetracarbonyl. See nickel carbonyl.

nickel titanate. See "Solfast Titan Yellow."

nicol. An optical material (Iceland spar) that functions as a prism, separating light rays that pass through it into two portions, one of which is reflected away, and the other transmitted. The transmitted portion is called plane-polarized light. See also calcite; optical isomerism.

"Nicom-12."²⁴¹ Trademark for a hydrosulfurization catalyst of nickel, cobalt, and molybdenum on alumina.

"Nicon."¹⁶⁹ Brand name for diethyldithiocarbamate used in the colorimetric determination of nickel.

nicotinamide. See niacinamide.

nicotinamide adenine dinucleotide. Name recommended by the International Union of Biochemistry and IUPAC. (NAD; diphosphopyridine nucleotide; DPN; coenzyme I; Co I; codehydrogenase I). $\text{C}_6\text{H}_4\text{N}_2\text{O} \cdot \text{C}_5\text{H}_8\text{O}_3 \cdot \text{PO}_3 \cdot \text{O} \cdot \text{HPO}_3 \cdot \text{C}_5\text{H}_8\text{O}_3 \cdot \text{C}_5\text{H}_4\text{N}_3$. A coenzyme necessary for the alcoholic fermentation of glucose, and the oxidative dehydrogenation of other substrates. Isolated from yeast. The phosphate is also available.

Uses: Biochemical research; chromatography.

nicotine (beta-pyridyl-alpha-N-methylpyrrolidine) $\text{C}_{10}\text{H}_{14}\text{N}_2$ or $\text{C}_5\text{H}_4\text{NC}_4\text{H}_7\text{NCH}_3$.

Properties: Alkaloid from tobacco; thick water-white levorotatory oil, turning brown on exposure to air. Hygroscopic; soluble in alcohol, chloroform, ether, kerosene, water, and oils. B.p. 247°C (dec); sp. gr. 1.00924. Also in form of dust or powder. Autoignition temp. 471°F . Combustible.

Derivation: By distilling tobacco with milk of lime and extracting with ether.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.5 mg per cubic meter of air.

Uses: Medicine; insecticide (horticultural); tanning. Use as insecticide may be restricted. Available as the dihydrochloride, salicylate, sulfate, and bitartrate. Shipping regulations: (Rail, Air) Poison label.

nicotine salts.

(a) Hydrochloride: $\text{C}_{10}\text{H}_{14}\text{N}_2 \cdot \text{HCl}$.

(b) Salicylate: $\text{C}_{10}\text{H}_{14}\text{N}_2 \cdot \text{C}_7\text{H}_5\text{O}_3$.

(c) Sulfate: $(\text{C}_{10}\text{H}_{14}\text{N}_2)_2 \cdot \text{H}_2\text{SO}_4$.

(d) Tartrate: $\text{C}_{10}\text{H}_{14}\text{N}_2 \cdot 2\text{C}_4\text{O}_6\text{H}_6 \cdot \text{H}_2\text{O}$.

Properties: (a) Colorless oil; (b) White crystals. M.p. 117.5°C . (c) White crystals; (d) White plates. M.p. 89°C . All the salts are soluble in water, alcohol and ether.

Derivation: By the action of the respective acid on the alkaloid.

Hazard: All highly toxic.

Shipping regulations: (Rail, Air) Poison label.

nicotinic acid. See niacin.

nicotinic acid amide. See niacinamide.

nicotinyl alcohol (USAN) (3-pyridinemethanol) $\text{C}_5\text{H}_4\text{NCH}_2\text{OH}$.

Properties: Hygroscopic liquid; b.p. $144\text{--}145^\circ\text{C}$ (16 mm); refractive index 1.5425 (n 20/D). Soluble in water and ether. Combustible.

Hazard: Toxic.

Use: Medicine.

nigrosine. A class of dark blue or black dyes, some soluble in water, some in alcohol and some in oil, used in manufacture of ink and shoe-polish and in dyeing leather, wood, textiles, etc. It is also used as shark-repellent.

nigre. The dark-colored layer, containing some soap as well as salts and impurities, formed in soap manufacture between the layers of soap proper and caustic solution.

"Nilite."²⁸ Trademark for a series of nitrocarbonitrile blasting agents.

"Nilofoam."³⁰⁰ Trademark for a silicone defoaming agent.

"Nilox U."⁷⁹ Trademark for a disproportionated rosin. Uses: Adhesives; greases; stitching waxes; rubber reclaiming; rubber compounding, manufacture of toners; wax paper coatings.

"Nilstain."¹⁵⁵ Trademark for a group of stainless steel alloys.

ninhydrin (triketohydrindene hydrate) $\text{C}_9\text{H}_4\text{O}_3 \cdot \text{H}_2\text{O}$.

Properties: White crystals or powder; m.p. $240\text{--}245^\circ\text{C}$; becomes red when heated above 100°C . Soluble in water and alcohol; slightly soluble in ether and chloroform.

Hazard: Toxic and irritant.

Uses: Chemical intermediate; reagent for determination of amines, amino acids, ascorbic acid.

niobe oil. See methyl benzoate.

niobic acid. Any hydrated form of Nb_2O_5 . It forms as a white insoluble precipitate when a potassium hydrogen sulfate fusion of a niobium compound is leached with hot water or when niobium fluoride solutions are treated with ammonium hydroxide. Soluble in concentrated sulfuric acid, concentrated hydrochloric acid, hydrofluoric acid, and in bases. Important in analytical determination of niobium.

niobite. See columbite.

niobium Nb (also columbium, Cb). The name niobium is officially approved by chemical authorities, but

columbium is still used, chiefly by metallurgists. Metallic element, atomic number 41; Group VB of the Periodic Table. Atomic weight 92.9064; valences 2, 3, 4, 5. No stable isotopes.

Properties: Gray or silvery, ductile metal; does not tarnish or oxidize at room temperature; sp. gr. 8.57; m.p. 2468°C. Reacts with oxygen and halogens only when heated. Less corrosion-resistant than tantalum at high temperature. Not attacked by nitric acid up to 100°C, but vigorously attacked by mixture of nitric and hydrofluoric acids. Hot, conc. hydrochloric, sulfuric, and phosphoric acids attack it, but hot, conc. nitric does not. Unaffected at room temperature by most acids and by aqua regia. It is attacked by alkaline solutions to some extent at all temperatures.

Occurrence: Found in two major ores, columbite (q.v.) and pyrochlore (a carbonate-silicate rock). Chief sources are Brazil, Nigeria, Canada.

Derivation: Niobium is so closely associated with tantalum that they must be separated by fractional crystallization or by solvent extraction, with subsequent purification.

Grades: Plates; rods; powder; single crystals.

Uses: Alloy steels; getter in vacuum tubes; nuclear reactors; cermets; missiles and rockets; cryogenic equipment.

niobium carbide NbC.

Properties: Lavender-gray powder; insoluble in water and in all acids except a mixture of nitric and hydrofluoric. M.p. about 3500°C; hardness 2400 kg/sq mm; sp. gr. 7.82.

Derivation: By direct combination of niobium with carbon or by the reduction of niobium oxide with lampblack.

Uses: Cemented carbide tipped tools; special steels; preparation of niobium metal.

niobium chloride (niobium pentachloride) NbCl₅.

Properties: Yellow crystalline solid; soluble in alcohol, ether, carbon tetrachloride, hydrochloric acid, conc. sulfuric acid. M.p. 205°C; b.p. 254°C; sp. gr. 2.75. Deliquescent; decomposes in moist air with evolution of hydrogen chloride fumes. Available in commercial quantities.

Derivation: Direct combination of niobium and chlorine; chlorination of niobium oxide in the presence of carbon.

Hazard: May evolve toxic fumes of HCl. Keep dry.

Uses: Preparation of pure niobium; intermediate.

niobium diselenide NbSe₂.

Properties: Gray-black solid; m.p. above 1316°C; vacuum-stable from -430 to 2400°F. Has higher electrical conductivity than graphite.

Uses: Lubricant and conductor at high temperatures and high vacuum.

niobium oxalate NbO(HC₂O₄)₃ · 4H₂O. White crystals; 99.99% pure. Very soluble in water. Used as an intermediate and in special catalysts.

niobium oxide (niobium pentoxide) Nb₂O₅.

Properties: White powder; insoluble in acids except hydrofluoric; soluble in fused potassium hydrogen sulfate, or carbonates or hydroxides of the alkali metals. Sp. gr. 4.5-5.0; m.p. 1460°C.

Derivation: Strong ignition of niobic acid.

Uses: Intermediate; electronics.

niobium pentachloride. See niobium chloride.

niobium pentoxide. See niobium oxide.

niobium potassium oxyfluoride (potassium niobium oxyfluoride; potassium oxyfluoniobate) K₂NbOF₃ · H₂O. **Properties:** White lustrous leaflets. Greasy to touch. Soluble in water.

Hazard: Toxic by ingestion; strong irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Separation of niobium from tantalum; electrolytic preparation of niobium metal.

niobium silicide NbSi₂. Crystalline solid; m.p. 1950°C. Used as a refractory material.

niobium-tin Nb₃Sn. Alloy used for special wire for super-conducting magnets to obtain high magnetic fields for use in communication, and containment of thermonuclear fusion plasmas.

niobium-titanium. Alloy used for magnetic devices of fields up to 100,000 gauss.

niobium-uranium. Niobium alloyed with 20% uranium yields a nuclear fuel which maintains tensile strength and hardness at 1600°F.

NIOSH. Abbreviation for National Institute for Occupational Safety and Health. It establishes work exposure standards in toxic environments. It is located in Rockville, Md.

"Niox."²⁸ Trademark for U.S.P. grade of ammonium nitrate. Used in manufacture of nitrous oxide gas.

"Ni-Plex."²⁸⁸ Trademark for a process for and materials used in the stripping of nickel from all basic metals without attack on the basic metals.

"Nirez."⁷⁹ Trademark for a group of resins including polyterpenes, terpene phenols, zinc resins, high melting limed resins, and medium-colored, high-melting metal resins.

Uses: Adhesives, rubber compounding, paper coatings, textile coatings, printing inks, paint and varnish.

"Niomet" 46.¹⁵⁵ Trademark for a magnetic alloy composed of nickel, 45%; iron, 55%.

Properties: Density, 8.17 gm/cm³; tensile strength, 70,000 psi. Used in cores and armatures for relays, motors, inductors, and transformers.

"Niron" 52.¹⁵⁵ Trademark for a magnetic alloy composed of nickel, 50% and iron, 50%.

Properties: Density 8.46 gm/cm³; tensile strength, 70,000 psi. Used in leads and armatures for glass-sealed relays, cores for magnetic amplifiers.

niter (nitre; saltpeter) KNO₃. A natural potassium nitrate (q.v.).

niter cake. See sodium bisulfate.

niter, Chile. See sodium nitrate.

nithiazide C₆H₈N₄O₃S. 1-Ethyl-3-(5-nitro-2-thiazolyl)-urea.

Properties: Crystals; practically insoluble in water; decomposes 228°C.

Use: Veterinary medicine.

nitralloy. See nitriding.

"Nitramex."²⁸ Trademark for a blasting agent which is not detonated by impacts from rifle bullets, sledge hammers or heat, but rather by specially constructed primers. Used for blasting in extremely hard shooting quarries.

nitralin. An herbicide used largely to control weeds in cotton and soybeans. Research indicates possible use in plant breeding; treatment of corn roots induces

abnormal chromosome formation and cell wall deterioration.

nitramine. See tetryl.

"Nitramite."²⁸ Trademark for a series of nitrocarbonate blasting agents.

"Nitrana."¹⁹⁷ Trademark for any of several nitrogen fertilizer solutions containing water, ammonia, and ammonium nitrate. It is used in manufacturing solid fertilizer and for direct application to the soil.

nitranilic acid (2,5-dihydroxy-3,6-dinitroquinone)

Properties: Flat yellow crystals; loses water at 100°C; decomposes explosively at 170°C; soluble in water and alcohol; insoluble in ether.

Hazard: Explosion risk when heated; evolves highly toxic fumes on decomposition.

nitraniline. See nitroaniline.

nitrating acid. Legal label name for mixed acid (q.v.).

nitration. A reaction in which a nitro group ($-\text{NO}_2$) replaces a hydrogen on a carbon atom by the use of nitric acid or mixed acid. An example is the nitration of cellulose to nitrocellulose. It is widely used in aromatic reactions to form such compounds as nitrobenzene, trinitrotoluene, nitroglycerin and other explosives. Aromatic nitrations are usually effected with mixed acid, a mixture of nitric and sulfuric acids, at 0 to 120°C. Aliphatic nitration is less common than aromatic, but propane can be nitrated under pressure to yield nitroparaffins.

"Nitrelmang."²⁵⁰ Trademark for a high purity nitrided manganese for use in the production of free-machining steels; high nitrogen tinplate; and special high temperature alloy steels.

"Nitrex."²⁴⁸ Trademark for synthetic rubber latices of the butadiene-acrylonitrile type; used for paper saturation, leather finishing, and as a plasticizer for resin latices.

nitric acid (aqua fortis; engraver's acid; azotic acid) HNO_3 . Eleventh highest-volume chemical produced in U.S. (1975).

Properties: Transparent, colorless or yellowish, fuming, suffocating, caustic and corrosive liquid. Will attack almost all metals. The yellow color is due to release of nitrogen dioxide on exposure to light. Strong oxidizing agent. Miscible with water; decomposes in alcohol. B.p. (decomposes) 86°C; f.p. -41.59°C; sp. gr. 1.504 (25/4°C); vapor pressure 62 mm (25°C); refractive index 1.3970 (n_D 24/D); viscosity 0.761 cp (25°C).

Derivation: (1) Oxidation of ammonia by air or oxygen with platinum catalyst. (Note: A pelleted catalyst not containing platinum or other noble metals is available.) Air oxidation yields 60% acid. Concentration is achieved by (a) distillation with sulfuric acid, (b) extractive distillation with magnesium nitrate, or (c) by neutralizing the weak acid with soda ash, evaporating to dryness, and treating with sulfuric acid. Method (c) yields synthetic niter cake (NaHSO_4) as a byproduct. (2) High-pressure oxidation of nitrogen tetroxide (yields 98% acid).

Strength of solutions: 36, 38, 40, 42° Bé; 58–63.5%; 95%.

Containers: Bottles; carboys; tank cars and trucks. Hazard: Highly toxic by inhalation; corrosive to skin and mucous membranes; strong oxidizing agent. Dangerous fire risk in contact with organic materials. Tolerance, 2 ppm in air. Safety data sheet available

from Manufacturing Chemists Assn., Washington, D.C.

Uses: Manufacture of ammonium nitrate for fertilizer and explosives; organic synthesis (dyes, drugs, explosives, cellulose nitrate, nitrate salts); metallurgy, photoengraving; etching steel; ore flotation; medicine; reagent.

Shipping regulations: (Rail) White label. (Air) Oxidizer label and Corrosive label. Not acceptable on passenger planes.

nitric acid, fuming.

(1) White fuming nitric acid (WFNA) contains more than 97.5% nitric acid, less than 2% water, and less than 0.5% oxides of nitrogen. It is a colorless or pale yellow liquid which fumes strongly. It is decomposed by light or elevated temperatures, becoming red in color from nitrogen dioxide.

(2) Red fuming nitric acid (RFNA) contains more than 86% nitric acid, approximately 6–15% oxides of nitrogen (as nitrogen dioxide) and less than 5% water. Derivation: From dilute nitric acid, nitrogen dioxide, and oxygen.

Containers: Stainless steel or aluminum drums.

Hazard: Highly toxic by inhalation; corrosive to skin and mucous membranes. Strong oxidizing agent; may explode in contact with strong reducing agents. Dangerous fire risk in contact with organic materials.

Uses: Preparation of nitro-compounds; rocket fuels; laboratory reagent.

Shipping regulations: See nitric acid.

nitric oxide NO. See also nitrogen dioxide.

Properties: Colorless gas (readily reacts with oxygen at room temperature to form nitrogen dioxide, NO_2 , a reddish brown gas). B.p. -152°C; f.p. -164°C; sp. gr. at b.p. 1.27; slightly soluble in water. Non-combustible.

Derivation: Oxidation of ammonia above 500°C; decomposition of nitrous acid (aqueous solution). Also from atmospheric oxygen and nitrogen in the electric-arc process for fixation of nitrogen.

Grade: Pure (99%).

Containers: Cylinders.

Hazard: Highly toxic by inhalation; strong irritant to skin and mucous membranes; supports combustion. Tolerance, 25 ppm in air.

Uses: To prepare nitrosyl carbonyls. Very dry, high purity gas is proposed for filling incandescent lamps and as in inert gas in electrical systems.

Shipping regulations: (Rail) Poison Gas label. Not accepted by express. (Air) Not acceptable.

nitriding. A process of case hardening in which a ferrous alloy, usually of special composition, is heated in an atmosphere of ammonia or in contact with nitrogenous material to produce surface hardening by absorption of the nitrogen without quenching. The alloys used for nitriding are known as nitroalloys. Several types are available with ranges of composition as follows: aluminum 0.85–11.2%; carbon 0.20–0.45%; chromium none to 1.8%; molybdenum 0.15–1.00%; manganese 0.4–0.7%; silicon 0.2–0.4%.

nitride. An organic compound containing the $-\text{CN}$ grouping; for example, acrylonitrile $\text{CH}_2=\text{CHCN}$; it may also contain a triple bond as in acetonitrile ($\text{CH}_3\text{C}\equiv\text{N}$).

Hazard: Some organic cyanide compounds are toxic and flammable (acetonitrile, acrylonitrile).

nitride rubber (acrylonitrile rubber; acrylonitrile-butadiene rubber; nitride-butadiene rubber; NBR). A synthetic rubber made by random polymerization of

acrylonitrile with butadiene by free radical catalysis. Alternating copolymers using Natta-Ziegler catalyst have been developed. About 20% of the total is used as latex; also available in powder form. Its repeating structure may be represented as

Typical properties: (Medium acrylonitrile): Sp. gr. (polymer) 0.98; tensile strength (psi) 1000 to 3000; elongation (%) 100 to 700; maximum service temperature (°F) 250 to 300. Combustible.

Uses: (High acrylonitrile): Oil well parts; fuel tank liners; fuel hose; gaskets; packing oils seals; hydraulic equipment.

(Medium acrylonitrile): General-purpose oil-resistant applications; shoe soles; kitchen mats, sink topping, and printing rolls.

(Low acrylonitrile): Gaskets, grommets, and O-rings (flexible at a very low temperature); adhesives. Binder-fuel in solid rocket propellants.

nitrile-silicone rubber (NSR). Combines the characteristic properties of silicones with the oil resistance of nitrile rubber. Resistant to jet fuels, solvents and hot oils.

nitrilotriacetic acid (NTA; triglycine; TGA; triglycolamic acid) $\text{N}(\text{CH}_2\text{COOH})_3$.

Properties: White crystalline powder; m.p. 240°C (with decomposition); insoluble in water and most organic solvents; forms mono-, di-, and tribasic salts which are water-soluble. Combustible; 70% biodegradable.

Hazard: A confirmed carcinogen in rats and mice.

Uses: Synthesis; chelating agent; eluting agent in purification of rare-earth elements.

Also available as the di- and trisodium salts.

Note: This substance and its sodium salt, sodium nitrilotriacetate, have been recommended as substitutes for phosphates in detergent builders, but their use for this purpose has not been officially approved because of possible toxic effects. A scientific study published in 1973 indicated that the material is sufficiently biodegradable, even in combination with toxic metals, to preclude environmental damage.

nitrilotriacetonitrile (NTAN) $\text{N}(\text{CH}_2\text{CH})_3$. White crystalline solid; m.p. 130–134°C; insoluble in water; soluble in acetone. Used as an intermediate and chelating agent.

Hazard: May be toxic. See nitrile.

para-nitroacetanilide $\text{NO}_2\text{C}_6\text{H}_4\text{NHCOCH}_3$.

Properties: White crystals; soluble in alcohol and ether; very slightly soluble in cold water. Soluble in hot water, in potassium hydroxide solution. M.p. 214–216°C. Combustible.

Derivation: By acetylating aniline, then nitrating.

Use: Manufacture of para-nitraniline.

para-nitro-ortho-aminophenol $\text{C}_6\text{H}_3\text{OHNH}_2\text{NO}_2$.

Properties: Yellow-brown leaflets containing water of crystallization melting at 80 to 90°C; anhydrous melts at 154°C. Soluble in acid.

Derivation: From dinitrophenol.

Hazard: Probably toxic.

Use: Dyes.

meta-nitroaniline (meta-nitraniline) $\text{NO}_2\text{C}_6\text{H}_4\text{NH}_2$.

Properties: Yellow needles; sp. gr. 1.43; m.p. 111.8°C; b.p. 306°C; soluble in alcohol and ether; slightly soluble in water.

Derivation: From aniline by nitration after acetyla-

tion, with subsequent removal of the acetyl group by hydrolysis.

Hazard: Highly toxic; absorbed by skin. Moderate fire risk; Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Color test for pine wood; dye intermediate.

Shipping regulations: (Air) Poison label.

ortho-nitroaniline (ortho-nitraniline) $\text{NO}_2\text{C}_6\text{H}_4\text{NH}_2$.

Properties: Orange-red needles; sp. gr. 1.443; m.p. 69.7°C. Soluble in alcohol and ether; slightly soluble in water. Not light-fast. Flash point 335°F. Autoignition temp. 970°F.

Derivation: From aniline by nitration after acetylation, with subsequent removal of the acetyl group by hydrolysis.

Containers: Drums; kegs.

Hazard: Highly toxic; absorbed by skin. Explosion risk. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Dye intermediate; synthesis of photographic antifogging agent, ortho-phenylenediamine, coccidiostats; interior paint pigment.

Shipping regulations: (Rail, Air) Poison label. (Rail) Legal label name, under Ortho-.

para-nitroaniline (para-nitraniline) $\text{NO}_2\text{C}_6\text{H}_4\text{NH}_2$.

Properties: Yellow needles; sp. gr. 1.437; m.p. 148°C; flash point 390°F. Combustible. Soluble in alcohol and ether; insoluble in water.

Derivation: (a) From p-chloronitrobenzene; (b) from aniline by nitration after acetylation.

Containers: Drums; carloads.

Hazard: Highly toxic, absorbed by skin. Tolerance, 1 ppm in air. Explosion risk. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Dye intermediate, especially para-nitraniline red; intermediate for antioxidants, gasoline gum inhibitors; medicinals for poultry; corrosion inhibitor.

Shipping regulations: (Rail, Air) Poison label. (Rail) Legal label name under Para-.

ortho-nitroanisole $\text{C}_6\text{H}_4\text{OCH}_3\text{NO}_2$.

Properties: Light reddish or amber liquid. Soluble in alcohol and ether; insoluble in water; sp. gr. 1.255 (20/20°C); crystallizing point 9.6°C; boiling range 268–271°C; refractive index 1.5602 (n 20/D). Combustible.

Derivation: From ortho-nitrophenol by methylation or from ortho-nitrochlorobenzene by action of methanol and caustic soda.

Grades: Technical.

Containers: Tank cars.

Uses: Organic synthesis; manufacture of intermediates for dyes and pharmaceuticals.

para-nitroanisole (1-methoxy-4-nitrobenzene)

Properties: Colored monoclinic crystals; m.p. 54°C; b.p. 260°C. Insoluble in water; soluble in alcohol, ether. Combustible.

Grades: Technical.

Containers: Drums.

Use: Intermediate.

5-nitrobarbituric acid (dilituric acid)

Properties: Prisms and leaflets from water; m.p. 176°C (dec); slightly soluble in water; soluble in al-

cohol and sodium hydroxide solution; insoluble in ether.

Use: Microreagent for potassium.

3-nitrobenzaldehyde (meta-nitrobenzaldehyde)

$\text{NO}_2\text{C}_6\text{H}_4\text{CHO}$.

Properties: Yellowish, crystalline powder; m.p. 58°C ; b.p. (23 mm) 164°C ; almost insoluble in water; soluble in alcohol, chloroform, ether.

Uses: Synthesis of dyes, pharmaceuticals, surface active agents; vapor phase corrosion inhibitor; anti-oxidant for chlorophyll; mosquito repellent.

nitrobenzene (oil of mirbane) $\text{C}_6\text{H}_5\text{NO}_2$.

Properties: Greenish-yellow crystals or yellow, oily liquid. Soluble in alcohol, benzene, and ether; slightly soluble in water. Sp. gr. 1.19867; m.p. 5.70°C ; b.p. 210.85°C . Flash point 190°F . Combustible. Auto-ignition temp. 900°F .

Derivation: From benzene by nitrating with nitric acid-sulfuric acid mixture.

Method of purification: By washing and distilling with steam, then redistilling.

Grades: Technical; redistilled; 97%.

Containers: Glass bottles; drums; tank cars.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 1 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Manufacture of aniline; solvent for cellulose ethers; modifying esterification of cellulose acetate; ingredient of metal polishes and shoe polishes; manufacture of benzidine, quinoline, azobenzene, etc.

Shipping regulations: (Rail, Air) Poison label. (Rail) Legal label name, nitrobenzol.

para-nitrobenzeneazoresorcinol.

$\text{NO}_2\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_3(\text{OH})_2$.

Properties: Red crystals. Slightly soluble in water; soluble in nitrobenzene. M.p. 198°C . Combustible.

Derivation: Diazotized para-nitroaniline is coupled with resorcinol.

Grade: Analytical.

Hazard: Probably toxic.

Use: Determination of magnesium.

meta-nitrobenzenesulfonic acid (3-nitrobenzenesulfonic acid) $\text{C}_6\text{H}_4\text{NO}_2\text{SO}_3\text{H}$. Crystals; m.p. 70°C . Soluble in water and alcohol. Used in organic synthesis. The sodium salt is a protective antireduction agent.

6-nitrobenzimidazole $\text{O}_2\text{NC}_6\text{H}_4\text{NHCH:N}$.

Properties: Solid; m.p. 203°C . Very soluble in alcohol; slightly soluble in water, ether, and benzene.

Use: Antifogging agent in photographic developers. See photographic chemistry.

nitrobenzoic acid $\text{C}_6\text{H}_4(\text{NO}_2)\text{COOH}$. (a) meta-, (b) ortho-, (c) para- (nitrodracrylic acid).

Properties: Yellowish-white crystals. (a) Soluble in alcohol and ether; slightly soluble in water; (b) Soluble in water, alcohol and ether; (c) Soluble in alcohol; sparingly soluble in water. 9a) Sp. gr. 1.494; m.p. $140\text{--}141^\circ\text{C}$; (b) Sp. gr. 1.575; m.p. 147.7°C ; (c) Sp. gr. 1.5497; m.p. 238°C . Combustible; low to moderate toxicity.

Derivation: (a and b) Nitration of benzoic acid; (c) Oxidation of para-nitrotoluene by hot chromic acid mixture.

Containers: Fiber drums; car loads.

Uses: (a and b) Organic synthesis; (c) preparations of anesthetics and as intermediate in the manufacture of dyes and sun-screening agents.

nitrobenzol. Legal label name (Rail) for nitrobenzene.

meta-nitrobenzotrifluoride (3-nitrobenzotrifluoride; meta-nitrotrifluoromethylbenzene) $\text{NO}_2\text{C}_6\text{H}_4\text{CF}_3$.

Properties: Pale straw, thin oily liquid, aromatic odor; distillation range $200.5\text{--}208.5^\circ\text{C}$; f.p. -5.0°C ; sp. gr. (15.5°C) 1.437; b.p. 203°C ; flash point (open cup) 214°F ; wt/gal 11.98 lb (15.5°C); viscosity 2.35 cp (100°F); soluble in organic solvents; insoluble in water. Combustible.

Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

meta-nitrobenzoyl chloride $\text{NO}_2\text{C}_6\text{H}_4\text{COCl}$.

Properties: Yellow to brown liquid; partially crystallized at room temperature; m.p. 34°C (approx); b.p. 278°C ; soluble in ether; decomposes in water and alcohol. Combustible.

Uses: Manufacture of dyes for fabrics and color photography; intermediate in preparation of pharmaceuticals.

para-nitrobenzoyl chloride $\text{NO}_2\text{C}_6\text{H}_4\text{COCl}$.

Properties: Yellow crystalline solid; m.p. 72°C ; b.p. 154°C (15 mm); decomposes in water and alcohol; soluble in ether. Combustible.

Uses: Intermediate for procaine hydrochloride; dyestuffs.

para-nitrobenzyl cyanide (para-nitro-alpha-tolunitril) $\text{NO}_2\text{C}_6\text{H}_4\text{CH}_2\text{CN}$.

Properties: Crystals; m.p. $116\text{--}118^\circ\text{C}$. Insoluble in water; soluble in alcohol and ether.

Derivation: Action of concentrated nitric acid on benzyl cyanide.

Uses: Intermediate for dyestuffs and pharmaceuticals preparation of para-nitrophenylacetic acid.

ortho-nitrobiphenyl (ONB; 4-nitrodiphenyl) $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{NO}_2$.

Properties: Light-yellow to reddish solid or liquid; sp. gr. 1.203 (25/25°C); 10 lb/gal; crystallizing pt. 34.5°C (min); refractive index 1.613 approx (25°C); b.p. 330°C approx. Flash point 290°F ; autoignition temp. 356°F . Soluble in carbon tetrachloride, mineral spirits, pine oil, turpentine, benzene, acetone, glacial acetic acid, and perchloroethylene. Combustible. Insoluble in water.

Derivation: By controlled nitration of biphenyl.

Hazard: Toxic by ingestion. Carcinogenic.

Uses: Organic research.

nitroform. See bromopicrin.

"Nitro BT."⁶⁴ Trademark for tetrazolium salt (q.v.).

2-nitro-1-butanol $\text{CH}_3\text{CH}_2\text{CHNO}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid; solubility in water 20 g/100 cc (20°C); sp. gr. 1.133 (20/20°C); b.p. 105°C (10 mm); f.p. -48 to -47°C ; wt/gal 9.44 lb (20°C); refractive index 1.4390 (20°C); pH of 0.1 M solution 4.51. Combustible.

Containers: 5- and 55-gal drums; 1-gal cans.

Use: Organic synthesis.

nitro carbo nitrate. A blasting agent consisting of ammonium nitrate sensitized with diesel oil. Will burn with explosive violence.

Hazard: Dangerous explosion risk. Strong oxidizing agent.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

nitrocellulose (cellulose nitrate; nitrocotton; guncotton; pyroxylin). Formula approximately $\text{C}_6\text{H}_7\text{O}_2(\text{ONO}_2)_3$.

Properties: Pulpy, cotton-like, amorphous solid (dry); colorless liquid to semisolid (solution). Contains from 10 to 14% nitrogen. High-nitrogen form (ex-

plosives) is soluble in acetone, insoluble in ether-alcohol mixtures. Low-nitrogen form (pyroxylin) is soluble in ether-alcohol mixtures and acetone (colloid and lacquers). Sp. gr. 1.66; flash point 55°F; autoignition point 338°F. Low toxicity.

Derivation: Treatment of cellulose (as cotton linters, wood pulp) with mixtures of nitric and sulfuric acids. By varying strength of acids, temperature and time of reaction, and acid/cellulose ratio, widely different products are obtained.

Forms: Colloided, block; colloided, flake or granular; flakes; powder; solutions of several viscosities (from 1/4 to 1000 seconds). May be dry or wet with alcohol or water.

Containers: Barrels; carlots.

Hazard: Highly flammable; dangerous fire and explosion risk. Somewhat less flammable when wet.

Uses: Fast-drying automobile lacquers; high explosives; collodion; rocket propellant; medicine; printing ink base; flashless propellant powder; coating book-binding cloth; leather finishing.

Shipping regulations: Consult regulations. Explosive types not acceptable for air freight.

nitrocellulose laquer. See lacquer.

nitrochlorobenzene. Legal label name (Air) for chloronitrobenzene.

nitrochloroform. See chloropicrin.

para-nitro-ortho-chlorophenyl dimethyl thionophosphate. See dicaphtho.

nitrocobalamin $C_{62}H_{90}N_{14}O_{16}PCo$. One of the active forms of vitamin B_{12} (q.v.) in which a nitro group is attached to the central cobalt atom.

"Nitrococals."²²³ Trademark for products consisting of pigments (carbon black or titanium dioxide) dispersed in various proportions of nitrocellulose and dibutyl phthalate. Used in high-gloss white, industrial-type, and high-grade jet black lacquer finishes. Available in two forms, chip and paste.

nitrocotton. See nitrocellulose.

2-nitro-para-cresol (4-methyl-2-nitrophenol)

$NO_2(CH_3)C_6H_4OH$.

Properties: Yellow crystals; density 1.24 g./ml (38/4°C); m.p. about 35°C; b.p. 234°C; slightly soluble in water; soluble in alcohol, ether. Combustible.

Containers: Steel drums.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Intermediate.

nitrodichloro derivative. See the corresponding dichloronitro derivative.

ortho-nitrodiphenyl. See ortho-nitrobiphenyl.

ortho-nitrodiphenylamine $C_6H_5NHC_6H_4NO_2$.

Properties: Red-brown crystalline powder; m.p. 75-76°C.

Use: Intermediate.

nitrodracyle acid. See para-nitrobenzoic acid.

nitro dye. A dye whose molecules contain the NO_2 chromophore group.

nitroethane $CH_3CH_2NO_2$. A nitroparaffin.

Properties: Colorless liquid. Solubility in water 4.5 cc/100 cc (20°C); solubility of water in nitroethane 0.9 cc/100 cc (20°C). Sp. gr. 1.052 (20/20°C); freezing point -90°C; b.p. 114°C; vapor pressure (15.6

mm) (20°C); flash point 82°F; autoignition temp. 779°F; wt/gal 8.75 lb (68°F); refractive index 1.3917 (20°C).

Derivation: By reaction of propane with nitric acid under pressure.

Containers: 5- and 55-gal drums; tank cars.

Hazard: Flammable, moderate fire risk. Moderately toxic. Tolerance, 100 ppm in air.

Uses: Propellant; solvent for nitrocellulose, cellulose acetate, cellulose acetopropionate, cellulose acetobutyrate, vinyl, alkyd, and many other resins, waxes, fats and dyestuffs; chemical synthesis.

2-nitro-2-ethyl-1,3-propanediol

$CH_2OHC(C_2H_5)NO_2CH_2OH$.

Properties: White, crystalline solid; m.p. 56-75°C; b.p. decomposes (10 mm); pH 0.1 M aqueous solution 5.48; soluble in organic solvents; very soluble in water.

Containers: Fiberpak boxes; drums.

Use: Organic synthesis.

"Nitroform."²⁶⁶ Trademark for a long-lasting, slow-release, high-nitrogen fertilizer. Nitrogen (total 38+%) released from urea-formaldehyde polymers by soil bacteria. Used for fertilizer manufacture and direct application.

nitrofurant. Any of several synthetic antibacterial drugs used to treat mammary gland infections in cows and to inhibit disease in swine, chickens, etc. Among them are nitrofurazone, furazolidone, nihydrazone, and furaltadone. All of the latter have been found to cause cancer in laboratory animals, and their use has been discontinued. See furazolidone.

nitrofurantoin $C_8H_8N_4O_5$. N-(5-nitro-2-furfurylidene)-1-aminohydantoin.

Properties: Yellow, bitter powder with slight odor. M.p. (dec) 270-272°C. Very slightly soluble in alcohol and practically insoluble in ether and water.

Grade: U.S.P.

Use: Medicine (antibacterial agent).

N-(5-nitro-2-furfurylidene-3-amino)-2-oxazolidinone. See furazolidone.

"Nitrogation."¹²⁵ Trademark for anhydrous ammonia specifically intended for direct injection into the irrigation stream for purpose of soil fertilization.

nitrogen N. Gaseous element of atomic number 7, of group VA of the periodic system. Atomic weight 14.0067; valences 1, 2, 3, 4, 5. There are two stable and 4 radioactive isotopes. The molecular formula is N_2 . Eighth highest-volume chemical produced in U.S. (1975).

Properties: Colorless, odorless, tasteless diatomic gas constituting about four-fifths of the air; colorless liquid, chemically unreactive; sp. gr. (gas) 0.96737, referred to air; (liquid) 0.804; (solid) 1.0265; f.p. -210°C; b.p. -195.5°C. Slightly soluble in water; slightly soluble in alcohol. Noncombustible; an asphyxiant gas.

Derivation: From liquid air by fractional distillation.

Impurities: Argon and other "rare gases"; oxygen.

Grades: U.S.P.; prepurified 99.966% min; extra dry 99.7% min; water pumped 99.6% min.

Containers: Steel cylinders; pipelines.

Uses: Production of ammonia, acrylonitrile, cyanamide, cyanides, nitrides; inert gas for purging, blanketing, and exerting pressure; electric and electronic industries; in-transit food refrigeration and

freeze drying, pressurizing liquid propellants; quick-freezing foods; chilling in aluminum foundries; bright annealing of steel; cryogenic preservation; inert pressuring and blanketing gas in missiles; food antioxidant; source of pressure in oil wells; inflating tires.

Shipping regulations: (Gas) (Rail) Green label. (Air) Nonflammable Gas label; (liquid, pressurized) Nonflammable Gas label. Not accepted on passenger planes; (liquid nonpressurized), No label required; (liquid, low-pressure), No label required.

nitrogen 15. A stable isotope with an atomic mass of 15.00011 which is present in naturally occurring nitrogen to the extent of 0.37%. Many nitrogen 15 compounds are commercially available.

nitrogenase. Enzyme which fixes nitrogen and can be isolated from soil bacteria. It is possible to synthesize ammonia from nitrogen and hydrogen without high temperatures and pressures by means of nitrogenase. Pyruvic acid is an adjunct of the reaction.

nitrogen chloride. See nitrogen trichloride.

nitrogen dioxide NO_2

Properties: A red-brown gas or yellow liquid; becomes colorless solid at -11.2°C , which exists in varying equilibrium with other oxides of nitrogen as the temperature is varied. A component of automotive exhaust fumes. M.p. (liquid) -9.3°C ; b.p. (gas) 21°C . Noncombustible.

Derivation: By oxidation of nitric oxide, an intermediate stage in the oxidation of ammonia to nitric acid.

Containers: 125-, 150-, 2000-lb cylinders; tank cars.

Grades: Pure, 99.5% min.

Hazard: Highly toxic; inhalation may be fatal. Tolerance, 5 ppm in air. Can react strongly with reducing materials.

Uses: Production of nitric acid; nitrating agent; oxidizing agent; catalyst; oxidizer for rocket fuels; polymerization inhibitor for acrylates.

Shipping regulations: (Rail) (liquid) Poison Gas label. Not accepted by express. (Air) Not acceptable.

nitrogen fixation. Utilization of atmospheric nitrogen to form chemical compounds. In nature, this function is performed by bacteria located on the root hairs of plants; as a result, plants are able to synthesize proteins. Industrial nitrogen fixation is exemplified by the synthesis of ammonia (q.v.) from a gaseous mixture containing carbon monoxide, hydrogen, and nitrogen. See also synthesis gas. Nitrogen can also be fixed by the electric arc process and the cyanamide process.

nitrogen monoxide. See nitrous oxide.

nitrogen mustard. A class of compounds with fishy odor and lachrymatory properties. They are named from their similarity in structure to mustard gas (dichlorodiethyl sulfide). The sulfur of the mustard gas is replaced by an amino nitrogen. Typical nitrogen mustards are halogenated alkylamines, such as methyl bis(2-chloroethyl)amine, $(\text{ClCH}_2\text{CH}_2)_2\text{NCH}_3$ (See mechloroethamine hydrochloride). Other examples are triethylene melamine, and triethylene thiophosphoramide (q.v.), and triethylene phosphoramidate. Hazard: Highly toxic; strong irritant to tissues; lachrymatory.

Use: Medicine; military poison gas.

Shipping regulations: See specific compound.

nitrogen oxides. The nitrogen oxides provide an example of the Law of Multiple Proportions and the +1 to +5 oxidation states of nitrogen. They are as

follows: N_2O (nitrous oxide); NO (nitric oxide); N_2O_3 (nitrogen trioxide or nitrogen sesquioxide); N_2O_4 (dinitrogen tetroxide or nitrogen peroxide); NO_2 (nitrogen dioxide); N_2O_5 (dinitrogen pentoxide); N_3O_4 (trinitrogen tetroxide); and NO_3 , which is unstable. These oxides, especially NO_2 , are a factor in air pollution from automotive emissions.

nitrogen solutions. Aqueous solutions of ammonium nitrate, ammonia, and/or urea. They are graded according to total nitrogen content and composition.

Containers: Tank cars and trucks.

Uses: Direct application to soil as fertilizer; neutralizing superphosphate fertilizers.

nitrogen trichloride (nitrogen chloride) NCl_3 .

Properties: Yellow oil or rhombic crystals; sp. gr. 1.653; b.p. less than 71°C ; f.p. less than -40°C ; insoluble in cold water, decomposes in hot water; soluble in chloroform, phosphorus trichloride, and carbon disulfide.

Hazard: May explode when heated to about 200°F or when exposed to direct sunlight. Moderately toxic by ingestion and inhalation. Strong irritant.

Shipping regulations: Consult authorities.

nitrogen triiodide NI_3 .

Properties: Black crystals.

Hazard: Explodes at slightest touch when dry; when handled it should be kept wet with ether. Too sensitive to be used as explosive as it cannot be stored, handled, or transported safely.

nitrogen trifluoride NF_3 .

Properties: Colorless, stable gas having a moldy odor; sp. gr. 1.537 (-129°C); gas density 0.1864 lb/cu ft (70°F); f.p. -206.6°C ; b.p. -128.8°C . Very slightly soluble in water. Nonflammable.

Containers: Steel cylinders.

Hazard: Toxic and corrosive to tissue. Tolerance, 10 ppm in air. Severe explosion hazard!

Uses: Oxidizer for high-energy fuels; chemical synthesis.

Shipping regulations: (Rail) Not listed. (Air) Nonflammable Gas label. Not acceptable on passenger planes.

nitrogen trioxide (dinitrogen trioxide; nitrogen sesquioxide) N_2O_3 .

Properties: Blue liquid; sp. gr. 1.447 (2°C); b.p. 3.5°C (1 atm); f.p. -102°C (1 atm). Partially dissociates into nitric oxide (NO) and nitrogen dioxide (NO_2).

Derivation: Prepared by passing nitric oxide into nitrogen tetroxide at about 0°C , until the stoichiometric amount has been absorbed.

Hazard: Highly toxic by inhalation; strong irritant.

Uses: Oxidant in special fuel systems; identification of terpenes; preparation of pure alkali nitrites.

Shipping regulations: (Rail) Poisonous liquids, n.o.s., Poison label. (Air) Not acceptable.

nitroglycerin (glyceryl trinitrate; trinitroglycerin)

$\text{CH}_2\text{NO}_3\text{CHNO}_3\text{CH}_2\text{NO}_3$.

Properties: Pale yellow, viscous liquid. Soluble in alcohol and ether; slightly soluble in water. Sp. gr. 1.6009; freezing point 13.1°C ; explosion point 260°C . Autoignition temp. 518°F .

Derivation: By dropping glycerol through cooled, mixed acid and stirring, followed by repeated washing with water.

Grade: Technical.

Hazard: Severe explosion risk; highly sensitive to shock and heat. Highly toxic by ingestion, inhala-

tion and skin absorption. Tolerance 0.2 ppm in air. Flammable, dangerous fire risk.

Uses: High explosive; production of dynamite and other explosives; medicine; combating fires in oil wells; rocket propellants.

Shipping regulations: (Rail) Consult regulations. Not accepted by express. (Air) Not acceptable. See regulations for spirits of nitroglycerin.

nitroguanidine $\text{H}_2\text{NC}(\text{NH})\text{NHNO}_2$. Exists in two forms, alpha and beta.

Properties: (a) Long thin flat, flexible, lustrous needles; (b) small, thin elongated plates. Both melting ranges are from 220 to 250°C. Beta-form appears to be more soluble in water.

Derivation: (a) Results when guanidine nitrate is dissolved in concentrated sulfuric acid and the solution is poured into water. (b) Nitration of a mixture of guanidine sulfate and ammonium sulfate which results from the hydrolysis of dicyandiamide by sulfuric acid.

Hazard: Dangerous fire and explosion risk.

Uses: High explosives, especially flashless propellant powder (with nitrocellulose); chemical intermediate.

Shipping regulations: (Rail) (dry) Consult regulations. Not accepted by express. (Wet with 20% water) Yellow label. (Air) (dry or wet with less than 20% water, Not acceptable; (wet with 20% water) Flammable Solid label.

nitrohydrochloric acid. See aqua regia.

3-nitro-2-hydroxybenzoic acid. See meta-nitrosalicylic acid.

4-nitro-3-hydroxymercuri-ortho-cresol anhydride. See nitromersol.

3-nitro-4-hydroxyphenylarsonic acid. See 4-hydroxy-3-nitrobenzenearsonic acid.

"Nitrojection Ammonia."¹²⁵ Trademark for anhydrous ammonia specifically intended for direct injection into the soil for fertilization.

nitromannite. See mannitol hexanitrate.

nitromersol (4-nitro-3-hydroxymercuri-ortho-cresol anhydride) $\text{C}_6\text{H}_2(\text{CH}_3)(\text{NO}_2)(\text{OHg})$.

Properties: Brownish yellow or yellow granules or powder. Odorless and tasteless. Insoluble in water; almost insoluble in alcohol, acetone, ether; soluble in solutions of alkalis, ammonia, by opening the anhydride ring and salt formation.

Grade: N.F.

Hazard: Toxic by ingestion and inhalation.

Use: Disinfectant for skin in extremely dilute solution (1 part in 1000 is maximum strength).

nitromethane CH_3NO_2 . A nitroparaffin.

Properties: Colorless liquid. Soluble in water and alcohol; solubility of water in nitromethane 2.2 cc/100 cc (20°C). Sp. gr. 1.139 (20/20°C); b.p. 101°C; vapor pressure 27.8 mm (20°C); flash point 95°F; wt/gal 9.5 lb; refractive index 1.3817 (20°C); freezing point -29°C. Autoignition temp. 785°F.

Derivation: By reaction of methane or propane with nitric acid under pressure.

Containers: 5- and 55-gal drums and 1-gal cans.

Hazard: Toxic by ingestion and inhalation; lower explosion limit 7.3% in air. Dangerous fire and explosion risk. Tolerance, 100 ppm in air.

Uses: Solvent for cellulosic compounds, polymers,

waxes, fats, etc; chemical synthesis; rocket fuel; gasoline additive.

Shipping regulations: (Air) Flammable Liquid label.

2-nitro-4-methoxyaniline $\text{NO}_2\text{C}_6\text{H}_3(\text{OCH}_3)\text{NH}_2$. Orange-red powder; m.p. 118-120°C; sparingly soluble in cold water and alcohol; soluble in hot water and dioxane. Used as a chemical intermediate.

Hazard: Probably toxic.

2-nitro-2-methyl-1,3-propanediol

$\text{CH}_2\text{OHC}(\text{CH}_3)\text{NO}_2\text{CH}_2\text{OH}$.

Properties: White, crystalline solid. Solubility in water 80 g/100 cc (20°C). M.p. 147-149°C; b.p. decomposes (10 mm); pH 0.1 M solution 5.42.

Hazard: Probably toxic.

Use: Intermediate.

nitromuriatic acid. See aqua regia.

nitron (1,4-diphenyl-3,5-endo-anilino-4,5-dihydro-1,2,4-triazole) $\text{C}_{20}\text{H}_{16}\text{N}_4$.

Properties: Lemon-yellow, fine crystalline needles. Soluble in chloroform, acetone, and acetic acid ester; slightly soluble in ether and alcohol.

Use: Reagent for detection of the nitrate ion (NO_3)—in very dilute solutions.

alpha-nitronaphthalene (1-nitronaphthalene) $\text{C}_{10}\text{H}_7\text{NO}_2$.

Properties: Yellow crystals. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.331; m.p. 55-56°C; b.p. 304°C; flash point 327°F; combustible.

Derivation: Action of a mixture of nitric and sulfuric acids on finely ground naphthalene.

Hazard: Moderate irritant.

Uses: Dyes; naphthylamine; added to mineral oils to mask fluorescence.

Note: The beta isomer is highly toxic by ingestion.

1-nitronaphthalene-5-sulfonic acid. (Laurent's alpha acid) $\text{C}_{10}\text{H}_6(\text{NO}_2)(\text{SO}_3\text{H})$.

Properties: Pale yellow needles. Soluble in water, alcohol, and ether. Combustible.

Derivation: By sulfonating nitronaphthalene with a mixture of chlorohydrin and sulfuric acid.

Hazard: May be toxic.

Use: Dyes.

nitronium perchlorate NO_2ClO_4 .

Properties: White crystalline solid; m.p. 120-140°C; hygroscopic; noncorrosive; soluble in water to form nitric and perchloric acids; highly reactive.

Derivation: From ozone, nitrogen dioxide, chlorine dioxide.

Hazard: Highly irritant to skin and mucous membranes. Strong oxidizing agent; may explode in contact with organic materials.

Use: Suggested as propellant oxidizer.

Shipping regulations: Perchlorates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

para-nitrophenetole $\text{NO}_2\text{C}_6\text{H}_4\text{OC}_2\text{H}_5$.

Properties: Crystallizes in prisms. Soluble in alcohol and ether. M.p. 58°C; b.p. 283°C.

Derivation: By ethylation of para-nitrophenol with ethyl chloride.

Uses: Dyes and other intermediates.

nitrophenide [bis(3-nitrophenyl) disulfide] $(\text{NO}_2\text{C}_6\text{H}_3)_2\text{S}$.

Properties: Yellow, rhomboid crystals; m.p. 83°C; insoluble in water; soluble in ether; slightly soluble in alcohol.

Derivation: Reduction of meta-nitrobenzenesulfonyl chloride with hydriodic acid.

Uses: Veterinary medicine and pharmaceutical intermediate.

meta-nitrophenol $\text{NO}_2\text{C}_6\text{H}_4\text{OH}$.

Properties: Pale yellow crystals; sp. gr. 1.485 (20°C); m.p. 96–97°C; b.p. 149°C (70 mm). Combustible.

Slightly soluble in water; soluble in alcohol.

Derivation: Diazotized meta-nitroaniline is boiled with water and sulfuric acid.

Use: Indicator.

ortho-nitrophenol $\text{NO}_2\text{C}_6\text{H}_4\text{OH}$.

Properties: Yellow crystals; sp. gr. 1.295 (45°C), 1.657 (20°C); m.p. 44–45°C; b.p. 214°C; soluble in hot water, alcohol, ether.

Derivation: Action of dilute nitric acid on phenol at low temperature; para-nitrophenol formed at same time. They are separated by steam distillation.

Containers: Glass bottles; fiber cans; drums.

Uses: Intermediate in organic synthesis; indicator.

para-nitrophenol $\text{NO}_2\text{C}_6\text{H}_4\text{OH}$.

Properties: Yellowish monoclinic prismatic crystals; sp. gr. 1.479–1.495 (20°C); m.p. 111.4–114°C (sublimes); b.p. 279°C (dec); soluble in hot water, alcohol, ether.

Derivation: (a) From p-chloronitrobenzene; (b) See orthonitrophenol.

Containers: Glass bottles; fiber cans; drums.

Use: Intermediate in organic synthesis; production of parathion; fungicide for leather.

para-nitrophenol, sodium salt (sodium para-nitrophenolate; para-nitro sodium phenolate) $\text{NO}_2\text{C}_6\text{H}_4\text{ONa}$. Yellow crystalline solid; soluble in water. Used as an intermediate.

para-nitrophenylacetic acid (para-nitro-alpha-toluic acid) $\text{NO}_2\text{C}_6\text{H}_4\text{CH}_2\text{COOH}$.

Properties: Colored needles. M.p. 152.3°C. Slightly soluble in cold water; soluble in alcohol and chloroform. Combustible.

Derivation: Hydrolysis of para-nitrobenzyl cyanide with 50% sulfuric acid.

Hazard: May be toxic.

Uses: Intermediate for dyestuffs, pharmaceuticals, penicillin precursors, local anesthetics.

4-nitrophenylarsonic acid $\text{NO}_2\text{C}_6\text{H}_4\text{AsO}(\text{OH})_2$.

Properties: Crystalline solid.

Derivation: Nitration of phenylarsonic acid.

Hazard: Toxic by ingestion. An arsenic compound.

Use: Veterinary medicine.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

para-nitrophenylazosalicylate sodium. See alizarin yellow R.

"Nitrophoska."⁴⁴⁰ Trademark for a group of complete (N-P-K) fertilizers for agricultural and horticultural crops.

nitrophosphate. A nitrogen-phosphorus fertilizer produced by the action of nitric acid or a mixture of nitric and sulfuric or phosphoric acids on phosphate rock. Potassium salts usually are added to produce complete fertilizers. Typical analysis: Available nitrogen 15%, available P_2O_5 15%, available K_2O 15%.

Containers: Bags, bulk, carloads.

Use: Fertilizer.

See also superphosphate; triple superphosphate.

1-nitropropane $\text{CH}_3\text{CH}_2\text{CH}_2\text{NO}_2$. A nitroparaffin.

Properties: Colorless liquid. Solubility in water 1.4 ml/100 ml (20°C); solubility of water in 1-nitropropane 0.5 cc/100 cc (20°C). Sp. gr. 1.003 (20/20°C);

b.p. 132°C; vapor pressure 7.5 mm (20°C); flash point 120°F (T.O.C.); wt/gal 8.4 lb (68°F); refractive index 1.4015 (20°C); freezing point -108°C; autoignition temp. 789°F. Combustible.

Derivation: By reaction of propane with nitric acid under pressure.

Containers: Drums, tank cars.

Hazard: Moderately toxic; moderate fire risk. Tolerance, 25 ppm in air. Moderate explosion hazard when shocked or heated.

Uses: Solvent; chemical synthesis; rocket propellant; gasoline additive.

2-nitropropane $\text{CH}_3\text{CHNO}_2\text{CH}_3$. A nitroparaffin.

Properties: Colorless liquid. Solubility in water 1.7 ml/100 ml (20°C); solubility of water in 2-nitropropane 0.6 cc/100 cc (20°C). Sp. gr. 0.992 (20/20°C); b.p. 120°C; vapor pressure 12.9 mm (20°C); flash point 103°F (T.O.C.); wt/gal 8.3 lb (68°F); refractive index 1.3941 (20°C); freezing point -93°C; autoignition temp. 802°F. Combustible.

Derivation: By reaction of propane with nitric acid under pressure.

Containers: Drums; tank cars.

Hazard: Moderately toxic; moderate fire risk. Tolerance, 25 ppm in air. Moderate explosion hazard when shocked or heated.

Uses: Solvent especially for vinyl and epoxy coatings; chemical synthesis; rocket propellant; gasoline additive.

meta-nitrosalicylic acid (3-nitro-2-hydroxybenzoic acid) $\text{C}_6\text{H}_3\text{COOH}(\text{OH})\text{NO}_2$.

Properties: Yellowish crystals. Soluble in water and in alcohol. M.p. 144°C.

Derivation: Nitration of salicylic acid.

Uses: Intermediate; azo dyes.

nitrosamine. Any of a group of organic compounds in which NNO is attached to an alkyl or aryl group, e.g., $(\text{C}_6\text{H}_5)_2\text{NNO}$. Some members of this group have given evidence of carcinogenicity.

"Nitrosan."²⁸ Trademark for a yellow powdered blowing agent of 70% $\text{N,N}'$ -dimethyl- $\text{N,N}'$ -dinitrosoterephthalamide and 30% white mineral oil. Controlled thermal decomposition liberates terephthalate. Non-staining, nondiscoloring gas generant. Used for formation of plastic foams.

Containers: 5-lb fiber drums.

N-nitrosodimethylamine (dimethylnitrosamine; DMN) $(\text{CH}_3)_2\text{N}_2\text{O}$.

Properties: Yellow liquid; soluble in water, alcohol, and ether. B.p. 152°C; sp. gr. 1.006. Combustible.

Hazard: Causes cancer in experimental animals.

Uses: Rocket fuels; solvent; organic research.

para-nitrosodimethylaniline. See N,N -dimethyl-para-nitrosoaniline.

nitroparaffin (nitroalkane). Any of a homologous series of compounds whose generic formula is $\text{C}_n\text{H}_{2n+1}\text{NO}_2$, the nitro groups being attached to a carbon atom through the nitrogen.

Properties: Colorless, mobile liquids; pleasant odor; b.p. range, 101–131°C; f.p. range, -28 to -104°C; sp. gr. range, 0.983–1.131; dielectric constant range, 23–35; slightly soluble in water. Flash point range, 82–120°F. Combustible. Moderately toxic by inhalation.

Derivation: Nitration of propane and other paraffin hydrocarbons under pressure.

Uses: Solvents for dyes, waxes, resins, gums and various polymeric substances; gravure and flexographic

inks; propellants and fuel additives; chemical intermediates.

See also nitroethane, nitromethane, nitropropane.

N-nitrosodiphenylamine (diphenylnitrosamine; nitrous diphenylamide) $(C_6H_5)_2NNO$.

Properties: Yellow to brown or orange powder or flakes; m.p. 64–66°C; sp. gr. 1.23; insoluble in water; soluble in alcohol, acetone, benzene, and ethylene dichloride. Somewhat soluble in gasoline.

Containers: Fiber drums.

Hazard: May be carcinogenic.

Uses: Retarder of vulcanization of rubber; pesticide.

para-nitro sodium phenolate. See para-nitrophenol, sodium salt.

nitroso dyes (quinone oxime dyes). Dyes whose molecules contain the $-NO$ or $=NOH$ chromophore group.

nitroso ester terpolymer. See nitroso polymer.

nitrosoguanidine $ONNHC(NH)NH_2$. Pale yellow crystalline powder.

Derivation: Cooling the reaction products of nitroguanidine, ammonium chloride and zinc dust.

Hazard: Severe explosion risk.

Use: An initiating explosive.

Shipping regulations: (Rail) Consult regulations. Not accepted by express. (Air) Not acceptable.

1-nitroso-2-naphthol (naphthoquinone oxime, one of several isomers. Alpha-nitroso-beta-naphthol).

Properties: Yellow needles. Soluble in alcohol and ether; insoluble in water. M.p. 110°C. Combustible.

Derivation: Action of nitrous acid on beta-naphthol.

Uses: Organic synthesis; prevention of gum formation in gasoline; analytical reagent.

para-nitrosophenol C_6H_4OHNO .

Properties: Crystallizes in light brown leaflets which decompose at 140°C. Soluble in alcohol, ether and acetone; moderately soluble in water. M.p. 140°C.

Derivation: From phenol by action of nitrous acid in the cold.

Hazard: Dangerous fire and explosion risk; reacts violently with acids and alkalis; may explode spontaneously. Intraplant transport must be in tightly covered steel barrels.

Use: Dyes.

Shipping regulations: Not listed.

nitroso polymer (nitroso rubber). A flame- and heat-resistant copolymer derived from trifluoronitrosomethane (CF_3NO) and tetrafluoroethylene ($CF_2=CF_2$). A third monomer (methyl-4-nitrosoperfluorobutylate) provides more easily cross-linked functional groups than heretofore available. This terpolymer, called nitroso ester terpolymer (NET), is a notable improvement on the earlier copolymer, and is especially effective for fireproof interiors of aerospace vehicles and airplanes. Cross-linking is by a peroxide mechanism. Properties of the terpolymer are a glass transition temperature of about $-50^\circ C$, decomposition temperature of $275^\circ C$, tensile strength 750 psi, elongation 500%, Shore hardness 78. Nonflammable.

nitrostarch (starch nitrate) $C_6H_{12}(NO_2)_xO_{10x}$.

Properties: Orange-colored powder; contains 16.5% nitrogen; soluble in ether-alcohol.

Containers: Steel drums or earthenware pots containing water.

Hazard: Severe explosion risk when dry. Flammable, dangerous fire risk.

Use: Explosives.

Shipping regulations: (Rail) Wet with 20% water.

Yellow label. Wet with 30% alcohol, Red label. Dry, not accepted by express. (Air) Dry or wet with less than 20% water or 30% solvent. Not acceptable. Wet with not less than 30% solvent, Flammable Liquid label. Wet with not less than 20% water, Flammable Solid label.

beta-nitrostyrene $C_6H_5CH:CHNO_2$.

Properties: Liquid. M.p. $58^\circ C$. Available as a 30% solution in styrene.

Hazard: Moderate fire and explosion risk.

Use: Chain stopper in styrene type polymerization.

para-nitrosulfathiazole $NO_2C_6H_4SO_2NHC_3H_2NS$.

Properties: Pale yellow powder; odorless; slightly bitter taste; m.p. $258-266^\circ C$. Slightly soluble in alcohol, very slightly soluble in chloroform, ether and water and practically insoluble in benzene.

Use: Medicine.

nitrosyl chloride $NOCl$. One of the oxidizing agents in aqua regia.

Properties: Yellow-red liquid or yellow gas; b.p. $-5.5^\circ C$; f.p. $-61.5^\circ C$; sp. gr. (gas) 2.3 ($0^\circ C$, air = 1); sp. gr. (liquid) 1.273 ($20^\circ C$); decomposed by water; dissociates into nitric oxide and chlorine on heating; soluble in fuming sulfuric acid. Nonflammable.

Derivation: By action of chlorine on sodium nitrate.

Grades: Pure, 93% min.

Containers: Nickel cylinders.

Hazard: Highly toxic; strong irritant, especially to lungs and mucous membranes.

Uses: Synthetic detergents; catalyst; intermediate.

Shipping regulations: (Rail) Green label. (Air) Nonflammable Gas label. Not acceptable on passenger planes.

nitrosylsulfuric acid $ONOSO_3H$ with H_2SO_4 .

Properties: Clear, straw-colored, oily liquid. Approximately 40% nitrosylsulfuric acid and 54% sulfuric acid. Pure $ONOSO_3H$: crystalline, m.p. $73^\circ C$ (dec).

Containers: Carboys; drums.

Hazard: Strong irritant to skin and mucous membranes.

Uses: Manufacture of dyes and intermediates.

Shipping regulations: Not listed.

meta-nitrotoluene (meta-methylnitrobenzene)

$NO_2C_6H_4CH_3$.

Properties: Yellow crystals; sp. gr. 1.1571 ($20/4^\circ C$); m.p. $15^\circ C$; b.p. $232.6^\circ C$; refractive index 1.5466 ($20^\circ C$). Insoluble in water; soluble in alcohol; miscible with ether. Flash point $223^\circ F$; combustible.

Derivation: From meta-nitro-para-toluidine.

Hazard: Toxic by inhalation, ingestion, skin absorption. Tolerance, 5 ppm in air.

Use: Organic synthesis.

Shipping regulations: (Air) Poison label.

ortho-nitrotoluene (ortho-methylnitrobenzene)

$NO_2C_6H_4CH_3$.

Properties: Yellow liquid; sp. gr. 1.1629 ($20^\circ C$); f.p. $-9.3^\circ C$; b.p. $220.4^\circ C$; refractive index 1.544 ($25^\circ C$). Insoluble in water; miscible with alcohol and ether. Flash point $223^\circ F$; combustible.

Derivation: From toluene by nitration and separation by fractional distillation.

Hazard: Toxic by inhalation, ingestion, skin absorption. Tolerance, 5 ppm in air.

Uses: For production of toluidine, tolidine, fuchsin, and various synthetic dyes.

Shipping regulations: (Air) Poison label.

para-nitrotoluene (para-methylnitrobenzene)

Properties: Yellow crystals; sp. gr. 1.299 (0/4°C); m.p. 51.7°C; b.p. 238.3°C; refractive index 1.5382 (15°C). Insoluble in water; very soluble in alcohol, ether, and benzene. Flash point 223°F; combustible.

Derivation: From toluene by nitration and separation by fractional distillation.

Hazard: Toxic by inhalation, ingestion, skin absorption. Tolerance, 5 ppm in air.

Uses: For production of toluidine, fuchsin, tolidine and various synthetic dyes.

Shipping regulations: (Air) Poison label.

para-nitro-alpha-toluic acid. See para-nitrophenylacetic acid.

meta-nitro-para-toluidine (3-nitro-4-toluidine)

Properties: Orange-red crystals; soluble in alcohol and concentrated sulfuric acid. M.p. 117°C. Flash point 315°F; combustible.

Derivation: From acetyl-para-toluidine by nitration.

Containers: Fiber drums; multiwall paper sacks.

Use: Intermediate for dyes and pigments.

para-nitro-ortho-toluidine (4-nitro-2-toluidine)

Properties: Yellow crystalline solid. Soluble in alcohol and ether. M.p. 104°C. Flash point 315°F; combustible.

Derivation: From ortho-toluidine by nitration.

Containers: Barrels; fiber drums; multiwall paper sacks.

Use: Intermediate for dyes and pigments.

para-nitro-alpha-tolunitrile. See para-nitrobenzyl cyanide.

nitrotrichloromethane. See chloropicrin.

meta-nitrotrifluoromethylbenzene. See meta-nitrobenzotrifluoride.

2-nitro-4-trifluoromethylbenzonitrile

Properties: Liquid. B.p. 156–158°C (18–19 mm); m.p. 47–48°C.

Derivation: From a cyclic halogen compound by heating with copper cyanide in the presence of amines.

Hazard: May be toxic.

Use: Dyes.

2-nitro-4-trifluoromethyl chlorobenzene

Properties: Pale yellow oil; f.p. –6°F; soluble in acetone, alcohol and other solvents; insoluble in water.

Hazard: May be toxic.

Uses: Intermediate for dyes and organic chemicals.

nitrourea $\text{NH}_2\text{CONHNO}_2$

Properties: White crystalline powder; slightly soluble in water; soluble in alcohol or ether; m.p. 158–159°C.

Derivation: Urea nitrate and concentrated sulfuric acid.

Containers: Steel drums.

Hazard: Severe explosion risk.

Use: Explosives.

Shipping regulations: (Rail) Consult regulations. Not accepted by express. (Air) Not acceptable.

nitrous acid HNO_2

Properties: A weak acid occurring only in the form of a light blue solution.

Derivation: Reaction of strong inorganic acids with nitrites, e.g., $\text{HCl} + \text{NaNO}_2$.

Uses: Formation of diazotizing compounds by reaction with primary aromatic amines; source of nitric oxide.

nitrous diphenylamide. See N-nitrosodiphenylamine.

nitrous oxide (nitrogen monoxide) N_2O .

Properties: Colorless, sweet-tasting gas; noncombustible; sp. gr. gas, 1.52 referred to air; liquid, 1.22 (–89°C); f.p. –90.8°C; b.p. –88.5°C; soluble in alcohol, ether, and concentrated sulfuric acid; slightly soluble in water. An asphyxiant gas.

Derivation: Thermal decomposition of ammonium nitrate; controlled reduction of nitriles or nitrates.

Grades: Pure, 98.0% min; U.S.P. (97% min).

Containers: Steel cylinders.

Hazard: Moderate fire risk; supports combustion; can form explosive mixtures with air.

Uses: Anesthetic in dentistry and surgery; propellant gas in food aerosols; leak detection.

Shipping regulations: (Rail) Green label. (Air) Non-flammable Gas label.

"Nitrox."²⁹² Trademark for a product designed to provide in a single operation the cleansing and neutralizing action of caustic soda and the corrosion protection properties of sodium nitrite. Used in cleaning, protection and neutralizing of iron and steel during processing and storage as, for example, tanks of petroleum tankers carrying light oils.

Containers: 400-lb steel drums.

nitroxanthic acid. See picric acid.

nitroxylenes (dimethylnitrobenzenes) $\text{C}_6\text{H}_3(\text{CH}_3)_2\text{NO}_2$.

There are three isomers (2,4-; 3,4-; and 2,5-).

Properties: Yellow liquid (2,4- and 2,5-); crystalline needles (3,4-). Sp. gr. 1.135; m.p. 2°C; b.p. 246°C. Soluble in alcohol and ether; insoluble in water.

Derivation: By nitrating xylene and separating from the resulting mixture by rectification.

Hazard: Highly toxic by ingestion, inhalation and skin absorption.

Uses: Organic synthesis; gelatinizing accelerators for pyroxylin.

Shipping regulations: (Rail, Air) Poison label. Legal label name: nitroxylol.

"Nivco."³⁰⁸ Trademark for a precipitation-hardening cobalt-base alloy with good strength-to-weight ratio for use at temperatures up to 1200°F. It contains somewhat more than 20% nickel and small amounts of titanium, zirconium, and iron. Used as a damping material for steam turbine blade applications.

nm Abbreviation for nanometer (q.v.).

NMR Abbreviation for nuclear magnetic resonance (q.v.).

No Symbol for the element nobelium (q.v.).

Nobel, Alfred B. (1833–1896). A native of Sweden, Nobel devoted most of his life to a study of explosives, and was the inventor of a mixture of nitroglycerin and diatomaceous earth which he called dynamite. He also invented blasting gelatin and smokeless powder. With the fortune he accumulated from his work, Nobel established the foundation that bears his name, which annually recognizes outstanding work in physics, chemistry, medicine, literature, and human relations. The Nobel prize is still the world's most valued scientific award.

nobelium No Synthetic radioactive element 102; one of the actinide series of elements; its discovery has been claimed by research groups in Sweden, U.S.S.R..

and California. It can be produced in a cyclotron by bombarding curium with nuclei of carbon 13 accelerated to high energies. The name nobelium has been accepted by the IUPAC Commission on Nomenclature of Inorganic Chemistry. Its isotopes are so short-lived that its chemical properties have not been determined. It has no known uses or compounds.

noble. In chemical terminology this term describes an element which either is completely unreactive or reacts only to a limited extent with other elements. Six noble gases constitute a group in the Periodic Table that is variously called the zero group (as the first three of its members have a valence of zero), the inert gas group, and the noble gas group. The last is preferable, as three of the gases, though unreactive, are not inert. The gases of this group are helium, neon, argon, krypton, xenon, and radon. The noble metals are generally considered to be gold, silver, platinum, palladium, iridium, rhodium, mercury, ruthenium, and osmium. The term has no reference to the commercial value of these metals. See also inert.

"Noctec."⁴¹² Trademark for chloral hydrate (q.v.).

NODA. Abbreviation for n-octyl, n-decyl adipate.

nodular iron. A ductile form of cast iron.

"Nogas."²⁸ Trademark for a metal pickling agent. Properties: Amorphous brown powder, soluble in water and acids. Will give foam-producing solutions when dissolved in water or acids.

Use: Addition agent in acid pickling of iron and steel products to produce a foam blanket and to improve the atmosphere around pickling operations by elimination of acid mist particles usually given off by the pickling operation.

"Nolane."³⁴² Trademark for 2,6-allyl-dichlorosilane-resorcinol, used for priming glass fibers, i.e., prior to laminating.

"Noludar."¹⁹⁰ Trademark for methypylon (q.v.).

nomenclature, chemical. See chemical nomenclature.

nomograph. A chart in which a straight line, either drawn or indicated by a ruler, intersects three scales at points that represent values that satisfy an equation or a given set of physical conditions. It thus enables one to determine the value of a dependent variable when that of the independent variable is known. Used by chemical engineers to determine relationships between the properties of materials.

"Nomex."²⁸ Trademark for a heat-resistant aromatic polyamide fiber. It retains useful properties after long-term exposure to temperatures up to 220°C; does not support combustion.

Uses: Military flight suits, electrical insulation, heat-resistant paper, coated fabrics; upholstery.

See also aramid.

nonadecane $C_{19}H_{40}$ or $CH_3(CH_2)_{17}CH_3$.

Properties: Leaflets; soluble in alcohol; insoluble in water; soluble in ether; sp. gr. 0.777; m.p. 32°C; b.p. 330°C. Combustible; low toxicity.

Use: Organic synthesis.

n-nonadecanoic acid $CH_3(CH_2)_{17}COOH$. A saturated fatty acid normally not found in natural vegetable fats or waxes. Combustible; low toxicity.

Properties: Colorless crystals; m.p. 68.7°C; b.p. 297°C (100 mm); soluble in alcohol and ether; insol-

uble in water. Synthetic product available 99% pure for organic synthesis.

gamma-nonolactone. See gamma-nonyl lactone.

nonanal (pelargonic aldehyde; n-nonyl aldehyde; aldehyde C-9) $C_9H_{17}CHO$.

Properties: Colorless liquid with an orange-rose odor; sp. gr. 0.822–0.830; refractive index 1.424–1.429. Soluble in 3 volumes of 70% alcohol, in mineral oil; insoluble in glycerol. Combustible.

Grades: Technical; F.C.C.

Uses: Perfumery; flavoring agent.

nonane (nonyl hydride) C_9H_{20} or $CH_3(CH_2)_7CH_3$.

Properties: Colorless liquid. Soluble in alcohol; insoluble in water. Sp. gr. 0.722; b.p. 150.7°C; f.p. –54°C; refractive index 1.40561 (20°C); flash point 86°F. (Closed cup); autoignition temp. 403°F.

Grades: Technical (95%); 99%; research.

Containers: Glass bottles; drums.

Hazard: Flammable, moderate fire risk. Irritant; narcotic in high concentrations.

Uses: Organic synthesis; biodegradable detergents; distillation chaser.

nonanedioic acid. See azelaic acid.

nonane-1,3-diol monoacetate $C_9H_{18}OOCCH_3$.

Properties: A mixture of isomers. Colorless to slightly yellow liquid; stable; soluble in alcohol. Combustible; low toxicity.

Uses: Perfumery; flavoring.

n-nonanoic acid. See pelargonic acid.

nonanol. See nonyl alcohol.

nonallyl chloride. See pelargonyl chloride.

noncombustible material. A solid, liquid or gas that will not ignite or burn, regardless of how high a temperature it is exposed to.

nondestructive testing. A test that does not involve destruction of the sample or material tested. Such tests are usually carried out by radiographic methods on large, finished metal products (castings and machine components) to determine the presence of internal defects likely to cause operational failure. An infrared camera scanning device for detection of internal weaknesses in tires is a recent development in nondestructive testing. X-radiation is used to determine the authenticity of paintings and other objects of art.

nondrying oil. See drying oil.

nonelectrolyte. A compound that resists passage of electricity (nonconductor) both in liquid form and in solution. Included in this classification are most organic compounds, with the exception of acids and amides, and such inorganic compounds as nonmetal halides. Nonelectrolytes are covalently bonded; some inorganic compounds having covalent bonds form electrolytic solutions in aqueous solution. See also electrolyte.

nonene. See nonylene.

nonflammable material. A gas or liquid whose flash point is above 100°F, or a solid whose ignition point is above 500°F. See combustible material and note under flammable material.

"Nonic."²⁰⁴ Trademark for a group of non-ionic surface-active agents based on polyethylene glycol tert-dodecylthioether or related compounds.

Superior numbers refer to Manufacturers of Trade Mark Products. For page number see Contents.

Uses: Detergents; paper manufacture; grease removal; wetting agents; emulsifier; clouding agent.

"Nonisol."²¹⁹ Trademark for a series of nonionic surface-active fatty acid esters of higher polyglycols (poly-oxyalkylenes).

Uses: Cosmetics; solvent emulsions; polishes; rust-preventive oils; insecticide and agricultural sprays.

nonmetal. (1) Any of a number of elements whose electronic structure, bonding characteristics, and consequent physical and chemical properties differ markedly from those of metals, particularly in respect to electronegativity and thermal and electrical conductivity. In general, nonmetals have very low to moderate conductivity and high electronegativity. The 25 elements classified as nonmetals may be considered in two groups: (a) those having moderate electrical conductivity (semiconductors), all of which are solids; and (b) those having very low conductivity, many of which are gases. The semiconductors of group (a) were formerly called metalloids since they more nearly resemble metals than those of group (b), but this term is no longer used by chemists. The nonmetals are given below based on this subgrouping, though any such list is open to challenge:

(a)		(b)
arsenic	polonium	halogens
antimony	phosphorus	hydrogen
boron	selenium	nitrogen
carbon	silicon	oxygen
germanium	tellurium	noble gases
		sulfur

(2) Loosely, any material that is not a metal, e.g., petroleum, plastics, waxes, etc. The term is widely used in this sense by engineers and specification writers.

n-nonoic acid. See pelargonic acid.

nonoic acid. An acid of the formula $C_8H_{17}COOH$, of which there are many possible isomers. Pelargonic acid (q.v.) is the normal or straight-chain acid. Various mixtures of branched chain nonoic acids are recovered from products of the Oxo process.

nonviscous neutral oil. A neutral oil of viscosity lower than 135 S.U.S. at 100°F.

nonwoven fabric. A fabric made from staple lengths of cotton, rayon, glass or thermoplastic synthetic fiber mechanically positioned in a random manner, and bonded with a synthetic adhesive or rubber latex. The sheets thus formed can be pressed together to form porous mats of high absorptivity and good elastic recovery on deformation. Permanent bonds are formed where the fibers touch each other as a result of heat treatment when the fibers are thermoplastic, or by use of a high-polymer binder.

A specialty nonwoven (so-called "melded") fabric trademarked "Cambrelle" (q.v.) is a composite of two different polymers; heating the exterior layer to its melting point causes the fibers to fuse into a fabric.

Applications are as a backing for plastic film; padding for surgical dressings, diapers, sanitary napkins; drapes and other decorative textile products; filtration; shoe liners; industrial wiping and polishing fabrics; disposable clothing; carpet backing.

n-nonyl acetate (acetate C-9) $CH_3COO(CH_2)_8CH_3$. Properties: Colorless liquid; strong, pungent odor; sp. gr. 0.864–0.868; refractive index 1.422–1.426. Soluble

in 4 volumes of 70% alcohol. Flash point 155°F. Combustible. Low toxicity. Several isomers exist. Uses: Perfumery; flavoring.

n-nonyl alcohol (nonanol; alcohol C-9; octyl carbinol, pelargonic alcohol) $CH_3(CH_2)_8CH_2OH$. Properties: Colorless liquid, with floral odor; sp. gr. 0.826–0.829; refractive index 1.431–1.435; f.p. –5°C; b.p. 215°C. Flash point 165°F. Combustible; low toxicity. Soluble in 7 volumes of 50% alcohol; insoluble in water. Several isomers exist. Uses: Perfumery; flavoring.

n-nonylamine $C_9H_{19}NH_2$. Properties: Colorless liquid. B.p. 75–85°C (20 mm); sp. gr. 0.798 (25°C); refractive index 1.4366 (n 20/D); may be prepared from nonyl halides by conventional techniques. Combustible. Hazard: Moderate fire risk; moderately toxic and skin irritant.

tert-nonylamine. Principally tert- $C_9H_{19}NH_2$ and tert- $C_{10}H_{21}NH_2$. Properties: Colorless liquid. Boiling range 160–174°C; sp. gr. 0.789 (25°C); refractive index 1.428 (25°C); flash point 120°F; insoluble in water; soluble in common organic solvents; especially in petroleum hydrocarbons. Combustible. Containers: Drums; tank cars. Hazard: Moderate fire risk; moderately toxic and skin irritant. Uses: Intermediate for rubber accelerators, insecticides, fungicides, dyestuffs, pharmaceuticals.

nonylbenzene (1-phenylnonane) $C_6H_5C_8H_{17}$. Properties: Light-straw liquid; aromatic odor; boiling range 245–252°C; sp. gr. 0.864 (20/20°C); refractive index 1.488 (20°C); viscosity 41.9 cp (20°C); flash point 210°F (closed cup). Combustible. Hazard: Probably irritant and narcotic in high concentrations. Use: Manufacture of surface-active agents.

nonyl bromide $C_9H_{19}Br$. Properties: Liquid. B.p. 81–85°C (10 mm); sp. gr. 1.101 (25°C); refractive index 1.4583 (n 20/D). Non-flammable. Derivation: High yields of nonyl bromide are obtained by passing hydrogen bromide into the alcohol while heating or by refluxing with aqueous hydrobromic acid in the presence of an acid catalyst.

nonyl chloride $C_9H_{19}Cl$. Properties: Liquid. B.p. 58–63°C (8 mm); sp. gr. 0.878 (25°C); refractive index 1.4379 (n 20/D). Non-flammable. Derivation: Nonyl alcohol reacts with hydrogen chloride at elevated temperatures and pressure to give nonyl chloride. It can also be made by refluxing a mixture of concentrated hydrochloric acid with the alcohol in presence of zinc chloride.

1-nonylene (1-nonene) C_9H_{18} or $CH_3(CH_2)_6CH=CH_2$. Properties: Colorless liquid; soluble in alcohol; insoluble in water. Sp. gr. 0.7433; b.p. 149.9°C. Combustible. Derivation: From propylene. Uses: Organic synthesis; wetting agent; lube oil additive; polymer gasoline.

nonyl hydride. See nonane.

n-nonylic acid. See pelargonic acid.

gamma-nonyl lactone (aldehyde C-18; 4-hydroxynonanoic acid, gamma lactone; gamma-nonalactone)

Properties: Yellowish to almost colorless liquid; coconut-like odor; sp. gr. 0.956–0.963; refractive index 1.447; soluble in 5 volumes of 50% alcohol; soluble in most fixed oils and mineral oil; practically insoluble in glycerol. Combustible; low toxicity.

Grades: Technical; F.C.C.

Uses: Perfumery; flavors.

nonyl nonanoate (nonyl pelargonate) $\text{C}_9\text{H}_{19}\text{OOC}\text{C}_8\text{H}_{17}$. Properties: Liquid; sp. gr. 0.863 (25°C); b.p. 315°C; refractive index 1.4419 (n 20/D); floral odor; combustible; low toxicity.

Uses: Flavors; perfumes; organic synthesis.

nonylphenol $\text{C}_9\text{H}_{19}\text{C}_6\text{H}_4\text{OH}$. A mixture of isomeric monoalkyl phenols, predominantly para-substituted. Properties: Pale yellow, viscous liquid with a slight phenolic odor. Insoluble in water; soluble in most organic solvents. Sp. gr. (20/20°C) 0.950; b.p. 315°C; f.p. –10°C (sets to glass below this temperature); viscosity 563 cp (20°C); flash point 285°F. Combustible.

Grade: Technical.

Containers: Drums; tank cars.

Uses: Non-ionic surfactant (nonbiodegradable); lube oil additives; stabilizers, petroleum demulsifiers, fungicides; antioxidants for plastics and rubber.

nonylphenoxyacetic acid $\text{C}_9\text{H}_{19}\text{C}_6\text{H}_4\text{OCH}_2\text{COOH}$.

Properties: Light amber liquid; miscible with organic solvents; insoluble in water; soluble in alkali. Flow point 0°C; viscosity (25°C) 6500 cp. Combustible.

Uses: Corrosion inhibitor for turbine oils, lubricants, fuels, greases; hydraulic fluids, cutting oils and metal coolants.

nonyl thiocyanate $\text{C}_9\text{H}_{19}\text{SCN}$.

Properties: B.p. 84–86.5°C (1 mm); sp. gr. 0.919 (25°C); refractive index 1.4696 (n 20/D). Nonyl thiocyanate can be made from nonyl chloride by refluxing with alcoholic sodium thiocyanate solution using conventional techniques.

nonyltrichlorosilane (trichlorononylsilane) $\text{C}_9\text{H}_{19}\text{SiCl}_3$. Properties: Water-white liquid with a pungent irritating odor. Fumes readily in moist air.

Hazard: Highly toxic; strong irritant to skin and mucous membranes.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

"Nopalcol."³⁰⁹ Trademark for a series of diethylene glycol and polyethylene glycol fatty esters.

Uses: General-purpose emulsifying agents for oils, solvents, essential oils, opacifying agents for cosmetics.

"Nop-cap."¹⁰⁹ Trademark for calcium pantothenate-containing products for the fortification of foods and feeds.

"Nopocell."³⁰⁹ Trademark for polyurethane foamed plastic for general uses.

"Nopcodraw" Compounds.³⁰⁹ Trademark for a group of die box lubricants. Powdered dry compounds for drawing and heading ferrous, alloy, stainless steel and refractory metals. Full range of formulations, based on soda, potash, aluminum, zinc, calcium, and barium soaps combined with inorganic and organic lubricants plus anti-wear agents.

"Nopcogen."³⁰⁹ Trademark for a series of fatty acid derivatives, including alkylolamides, polyamine con-

densates, alkylolamine condensates, and sulfonated amine condensates, used as softeners, detergents, wetting, or emulsifying agents.

"Nopcosant."³⁰⁹ Trademark for sodium salt of condensed naphthalene sulfonic acid.

Use: Dispersing agent for pigments.

"Nopcoset."³⁰⁹ Trademark for a series of polyvinyl acetate emulsions for use in the paper, textile, paint, leather and wood-working industries.

"Nopcosize."³⁰⁹ Trademark for polyacrylic sizes for nylon filament.

"Nopcosulf."³⁰⁹ Trademark for a series of sulfated oils, fatty acids and fatty esters.

Uses: Mineral oil emulsifiers, dyestuff dispersants, latex paint additives, cosmetic emulsifiers, textile wetting and re-wetting agents, paper wetting agents and softeners.

"Nopcote" C-104.³⁰⁹ Trademark for a fluid, stable, 50% calcium stearate dispersion for lubricating protein, starch or latex coating colors for friction control.

nopinene. See beta-pinene.

NOPON. See para-bis[2-(5-alpha-naphthylloxazoly)]-benzene.

"Norad."¹²¹ Trademark for a water-soluble adhesive used to prevent slippage of palletized multiwall bags. Shipped in 55-gal steel drums.

"Norane."⁴² Trademark for a group of water repellents used in the textile industry for a wide variety of fabrics. Include formulations of anionic wax emulsions, silicone resins, thermosetting resins, fluorophilic compounds, and fatty acid amide condensates.

"Norbide."²⁴⁹ Trademark for boron carbide (q.v.).

norbornide. Generic name for 5-(alpha-hydroxy-alpha-2-pyridylbenzyl)-1-(alpha-2-pyridylbenzylidene)-5-norbornene-2,3-dicarboximide.

Properties: White solid; m.p. 180–190°C. Insoluble in water; soluble in dilute acids.

Hazard: Highly toxic by ingestion.

Use: Rodenticide.

5-norbornene-2-methanol (2-hydroxymethyl-5-norbornene; "Cyclol") $\text{C}_7\text{H}_{10}\text{CH}_2\text{OH}$.

Properties: Stable, colorless liquid; sp. gr. 1.022–1.024 (25/25°C); refractive index 1.4985–1.4995 (25/D); a high-boiling solvent, b.p. 192–198°C; miscible with most common organic solvents; slightly soluble in hot water. Flash point 183°F (TOC). Combustible.

Containers: 55-gal drums.

Hazard: May be toxic.

Uses: Monomer for the modification of condensation and addition polymers for coatings.

5-norbornene-2-methyl acrylate.

Properties: Colorless liquid; b.p. 103–105°C; sp. gr. (25/25°C) 1.027–1.031; soluble in most organic solvents; inhibitor 0.02% MEHQ.

Use: A difunctional monomer particularly suited for in situ crosslinking of vinyl acetate emulsions polymer systems.

"Nordel."²⁴ Trademark for an elastomer based on an ethylene-propylene-hexadiene terpolymer; sulfur-curable.

Uses: Automotive and appliance components; wire insulation; electrical accessories, belts, hose, mechanical products.

nordhausen acid. Fuming sulfuric acid of sp. gr. 1.86–1.90.

Hazard: Corrosive to skin and tissue.

Shipping regulations: (Air) Corrosive label. Not acceptable on passenger planes.

See sulfuric acid, fuming.

nordihydroguaiaretic acid (NDGA)

$[C_6H_3(OH)_2CH_2CH(CH_3)]_2$ 4,4'-(2,3-Dimethyltetramethylene)dipyrocatechol.

Properties: Crystals from acetic acid, m.p. 184–185°C. Soluble in methanol, ethyl alcohol, ether; slightly soluble in hot water, chloroform; nearly insoluble in benzene, petroleum ether.

Grades: Technical; F.C.C.

Derivation: Extraction from guaiac; also synthetically.

Hazard: Use in foods prohibited by FDA.

Use: Antioxidant to retard rancidity of fats and oils.

norea. Generic name for 3-(hexahydro-4,7-methanoindan-5-yl)-1,1-dimethylurea,

$C_{10}H_{14}NHCON(CH_3)_2$.

Properties: White solid; m.p. 168–169°C. Very slightly soluble in water; soluble in polar solvents such as cyclohexanone, acetone, alcohol; less soluble in non-kerosene.

Hazard: May be toxic.

Use: Herbicide.

***dl*-norephedrine hydrochloride.** See phenylpropanolamine hydrochloride.

***l*-norepinephrine.** See levarterenol.

norgestrel. A synthetic steroid hormone used as ingredient of oral contraceptives. Approved by FDA. See "Ovral."

"Norit."¹⁰⁷ Trademark for activated adsorption carbons of vegetable origin.

Containers: 40-, 50-, 60-lb bags (powdered and pelletized); 100 to 150 lb drums (granular).

Uses: Purification and decolorization of chemical solutions; bleaching agent for glycerin, vegetable oils, and fats; dechlorination, taste and odor control in water treatment; catalyst and carrier for catalysts; recovery of volatile solvents; air purification; gas treatment and separation.

"Norlestrine."³³⁰ Trademark for an oral contraceptive.

norleucine (alpha-aminocaproic acid)

$CH_3(CH_2)_4CH(NH_2)COOH$. A nonessential amino acid found naturally in the L(+) form.

Properties: Leaflets, crystallized from water. DL-norleucine. Soluble in water; slightly soluble in alcohol; soluble in acids; decomposes 327°C. Available commercially.

L(+)-norleucine: Slightly sweet; sublimes 275–280°C; m.p. 301°C (dec).

D(–)-norleucine: Bitter; partially sublimes 275–280°C; m.p. 301°C (dec).

Derivation: Found in traces in proteins; also synthetically.

Uses: Biochemical research; medicine.

"Norlig."¹²¹ Trademark for a line of unmodified or partially modified lignosulfonates derived from spent sulfite liquor. Available in both powder and liquid

forms. Liquids are darker brown in color and more sticky as solids concentration increases.

Uses: Road binder; linoleum paste; foundry products; leather tanning; gypsum board; soil stabilization; feed pellets.

normal. (1) Of hydrocarbon molecules: containing a single unbranched chain of carbon atoms, usually indicated by the prefix *n*-, as *n*-butane, *n*-propane, etc.

(2) Of solutions: containing one equivalent weight (q.v.) of a dissolved substance per liter of solution; a standard measure of concentration, indicated by *N*, e.g., 2*N*, 0.5*N*, etc. (See also molar).

(3) Perpendicular or at right angles to, as for example, incident light rays normal to a surface.

normalize. To temper steels and other alloys by heating to a predetermined temperature and cooling at a controlled rate to relieve internal stresses and improve strength (analogous to annealing of glass).

"Normasal."³⁰⁴ Trademark for normal lead salicylate vinyl stabilizer.

"Norox."³¹⁰ Trademark for tert-butyl peroxy benzoate (q.v.).

norphytane. See pristane.

"Nortron." Trademark for an herbicide and weed-killing agent (made by Fisons, Ltd, U.K.). Active ingredient reported to be 2-ethoxy-2,3-dihydro-3,3-dimethyl-5-benzofuranil methane sulfonate.

"Norva."⁵¹ Trademark for nonsoap grease for specialized application as, for instance, where high temperature prevails. Has water resistance and good adhesiveness.

Norway saltpeter. See ammonium nitrate.

Norwegian saltpeter. See calcium nitrate.

n.o.s. Abbreviation for "not otherwise specified." Used in shipping regulations for classes of substances to which a restriction applies, individual members of which are not listed in the regulations.

noscapine (l-alpha-narcotine; narcosine). An isoquinoline alkaloid of opium. $C_{22}H_{23}NO_7$.

Properties: Fine white crystalline powder. M.p. 176°C; sublimes at 150–160°C. Insoluble in water; practically insoluble in vegetable oils; slightly soluble in hot solutions of potassium and sodium hydroxide; soluble in most organic solvents. Salts formed with acids are dextrorotatory and unstable in water.

Derivation: Prepared from the seed capsules of *Papaver somniferum*.

Grade: U.S.P.

Containers: Cans.

Hazard: Toxic and narcotic. Use legally restricted.

Use: Medicine (also as hydrochloride).

"Novadelox."²⁸² Trademark for a mixture of benzoyl peroxide and an inert filler used to bleach flour.

"Novege."²³³ Trademark for compositions containing 2,4,5-T (q.v.).

novobiocin $C_{31}H_{36}O_{11}$.

Properties: A light yellow to white antibiotic produced by *Streptomyces niveus*. Available as calcium and sodium salts.

Hazard: May have damaging side effects.

"Novocain."¹⁶² Trademark for a brand of procaine hydrochloride. Used as local anesthetic in dentistry and minor surgery.

ovolak (novolac). A thermoplastic phenol-formaldehyde type resin obtained primarily by the use of acid catalysts and excess phenol. Generally alcohol-soluble and require reaction with hexamethylenetetramine, paraformaldehyde, etc. for conversion to cured, cross-linked structures by heating to 200–400°F.

Uses: Molding materials; bonding materials; bonding agent in brake linings, abrasive grinding wheels; electrical insulation; clutch facings; air-drying varnishes; reinforcing agent and modifier for nitrile rubber.

Novoviol.¹⁸⁸ Trademark for a series of ionones.

noxious gas. Any natural or by-product gas or vapor that has specific toxic effects on humans or animals. (Military poison gases are not included in this group). Examples of noxious gases are ammonia, carbon monoxide, nitrogen oxides, hydrogen sulfide, sulfur dioxide, ozone, fluorine, and vapors evolved by benzene, carbon tetrachloride, and a number of chlorinated hydrocarbons. Gases which act as simple asphyxiants are not classified as noxious. See also air pollution.

Np Symbol for neptunium.

NP-10.²⁵⁶ Trademark for a polymeric plasticizer; used for vinyl formulations.

N-P-K mixtures. Fertilizers containing nitrogen, phosphorus and potassium. These are usually characterized by numbers such as 5-10-10, meaning 5% nitrogen, 10% phosphorus as P_2O_5 , and 10% potassium as K_2O . The percentages refer to the amount of N, P, or K present in available form rather than to the amount of the compounds.

NPN. Abbreviation for n-propyl nitrate.

NPO. See alpha-naphthylphenyloxazole.

NQR spectroscopy. The initials stand for nuclear quadrupole resonance, an analytical technique which requires no magnets, as does NMR. It utilizes instead the electric fields naturally present in the crystals under analysis. Chlorine has been studied extensively by this method. See also analytical chemistry; nuclear magnetic resonance.

NR. Abbreviation for natural rubber.

NRC. Abbreviation of Nuclear Regulatory Commission (q.v.).

500 NS.⁵⁴⁵ A high potency compound whose active ingredients are aryl disulfides. Used to reclaim natural and synthetic rubber.

NSAE Powder.³²⁸ Trademark for a sodium alkyl-naphthalenesulfonate; an agricultural dispersing agent for sulfur.

N-Sol.²⁰¹ Trademark for a series of patented processes used in water treatment. Dilute alkali silicate is partially neutralized with an acid reactant to develop an activated silica for use as a coagulant aid in clarifying raw and waste waters.

NSR. Abbreviation for nitrile silicone rubber.

NTA. Abbreviation for nitrilotriacetic acid (q.v.).

NTAN. Abbreviation for nitrilotriacetonitrile (q.v.).

Nuactant.³⁰⁰ Trademark for a fiber reactant to improve crush resistance and dimensional control in cellulosic fabrics.

Nuact.⁷⁴ Trademark for lead hydroxynaphthenate paste (see lead naphthenate).

Nuade.⁷⁴ Trademark for a rubber-based tackifying agent used as a mastication aid.

Nubrite.¹³⁴ Trademark for barrel nickel-plating additive.

Nucerite.⁵²² Trademark for a material of construction for high-temperature corrosive environments. A family of composites consisting of a crystalline glass ceramic bonded to steel, e.g., "Nucerite" 7000 ceramic. Used for nozzles, flange faces, reaction equipment, etc. See also "Glasteel"; glass ceramic.

Nuchar.²²⁸ Trademark for activated carbon of vegetable origin.

Grades: Industrial and water purification.

Containers: Up to hopper cars and trucks.

Uses: Taste and odor control of municipal and potable water.

nuclear chemistry. The division of chemistry dealing with changes in or transformations of the atomic nucleus (see nucleus) (1). It includes spontaneous and induced radioactivity, the fission or splitting of nuclei, and their fusion, or union; also the properties and behavior of the reaction products and their separation and analysis. The reactions involving nuclei are usually accompanied by large energy changes, millions of times greater than those of chemical reactions; they are carried out in nuclear reactors for military purposes and for electric power production; also (in research work) in cyclotrons. See also nuclear energy, fission, fusion (2).

nuclear energy. The energy liberated by (1) the splitting or fission (q.v.) of an atomic nucleus; (2) the union or fusion (q.v.) of two atomic nuclei; and (3) the radioactive decay of a nucleus (transmutation). The energy emitted in (1) is the equivalent of the slight difference in mass between the nucleus as a whole and its constituents (see mass defect). The transformation of mass to energy is stated by Einstein's equivalence equation $E = mc^2$. In the fission process the release of energy is of the order of nanoseconds; it may involve a vast number of nuclei (atomic bomb) or comparatively few (nuclear reactor), where the rate of release is under strict control. In the fusion process energy release is much greater than in fission; no means of controlling it has as yet been found, though research on this immensely useful possibility is continuing. In radioactive decay, the rate of release is extremely slow, extending in some cases for millions of years. See also radioactivity, radiation synthesis, ionizing radiation; fission; fusion (2).

Note: In 1975 nuclear power provided about 9% of the electricity generated in the U.S. and about 2.3% of the total energy consumption. After balancing the pros and cons of safety, environmental factors, costs, etc. it may be regarded as an acceptable risk in future energy production, always provided that the very highest standards of expertise and plant maintenance are observed.

nuclear fuel. Any material which is the source of energy in a nuclear reactor. At the present state of technology the term usually refers to uranium, thorium, or plutonium, either as natural materials, or enriched or synthesized isotopes. See also nuclear reaction; breeder; plutonium; fission.

nuclear fuel element. A rod, tube, plate, or other mechanical shape or form into which a nuclear fuel is fabricated for use in a reactor. The word "element" is used here in its electrical engineering rather than its chemical sense.

nuclear magnetic resonance (NMR). A type of radio-frequency spectroscopy, based on the magnetic field generated by the spinning of the electrically charged nucleus of certain atoms. This nuclear magnetic field is caused to interact with a very large (10,000–50,000 gauss) magnetic field of the instrument magnet. Each nuclear species of atom requires a different instrumental setting to obtain resonance of the magnetic field frequency of the instrument with that of the nucleus. The setting also varies with the electron distribution around each atom, so that it is possible for instance to distinguish between the three kinds of hydrogen atoms in ethyl alcohol. Frequently used nuclear species are the elements: hydrogen, deuterium, fluorine, boron, phosphorus, carbon-13, oxygen-17, nitrogen-15, and silicon-29.

The direct relation of NMR spectral band height to concentration of a chemical compound allows NMR to be used for quantitative analysis and the following of chemical rates of reaction and equilibria of chemicals in solution. The splitting of bands due to interactions between adjacent nuclei with spin in a compound is used to aid in establishing structural formulas. This technique is a useful method of determining whether hydrogen atoms in a molecule are part of a CH_3 — group, a $-\text{CH}_2$ — group, an $-\text{OH}$ group or other characteristic grouping. It also indicates the number of hydrogen atoms in each category. See also magnetochemistry; nucleus (note).

nuclear reaction. A reaction that involves a change in the nucleus of an atom, as opposed to a chemical reaction, in which only the electrons take part. Nuclear reactions usually result in release of tremendous amounts of energy; the energy obtained from chemical reactions is slight, e.g., rupture of a chemical bond evolves about 5 eV compared with 200 million eV resulting from the fission of an atomic nucleus. There are three types of nuclear reaction, namely, (1) transmutation (radioactive disintegration), (2) fission, and (3) fusion (thermonuclear). See these entries for details.

Nuclear Regulatory Commission. A Federal agency established in 1975 to regulate all commercial uses of atomic energy, including construction and operation of nuclear power plants, nuclear fuel reprocessing plants, and research applications of radioactive materials. It is also responsible for safety and environmental protection.

nucleation. The process by which crystals are formed from liquids, supersaturated solutions (gels), or saturated vapors (clouds). Crystals originate on a minute trace of a foreign substance acting as a nucleus. These are provided by impurities or by container walls in laboratory apparatus. Crystals form initially in tiny regions of the parent phase and then propagate into it by accretion. Rain and snow are formed in this way in moisture-laden air; the moisture condenses on minute particles of dust or ice. Cloud seeding with silver iodide or carbon dioxide is based on this principle. The former has a crystal structure similar to that of ice, and the latter causes rapid formation of ice nuclei by intense local lowering of temperature. See also crystal; whiskers.

There are various methods for growing crystals, including: (a) evaporation of a solution; (b) cooling of a saturated solution, or melt; (c) condensation of a vapor (plasmas are sometimes used to generate the vapor); (d) electrodeposition; (e) growth in gel media (in order to slow growth). Methods (b) through (e) are particularly suited for the growth of large crystals, which are widely used in modern technology.

nucleic acid. Any of several complex compounds occurring in living cells, usually chemically bound to proteins to form nucleoproteins. Nucleic acids are of high molecular weight and are easily changed by many mild chemical reagents. They contain carbon, hydrogen, oxygen, nitrogen (15–16%), and phosphorus (9–10%).

The fundamental units of nucleic acid are nucleotides (q.v.); nucleic acids are polynucleotides in which the nucleotides are linked by phosphate bridges. Upon extensive heating in the presence of water (hydrolysis), nucleic acids yield a mixture of purines and pyrimidines, D-ribose or D-deoxyribose, and phosphoric acid. Nucleic acids are subdivided into two types: ribonucleic acid (RNA), containing the sugar D-ribose; and deoxyribonucleic acid (DNA) containing the sugar D-deoxyribose. See deoxyribonucleic acid; ribonucleic acid; nucleoside; nucleotide; nucleoprotein.

Good sources of nucleic acids are salmon, thymus, yeast, and wheat kernel embryo.

Uses: Biochemical and medical research in genetics, virus diseases and cancer.

nucleon. General name applied to neutrons and protons, the essential constituents of atomic nuclei, and also used as a class name for fundamental particles of that mass. The study of subatomic particles is often called nucleonics.

nucleophile. An ion or molecule that donates a pair of electrons to an atomic nucleus to form a covalent bond; the nucleus that accepts the electrons is called an electrophile. This occurs, for example, in the formation of acids and bases according to the Lewis concept, as well as in covalent carbon bonding in organic compounds. See also Lewis base; donor.

nucleoprotein. A type of protein universally present in the nuclei and the surrounding cytoplasm of living cells. A nucleoprotein is composed of a protein, which is rich in basic amino acids, and a nucleic acid (q.v.). The nucleic acid portions can be isolated and used in medical and biochemical research. See also deoxyribonucleic acid; chromatin; virus.

nucleoside. A compound of importance in physiological and medical research, obtained during partial decomposition (hydrolysis) of nucleic acids (q.v.), and containing a purine or pyrimidine base linked to either D-ribose, forming ribosides, or D-deoxyribose, forming deoxyribosides. They are nucleotides minus the phosphorus group. For specific nucleosides see adenosine, cytidine, guanosine and uridine.

nucleotide. A fundamental unit of nucleic acids (q.v.); some are important coenzymes. The four nucleotides found in nucleic acids are phosphate mono-esters of nucleosides (q.v.): adenylic acid, guanylic acid, uridylic acid, and cytidylic acid. Great progress has been made in determining the nucleotide sequence in fundamental materials, such as yeast genes.

The term is also applied to compounds not found in nucleic acids and which contain substances other than the usual purines and pyrimidines. Such compounds are modified vitamins, and function as coen-

zymes; examples are riboflavin phosphate (flavin mononucleotide), flavin adenine nucleotide, nicotinamide adenine dinucleotide, nicotine adenine dinucleotide phosphate, and coenzyme A. The nucleotides inosine-5'-monophosphate and guanosine-5'-monophosphate are used as flavor potentiators.

nucleus. (1) The positively charged central mass of an atom; it contains essentially the total mass in the form of protons and neutrons. The nucleus of the hydrogen atom consists of one proton, while that of uranium is comprised of 92 protons and 146 neutrons. The atomic nuclei of certain unstable (radioactive) elements, such as uranium, can be split by bombardment with protons or neutrons from an external source, yielding 200 MeV of energy and an average of 2.5 free neutrons for every nucleus split; gamma radiation is also present.

(2) The central portion of a living cell, consisting primarily of nucleoplasm in which chromatin (q.v.) is dispersed. It is enclosed by a membrane that separates it from the surrounding cytoplasm. All the most important functions of the cell, including the mechanics of division (mitosis) and the programming of the genetic code, take place in the nucleus. (See also gene, chromosome).

(3) The characteristic structure of a group of chemical compounds, e.g., the benzene nucleus.

(4) Any small particle which can serve as the basis for crystal growth (see nucleation).

Note: The multiple meanings of "nucleus" and "resonance" can be a source of confusion, especially when these terms are closely associated, as in nuclear magnetic resonance and resonance of a molecular nucleus. In the first of these expressions, nucleus is used in sense (1) under nucleus, and resonance in sense (2) under resonance. In the second expression, nucleus is used in sense (3) under nucleus and resonance in sense (1) under resonance.

nuclide. A particular species of atom, characterized by the mass, the charge (number of protons), and the energy content of its nucleus. A radionuclide is a radioactive nuclide. Example: carbon 14 is a radionuclide of carbon. See also isotope.

"Nuclon."¹⁷⁷ Trademark for a polycarbonate thermoplastic resin.

Properties: High impact resistance not appreciably reduced by temperature fluctuations; good dimensional stability; good electrical resistance. Naturally transparent, of light straw color.

Uses: Engineering plastic for "hard service" parts and components.

"Nucon."⁴⁴⁶ Trademark for a magnesia-chrome refractory made by a high-fired direct bonding process.

Uses: Copper and lead furnace roofs; linings of rotary kilns used to burn lime, dolomite and magnesia; steel furnace sidewalls and roofs.

"Nuflon."²⁸⁵ Trademark for a high quality, extra fine kaolin treated with a surfactant by an intimate mixing process. A number of grades are obtained by applying various percentages of additive.

Uses: Conditioning prilled ammonium nitrate and other high analysis granular fertilizers.

"Nugreen."²⁸ Trademark for a urea fertilizer containing 45% nitrogen. Can be used as solid or spray.

nuisance particulate. Fine particles (dusts) that are relatively harmless in low concentrations. Among

them are clay, calcium carbonate, emery, glass fiber, silicon carbide, gypsum, starch, Portland cement, marble, and titanium dioxide. See also dust, industrial.

"Nu-Iron."⁹³ Trademark for an iron chelate. A fine yellow powder used as a spray, dust or soil application to correct iron deficiencies in agriculture and horticulture. It reduces the hazard of arsenical sprays.

"Nulocrystal."¹⁵⁷ Trademark for a partial invert sugar, proprietary pure-food noncrystallizing product, consisting of sucrose, levulose, and dextrose.

Uses: Confectionery; baking; beverages; syrups; pharmaceuticals; animal and vegetable adhesives; paper (as a plasticizer); and varied other products where glycerin can be used.

"Nulomoline."¹⁵⁷ Trademark for invert sugar; pure-food product consisting of levulose and dextrose.

Uses: See "Nulocrystal."

"Nu-Manese."⁹³ Trademark for manganous oxide. Available in a variety of grades for use in mixed fertilizers, foliar sprays or dusts, animal nutrition and certain industrial applications.

numerals. For their use and meaning in chemical names see Geneva System; benzene; chemical nomenclature.

"Numet."⁴³⁹ Trademark for depleted uranium.

Properties: Uranium metal wherein U-235 isotopic content has been reduced below 0.7% as found in normal uranium. Has high structural strength coupled with high density of 18.9 g/cc.

Derivation: Processed from uranium hexafluoride as tailing from gaseous diffusion plants.

Uses: Balance weights for aircraft, high speed rotors in gyro-compasses, gamma radiation shielding, radio-isotope transportation casks and fuel element transfer casks; in general as structural material applicable to radiation shielding.

"Nuocure 28."⁷⁴ Trademark for a curative containing 28% tin octoate for silicone resins, one-shot polyurethane foams, and rubber, offering a wide range of curing time.

"Nuodex 100 VT."⁷⁴ Trademark for quaternary ammonium naphthenate.

Use: Fungicide for vinyl formations.

"Nuogel" AO.⁷⁴ Trademark for aluminum octoate. Used in protective coatings and printing inks.

718 & 753. Aluminum soap. Used as gelling agent.

"Nuolates."⁷⁴ Trademark for driers based on metallic salts of tall oil acids.

"Nuophene."⁷⁴ Trademark for a technical grade of dihydroxydichlorodiphenylmethane.

Use: Industrial fungicide.

"Nuoplaz 1046."⁷⁴ Trademark for a non-phthalate ester used as plasticizer for stain-resistant vinyl compounds.

"Nuostabe."⁷⁴ Trademark for a series of vinyl stabilizers and fungicides. Many of them are metallic soaps or metal-organic complexes.

"Nupercainal."³⁰⁴ Trademark for dibucaine (q.v.).

nuplex. An acronym of nuclear-powered agroindustrial complex. The concept is based on use of nuclear re-

actors to provide heat for desalination of sea water and generation of electric power.

"Nu-Pon."⁴⁴⁸ Trademark for epoxy resin primers and enamels for household appliances, metal products, and corrosion-resistant applications.

"Nuroz."⁷⁹ Trademark for a polymerized wood rosin. Uses: Adhesives; gloss oils; paper label coatings; oleoresinous varnishes; solder flux; spirit varnishes; waxed paper and hot melt compounds; synthetic resins.

"Nusat."¹³⁴ Trademark for proprietary satin finish nickel-plating additive.

"Nuso."⁵¹ Trademark for highly aromatic oils used as resin plasticizers.

Nusselt number. A value used in heat transfer studies and calculations to compare heat losses by conduction from various shaped objects under various conditions. It combined into a single number the actual heat loss (Q), the temperature difference (ΔT) between the body and its surroundings, the size (d) and shape of the body and the thermal conductivity (k) of the fluid surrounding the object, in the equation $Nu = Qd/\Delta Tk$.

"Nuto."⁵¹ Trademark for lubricating oils of good color and high resistance to oxidation; recommended for circulating and hydraulic systems.

"Neutralac."²⁴⁴ Trademark for a hydrated compound consisting of sodium carbonate and sodium bicarbonate.

Uses: Dairy and food industry for neutralizing acidity in cream and related foods; dishwashing preparations; leather tanning; and textile processing.

nutrient. Any element or compound that is essential to the life and growth of plants or animals, either as such or as transformed by chemical or enzymatic reactions. In plants, nutrients include numerous mineral elements as well as nitrogen, carbon dioxide and water. In animals and man the primary nutrients are the proteins, carbohydrates and fats obtained from plants, either directly or indirectly, supplemented by vitamins and minerals. Water and oxygen are included in this definition. All told, there are 43 basic nutrients. See also food.

nutrient solution. A water solution of minerals and their salts necessary for plant growth which is used instead of soil, the plants being supported by mechanical means. Such solutions contain combined nitrogen, potassium, phosphorus, calcium, sulfur, and magnesium, together with traces of iron, boron, zinc, and copper. They are extensively used for commercial growing of flowers and vegetables particularly on islands, and also to some extent for house plants.

nutrification. Addition of nutrients to a food either to replace those lost in processing (restoration), to provide nutrients that are not normally present in the food (fortification), or to bring the food into conformity with a specific standard for that food.

nutrition. The effects of nutrients on living organisms and the biochemical mechanisms involved in bringing them about; also, that subdivision of biochemistry which deals specifically with these effects. In plant nutrition the essential requirements are carbon dioxide and water, from which the plant forms carbohydrates by photosynthesis (q.v.); nitrogen, which is essential for the synthesis of proteins by the plant,

with the aid of nitrogen-fixing bacteria; as well as phosphorus, calcium, potassium and a number of trace elements (micronutrients). Besides proteins and carbohydrates, plants also synthesize vitamins and various fats and oils. Thus they provide a basis for human nutrition, both directly (grain and other vegetables) and indirectly (meats and dairy products), though the conversion to protein values for human nutrition is only about 10% for meats.

Human diet requires proteins (milk, eggs, fish and some vegetables); carbohydrates (plants); fats (oils) from both plants and animals; minerals from milk and meats; salt (chloride); vitamins from green vegetables and citrus fruits; and water. Micronutrients are furnished by sea food, cereals, vegetables, and fruit.

Human digestive processes involve primarily the hydrolysis of complex carbohydrates to simple sugars, of proteins to a mixture of amino acids, and of fats to glycerol and higher fatty acids. Hydrolysis is catalyzed by various enzymes (q.v.) in the saliva and digestive tract. The end products of digestion are absorbed across a semipermeable membrane in the intestine and thus enter the blood stream, unusable products being eliminated. The efficiency of digestion plus absorption is about 92% for protein, 95% for fat and 98% for carbohydrates. See also metabolism; digestion (1); plant (1); nutrient; RDA.

nut shells. In a fine-ground state the shells of coconuts and other nuts are a source of decolorizing carbon; the pits of peaches and similar fruits have been used for gas-adsorbent carbon.

nux vomica. See strychnine.

"Nu-Z."⁹³ Trademark for a fine cream-white powder assaying 52% zinc. Used as a foliar application to correct zinc deficiencies in plants, and in animal nutrition.

NW acid. Abbreviation for Neville and Winther's acid. See 1-naphthol-4-sulfonic acid.

"Nydrasid."⁴¹² Trademark for isoniazid (q.v.).

"NyeBar."⁴⁸³ Trademark for a liquid applied around oiled areas to retard oil spreading. A solvent evaporates leaving a polymer film across which lubricants do not spread or creep.

"NyeFret."⁴⁸³ Trademark for a dolphin oil lubricant which reduces fretting corrosion for small springs and other instrument components. Viscosity 6 centistokes at 100°F.

"NyeSolve."⁴⁸³ Trademark for a nonflammable, low-toxicity solvent for cleaning oils and oil-held soils from fine instruments.

"Nylafil."⁵³⁹ Trademark for glass fiber-reinforced nylon.

nylidrin hydrochloride $\text{HOC}_6\text{H}_4\text{CH}(\text{OH})\text{CH}(\text{CH}_3)\cdot\text{NHCH}(\text{CH}_3)(\text{CH}_2)_2\text{C}_6\text{H}_5\cdot\text{HCl}$. para-Hydroxy-alpha-[1-(1-methyl-3-phenyl-propylamino)-ethyl] benzyl alcohol hydrochloride.

Properties: White, odorless, tasteless, crystals or powder; slightly soluble in water, alcohol; very slightly soluble in chloroform, ether; pH of 1% solution is between 4.5 and 6.5.

Grade: N.F.

Use: Medicine (treatment of heart disease).

nylon. Generic name for a family of polyamide polymers characterized by the presence of the amide group —CONH. By far the most important are nylon

66 (75% of U.S. consumption) and nylon 6 (25% of U.S. consumption). Except for slight difference in melting point, the properties of the two forms are almost identical, though their chemical derivations are quite different. Other types are nylons 4, 9, 11, and 12 (see Grades).

Properties: Crystalline, thermoplastic polymers. May be extruded as monofilament over a wide dimensional range. Filaments are oriented by cold-drawing. Tensile strength (high-tenacity) up to 8 grams per denier (about 100,000 psi). Sp. gr. 1.14. Melting point (66) 264°C; (6) 223°C. Low water absorption. Good electrical resistance, but accumulates static charges. Highly elastic, with rather high percentage of delayed recovery at low strain values; low permanent elongation. Moisture absorption 4% at 65% R. H. Wet strength about 90% of dry strength. Can be dyed with ionic and nonionic dyestuffs. Attacked by mineral acids, but resistant to alkalis and cold abrasion. Soluble in hot phenols, cresols and formic acids; insoluble in most organic solvents. Difficult to ignite; self-extinguishing; melts, forming beads. Resistant to attack by moths, carpet beetles, etc. Compatible with wool and cotton; increases wear and crease resistance in 30% blends with natural fibers. Nontoxic. Rods and blanks are machinable.

Forms: Monofilaments, yarns, bristles, molding powders, rods, bars, sheets. Microcrystalline nylon is now available.

Grades: Nylon 66 is a condensation product of adipic acid and hexamethylenediamine developed by Carothers (q.v.) in 1935. Adipic acid is obtained by catalytic oxidation of cyclohexane. Nylon 6 is a polymer of caprolactam (q.v.), originated by I. G. Farbenindustrie in 1940. Nylon 4 is based on butyrolactam (2-pyrrolidone); its tenacity, abrasion resistance, and melting point are said to be about the same as for the 6 and 66 grades. It has excellent dyeability. See "Tajmir."

Nylon 610 (trademarked "Tynex") is obtained by condensation of sebacic acid and hexamethylenediamine, and nylon 11 (trademarked "Rilsan") from castor bean oil (developed in France). Nylon 12 (also called "Rilsan" 12) is made from butadiene, also by a French process involving photolysis of cyclohexane by actinic light from mercury lamps. Its properties are similar to those of nylon 11. Nylon 9 can be made from 9-aminononanoic acid, present in soybean oil. It has properties specifically desired in metal coatings and electrical parts; higher electrical resistance than 6 and 66; absorbs less moisture; and has better distortion resistance.

Uses: Tire cord; hosiery; wearing apparel component; bristles for toothbrushes, hairbrushes, paint brushes

(nylon 610); cordage and towlines for gliders; fish nets and lines; tennis rackets; rugs and carpets; molded products; turf for athletic fields; parachutes; composites; sails; automotive upholstery; film; gears and bearings; wire insulation; surgical sutures; artificial blood vessels; metal coating; pen tips; osmotic membranes; fuel tanks for automobiles.

See also polyamide; aramid.

Note: Not all nylons are polyamide resins, nor are all polyamide resins nylons, e.g. "Versamide." One class of polyamide resins distinct from nylons is derived from ethylenediamine; they may be liquids or low-melting solids and have lower molecular weight than nylons. Another class, called aramids, is aromatic in nature.

"NyoGel."⁴⁸³ Trademark for a series of low shear thixotropic greases and semifluid instrument lubricants for use where nonspreading properties are critical.

"NyoSil."⁴⁸³ Trademark for a wide temperature silicone instrument oil halogenated for improved wear properties. Viscosity 55 centistokes at 100°F.

nystatin (fungicidin) C₄₆H₇₇NO₁₉. An antifungal agent. **Properties:** Yellow to light tan powder; odor suggestive of cereals; hygroscopic; affected by light, heat, air and moisture. Sparingly soluble in methanol, ethanol; very slightly soluble in water; insoluble in chloroform, ether and benzene. In solution is rapidly inactivated by acids and bases. Nontoxic.

Derivation: Produced by fermentatoin with *Streptomyces noursei* and *aureus*.

Grades: U.S.P.

Use: Medicine; feed additive.

"Nytal."⁶⁹ Trademark for talc or magnesium-calcium silicate.

Uses: Dusting uncured rubber; filler in specialized applications.

nytril. Generic name for a manufactured fiber containing at least 85% of a long-chain polymer of vinylidene dinitrile. —CH₂C(CH₃)₂—, where the vinylidene dinitrile content is no less than every other unit in the polymer chain (Federal Trade Commission).

Properties: Soft, resilient fabric is obtained; is easy to clean; does not pill; resists wrinkling, and retains shape after pressing.

Uses: Fur-like pile fabrics; sweaters; yarns; blended fabrics for coats and suits.

O Symbol for oxygen; the molecular formula is O_2 .

o-. Abbreviation for ortho- (q.v.).

O.C. Abbreviation for oxygen consumed (q.v.).

Occupational Safety and Health Administration (OSHA). A Federal agency responsible for establishing and enforcing standards for exposure of workers to harmful materials in industrial atmospheres, and other matters affecting the health and well-being of industrial personnel. Its present standards (1975) are based on the threshold limit values (TLV) recommended by the American Conference of Governmental Industrial Hygienists for 1968, which were adopted by OSHA in 1972. New and stricter limitations on a number of toxic substances including asbestos, lead, and toluene, have been proposed. See also threshold limit value.

ocean water (sea water). A uniform solution of essentially constant composition containing 96.5% water and 3.5% ionized salts, associated compounds, elements and ionic complexes. Na^+ and Cl^- are completely ionized, but $MgSO_4$ and $AuCl$ remain in bound form. Dissolved gases, e.g., oxygen and nitrogen, are also present.

Composition: Over 60 elements, by far the most important of which are (in tons per cubic mile): chlorine 89,500,000; sodium 49,500,000; magnesium 6,400,000; sulfur 4,200,000; calcium 1,900,000; potassium 1,800,000; bromine 306,000; carbon 132,000. Other elements present include (tons per cubic mile): copper 14; zinc 47; silver 1; lead 0.1; gold 0.02. Total solids content per cubic mile is about 166 million tons.

Properties: Colorless liquid; sp. gr. 1.03; pH 7.8–8.2; f.p. 27°F; b.p. 214°F; average temperature about 5°C; bitter taste; faint odor (depending on organic impurities).

Hazard: Ingestion of substantial amounts will create bodily chloride imbalance with harmful effects.

Uses: Source of magnesium, bromine, sodium chloride, and fresh water; possible energy source.

Note: Dr. Donald F. Othmer has stated: "It has been estimated that the heat in the warm water of the Gulf Stream could generate over 75 times the entire power production of the U.S. Thus the trillions of BTU's in a cubic mile of warm seawater which may be passed to colder seawater may develop mechanical energy during the process to make electric power. The total amount of water to be handled may be less than that required to produce the same amount of power in a hydroelectric plant..." Feasibility studies of this possibility are in process.

"Ocenol."²⁸ Trademark for technical grades of oleyl alcohol rich in cetyl and unsaturated alcohols.

ocher. Any of various colored earthy powders consisting essentially of hydrated ferric oxides mixed with clay, sand, etc. Some grades are calcined (burnt ocher). The colors are yellow, brown, or red. Non-combustible, nontoxic.

Uses: Paint pigments; cosmetics; theatrical make-up. See also umber; sienna.

ocimene (2,6-dimethyl-1,5,7-octatriene)
 $CH_2:C(CH_3)(CH_2)_2CH:C(CH_3)CH:CH_2$. A terpene obtained from sweet basil oil; b.p. 81°C (30 mm); sp. gr. 0.8031 (15°C). Used in flavors and perfumes. Combustible.

ocotea oil. A volatile oil derived from *Ocotea cymbarum*, and used for its safrole content for the manufacture of heliotropin.

Containers: Drums.

"OCPN."²³³ Trademark for 2-chloro-4-nitroaniline (q.v.).

octadecadienoic acid. See linoleic acid.

n-octadecane $C_{18}H_{38}$ or $CH_3(CH_2)_{16}CH_3$.
Properties: Colorless liquid; sp. gr. 0.7767 (28/4°C); b.p. 318°C; m.p. 28.0°C; refractive index 1.4369 (n 28/D). Soluble in alcohol, acetone, ether, petroleum, coal-tar hydrocarbons; insoluble in water. Combustible; low toxicity.

Uses: Solvents; organic synthesis; calibration.

1,12-octadecanediol. See 1,12-hydroxystearyl alcohol.

n-octadecanoic acid. See stearic acid.

1-octadecanol. See stearyl alcohol.

n-octadecanoyl chloride. See stearyl chloride.

octadecatrienol. See linolenyl alcohol.

9-octadecen-1,12-diol. See ricinoleyl alcohol.

1-octadecene $C_{18}H_{36}$ or $CH_3(CH_2)_{15}CH:CH_2$.
Properties: Colorless liquid; sp. gr. 0.7884 (20/4°C); refractive index (n 20/D) 1.4456; b.p. 180°C (15 mm); soluble in alcohol, acetone, ether, petroleum and coal-tar solvents; insoluble in water. Combustible.

Grade: 95% min. purity.

Containers: Glass bottles.

Uses: Organic synthesis; surfactants.

octadecene-octadecadieneamine. See oleyl-linoleylamine.

cis-9-octadecenoic acid. See oleic acid.

trans-9-octadecenoic acid. See elaidic acid.

octadecenol. See oleyl alcohol.

cis-9-octadecenoyl chloride. See oleoyl chloride.

octadecenyl aldehyde (oleyl aldehyde) $C_{17}H_{35}CHO$.
Properties: Liquid. B.p. 167°C (20 mm); refractive index 1.4620 (25°C); sp. gr. 0.847 (25°C).

Hazard: Flammable, moderate fire risk. Irritant to skin and mucous membranes.

Uses: Intermediate for vulcanization accelerators, rubber antioxidants, synthetic drying oils and pesticides.

octadecyl alcohol. See stearyl alcohol.

octadecyldimethylbenzylammonium chloride
 $C_{18}H_{37}(CH_3)_2(C_6H_5CH_2)NCl$. White, crystalline pow-

der. Soluble in water, chloroform, benzene, acetone, xylene. A quaternary ammonium salt.

octadecyl isocyanate. A straight-chain, saturated mono-isocyanate consisting principally of a mixture of C_{18} and C_{16} alkyls, $CH_3(CH_2)_{16}CH_2NCO$ and $CH_3(CH_2)_{14}CH_2NCO$.

Properties: Colorless, slightly cloudy liquid at ordinary temperatures; f.p. 10–20°C; b.p. 170°C (2 mm); flash point (open cup) 355°F. Combustible.

Containers: 55-gal steel drums.

Hazard: Moderately toxic by inhalation; irritant to skin.

Uses: Intermediate in synthesis; water-repellent textiles, paper, and other surfaces.

octadecyl mercaptan. See stearyl mercaptan; thiol.

octadecyltrichlorosilane (trichlorooctadecylsilane)

$C_{18}H_{37}SiCl_3$.

Properties: Water-white liquid; pungent odor; sp. gr. 0.984 (25°C); refractive index 1.4580 (25°C); b.p. 380°C. Flash point 193°F. Combustible. Soluble in benzene, ethyl ether, heptane, and perchloroethylene. Hazard: Highly toxic; strong irritant to skin and mucous membranes.

Use: Intermediate for silicones.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

octafluoro-2-butene (perfluoro-2-butene)

$CF_3CF=CF_2CF_3$.

Properties: Colorless nonflammable gas or liquid; density of liquid (at b.p.) 1.5297 g/cc; b.p. 1.2°C; f.p. -136 to -134°C; specific volume 2.7 cu ft/lb (70°F, 1 atm). Nontoxic.

Grade: 95%.

Uses: Organic intermediate; fluorocarbon polymers.

octafluoropropane (perfluoropropane) C_3F_8 .

Properties: Colorless, nonflammable gas; sp. gr. 1.29; b.p. -36.7°C; f.p. approx. -160°C; specific volume 2.02 cu ft/lb (70°F, 1 atm). Nontoxic.

Grade: 98% min purity.

Derivation: Electrofluorination of various organic compounds.

Uses: Refrigerant (when combined with chlorofluorohydrocarbons); gaseous insulator, especially for radar wave guides.

octakis(2-hydroxypropyl)sucrose.

Properties: Viscous straw-colored liquid; sp. gr. 1.170 (70/20°C); refractive index 1.485 (25°C); pour point 38°C; flash point 485°F; soluble in water, methanol and ether. Combustible.

Uses: Crosslinking agent for urethane foams; plasticizer for celluloses, glue, starch and many resins.

octamethyl pyrophosphoramidate. See schradan.

"Octamine."²⁴⁸ Trademark for a reaction product of diphenylamine and diisobutylene.

Properties: Light brown granular waxy solid; sp. gr. 0.99; m.p. 75–85°C; good storage stability. Soluble in gasoline, benzol, ethylene dichloride and acetone. Insoluble in water.

Use: Rubber antioxidant.

octanal (n-octyl aldehyde; aldehyde C-8; caprylic aldehyde) $CH_3(CH_2)_6CHO$.

Properties: Colorless liquid with strong fruity odor; sp. gr. 0.820–0.830; refractive index 1.418–1.425; b.p. 163°C. Soluble in 70% alcohol and mineral oil; in-

soluble in glycerol. Low toxicity. Flash point 125°F (c.c.). Combustible.

Grades: Technical; F.C.C.

Hazard: Moderate fire risk.

Uses: Perfumery; flavors.

n-octane C_8H_{18} or $CH_3(CH_2)_6CH_3$.

Properties: Colorless liquid; sp. gr. 0.7026 (20/4°C); refractive index (n_D 20/D) 1.39745; b.p. 125.667°C; f.p. -56.798°C; flash point 56°F; autoignition temp. 428°F. Soluble in alcohol, acetone; insoluble in water.

Grades: 95%; 99% research.

Containers: Bottles; 5-gal drums; tank cars.

Hazard: Flammable, dangerous fire risk. Tolerance, 400 ppm in air.

Uses: Solvent; organic synthesis; calibrations; azeotropic distillations.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

1,8-octanedicarboxylic acid. See sebacic acid.

octanedioic acid. See suberic acid.

octane number. A number indicating the antiknock properties of an automotive fuel mixture under standard test conditions. Pure normal heptane (a very high-knocking fuel) is arbitrarily assigned an octane number of zero, while isooctane (a branched-chain paraffin) is assigned 100. Thus a rating of 80 for a given fuel indicates that its degree of knocking in a standard test engine is that of a mixture of 80 parts isooctane and 20 parts n-heptane.

Octane ratings as high as 115 have been obtained by addition of tetraethyllead to isooctane. Premium leaded gasolines have a Research octane rating of about 100, but this value drops to from 85 to 90 for unleaded gasolines. The octane rating scale ends at 125, and any higher figure is meaningless.

Research octane numbers are those obtained under test or "laboratory" conditions; they generally run about ten points higher than the so-called Motor octane numbers, which represent actual road operating conditions. Thus the 90 Research o.n. gasoline (unleaded), necessitated by air pollution requirements, has a Motor o.n. of about 80. See also under gasoline.

octanoic acid (octylic acid; octoic acid; caprylic acid). $CH_3(CH_2)_6COOH$.

Properties: Colorless oily liquid; slight odor; rancid taste; sp. gr. 0.9105 (20/4°C); m.p. 16°C; b.p. 237.9°C, 147.9°C (30 mm); refractive index 1.4278 (20°C). Flash point 270°F. Slightly soluble in water; soluble in alcohol and ether. Combustible; low toxicity.

Derivation: By saponification and subsequent distillation of coconut oil.

Method of purification: Crystallization or rectification.

Grades: Technical; 99%; F.C.C.

Containers: Drums; tanks; carload lots.

Uses: Synthesis of various dyes, drugs, perfumes, flavors; antiseptics and fungicides; ore separations.

octanol. See octyl alcohol.

2-octanone. See methyl hexyl ketone.

octanoyl chloride (capryloyl chloride; sometimes called caprylyl chloride) $CH_3(CH_2)_6COCl$.

Properties: Water-white to straw-colored liquid with pungent odor. Miscible with most common solvents;

reacts with alcohol and water. Freezing point below -70°C ; distillation range $183\text{--}212^{\circ}\text{C}$; sp. gr. 0.9576 ($15.5/15.5^{\circ}\text{C}$); refractive index 1.4357 (n_{D}^{20}); flash point 180°F ; combustible.
Containers: 5-, 13-gal carboys.
Hazard: Irritant to eyes and skin.
Use: Synthesis.

"Octasols."¹³⁴ Trademark for metal salts of 2-ethylhexoic acid, in liquid form. Soluble in most hydrocarbons, vegetable oils, paint vehicles, etc. Used as paint driers, wetting agents, catalysts, etc.

1-octene (1-octylene; 1-caprylene) C_8H_{16} or $\text{CH}_3(\text{CH}_2)_6\text{CH}=\text{CH}_2$.

Properties: Colorless liquid; sp. gr. 0.7160 ($20/4^{\circ}\text{C}$); b.p. 121.27°C ; f.p. -102.4°C ; refractive index (n_{D}^{20}) 1.4088; flash point 70°F (TOC); soluble in alcohol, acetone, ether, petroleum and coal-tar solvents; insoluble in water.

Grades: 95%, 99%, research.

Containers: Glass bottles; drums.

Hazard: Flammable, dangerous fire risk.

Uses: Organic synthesis; plasticizer; surfactants.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

2-octene C_8H_{16} or $\text{CH}_3(\text{CH}_2)_4\text{CH}=\text{CHCH}_3$. Cis and trans forms exist.

Properties: Colorless liquid; sp. gr. cis 0.7243, trans 0.7199, commercial 0.7185–0.7200 ($20/4^{\circ}\text{C}$); b.p. cis 125.6°C , trans 125.0°C , commercial $124.5\text{--}127^{\circ}\text{C}$; f.p. -94.04°C ; refractive index cis 1.4150, trans 1.4132, commercial 1.4120–1.4145 (n_{D}^{20}); flash point (mixed isomers) 70°F (TOC); soluble in alcohol, acetone, ether, petroleum and coal-tar solvents; insoluble in water.

Containers: Glass bottles; drums.

Grades: 95; 99 mole %.

Hazard: Flammable, dangerous fire risk.

Uses: Organic synthesis; lubricants.

Shipping regulations: Same as 1-octene.

"Octin."⁹ Trademark for isomethptene (q.v.).

octoic acid. An eight-carbon acid; usually designates caprylic acid.

octyl. The general name describing all eight-carbon radicals having the formula C_8H_{17} ; often used interchangeably for the 2-ethylhexyl isomer (q.v.).

n-octyl acetate (acetate C-8; caprylyl acetate) $\text{CH}_3\text{COO}(\text{CH}_2)_6\text{CH}_3$.

Properties: Colorless liquid; floral-fruity odor. Slightly soluble in water; soluble in alcohol and most other organic liquids. Sp. gr. 0.865–0.869; flash point 180°F (O.C.); refractive index 1.419–1.422; b.p. 199°C . Combustible; low toxicity.

Containers: Glass bottles.

Uses: Perfumery; flavors.

n-octyl alcohol, primary (1-n-octanol; alcohol C-8; heptyl carbinol) $\text{CH}_3(\text{CH}_2)_6\text{CH}_2\text{OH}$. In industrial practice, the term octyl alcohol has been used for both 1-octanol and 2-ethylhexanol. The latter is also sometimes called isoctanol. The term capryl alcohol has been used for both 1-octanol and 2-octanol. It therefore seems preferable to designate the normal primary alcohol as 1-n-octanol.

Properties: Colorless liquid with penetrating, aromatic odor; sp. gr. 0.826 (20°C); b.p. $194\text{--}195^{\circ}\text{C}$, 108.7°C (30 mm); refractive index 1.430 (20°C); f.p. -16°C . Flash point 178°F ; combustible. Low toxicity. Miscible with alcohol, chloroform, mineral oil; immiscible with water and glycerol.

Derivation: By reduction of caprylic acid.

Grades: Technical; C. P.; pure; perfume; F.C.C.

Containers: Drums; tank cars.

Uses: Perfumery; cosmetics; organic synthesis; solvent; manufacture of high-boiling esters; antifoaming agent; flavoring agent.

sec.-n-octyl alcohol (2-n-octanol; methyl hexyl carbinol) $\text{CH}_3(\text{CH}_2)_5\text{CHOHCH}_3$. Frequently called capryl alcohol (q.v.).

Properties: Colorless, oily liquid; refractive; aromatic odor. Miscible with alcohol, ether; slightly soluble in water. Sp. gr. 0.825 (15°C); b.p. $178\text{--}179^{\circ}\text{C}$; f.p. -38°C ; refractive index 1.437 (20°C). Flash point 190°F . Combustible; low toxicity.

Derivation: By distilling sodium ricinoleate with an excess of sodium hydroxide.

Grades: Technical 92–99%; pure.

Containers: Bottles; drums; tank cars.

Uses: Solvent; manufacture of plasticizers, wetting agents, foam control agents, hydraulic oils, petroleum additives, perfume intermediates; masking of industrial odors.

octyl aldehyde. See octanal and 2-ethylhexaldehyde.

n-octalamine. $\text{CH}_3(\text{CH}_2)_7\text{NH}_2$.

Properties: Water-white liquid; amine odor; boiling range $170\text{--}179^{\circ}\text{C}$; sp. gr. 0.779 ($20/20^{\circ}\text{C}$); refractive index 1.431 (20°C); flash point 140°F . Low toxicity. Combustible.

tert-octylamine $(\text{CH}_3)_3\text{CCH}_2\text{C}(\text{CH}_3)_2\text{NH}_2$.

Properties: Colorless liquid; amine odor; b.p. $137\text{--}143^{\circ}\text{C}$; sp. gr. 0.771 (25°C); refractive index 1.423 (25°C); flash point 92°F (o.c.); insoluble in water; soluble in common organic solvents, especially petroleum hydrocarbons.

Containers: Drums; tank cars.

Hazard: Flammable, moderate fire risk. Skin irritant.

Uses: Intermediate for rubber accelerators, insecticides, fungicides, dyestuffs; pharmaceuticals.

N-octylbicycloheptene dicarboximide (N-(2-ethylhexyl)-bicyclo(2,2,1)-5-heptene-2,3-dicarboximide) $\text{C}_8\text{H}_{17}\text{NC}_9\text{H}_8\text{O}_2$.

Properties: Liquid; b.p. 158°C (2 mm); sp. gr. 1.05 (18°C); refractive index 1.505 (n_{D}^{20}). Miscible with most organic solvents and oils. Combustible.

Derivation: From maleic anhydride, cyclopentadiene and 2-ethylhexylamine.

Use: Insecticide and pesticide synergist.

n-octyl bromide (capryl bromide; caprylic bromide) $\text{CH}_3(\text{CH}_2)_6\text{CH}_2\text{Br}$.

Properties: Colorless liquid. Miscible with alcohol, ether; immiscible with water. Sp. gr. 1.118 (15°C); b.p. 202°C ; f.p. -55°C ; refractive index 1.4503 (25°C). Low toxicity.

Grades: Technical.

Use: Synthesis of quaternary ammonium compounds, organometallics, vinyl stabilizers.

octyl carbinol. See nonyl alcohol.

n-octyl chloride $\text{CH}_3(\text{CH}_2)_6\text{CH}_2\text{Cl}$.

Properties: Colorless liquid; soluble in most organic solvents. Sp. gr. 0.8697 ($25/15.5^{\circ}\text{C}$); refractive index (n_{D}^{25}) 1.4288; f.p. -62°C ; b.p. 181.6°C ; flash point 158°F . Combustible.

Containers: 55-gal steel drums; tank cars.

Uses: Chemical intermediate; manufacture of organometallics.

n-octyl n-decyl adipate (NODA).

Properties: Liquid, mild odor; sp. gr. 0.92–0.98 (20/20°C); f.p. –50°C; boiling range 220–254°C (4 mm); refractive index 1.447. Combustible.

Containers: 5-gal cans; 55-gal drums; tank cars.

Use: Low-temperature plasticizer.

n-octyl n-decyl alcohol. A blend of alcohols. Combustible. Available in tank cars and trucks. Used as intermediate for plasticizers.**n-octyl n-decyl phthalate.**

Properties: Clear liquid; mild characteristic odor. Sp. gr. 0.972–0.976 (20/20°C); f.p. –40°C; boiling range 232–267°C (4 mm); refractive index 1.482 (25°C). Flash point 455°F. Combustible.

Containers: 55-gal drums; tank cars and trucks.

Uses: Plasticizer for vinyl resins.

octylene. See octene.**octylene glycol titanate.**

Properties: Light-yellow solid.

Derivation: Reaction of butyl titanate with octylene glycol.

Uses: Cross-linking agent; surface-active agent.

See also titanium chelate.

oxylene oxide Mixed $\text{CH}_3(\text{CH}_2)_5\text{CHCH}_2\text{O}$ and

$\text{CH}_3(\text{CH}_2)_4\text{CHCH}(\text{CH}_3)\text{O}$. Sp. gr. of liq. 0.830 (25°C). Combustible.

Uses: Organic intermediate; epoxy resins.

octyl formate $\text{C}_8\text{H}_{17}\text{OOCH}$.

Properties: Colorless liquid; fruity odor. Soluble in mineral oil; practically insoluble in glycerin. One ml dissolves in 5 ml of 70% alcohol; sp. gr. 0.869–0.872 (25°C); refractive index 1.4180–1.4200 (20°C). Combustible.

Grade: F.C.C.

Use: Flavoring agent.

octylic acid. See caprylic acid.**2-octyl iodide** (caprylic iodide; secondary normal capryl iodide) $\text{CH}_3(\text{CH}_2)_5\text{CHICH}_3$.

Properties: Oily liquid. Sp. gr. 1.318 (18°C); b.p. (approx) 210°C (dec).

Hazard: Moderately toxic by ingestion and inhalation. Keep away from light and air.

Use: Organic synthesis.

octylmagnesium chloride $\text{C}_8\text{H}_{17}\text{MgCl}$. A Grignard reagent available in tetrahydrofuran solution.

Containers: Up to 55-gal drums.

n-octyl mercaptan $\text{C}_8\text{H}_{17}\text{SH}$.

Properties: Water-white liquid with mild odor; b.p. 199°C; sp. gr. 0.8395 (25/4°C); refractive index 1.4497 (25°C); flash point 115°F (o.c.). Combustible.

Hazard: Moderate fire risk. Probably toxic.

Uses: Polymerization conditioner; synthesis.

tert-octyl mercaptan $\text{C}_8\text{H}_{17}\text{SH}$.

Properties: Colorless liquid. Boiling range 154–166°C; sp. gr. 0.848 (60/60°F); refractive index 1.454 (n_D 20/D); flash point 105°F. Combustible.

Grade: 95%.

Containers: Drums; tank cars.

Hazard: Moderate fire risk. Probably toxic.

Uses: Polymer modification; lubricant additive.

n-octyl methacrylate $\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{COOC}_8\text{H}_{17}$.

Properties: Water-insoluble colorless liquid; polymerizes to a resin if unstabilized.

octyl peroxide (caprylyl peroxide).

Properties: Straw-colored liquid with sharp odor. Immiscible with water.

Hazard: Dangerous fire risk. Strong oxidizing agent.

Shipping regulations: (Solution) (Rail) Yellow label.

(Air) Organic Peroxide label. Legal label name: caprylyl peroxide.

octyl phenol (diisobutyl phenol) $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4\text{OH}$. Probably a mixture of isomers.

Properties: White flakes; congeals 72–74°C; sp. gr. 0.89 (90°C); b.p. 280–302°C; hydroxyl coefficient 259–275. Insoluble in hot and cold water. Limited solubility in alkalis. Soluble in 1:1 mixture of methanol and 50% aqueous potassium hydroxide, also in alcohol, acetone, fixed oils. Available commercially as a liquid. Combustible.

Derivation: (p-tert-isomer): Catalytic alkylation of phenol with olefins.

Containers: Bags; drums; carloads; tank cars.

Use: Nonionic surfactants; plasticizers; antioxidants; fuel oil stabilizer; intermediate for resins, fungicides, bactericides, dyestuffs, adhesives, rubber chemicals.

para-tert-octylphenoxy polyethoxyethanol

$(\text{CH}_3)_2\text{CCH}_2\text{C}(\text{CH}_3)_2\text{C}_6\text{H}_4\text{O}(\text{CH}_2\text{CH}_2\text{O})_x\text{H}$. Anhydrous liquid mixture of mono-para-(1,1,3,3-tetramethylbutyl)phenyl esters of polyethylene glycols in which x varies from 5 to 15.

Properties: Yellow, viscous liquid; faint odor; bitter taste, sp. gr. 1.060; refractive index 1.489 (25°C); soluble in water, alcohol, acetone, benzene, toluene; insoluble in hexane; pH is between 7 and 9. Combustible.

Grade: N.F.

Uses: Food packaging, probably as a plasticizer for films.

para-octylphenyl salicylate $\text{C}_8\text{H}_{17}\text{OHCOOC}_6\text{H}_4\text{C}_8\text{H}_{17}$.

Properties: White solid; m.p. 72–74°C; density 5.6 lb/gal (20°C). Soluble in hexane, benzene, acetone and ethanol. Insoluble in water.

Use: Prevents photooxidation in polyethylene and polypropylene.

octyl phosphate. See triioctyl phosphate.**n-octyl sulfoxide isosafrole.** See sulfoxide.**octyl trichlorosilane** (trichlorooctylsilane) $\text{C}_8\text{H}_{17}\text{SiCl}_3$.

Properties: Water-white liquid with pungent irritating odor. Fumes readily in moist air to evolve corrosive vapors.

Hazard: Highly toxic by ingestion and inhalation; strong irritant to skin and mucous membranes. Moderate fire risk in contact with oxidizing materials.

Use: Intermediate silicones.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not accepted on passenger planes.

“Odamask.”TM Trademark for deodorizing and reodorizing aromatics for industrial use.

ODPN. Abbreviation for beta, beta'-oxydipropionitrile.

odor. An important property of many substances, manifested by a physiological sensation due to certain

tact of their molecules with the olfactory nervous system. Odor and flavor are closely related, and both are profoundly affected by submicrogram amounts of volatile compounds. Attempts to correlate odor with chemical structure have produced no definitive results. Objective measurement techniques involving chromatography are under development. Even potent odors must be present in a concentration of 1.7×10^7 molecules per cc to be detected. It has been authentically stated that the nose is 100 times as sensitive in detection of threshold odor values as the best analytical apparatus.

Many compounds have a characteristic odor that is an effective means of identification. Toxic and noxious gases have distinctive odors often utilized for warning purposes. An important exception is carbon monoxide, which is almost odorless. The penetrating, banana-like odor of amyl acetate has been used in mine rescue work. Among the most powerful unpleasant odors are those of organic sulfur compounds, especially ethyl mercaptan (skunk). Organic substances having a pleasant odor are broadly designated as aromatic, regardless of chemical nature. The cyclic aromatic (benzene) series of hydrocarbons was so named for this reason. Most essential oils have a pleasant odor and are the basis of perfumes and fragrances. Odor research, including evaluation by test panels, is conducted at the Olfactronics and Odor Sciences Center at Illinois Institute of Technology, Chicago.

odorant. A substance having a distinctive, sometimes unpleasant, odor which is deliberately added to essential oils or odorless materials to provide warning of their presence. For example, mercaptan derivatives may be added to natural gas for this purpose. In a broad sense, perfumes are odorants which are added to cosmetics, toilet goods, etc. largely for consumer appeal. See also odor; deodorant; perfume; fragrance.

"Oenethyl."⁹ Trademark for 2-methyl-aminoheptane; employed as hydrochloride salt.

oenology. The study of wines.

"OFHC."⁴³ Trademark for high-conductivity oxygen-free copper in cast or wrought form.

oil. The word "oil" has little specific meaning, as it is applied to a wide range of substances that are quite different in chemical nature. Oils derived from animals or from plant seeds or nuts are chemically identical with fats, the only difference being one of consistency at room temperature. They are composed largely of glycerides of the fatty acids, chiefly oleic, palmitic, stearic and linolenic. As a rule the more hydrogen the molecule contains, the thicker the oil becomes. Petroleum (rock oil) is quite different from animal and vegetable oils, being composed of hydrocarbon mixtures comprising hundreds of chemical compounds. It is thought to be derived from the remains of tiny sea animals laid down in past geologic ages. Following is a classification of oils by type and function.

I. Mineral

1. Petroleum

- (a) Aliphatic or wax-base (Pennsylvania)
- (b) Aromatic or asphalt-base (California)
- (c) Mixed-base (Midcontinent)

2. Petroleum-derived

- (a) Lubricants: engine oil, machine oil, cutting oil
- (b) Medicinal: refined paraffin oil

II. Vegetable (chiefly from seeds or nuts)

1. Drying (linseed, tung, oiticica)
2. Semidrying (soybean, cottonseed)
3. Nondrying (castor, coconut)
4. Inedible soap stocks (palm, coconut)

III. Animal

These usually occur as *fats* (tallow, lard, stearic acid). The liquid types include fish oils, fish-liver oils, oleic acid, sperm oil, etc. They usually have a high fatty acid content.

IV. Essential

Complex volatile liquids derived from flowers, stems and leaves, and often the entire plant. They contain terpenes (pinene, dipentene, etc.) and are used chiefly for perfumery and flavorings. Usually resinous products are admixed with them. Turpentine is a highly resinous essential oil.

V. Edible

Derived from fruits or seeds of plants and used chiefly in foodstuffs (margarine, etc.). Most common are corn, coconut, soybean, olive, cottonseed.

oil black. A carbon black made from oil, usually an aromatic-type petroleum oil. See furnace black.

"Oil Blue A."²⁸ Trademark for hydrocarbon-soluble dye for imparting distinctive color to gasoline and other petroleum products. Essentially 1,4-di(isopropylamino)anthraquinone. Available in liquid and flake form.

oil bois de rose (rosewood oil). An essential oil derived from linaloe wood; formerly an important perfume component, but has been largely replaced by synthetics in recent years. Its main constituent is linalool (q.v.).

"Oil Bronze."²⁸ Trademark for blend of Oil Red and Oil Orange, petroleum dyes used to color gasoline, etc.

oil cake. The residue obtained after the expression of vegetable oils from oil-bearing seeds, used as cattle feed and fertilizer. When ground they are known as meal. See also cottonseed cake and meal; peanut oil meal, etc.

oil, chloronaphthalene.

Properties: Almost colorless, thin, mobile liquid. Sp. gr. 1.20-1.25 (68°F); liquid down to -25°F; congealing point -30°F; flash point (approx) 350°F; volatile at 212°F; b.p. 480-550°F. Combustible. Soluble in practically all organic solvent liquids and oils.

Derivation: By chlorinating naphthalene.

Containers: 55-gal steel drums; tank cars.

Hazard: Toxic by inhalation; strong skin irritant.

Uses: Plasticizer; carbon softener and remover; heat-transfer medium; solvent for rubber, aniline and other dyes, mineral and vegetable oils, varnish gums and resins, waxes.

"Oildag."⁴⁶ Trademark for a dispersion of colloidal graphite in petroleum oil for general industrial and automotive lubricants.

"Oilfos."⁵⁸ Trademark for glassy sodium phosphate, a dry powder used exclusively for controlling viscosity of oil-well drilling muds.

oil gas. A gas made by the reaction of steam at high temperatures on gas oil or similar fractions of petroleum, or by high-temperature cracking of gas oil. One typical analysis is: heating value about 554 Btu/cu ft, illuminants 4.2%, carbon monoxide 10.4%,

hydrogen 47.6%, methane 27.0%, carbon dioxide 4.6%, oxygen 0.4%, nitrogen 5.8%. Autoignition temp. 637°F.

Hazard: Highly toxic by inhalation. Flammable; dangerous fire and explosion risk.

Shipping regulations: (Air) Flammable gas label. Not acceptable on passenger planes.

oiliness. That property of a lubricant that causes a difference in coefficient of friction when all the known factors except the lubricant itself are the same. This concept is also expressed by the term *lubricity*.

oil of bitter almond. The volatile essential oil distilled from ground kernels of bitter almonds, which contain amygdalin (q.v.), imported from Spain, Portugal, and France. It consists of about 90% benzaldehyde and 10% hydrocyanic acid, which must be removed before use. Sp. gr. 1.04–1.06. Used in cosmetic creams, perfumes, and pharmacy. See also benzaldehyde; benzoin.

oil of mirbane. See nitrobenzene.

oil of sweet almond. The fatty nondrying oil comprised chiefly of unsaturated fatty acids expressed from the kernels of either bitter or sweet almonds. As sweet almonds are too valuable as such to be used for oil, which is almost identical in its properties with that from bitter almond, the term "sweet almond oil" is actually a misnomer. Most of the commercial product is derived from bitter almonds. Its sp. gr. is 0.91 and iodine no. 95–105. Used as emollient in cosmetics, and in perfumes.

oil of vitriol. See sulfuric acid.

oil of wintergreen. See methyl salicylate.

"Oil Orange."²⁸ Trademark for a petroleum dye used to color gasoline, etc. Essentially phenylazo-2-naphthol.

"Oil Red."²⁸ Trademark for a petroleum dye used to color gasoline, etc. Essentially methyl derivatives of azobenzene 4-azo-2-naphthol.

oil sands (tar sands). Porous geological structures located in the Athabaska region of northern Alberta which bear a high ratio of petroleum-to-solids content. These structures lie not only on the surface but extend to considerable depth beneath it. Only a small fraction of the oil values can be extracted by strip mining. Though these deposits represent a potential energy source of considerable magnitude, the high cost of extraction has retarded its development. Experimental investigations have been carried on for some time without significant results.

oil shale. Extensive sedimentary rock deposits in Western U.S. (chiefly in Wyoming, Colorado and Utah) having a relatively high (30 to 60%) content of bituminous matter (kerogen) from which shale oil can be derived by heating in absence of air. Some shales yield up to 65 gallons of oil per ton. See also shale oil.

oil spill treatment. Several methods have been tried, none of which has proved more than partially satisfactory: (1) Mechanical containment by log booms or similar devices; (2) combustion; (3) absorption by straw, colloidal silica, or polyurethane foam; (4) chemical detergents or emulsifiers. Of these the absorption method shows the most promise, not only for its direct effectiveness but because it does less ecological damage than chemical dispersants, which ex-

pose marine life to toxic components of petroleum hydrocarbons. Combustion is ineffective, as the heat applied is too rapidly dissipated to ignite the oil. Research is being conducted on development of active bacteria that can decompose petroleum by enzymatic means. An international system for monitoring petroleum in the oceans was instituted in 1975.

oil varnish. See varnish.

oil, vulcanized. See factice.

oil white. One of several mixtures of lithopone and white lead or zinc white (q.v.). It may also contain gypsum, magnesia, whiting, or silica. Used as a white-lead substitute.

"Oil Yellow NB."²⁸ Trademark for a petroleum dye used to color gasoline, etc. Essentially para-diethyl-aminoazobenzene.

oiticica oil.

Properties: Light yellow drying oil which slowly solidifies unless first heated for about 30 minutes at 210–220°C. Properties vary according to whether the oil is raw or heat-treated (semi-polymerized). Combustible; nontoxic.

Derivation: By expression from the seeds of the Brazilian oiticica tree, *Licania rigida*.

Chief constituents: Glycerides of alpha-licanic acid (4-keto-9,11,13-octadecatrienoic acid).

Containers: Steel drums; tank trucks.

Uses: Drying oil in paints, varnishes, etc.

"O K Liquid."⁴⁸⁷ Trademark for a combination of anionic and nonionic surfactants plus suitable solvents for use as a foaming agent in air and gas drilling of oil wells.

"OKO."⁶⁴ Trademark for a series of polymerized linseed oils produced by vacuum polymerization to remove all traces of decomposed matter. Low acid, light, color, minimum after-yellowing.

Uses: Paints, varnishes, enamels, flats, printing inks, brake linings.

-ol. A suffix indicating that one or more hydroxyl groups (OH) are present in an organic compound, e.g., alcohol, phenol, menthol. Thiol is an exception, the oxygen of the OH group being replaced by sulfur. There are a few other exceptions among the essential oils, e.g., eucalyptol.

oleamide $\text{cis-CH}_3(\text{CH}_2)_7\text{CH:CH}(\text{CH}_2)_7\text{CONH}_2$.

Properties: Ivory-colored powder; approximate melting point 72°C; sp. gr. 0.94. Combustible; low toxicity.

Grade: Refined.

Uses: Slip-agent for extrusion of polyethylene; wax additive; ink additive.

"Oleandomycin."²⁹⁹ Trademark for oleandomycin phosphate.

oleandomycin phosphate $\text{C}_{25}\text{H}_{41}\text{NO}_{12} \cdot \text{H}_3\text{PO}_4$.

Properties: White, odorless, crystals or powder; soluble in water, alcohol; slightly soluble in ether.

Derivation: *Streptomyces antibioticus*.

Grade: N.F.

Use: Medicine.

"Olefane."⁴²⁹ Trademark for polypropylene film.

olefin (alkene). A class of unsaturated aliphatic hydrocarbons having one or more double bonds, obtained by cracking naphtha or other petroleum

fractions at high temperatures (1500 to 1700°F). Those containing one double bond are called alkenes, and those with two alkenes, or diolefins. They are named after the corresponding paraffins by adding "ene" or "ylene" to the stem. Alpha-olefins are particularly reactive because the double bond is on the first carbon. Examples are 1-octene and 1-octadecene, which are used as the starting point for medium-biodegradable surfactants. Other olefins (ethylene, propylene, etc.) are starting points for manufactured fibers, of which the polymer comprises at least 85% by weight. See also diolefin.

oleic acid (cis-9-octadecenoic acid; red oil)
 $\text{CH}_3(\text{CH}_2)_7\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOH}$. A monounsaturated fatty acid; a component of almost all natural fats as well as tall oil. Most oleic acid is derived from animal tallow or vegetable oils.

Properties: Commercial grades: Yellow to red oily liquid; lardlike odor; darkens on exposure to air. Insoluble in water; soluble in alcohol, ether and most organic solvents, fixed and volatile oils. Solvent for other oils, fatty acids and oil-soluble materials.

Purified grades: Water-white liquid; sp. gr. 0.895 (20/4°C); m.p. 13.2°C; b.p. 286°C (100 mm), 225°C (10 mm); refractive index 1.4599 (20°C); acid value 196–204; iodine value 83–103; saponification value 196–206. Flash point 372°F; combustible; nontoxic.

Derivation: The free fatty acid is obtained from the glyceride by hydrolysis, steam distillation and separation by crystallization or solvent extraction. Filtration from the press cake results in the oleic acid of commerce (red oil) which is purified and bleached for specific uses.

Grades: Variety of technical grades; grade free from chick edema factor; U.S.P.; F.C.C.; 99+%. A purified technical oleic acid containing 90% or more oleic, 4% maximum linoleic and 6% maximum saturated acids is available.

Containers: Drums; tank trucks; tank cars.

Uses: Soap base; manufacture of oleates; ointments; cosmetics; polishing compounds; lubricants; ore flotation; intermediate; surface coatings; food-grade additives.

olein (triolein; glyceryl trioleate) $(\text{C}_{17}\text{H}_{33}\text{COO})_3\text{C}_3\text{H}_5$. The triglyceride of oleic acid, occurring in most fats and oils. It constitutes about 70–80% of olive oil.

Properties: Yellow, oily liquid; sp. gr. 0.915; m.p. –4 to –5°C; soluble in chloroform, ether, carbon tetrachloride; slightly soluble in alcohol. Combustible; nontoxic.

Impurities: Stearin, linolein.

Derivation: Refined natural oils.

Use: Textile lubricants.

oleoresin. Any of a number of mixtures of essential oils and resins characteristic of the tree or plant from which they are derived. Most types are semisolid and tacky at room temperature, becoming soft and sticky at higher temperatures. They have various distinctive odors. See also balsam; rosin.

oleoyl chloride (cis-9-octadecenoyl chloride)
 $\text{CH}_3(\text{CH}_2)_7\text{CH}:\text{CH}(\text{CH}_2)_7\text{COCl}$.

Properties: Liquid; b.p. 175–180°C (3 mm); soluble in hydrocarbons and ethers; reacts slowly with water. Combustible; low toxicity.

Containers: Bottles; carboys; 55-gal drums.

Use: Chemical intermediate.

N-oleoylsarcosine $\text{C}_{17}\text{H}_{33}\text{N}(\text{CH}_3)\text{CH}_2\text{COOH}$.
 Properties: Amber liquid; sp. gr. 0.955 (20/20°C); re-

fractive index 1.4703 (n 20/D). About 95% pure. Combustible.

Containers: Drums; tanks.

Use: Surfactants.

oleum. The Latin name for oil. Also applied to fuming sulfuric acid (q.v.).

oleyl alcohol (octadecenol)

$\text{CH}_3(\text{CH}_2)_7\text{CH}:\text{CH}(\text{CH}_2)_7\text{CH}_2\text{OH}$. The unsaturated alcohol derived from oleic acid. Clear viscous liquid at room temperature. Iodine value 88, cloud point 20°F, boiling point 333°C; f.p. –7.5°C. Sp. gr. 0.84. Combustible; low toxicity.

Impurities: Linoleyl, myristyl and cetyl alcohols.

Derivation: Reduction of oleic acid; occurs in fish and marine mammal oils.

Grades: Technical; commercial (80–90% pure).

Uses: Chemical synthesis, petroleum additives, surfactants; polymers; plasticizer; antifoaming agent.

oleyl aldehyde. See octadecenyl aldehyde.

oleylhydroxamic acid $\text{C}_{17}\text{H}_{33}\text{CONHOH}$.

Properties: Waxy solid; off-white color; sp. gr. 0.897 (70/25°C); insoluble in water; soluble in aqueous potassium hydroxide and organic solvents.

oleyl-linoleylamine (octadecene-octadecadieneamine).

Properties: Highly unsaturated primary amine; soluble in many organic solvents; insoluble in water. Sp. gr. 0.83; m.p. 19°C; b.p. 198–209°C; amine no. 200–210; iodine value 90 min.

Use: Organic intermediate.

oleyl methyl tauride. See sodium N-methyl-N-oleoyl taurate.

oligo- A prefix meaning "a few" or "very little." See following entries.

oligodynamic. Literally, active in small amounts. In technical literature, the term describes the sterilizing or purifying action of a substance, e.g., silver.

oligomer. A polymer molecule consisting of only a few monomer units (dimer, trimer, tetramer).

oligopeptide. A peptide made up of not more than ten amino acids.

oligosaccharide. A carbohydrate containing from two up to ten simple sugars linked together (e.g., sucrose, composed of dextrose and fructose). Beyond ten they are called polysaccharides.

olive oil.

Properties: Pale yellow or greenish-yellow liquid; a nondrying oil; slight odor and taste. Soluble in ether, chloroform and carbon disulfide; sparingly soluble in alcohol. Sp. gr. 0.910–0.918; saponification value 188–196; iodine value 77–88. Flash point 437°F; combustible; nontoxic. Cloud point 20–30°F.

Derivation: By expressing the pulp of the fruit of the olive tree, *Olea europea*, cultivated in Spain, Greece, Tunisia and Turkey.

Chief constituents: oleic acid, palmitic acid, linoleic acid.

Grades: U.S.P.; edible; commercial; sulfur oil (olive oil foots). The edible and commercial oils are obtained by expression, and the last grade by extraction, usually with carbon disulfide.

Containers: Drums.

Uses: Salad dressings and other foods; ointments; liniments, etc.; Castile soap; special textile soaps; lubricant; sulfonated oils; cosmetics.

olivine (chrysolite) $(\text{Mg}, \text{Fe})_2\text{SiO}_4$. Natural magnesium-iron silicate, found in igneous and metamorphic

- rocks, meteorites, and blast furnace slags. A complete series exists from Fe_2SiO_4 to Mg_2SiO_4 .
 Grades: Crude, 20 mesh, 100 mesh.
 Uses: Refractories; cements.
- "OLOA."¹⁵¹ Trademark for mixtures of metal-organic and/or organic compounds in a lubricating oil carrier. Used to fortify well-refined base stocks to yield motor oils that minimize engine deposits, engine wear, bearing corrosion, engine rusting, and friction between rubbing surfaces.
- "OM-4."²⁹⁹ Trademark for an antibiotic preparation for addition to animal feeds containing oleandomycin.
- "Omadine."⁸⁴ Trademark for a series of derivatives of pyridinethione [such as 1-hydroxy-2-pyridinethione, $\text{C}_5\text{H}_4\text{NOH(S)}$] having bactericide-fungicide properties. Used in cosmetics, textiles, cutting oils and coolant systems, vinyl films and rubber products.
- "Omazene."⁸⁴ Trademark for copper dihydrazinium sulfate (q.v.). Available as 50% wettable powder.
 Use: Foliage fungicide.
- OMC. Abbreviation of oxidized microcrystalline waxes.
- "Omnadin."¹⁶² Trademark for prolipin (q.v.).
- OMPA. Abbreviation for octamethyl pyrophosphoramide. See schradan.
- "Onamine."³²⁸ Trademark for a series of liquid cationic detergents.
 Uses: Intermediate; acid-stable emulsifier; corrosion inhibitor.
- ONB. Abbreviation for ortho-nitrobiphenyl.
- oncogenic. Designating any substance that will cause tumors in test animals, either benign or malignant. EPA pesticide regulations use this term instead of "tumorigenic" and "carcinogenic."
- "Ondal" A.²⁸ Trademark for an oxidizing agent for one-bath soaping and oxidizing of vat colors.
- one-step resin. See A-stage resin.
- "Onyxcide 75%."³²⁸ Trademark for a 75% concentration of alkenyl dimethyl ethyl ammonium bromide. Used as an algicide.
- "Onyx-ol."³²⁸ Trademark for a series of fatty acid ethanolamine and isopropanolamine condensates.
 Uses: Foam stabilizers; thickeners; nonionic detergents.
- "OP-100,101,102."²¹⁰ Trademark for a series of specialty chemicals used in paper wet strengthening; selective oxidatoin of carbohydrates, amino acids, etc.; cotton grafting; photographic paper, etc.
- opacity. The optical density of a material, usually a pigment; the opposite of transparency. A colorant or paint of high opacity is said to have good hiding power or covering power, by which is meant its ability to conceal another tint or shade over which it is applied. Apparatus for measuring opacity is available.
- "Opalon."⁵⁴ Trademark for vinyl chloride extruding and calendaring material and molding compounds.
- "Opalwax."²⁰² Trademark for hydrogenated castor oil. See "Castorwax" and glyceryl tri-12-hydroxystearate.
- "Opax."¹¹⁷ Trademark for a brand of zirconium oxide containing 88% minimum of zirconium oxide and 7%

maximum silicon dioxide. M.p. 4500°F. Used in ceramic enamels and glazes. See also zirconium oxide.

OPDN. Abbreviation for beta, beta-oxydipropionitrile (q.v.).

"Opex."¹⁴¹ Nitrocellulose lacquer for automotive and industrial finishes.

OPG. Abbreviation for oxypolygelatin (q.v.).

opium. A plant alkaloid.

Derivation: The air-dried, milky exudate obtained from the unripe capsules of *Papaver somniferum*.

Containers: Tins.

Hazard: Highly toxic. A habit-forming narcotic. Importation and sale restricted by law in U.S.

Use: Medicine; source of morphine.

"Oppanol."⁴⁴⁰ Trademark for a series of polyisobutylenes, varying from oily liquids through highly viscous materials to rubberlike solids according to degree of polymerization.

optical activity. See optical rotation.

optical brightener (optical bleach; colorless dye; fluorescent brightener). A colorless fluorescent organic compound which absorbs ultraviolet light and emits it as visible blue light. The blue light masks the undesirable yellow of textiles, paper, detergents and plastics. Some examples are: derivatives of 4,4'-diaminostilbene-2,2'-disulfonic acid; coumarin derivatives such as 4-methyl-7-diethylaminocoumarin.

optical crystal. A comparatively large crystal, either natural or synthetic, used for infrared and ultraviolet optics, piezoelectric effects, and short wave radiation detection. Examples are sodium chloride, potassium iodide, silver chloride, calcium fluoride, and (for scintillation counters) such organic materials as anthracene, naphthalene, stilbene, and terphenyl.

optical glass. See glass.

optical isomer. Either of two kinds of optically active three-dimensional isomers (stereoisomers). One kind is represented by mirror-image structures called enantiomers, which result from the presence of one or more asymmetric carbon atoms in the compound (glyceraldehyde, lactic acid, sugars, tartaric acid, amino acids). The other kind is exemplified by diastereoisomers, which are not mirror images. These occur in compounds having two or more asymmetric carbon atoms; thus such compounds have 2ⁿ optical isomers, where n is the number of asymmetric carbons. See also enantiomer; diastereoisomer; optical rotation; asymmetry.

optical microscopy. Microscopy which utilizes light in the visible wavelengths of the spectrum, as opposed to ultraviolet microscopy and electron microscopy, which utilize shorter wavelengths.

optical rotation. The change of direction of a ray of plane-polarized light to either the right or the left as it passes through a molecule containing one or more asymmetric carbon atoms, e.g., sugars. The direction of rotation, if to the right, is indicated by either a plus sign (+) or an italic *d*; if to the left, by a minus sign (-) or an italic *l*. Molecules having a right-handed configuration (*D*) usually are dextrorotatory. *D*(+), though they may be levorotatory. *D*(-); those having a left-handed configuration (*L*) are usually levorotatory. *L*(-), but may be dextrorotatory. *L*(+). Compounds having this property

are said to be optically active, and are isomeric. The amount of rotation varies with the compound, but is the same for any two isomers, though in opposite directions. See also optical isomer; nicol.

optical spectroscopy. Absorption or emission spectroscopy utilizing radiation in the visible portion of the electromagnetic spectrum.

"Oragrafín."⁴¹² Trademark for calcium ipodate (q.v.).

oral contraceptive. See antifertility agent.

orange III. See methyl orange.

orange IV. See torpeolin OO.

orange cadmium. See cadmium sulfide.

orange flower oil. See neroli oil.

orange mineral. A red lead oxide pigment made in a furnace by roasting lead carbonate or sublimed litharge; it is a very bright orange, but has low tinting strength.

Properties: Fine powder; -325 mesh; sp. gr. 9.0; contains 95.5% red lead (Pb_3O_4).

Use: Pigment in printing inks and primers.

orange peel oil. See citrus peel oils.

orange seed oil. See citrus seed oils.

"Orange Crystals."²²⁷ Trademark for methyl betanaphthyl ketone.

"Orange Liquid." Liquid mixture of alpha- and betanaphthylmethyl ketone.

"Orasol."⁴⁴³ Trademark for solvent dyes for transparent coatings, inks, and plastics.

"Oratol."³⁰⁹ Trademark for a neutralized sulfonated ester of a higher alkanolamide, containing added solvents for increased scouring efficiency.

orbital theory. The quantum theory of matter applied to the nature and behavior of the electron, either in single atoms (atomic orbital) or in united atoms (molecular orbital). A combination of Schrödinger's wave mechanics and Heisenberg's uncertainty principle, the orbital theory was formulated in 1926. It has yielded a better understanding of the electron and its critical part in chemical bonding than is possible with Newtonian mechanics. In simple language, the orbital theory considers the electron not as a particle, but as a three-dimensional wave that can exist at several energy levels; its exact location and position in the "shell" (which in most elements is a group of orbitals) cannot be precisely determined, but only predicted by the laws of mathematical probability. The orbital levels and the movement of electrons within them are expressed by wave functions and quantum numbers (q.v.). The probability that an electron will be found in a given volume (i.e., the square of the one-electron wave function) is called the orbital of that electron, and the shape of the orbital is defined by surfaces of constant probability (i.e., spheres and doughnut-shaped ellipses). The electron orbital, described in terms of probability, is like a cloud, with indefinite boundaries. The energy state of each electron is given by four quantum numbers which describe its principal level, its angular momentum, its magnetic moment, and its spin. This concept has exerted a profound effect on modern ideas about chemical bonding, transition metal complexes, semiconductors, and solid state physics.

orcin (dihydroxytoluene; methylresorcinol; orcinol) $CH_3C_6H_3(OH)_2 \cdot H_2O$. 1-Methyl-3,5-dihydroxybenzene.

Properties: White, crystalline prisms, becoming red in air; intensely sweet, unpleasant taste. Soluble in water, alcohol, and ether. Sp. gr. 1.2895; m.p. (anhydrous) 107°C, (hydrated) 56°C; b.p. 287-290°C.

Derivation: By fermentation of various species of lichens (roccella), and extraction.

Uses: Medicine; reagent for certain carbohydrates.

order of magnitude. A range of values applied to numbers, distances, dimensions, etc. which begins at any value and extends to ten times that value; e.g., 2 is of the same order of magnitude as any number between itself and 20; 5 miles is of the same order of magnitude as any distance between 5 and 50 miles. The expression usually applies to extremely large or extremely small units, i.e., the size ranges of atoms, molecules, colloidal particles, etc., or astronomical distances.

"Ordess."⁵¹⁰ Trademark for a series of ortho esters (including tridecyl orthoformate). Useful for removing small quantities of water from ethers or other solvents where acid catalysis can be employed.

ore. An aggregate of valuable minerals and gangue (q.v.) from which one or more metals can be extracted at a profit.

ore flotation. See flotation.

"Oreton."³²¹ Trademark for a brand of testosterone (q.v.) and its derivatives.

organelle. A portion of a cell having specific functions, distinctive chemical constituents and characteristic morphology; it is a unit subsystem of a cell. Examples are mitochondria and chromosomes (q.v.). Organelles are often closely associated with enzymes. The lysosome (an enzyme-bearing organelle) has been synthesized.

organic compound. Any substance that contains the element carbon, with the exception of carbon oxides, and various carbonates. Some 700,000 organic substances have been identified. A brief classification follows:

I. Aliphatic (straight-chain)

1. Hydrocarbons (petroleum and coal-derived)

(a) paraffins or alkanes (saturated) (C_nH_{2n+2}) methane and homologs

(b) Olefins (unsaturated)

(1) alkenes (one double bond) (C_nH_{2n}) ethylene and homologs

(2) alkadienes (two double bonds) (C_nH_{2n-2}) butadiene, allene

(c) acetylenes or alkynes (triple bond)

2. Alcohols (ROH): methanol and homologs

3. Ethers (ROR): methyl ether and homologs

4. Aldehydes (RCHO): formaldehyde, acetaldehyde

5. Ketones (RCOR): acetone, methylethylketone

6. Carboxylic acids (RCOOH)

7. Carbohydrates ($C_nH_{2n}O_n$)

(a) Sugars: glucose, fructose, sucrose

(b) Starches: wheat, corn, potato

(c) Cellulose: cotton, plant fibers

II. Cyclic (closed ring)

1. Alicyclic hydrocarbons (properties similar to aliphatics):

- (a) cycloparaffins (naphthenes) (saturated): cyclohexane, cyclopentane, etc.
 - (b) cycloolefins (unsaturated): cyclopentadiene, cyclooctatetraene
 - (c) cycloacetylenes (triple bond)
 - 2. Aromatic hydrocarbons (arenes): unsaturated compounds; hexagonal ring structure with three double bonds; single and multiple fused rings
 - (a) benzene group (1 ring)
 - (b) naphthalene group (2 rings)
 - (c) anthracene group (3 rings)
 - 3. Heterocyclic: unsaturated; usually pentagonal rings, containing at least one other element besides carbon.
 - (a) pyrroles
 - (b) furans
 - (c) thiazoles
 - (d) porphyrins
- III. Combinations of aliphatic and cyclic structures
- 1. terpene hydrocarbons
 - 2. amino acids (some are aliphatic and others combinations)
 - 3. proteins and nucleic acids (coiled or helical formations)

organoclay (organopolysilicate). A clay such as kaolin or montmorillonite, to which organic structures have been chemically bonded; since the surfaces of the clay particles, which have a lattice-like arrangement, are negatively charged, they are capable of binding organic radicals. When this type of structure is in turn reacted with a monomer such as styrene, a complex results that is known as a polyorganosilicate graft polymer.

organoleptic. A term widely used to describe consumer testing procedures for food products, perfumes, wines, and the like, in which samples of various products, flavors, etc., are submitted to groups or panels. Such tests are a valuable aid in determining the acceptance of the products, and thus may be viewed as a marketing technique. They also serve psychological purposes, and are an important means of evaluating the subjective aspects of taste, odor, color, and related factors.

organopolysilicate. See organoclay.

organometallic compound. A compound comprised of a metal attached directly to carbon (RM); such compounds have been prepared of practically all the metals. Metallic salts (soaps) of organic acids are excluded from this group. Examples are diethylzinc (the first known organometallic); Grignard compounds such as methyl magnesium iodide (CH_3MgI); metallic alkyls such as butyllithium ($\text{C}_4\text{H}_9\text{Li}$); tetraethyllead; triethyl aluminum; tetrabutyl titanate; sodium methylate; copper phthalocyanine; metal carbonyls; and metallocenes (q.v.). Some are highly toxic or flammable; others are coordination compounds. See specific compound for details.

Reactive and moderately reactive organometallic compounds will react with all functional groups; two major types of reaction in which they are involved are oxidation and cleavage by acids. Probably the most important organometallic reactions are those involving addition to an unsaturated linkage.

organophosphorus compound. Any organic compound containing phosphorus as a constituent. These fall into several groups, chief of which are the follow-

ing: (1) phospholipids, or phosphatides, which are widely distributed in nature in the form of lecithin, certain proteins, and nucleic acids; (2) esters of phosphinic and phosphonic acids, used as plasticizers, insecticides, resin modifiers, and flame retardants; (3) pyrophosphates, for example, tetraethyl pyrophosphate, which are the basis for a broad group of cholinesterase inhibitors used as insecticides; (4) phosphoric esters of glycerol, glycol, sorbitol, etc., which are components of fertilizers. While many of these compounds play an important part in animal metabolism, those in group (3) are toxic and should be handled with extreme care.

"Organ-O-Sil."²⁷⁵ Trademark for treated fumed silicon dioxide for use as a free-flowing or anti-caking agent.

organosol. Colloidal dispersion of any insoluble material in an organic liquid; specifically the finely divided or colloidal dispersion of a synthetic resin in plasticizer in which dispersion the volatile content exceeds 5% of the total. See platisol.

organotin compound. A family of alkyl tin compounds widely used as stabilizers for plastics, especially rigid vinyl polymers used as piping, construction aids and cellular structures. Some have catalytic properties. They include butyl tin trichloride, dibutyltin oxide, etc., and various methyltin compounds. They are both liquids and solids, and all are highly toxic, with a tolerance of 0.1 mg per cubic meter of air. For specific data, see dibutyltin entries.

"Oriex."⁴⁸² Trademark for a bi-axially oriented vinyl. Available in roll and sheet form for shrink packaging.

origanum oil, Spanish.

Properties: Light yellow essential oil; spicy odor; sp. gr. 0.935–0.960 (25°C); refractive index 1.5020–1.5080 (20°C); angular rotation -2 to $+3^\circ$. Soluble in 2 volumes 70% alcohol; soluble in fixed oils and mineral oil; insoluble in glycerol. Combustible.

Components: (F.C.C.) 60–75% by volume of phenols. Derivation: By steam distillation from the flowering herb. *Thymus capitatus*, and various species of *Origanum*.

Grade: F.C.C.

Hazard: May be toxic by ingestion.

Uses: Pharmacy; flavoring.

"Orlon."²⁸ Trademark for a copolymer containing at least 85% acrylonitrile. Available in various types of staple and tow.

Properties: Sp. gr. 1.14–1.17; tensile strength (psi) 32,000–39,000; break elongation 20–28%; moisture regain 1.5% (70°F, 65% R.H.); softens at 455°F; soluble in butyrolactone (hot), dimethyl formamide (hot), ethylene carbonate (hot). Resistant to mineral acids; fair to good resistance to weak alkalis. Insoluble in alcohol, acetone, benzene, carbon tetrachloride, and petroleum ether; soluble in dimethyl sulfoxide; maleic anhydride, ethylene carbonate, nitriles, and nitrophenols.

Hazard: Combustible; burns freely and rapidly.

Containers: Bales and cartons.

Uses: In apparel, usually blended with wool or other fibers.

Orn Abbreviation for ornithine.

ornithine (2,5-diaminovaleric acid)

$\text{NH}_2(\text{CH}_2)_3\text{CH}(\text{NH}_2)\text{COOH}$. A nonessential amino

acid produced by the body and important in protein metabolism.

Properties: L(+)-ornithine: Crystals from alcohol-ether; m.p. 140°C; soluble in water and alcohol.
DL-ornithine: Crystals from water; slightly soluble in alcohol.

Derivation: Isolated from proteins after hydrolysis with alkali.

Use: Biochemical research.

"Oronite."¹⁵¹ Trademark for a series of petroleum products used as detergents, chelating agents, hydraulic fluids, odorants, lube-oil additives, sealants, etc.

"Oropon."²³ Trademark for proteolytic enzyme concentrates, formulated with or without deliming salts. Various grades include enzymes of pancreatic, fungal or bacterial origin, to remove undesirable protein matter and excess lime from dehaired animal skins.
Use: Bating of skins in preparation for tanning.

"Orotan" TV.²³ Trademark for a synthetic tanning agent with attributes of vegetable tannins. Dark-red viscous solution, 31% tannin. Imparts high degree of tannage, strength, fullness and solidity to leather. Solubilizing, penetrating and bleaching agent.

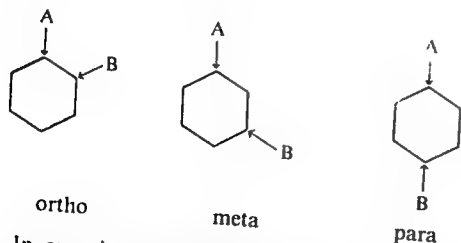

orotic acid (uracil-6-carboxylic acid; 6-carboxyuracil) $C_4N_2H_3(O)_2COOH$. Occurs in cow's milk and has also been isolated from certain strains of molds (Neurospora). A growth factor for certain microorganisms.

Properties: Crystals with m.p. 345–346°C.
Use: Biochemical research, especially the biosynthesis of nucleic acids.

orpiment. Obsolete name for arsenic trisulfide.

orthamine. See ortho-phenylenediamine.

ortho-. A prefix meaning "straight ahead"; *meta* means "beyond"; *para* means "opposite." These prefixes are used in organic chemistry in naming disubstitution products derived from benzene in which the substituent atoms or radicals are located in certain definite positions on the benzene ring. This is illustrated in the diagram, where A and B represent the substituent atoms or groups. When attached to adjoining carbon atoms, B is in the ortho position in respect to A (also called the 1,2-position). If B is located on the third carbon atom in respect to A, it is in the meta position (also called 1,3-); when B is attached to the opposite carbon atom, it is the para position (1,4).

In organic compounds these prefixes conventionally appear in italics (often abbreviated *o*-, *m*-, and *p*-) and are ignored in alphabetizing.

In inorganic chemistry the prefix *ortho* designates the most highly hydrated acid, or its salt, to contrast with the *meta*- or less hydrated acid or salt. For example, $H_3PO_4(P_2O_5 \cdot 3H_2O)$ is orthophosphoric acid and $HPO_3(P_2O_5 \cdot H_2O)$ is metaphosphoric acid.

orthoarsenic acid. See arsenic acid.

orthoboric acid. See boric acid.

"Orthochrom."²³ Trademark for pigmented plasticized nitrocellulose lacquers and thinners. Produce durable, washable, flexible, colored lacquer finishes of good light fastness.
Use: Finishing of belt, garment, upholstery and other leathers.

"Orthocide."²⁵³ Trademark for a type of fungicide products containing captan.

"Orthoclear."²³ Trademark for permanently plasticized nitrocellulose binders and lacquers in various solvents. Produce clear, durable, flexible finishes.
Use: Topcoat finishes for glazing or high gloss leather coatings.

orthoform. See methyl meta-amino-para-hydroxybenzoate.

"Ortho-Klor."²⁵³ Trademark for insecticide products containing chlordan.
Hazard: Probably toxic; absorbed by skin.

"Ortholeum."²⁸ Trademark for a series of lubricant additives.

"Ortholite."²³ Trademark for clear and pigmented vinyl lacquers, binders, and solvents. Produce finishes of outstanding abrasion resistance and low-temperature flexibility.
Use: Finishes on upholstery, automotive, luggage, and case leathers.

"Orthol-K."²⁵³ Trademark for pesticide products containing phytonomic or similar type petroleum oils.

"Orthophen" 278.²⁰⁴ Trademark for a special blend of amyl phenol isomers.
Properties: Straw colored liquid; sp. gr. 0.94–0.95; distillation range, 75–270°C.
Use: Antiskin agent for paint industry.

"Orthophos."²⁵³ Trademark for a type of insecticide containing parathion.
Hazard: Highly toxic; absorbed by skin.

"Orthorix."²⁵³ Trademark for a type of parasiticide containing lime sulfur.

"Orthosil."²⁰⁴ Trademark for a practically anhydrous, water-soluble, sodium orthosilicate in granular form. Quick-acting detergent used in heavy-duty metal cleaning. Special types made for still tank cleaning have suitable wetting and water softening additions.

"Orthoxine" Hydrochloride.³²⁷ Trademark for methoxyphenamine hydrochloride.

"Ortolan."⁴⁴⁰ Trademark for series of dyes for dyeing and printing textiles of animal fibers and wool-nylon mixtures.

"Orvus."⁴⁸⁷ Trademark for a series of surfactants and detergents.

"Orzan."⁴⁸ Trademark for a group of dark brown lignosulfonates (spent sulfite liquor products).
Containers: Free-flowing powder, up to 50-lb bags; 50% solid solution, up to tank cars.
Uses: Dispersant; flotation reagent; chelating agent; emulsion stabilizer; binder; tannin extender; adhesive ingredient.

Os Symbol for osmium.

-ose. A suffix indicating a carbohydrate compound or polymer, usually a simple or complex sugar, for ex-

ample, sucrose, fructose, glucose, maltose, etc., and also cellulose, cellobiose, amylose (starch).

OSHA. Abbreviation for Occupational Safety and Health Administration (q.v.).

osmic acid anhydride (osmium tetroxide; perosmic acid anhydride; perosmic oxide) OsO_4 .

Properties: A dimorphic compound with both crystalline and amorphous forms. Colorless; pungent, disagreeable odor. Soluble in water, alcohol, and ether. Sp. gr. 4.90; m.p. 40°C ; b.p. 130°C .

Derivation: By heating powdered osmium in air, or by treating it with nitric acid, aqua regia, or chlorine.

Hazard: Highly toxic by inhalation; strong irritant to eyes and mucous membranes. Tolerance, 0.002 mg per cubic meter of air.

Uses: Microscopic staining; photography; catalyst in organic synthesis.

Shipping regulations: (Air) Poison label.

osmiridium. See iridosmine.

osmium Os Metallic element having atomic number 76; in group VIII of the periodic system. Atomic weight 190.2; valences 2,3,4,6,8. Has 7 stable isotopes.

Properties: Hard white metal of the platinum group. On heating in air gives off poisonous fume of osmium tetroxide. Insoluble in acids and aqua regia; attacked by fused alkalis. Sp. gr. 22.5; m.p. 3000°C ; b.p. 5500°C . It has the highest specific gravity and melting point of the platinum metals. Metallurgically unworkable.

Occurrence: Tasmania, So. Africa, U.S.S.R., Canada.

Derivation: Occurs with platinum from which it is recovered during the purification process. Also occurs with iridium as a natural alloy, iridosmine.

Hazard: Irritant to skin.

Uses: Alloys; hardener for platinum; phonograph needles; instrument pivots; laboratory catalyst.

osmium ammonium chloride. See ammonium hexachloroosmate.

osmium chloride (osmium dichloride; osmous chloride) OsCl_2 .

Properties: Dark green needles. Hygroscopic. Keep away from air! Soluble in alcohol, ether; insoluble in water.

Hazard: May be toxic.

osmium dichloride. See osmium chloride.

osmium potassium chloride. See potassium hexachloroosmate.

osmium sodium chloride. See sodium hexachloroosmate.

osmium tetroxide. See osmic acid anhydride.

osmocene (dicyclopentadienylosmium) $(\text{C}_5\text{H}_5)_2\text{Os}$.

Properties: Stable white solid; m.p. $229\text{--}230^\circ\text{C}$.

Uses: Intermediate; high-temperature applications; derivatives used as an ultraviolet radiation absorber. See metallocene.

"Osmon."¹⁶⁹ Trademark for 1-naphthylamine-4,6,8-trisulfonic acid used in the colorimetric determination of osmium.

osmosis. Passage of a pure liquid (usually water) into a solution (e.g., of sugar and water) through a membrane that is permeable to the pure water but not to

the sugar in the solution. This passage can also occur when the two phases consist of solutions of different concentrations. The membrane is called semipermeable when the molecules of the solvent, but not those of the solute, can penetrate it. This pushing of water through a membrane into a solution results from the greater tendency of water molecules to escape from water than from a solution. The term osmosis is usually restricted to movement through a solid or liquid barrier that prevents the phases from mixing rapidly. In test apparatus parchment or celloidion membranes are used; in plants and animals the cell wall acts as a diffusion barrier. The pressure exerted by osmosis is substantial, and accounts for the elevation of sap from root systems to the tops of trees. Osmosis is considered an essential characteristic of growth. See also diffusion.

Reverse osmosis is utilized as a method of desalting sea water (see desalination), recovering waste water from paper mill operations, pollution control, industrial water treatment, chemical separations, and food processing. This method involves application of pressure to the surface of a saline solution, thus forcing pure water to pass from the solution through a membrane that is too dense to permit passage of sodium and chloride ion. Hollow fibers of cellulose acetate or nylon are used as membranes, since their large surface area offers more efficient separation.

See also dialysis; membrane.

osmous chloride. See osmium chloride.

otto. See attar.

ouabain (g-strophanthin; strophanthin thoms)

$\text{C}_{29}\text{H}_{44}\text{O}_{12} \cdot 8\text{H}_2\text{O}$. A glucoside.

Properties: White odorless crystals; stable in air but affected by light; soluble in water and alcohol; specific rotation (alpha) -31 to -32.5° 20/D (anhydrous). M.p. 190° (dec).

Grades: U.S.P.

Use: Medicine.

ouricury wax. A vegetable wax exuded by the leaves of *Cocos coronapa* (South America).

Properties: Brown; acid value 10; saponification value 80; sp. gr. 0.970 (15°C); m.p. 83°C ; foreign matter (dirt, etc.) sometimes 18%. Combustible; nontoxic.

Grades: Crude; refined.

Containers: Bags.

Use: Substitute for carnauba wax.

-ous. A suffix used in naming inorganic compounds which indicates that the central element has an oxidation number of +2, or a valence of 2. For example, in ferrous chloride (FeCl_2), the iron atom is in an intermediate oxidation state. It can also be expressed as iron (II) chloride.

outgassing. The removal of gas from a metal by heating at a temperature somewhat below melting, while maintaining a vacuum in the space around the metal. Usually done before melting but sometimes afterward. Used in manufacture of tubes and other vacuum devices.

ovalbumin. See albumin, egg.

ovex. Generic name for para-chlorophenyl para-chlorobenzenesulfonate, $\text{ClC}_6\text{H}_4\text{OSO}_2\text{C}_6\text{H}_4\text{Cl}$.

Properties: White crystalline solid; m.p. 86.5°C ; insoluble in water; soluble in acetone and aromatic solvents.

Hazard: Toxic by ingestion. Strong irritant to skin.
Uses: Insecticide and acaricide.

"Ovocylin" Dipropionate.³⁰⁵ Trademark for estradiol dipropionate.

"Ovral."²⁴ Trademark for an oral contraceptive containing norgestrel, a synthetic progestogen. Contains 0.5 mg norgestrel and 0.05 mg ethinyl estradiol.

oxa-. Prefix indicating the presence of oxygen in a heterocyclic ring.

"OXAF."²⁴⁸ Trademark for the zinc salt of 2-mercaptobenzothiazole. $\text{Zn}(\text{SCNSC}_6\text{H}_4)_2$.

Properties: White to pale yellow powder. Sp. gr. 1.63; melting range, decomposes without melting when heated to 200°C or over. Excellent storage stability. Slightly soluble in ethylene dichloride and acetone. Insoluble in water, benzol, and gasoline. Available in pelletized form.

Use: Rubber accelerator; especially latex, foam sponge, wire insulation, air-cured footwear, druggist sundries and specialties.

oxalic acid $\text{HOOC}\text{COOH} \cdot 2\text{H}_2\text{O}$.

Properties: Transparent, colorless crystals; m.p. 187°C of anhydrous form, 101.5°C for dihydrate.

Derivation: Occurs naturally in many plants (wood sorrel, rhubarb, spinach) and can be made by alkali extraction of sawdust. Now manufactured by reaction of sodium formate with sodium hydroxide, followed by distillation of the resulting dihydrate crystals.

Grades: Technical (crystals and powder); C.P.

Containers: Bags; drums; carlots.

Hazard: Toxic by inhalation and ingestion; strong irritant. Tolerance, 1 mg per cubic meter of air.

Uses: Automobile radiator cleanser; general metal and equipment cleaning; purifying agent and intermediate for many compounds; leather tanning; catalyst; laboratory reagent; stripping agent for permanent press resins; bleaching of textiles; rare-earth processing.

Shipping regulations: (Rail) Poisonous solids, n.o.s., Poison label. (Air) Poison label.

7-oxalobicyclo-[2.2.1]-heptane-2,3-dicarboxylic acid.
See endothall.

oxalonitrile. See cyanogen.

oxalyl chloride (ethanedioyl chloride) $(\text{COCl})_2$.

Properties: Colorless liquid. If cooled to -12°C, solidifies to a white, crystalline mass. Gives off carbon monoxide on heating. Decomposed by water and alkaline solutions. Soluble in ether, benzene, chloroform. B.p. 64°C; f.p. -12°C; sp. gr. 1.43.

Derivation: Interaction of oxalic acid and phosphorus pentachloride.

Containers: Steel drums.

Hazard: Toxic by inhalation and ingestion.

Uses: Military poison gas; chlorinating agent in organic synthesis.

Shipping regulations: (Rail) Poisonous solids, n.o.s., Poison label. (Air) Poison label.

oxamide $\text{NH}_2\text{COCONH}_2$.

Properties: White, odorless powder; m.p. 419°C (dec) (probably the highest melting organic compound); slightly soluble in water; very slightly soluble in alcohol and ether; not hygroscopic; decomp. to ammonia and carbonic acid.

Use: Stabilizer for nitrocellulose preparations; possible substitute for urea as fertilizer.

oxammonium. See hydroxylamine.

oxamycin. See amino-3-isoxazolidone.

"Oxanal."⁴⁴³ Trademark for dyes for coloring anodized aluminum.

oxazole OCH:NCH:CH . A five-membered heterocyclic compound valuable for its derivatives. The dihydro forms, 2- and 4-oxazoline, are the parents of increasingly useful commercial compounds, e.g., surface-active agents, detergents, etc.; 2-oxazoline is $\text{OCH}_2\text{NHCH:CH}$.

oxazoline wax. A series of synthetic waxes having the oxazoline structure. See oxazole. They can be made to fairly exact specifications; are miscible with most natural and synthetic waxes, and can be applied to the same uses.

oxetane (trimethylene oxide). $\text{CH}_2\text{OCH}_2\text{CH}_2$. An oxetane group ($=\text{COCH}_2\text{C}=\text{O}$) is one kind of epoxy group. See "Penton."

oxidase. An enzyme whose activity results in the transfer of electrons on the substrate; an oxidizing enzyme.

oxidation. The term "oxidation" originally meant a reaction in which oxygen combines chemically with another substance, but its usage has long been broadened to include any reaction in which electrons are transferred. Oxidation and reduction always occur simultaneously (redox reactions), and the substance which gains electrons is termed the oxidizing agent. For example, cupric ion is the oxidizing agent in the reaction: $\text{Fe (metal)} + \text{Cu}^{++} \rightarrow \text{Fe}^{++} + \text{Cu (metal)}$; here, 2 electrons (negative charges) are transferred from the Fe atom to the Cu atom; thus the Fe becomes positively charged (is oxidized) by loss of 2 electrons while the Cu receives the 2 electrons and becomes neutral (is reduced). Electrons may also be displaced within the molecule without being completely transferred away from it. Such partial loss of electrons likewise constitutes oxidation in its broader sense and leads to the application of the term to a large number of processes which at first sight might not be considered to be oxidations. Reaction of a hydrocarbon with a halogen, for example, $\text{CH}_4 + \text{Cl}_2 \rightarrow \text{CH}_3\text{Cl} + \text{HCl}$, involves partial oxidation of the methane; halogen addition to a double bond is regarded as an oxidation.

Dehydrogenation is also a form of oxidation, when two hydrogen atoms, each having one electron, are removed from a hydrogen-containing organic compound by a catalytic reaction with air or oxygen, as in oxidation of alcohols to aldehydes. See dehydrogenation.

oxidation number. The number of electrons that must be added to or subtracted from an atom in a combined state to convert it to the elemental form; i.e., in barium chloride (BaCl_2) the oxidation number of barium is +2 and of chlorine is -1. Many elements can exist in more than one oxidation state. See also valence.

oxidation-reduction indicator. A substance that has a color in the oxidized form different from that of the reduced form, and can be reversibly oxidized and reduced. Thus if diphenylamine is present in a ferrous sulfate solution to which potassium dichromate is being added, a violet color appears with the first drop of excess dichromate. See also indicator.

oxidative coupling. A polymerization technique for certain types of linear high polymers. Oxidation of 2,6-dimethylphenol with an amine complex of a copper salt as catalyst forms a polyether, with splitting off of water. The product is soluble in aromatic and chlorinated hydrocarbons, insoluble in alcohols, ketones, and aliphatics. It is thermoplastic and unaffected by acids, bases, and detergents. It has a very broad useful temperature range (from -275 to $+375^{\circ}\text{F}$). It is also dimensionally stable and has good electrical resistance. Oxidative coupling of diacetylenes and dithiols also yields promising polymers. See also "PPO."

"Oxidex."¹¹⁸⁸ Trademark for an antioxidant for soap fats and oils. It can be added to the oils before saponification or it can be added by milling into the finished soap in the same manner that perfume is incorporated. The correct proportion for solid soaps is 0.1%.

oxidizing material. Any compound that spontaneously evolves oxygen either at room temperature or under slight heating. The term includes such chemicals as peroxides, chlorates, perchlorates, nitrates, and permanganates. These can react vigorously at ambient temperatures when stored near or in contact with reducing materials such as cellulosic and other organic compounds. Storage areas should be well ventilated and kept as cool as possible.

oxine. See 8-hydroxyquinoline.

oxirane. A synonym for ethylene oxide, H_2COCCH_2 .

An oxirane group is one having the structure =COC= , and is one kind of epoxy group.

oxirene (oxacyclopropene). An organic intermediate containing four pi electrons, reported to result from oxidation of acetylene.

"Oxitol."¹²⁵ Trademark for ethylene glycol monoethyl ether having an A.S.T.M. distillation range $134\text{--}136^{\circ}\text{C}$.

2-oxohexamethylenimine. See caprolactam.

"Oxone."²⁸ Trademark for an acidic, white granular, free-flowing solid containing the active ingredient potassium peroxymonosulfate; readily soluble in water; 1% solution has pH of 2-3. Minimum active oxygen content 4.5%. Strong oxidizing agent. Containers: 50-lb bags.

Hazard: Fire risk in contact with organic materials.

Uses: Manufacture of dry laundry bleaches, detergent-bleach washing compound, scouring powders, plastic dishware cleaners, and metal cleaners; hair wave neutralizers and pharmaceuticals; general oxidizing reactions.

oxonium ion. Formerly called hydronium ion; it results from ionization of water: $2\text{H}_2\text{O} \rightarrow \text{H}_3\text{O}^+ + \text{OH}^-$.

2-oxopentanedioic acid. See alpha-ketoglutaric acid.

4-oxopentanoic acid. See levulinic acid.

Oxo process. Production of alcohols, aldehydes and other oxygenated organic compounds by passage of olefin hydrocarbon vapors over cobalt catalysts in the presence of carbon monoxide and hydrogen. Aldehydes are formed as products, but in most cases these are hydrogenated at once to the corresponding alcohol. Propylene produces normal and isobutylaldehyde; higher olefins produce a mixture of aldehydes

containing one more carbon atom than the olefins. n-Butyl, isobutyl, amyl, isooctyl, decyl and tridecyl alcohols are produced in large quantities.

oxosilane. See siloxane.

oxybenzoic acid. See hydroxybenzoic acid.

para,para'-oxybis(benzenesulfonylhydrazide)

$\text{H}_2\text{NNHSO}_2\text{C}_6\text{H}_4\text{OC}_6\text{H}_4\text{SO}_2\text{NHNH}_2$.

Properties: Fine white crystalline powder; odorless; sp. gr. 1.52; mp. decomposes at $150\text{--}160^{\circ}\text{C}$; soluble in acetone; moderately soluble in ethanol and polyethylene glycols; insoluble in gasoline and water. Combustible.

Use: Blowing agent for sponge rubber and expanded plastics.

oxyconiine. See conhydrine.

oxydemetonmethyl. Generic name for S-[2-(ethylsulfinyl)ethyl] O,O-dimethyl phosphorothioate. See O,O-dimethyl S-2-(ethylsulfinyl)ethyl phosphorothioate.

N-oxidiethylene-2-benzothiazolesulfenamide. See 2-(morpholiniothio)benzothiazole.

beta,beta'-oxydipropionitrile (ODPN). $\text{O}(\text{CH}_2\text{CH}_2\text{CN})_2$.

Properties: Colorless liquid; f.p. -26.3°C ; b.p. 120°C (1 mm); b.p. 155°C (5 mm); sp. gr. 1.0405 (30°C); viscosity (30°C) 8.00 cp; refractive index (n 25°D) 1.4392; flash point 180°F (TOC); combustible; soluble in water. It is thermally unstable, yielding acrylonitrile and water above 175°C . Hydrolyzed by strong acids and bases; quite immiscible with paraffin hydrocarbons, but dissolves aromatics. Combustible.

Derivation: From acrylonitrile.

Hazard: Toxic by inhalation and ingestion.

Use: Solvent in fractional extraction.

"Oxyfume."²¹⁴ Trademark for a sterilant mixture of ethylene oxide and either carbon dioxide or dichlorodifluoromethane. Colorless and tasteless gas; excellent penetrating ability and ether odor. Available as: "Oxyfume" Sterilant-20, 20% ethylene oxide and 80% carbon dioxide by weight and gas volume; "Oxyfume" Sterilant-12, a mixture of 12% ethylene oxide and 88% dichlorodifluoromethane by weight.

oxygen O. Gaseous element of atomic number 8; Group VIA of the Periodic Table; atomic weight 15.9994; Valence 2; isotopes 16, 17, 18. Molecular oxygen is O_2 and ozone O_3 . Oxygen was discovered by Priestley in England in 1774. Fourth highest-volume chemical produced in U.S. (1975).

Properties: Colorless, odorless, tasteless diatomic gas. Liquefiable at -183°C to slightly bluish liquid; solidifiable at -218°C . It constitutes about 20% by volume of air at sea level. Sp. gr. (gas) 1.10535, referred to air; (liquid) 1.14 (-183°C). Soluble in water and alcohol. Oxygen is noncombustible, but actively supports combustion (q.v.).

Derivation: Commercial method for tonnage oxygen is fractionation of liquid air; electrolysis of water is used for small amounts and for laboratory demonstration. Note: Atmospheric oxygen originated from photosynthesis (q.v.).

Grades: Low purity; high purity; U.S.P.

Containers: (Compressed gas) steel cylinders, tank cars, tube trailers; (Liquid) vacuum-jacketed cylinders, truck cargo tanks, tank cars. (Gas) Pipelines for distances of about 50 miles.

Hazard: (Gaseous) Moderate fire risk as oxidizing agent. Therapeutic overdoses can cause convulsions. (Liquid): May explode on contact with heat or oxidizable materials; irritant to skin and tissue.

Uses: Blast furnaces; copper smelting; steel production (basic oxygen converter process); manufacture of synthesis gas (q.v.) for production of ammonia, methyl alcohol, acetylene, etc.; oxidizer for liquid rocket propellants; resuscitation; heart stimulant; decompression chambers; spacecraft; chemical intermediate; to replace air in oxidation of municipal and industrial organic wastes; to counteract effect of eutrophication in lakes and reservoirs; coal gasification.

Shipping regulations: (Rail) (gas and pressurized liquid) Green label. (Air) (gas) Nonflammable gas label; (liquid, pressurized and nonpressurized) Not acceptable.

See also ozone.

oxygen 18 (heavy oxygen). Oxygen isotope of atomic weight 18. Occurs in proportion of 8 parts to 10,000 of ordinary oxygen in water, air, rocks, etc. The proportion may be increased by passing carbon dioxide gas repeatedly through a packed column down which water is passed. The carbon dioxide leaving the top of tower is enriched in heavy oxygen and the water leaving the bottom is depleted. Used in tracer experimentation. See also heavy water.

"Oxygenated Hydrocarbons."⁵⁶⁹ Trademark for a series of petroleum-derived oxidates composed primarily of organic acids and esters. Designated by TC or TX followed by a four digit number e.g., TC-5416, TC-6664.

Uses: Corrosion inhibitors; surface-active components in wax emulsions; emulsifiable lubricants; plasticizer; intermediate; leather and cordage oils; lubricity agents and solubilizers.

oxygen consumed (C.O.D.) (O.C.) (D.O.C.). A measure of the quantity of oxidizable components present in water. Since the carbon and hydrogen, and not the nitrogen, in organic matter are oxidized by chemical oxidants, the oxygen consumed is a measure only of the chemically oxidizable components and is dependent upon the oxidant, structure of the organic compound and manipulative procedure. Since this value does not differentiate stable from unstable organic matter, it does not necessarily correlate with the biochemical oxygen demand value. It is also known as chemical oxygen demand (C.O.D.) and dichromate oxygen consumed (D.O.C.). See also biochemical oxygen demand; dissolved oxygen.

oxygen fluoride (oxygen difluoride, fluorine monoxide). OF_2 . An unstable, colorless gas; f.p. -224°C ; b.p. -145°C ; slightly soluble in water and alcohol. Suggested as oxidizer for rocket propellants (q.v.).

Hazard: Highly toxic; explodes on contact with water, air, and reducing agents. Tolerance, 0.05 ppm in air.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

"Oxygen Scavenger K-91."¹⁰⁸ Trademark for a technical grade of sodium sulfite in a dry, tan, water-soluble powder form.

Containers: 100-lb bags.

Uses: To chemically remove dissolved oxygen left in the feed-water after mechanical deaeration. Specially catalyzed for quick reaction. Usable in cold water.

oxyhemoglobin. See hemoglobin.

"Oxylone."³²⁷ Trademark for fluorometholone (q.v.).

oxyluminescence. See chemiluminescence.

oxymethylene. See formaldehyde.

beta-oxynaphthoic acid. See 3-hydroxy-2-naphthoic acid.

oxyneurine. See betaine.

oxyphosphorane. One of a class of compounds derived from trialkyl phosphites and orthoquinones. Their

molecules have a five atom ring, $\overline{\text{OCCOP}}(\text{OR})_3$ in which the two carbon atoms are part of an aromatic ring. They react by liberating a phosphate ester.

oxypolygelatin (OPG). A purified gelatin treated with glyoxal, followed by oxidation with hydrogen peroxide. A possible plasma substitute.

oxyquinoline. See 8-hydroxyquinoline.

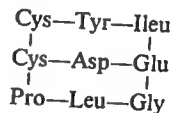

oxytetracycline $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_9 \cdot 2\text{H}_2\text{O}$. An antibiotic obtained by fermentation from *Streptomyces rimosus*, an actinomycete. Its chemical structure is that of a modified naphthacene molecule having six asymmetric centers; also recently synthesized. Nontoxic.

Properties: Dull yellow, odorless, slightly bitter crystalline powder. M.p. $179-182^\circ\text{C}$ (dec). Soluble in acids and alkalies; very slightly soluble in acetone, alcohol, chloroform and water; practically insoluble in ether. Stable in air; affected by sunlight. Deteriorates in solution with pH below 2; destroyed rapidly by alkali hydroxide solutions; pH (saturated solution) about 6.115.

Grade: N.F.

Use: Medicine (antibiotic). Inhibitor of lethal yellowing in coconut palm trees. The hydrochloride is trademarked "Terramycin."

oxytocin (alpha-hypophamine) $\text{C}_{43}\text{H}_{66}\text{N}_{12}\text{O}_{12}\text{S}_2$. A hormone secreted by the posterior lobe of the pituitary gland. Its chief action is stimulation of the contraction of the smooth muscle of the uterus. It contains eight different amino acids. In 1955 duVigneaud elucidated its amino acid sequence, the first such determination ever made; it may be represented:

It is available as a solution for injection (oxytocin injection, U.S.P.).

"Oxyltol."⁴⁹² Trademark for a chemically modified, cold-water-swelling starch that produces noncongealing pastes. Free-flowing, light cream, small granules that form straw-colored sols that are mildly alkaline in water. Used for sizing cotton yarns and other fabrics. A low B.O.D. in sizing wastes is claimed.

oyster shells. Shells of *Ostrea virginica*, taken from the Gulf of Mexico coast in Texas and Louisiana and from Chesapeake Bay. Average analysis: CaCO_3 93-97%; MgCO_3 1%; silica 0.5-2.0%; SO_4 (as CaSO_4) 0.3-0.4%; also miscellaneous substances.

Uses: Source of lime; drilling muds, road beds; poultry and cattle feeds.

"Ozene."²⁹² Trademark for an emulsifiable orthodichlorobenzene (q.v.).

"Ozlo."¹⁴¹ Trademark for leaded zinc oxides produced by the co-fumed process. Composition varies as follows:

lows; zinc oxide 50–88% and basic lead sulfate, $\text{PbSO}_4 \cdot \text{PbO}$, 12–55% depending upon grade. Used in paint pigments.

ozocerite (mineral eax; fossil wax; ozokerite).

Properties: Waxlike hydrocarbon mixture, yellow-brown to black or green, translucent when pure and having a greasy feel. Soluble in light petroleum hydrocarbons, benzene, turpentine, kerosine, ether, carbon disulfide; slightly soluble in alcohol; insoluble in water. Sp. gr. 0.85–0.95; m.p. 55–110°C, usually about 70°C. Combustible; nontoxic.

Occurrence: Utah; Australia; near the Caspian Sea.

Method of purification: Filtration.

Grade: Technical.

Uses: Electric insulation; rubber products; paints; leather polish; lithographic and printing inks; electrotypers' wax; carbon paper; source of ceresin; floor polishes; impregnating furniture and parquet floor lumber; lubricating compositions; grease crayons; sizing and glossing paper; waxed paper; cosmetics; ointments; matrices for galvanoplastic work; textile sizings; waxed cloth; substitute for carnauba and beeswax.

ozone O_3 An allotropic form of oxygen.

Properties: Unstable blue gas with pungent odor; liquefiable at -12°C ; more active oxidizing agent than oxygen. Contributes to formation of photochemical smog. Deterioration of rubber is accelerated by traces of ozone. B.p. -112°C ; f.p. -192°C ; sp. gr. (liquid) about 1.6. More soluble in water than oxygen.

Occurrence: Formed locally in air from lightning, in stratosphere by UV radiation; inhibits penetration of UV. Also occurs in automobile engines, and by electrolysis of alkaline perchlorate solutions. Commercial mixtures containing up to 2% ozone are pro-

duced by electronic irradiation of air. It is usually manufactured on the spot, as it is too expensive to ship. Tonnage quantities are used.

Hazard: Toxic by inhalation; strong irritant. Dangerous fire and explosion risk in contact with organic materials. Tolerance, 0.1 ppm in air (industrial workrooms); U.S. standard 0.080 ppm.

Uses: Purification of drinking water; industrial waste treatment; deodorization of air and sewage gases; bleaching waxes, oils, wet paper and textiles; production of peroxides; bactericide. Oxidizing agent in several chemical processes (acids, aldehydes, ketones from unsaturated fatty acids); steroid hormones; removal of chlorine from nitric acid; oxidation of phenols and cyanides.

Note: Depletion of the ozone layer in the stratosphere, which acts as a shield against penetration of UV light in the sun's rays, has become a matter of concern. This is thought to be due to light-induced chlorofluorocarbon decomposition resulting from increased use of halocarbon aerosol propellants. Research on the extent of this effect is in progress; meanwhile use of halocarbon aerosols has been reduced or discontinued by some manufacturers.

ozonide. A product of ozonolysis (q.v.).

ozonolysis. (1) Oxidation of an organic material by means of ozone, i.e., tall oil, oleic acid, safflower oil, cyclic olefins; carbon treatment; peracetic acid production. See also ozone. (2) The use of ozone as a tool in analytical chemistry to locate double bonds in organic compounds, and a similar use in synthetic organic chemistry for preparing new compounds. Under proper conditions, ozone attaches itself at the double bond of an unsaturated compound to form an ozonide. Since many ozonides are explosive, it is customary to decompose them in solution and deal with the final product.

P

P Symbol for phosphorus.

p- Abbreviation for para-.

Pa Symbol for protactinium.

PA. Abbreviation for phthalic anhydride and for polyamide.

PABA. Abbreviation for para-aminobenzoic acid.

PABA sodium. See sodium para-aminobenzoate.

packaging. The operation of placing materials in suitable containers or protective covering for purposes of storage, distribution, and sale. Some packages act merely as containers, but others protect perishable materials (especially foodstuffs) from environmental damage, contamination, and biological deterioration; in this respect the critical factor is exclusion of moisture vapor, bacteria, and oxygen. Some packages perform both functions simultaneously. Common packaging materials are:

(for nonperishable products)	(for perishable products)
wooden boxes, kegs, barrels	glass bottles
fiber drums	"tin" cans
glass bottles (perfumes, pharmaceuticals)	plastic film
polyvinyl chloride bottles (detergents)	cellophane (tobacco)
aluminum tubes (toothpaste)	polypropylene
paperboard cartons	polyvinylidene chloride
polyethylene film (textiles)	polyethylene
ceramic jars (cosmetic creams)	paraffin-coated paper and board
steel cylinders (gases)	aluminum cans (beer, soft drinks)

packing. (1) A collar or gasket used to seal mechanical devices to prevent leakage of oil or water; often made of specially compounded rubber or of a flexible plastic. (2) The operation of placing solid materials or objects in shipping containers in such a way as to secure maximum space economy and freedom from damage by vibration or impact. Barriers of paperboard, foamed plastic or glass fiber are widely used.

PAHA. See para-aminohippuric acid.

paint. A uniformly dispersed mixture having a viscosity ranging from a thin liquid to a semisolid paste and consisting of (1) a drying oil, synthetic resin, or other film-forming component, called the binder; (2) a solvent or thinner; and (3) an organic or inorganic pigment. The binder and the solvent are collectively called the vehicle (q.v.). Paints are used (1) to protect a surface from corrosion, oxidation, or other type of deterioration, and (2) to provide decorative effects.

Hazard: Flammable, dangerous fire risk (except water-based). May be toxic if vapors are inhaled

over a long period. The lead content of household paints is limited to 0.5%.

Shipping regulations: (except water-based) (Rail) Red label. (Air) Flammable Liquid label.

For further information refer to National Paint, Varnish and Lacquer Association, 1500 R. I. Ave., Washington, D.C.

See also paint, emulsion; vehicle; protective coating; antifouling paint.

paint, emulsion (latex paint). A paint composed of two dispersions: (1) dry powders (colorants, fillers, extenders) and (2) a resin dispersion. The former is obtained by milling the dry ingredients into water. The resin dispersion is either a latex formed by emulsion polymerization or a resin in emulsion form. The two dispersions are blended to produce an emulsion paint. Surfactants and protective colloids are necessary to stabilize the product. Emulsion paints are characterized by the fact that the binder is in a water-dispersed form, whereas in a solvent paint it is in solution form. The principal latex paints are styrene-butadiene, polyvinyl acetate, and acrylic resins. Percentage composition may be 25 to 30% dry ingredients, 40% latex, and 20–30% water, plus stabilizers. The unique properties of emulsion paints are ease of application, absence of disagreeable odor, and nonflammability. They can be used on both interior and exterior surfaces.

paint, inorganic. A potassium silicate-based corrosion-resistant coating designed for use on bridges and other metal work subject to marine environments.

paint, metallic. A paint in which the primary pigment is a finely divided metal dispersed in the vehicle. Most common is aluminum paint, but other metals are also used.

paint remover (varnish remover). A mixture in liquid or paste form containing volatile solvents and non-volatile components which retard evaporation of the solvent, thereby prolonging its action. Typical solvents are: methanol, denatured ethyl alcohol, methylene chloride, toluene, benzene, and ethyl acetate. Paraffin is often used as the retarder. Caustic removers contain sodium phosphate, sodium silicate, caustic soda, or the like.

paint, water-based. See paint, emulsion.

"Palacet."⁴⁴⁰ Trademark for a series of organic pigments used for dyeing and printing on acetate, nylon and polyester fibers.

"Palanil."⁴⁴⁰ Trademark for a series of dyes for polyester fibers.

"Palanthrene."⁴⁴⁰ Trademark for a series of vat dyes, mainly anthraquinonoid types.

"Palatine."³⁰⁷ Trademark for metallized acid dyes, approaching the fastness of chrome colors.

"Palatone."²³³ Trademark for a synthetic aromatic chemical; used in soap, cosmetic perfumery, and flavor compounding.

"Palconate."¹²⁶ Trademark for the sodium salt of complex organic acids extracted from redwood bark. Uses: Dispersing agent, phenol and tannin replacement, ceramic binder, ore flotation, battery expander, leather tanning, and water treatment.

"Paliofast."⁴⁴⁰ Trademark for high-grade organic pigments for dyeing lacquers, varnishes, printing colors, and plastics.

palladium Pd Metallic element of atomic number 46; atomic weight 106.4; valences 2,3,4; Group VIII of the Periodic Table. There are six stable isotopes.

Properties: Silver-white, ductile metal which does not tarnish in air. It is the least noble (most reactive) of the platinum group. Absorbs up to 800 times its own volume of hydrogen. Attacked by hot, concentrated nitric acid and boiling sulfuric acid; soluble in aqua regia and fused alkalis. Insoluble in organic acids. Good electrical conductor. Sp. gr. 12.0; m.p. 1554°C; b.p. 2927°C; Brinell hardness (annealed) 46. Nontoxic; noncombustible, except as dust.

Occurrence: Siberia, Ural Mts (U.S.S.R.); Ontario; So. Africa.

Derivation: In ores with platinum, gold, copper, etc. Concentrated ores are dissolved in aqua regia; after gold and platinum are removed by chemical treatment, palladium is precipitated by ammonia, followed by hydrochloric acid. After further purification treatment, ignition yields palladium metal.

Forms: Wire; leaf; powder; single crystals.

Grades: C.P. (99.99%); technical (99.0%).

Uses: Alloys for electrical relays and switching systems in telecommunication equipment; catalyst for reforming cracked petroleum fractions and hydrogenation; metallizing ceramics; "white gold" in jewelry; resistance wires; hydrogen valves (in hydrogen separation equipment); aircraft spark plugs; protective coatings.

palladium chloride (palladous chloride; palladium dichloride) (a) PdCl_2 (b) $\text{PdCl}_2 \cdot 2\text{H}_2\text{O}$.

Properties: Dark brown, deliquescent powder or crystals; soluble in water, hydrochloric acid, alcohol and acetone. (a) Sp. gr. 4.0 (18°C); m.p. 501°C (decomposes).

Derivation: By solution of palladium in aqua regia and evaporation.

Grades: Technical; reagent.

Uses: Analytical chemistry; "electroless" coatings for metals; manufacture of stearin, porcelains, germicides.

palladium dichloride. See palladium chloride.

palladium iodide (palladous iodide PdI_2).

Properties: Black powder; sp. gr. 6.003 (18°C); soluble in a solution of potassium iodide; insoluble in alcohol, water, and ether. Decomposes at 350°C.

palladium monoxide. See palladium oxide.

palladium nitrate (palladous nitrate) $\text{Pd}(\text{NO}_3)_2$.

Properties: Brown salt, deliquescent; decomposed by heat; soluble in water with turbidity; soluble in dilute nitric acid.

Hazard: Oxidizing agent. May react with organic materials.

Use: Analytical reagent.

Shipping regulations: (Rail) Nitrates, n.o.s., Yellow label. (Air) Nitrates, n.o.s., Oxidizer label.

palladium oxide (palladium monoxide) PdO .

Properties: Black-green or amber solid; sp. gr. 8.70

(20°C); m.p. (dec) 750°C; soluble in dilute acids.

Derivation: Careful ignition of the nitrate or prolonged heating of the finely divided metal at about 800°C.

Use: Reduction catalyst in organic synthesis.

palladium potassium chloride (palladous potassium chloride; potassium palladium chloride) $\text{PdCl}_2 \cdot 2\text{KCl}$. Properties: Reddish-brown crystals; soluble in water; slightly soluble in hot alcohol. Sp. gr. 2.67; m.p. 524°C.

Use: Reagent for carbon monoxide determination.

palladium sodium chloride (palladous sodium chloride; sodium palladium chloride) $\text{PdCl}_2 \cdot 3\text{H}_2\text{O}$.

Properties: Brown salt; hygroscopic; soluble in alcohol and water.

Use: Analysis (testing for carbon monoxide, ethylene, illuminating gas, iodine).

"Palldon."¹⁶⁹ Trademark for para-nitrosodimethylaniline used in the colorimetric determination of palladium and platinum.

palladous chloride. See palladium chloride.

palladous iodide. See palladium iodide.

palladous nitrate. See palladium nitrate.

palladous potassium chloride. See palladium potassium chloride.

palladous sodium chloride. See palladium sodium chloride.

palmarosa oil (geranium oil, Turkish).

Properties: Colorless or light yellow, essential oil, occasionally colored green by copper. Rose-like odor; sp. gr. 0.885–0.897 (15°C); optical rotation -2° to $+3^\circ$; refractive index (n_D 20) 1.4730–1.4775; soluble in 2 volumes of 70% alcohol, benzyl benzoate, fixed oils, propylene glycol, mineral oil; insoluble in glycerin. Combustible; nontoxic.

Chief known constituent: Geraniol.

Derivation: By distilling *Cymbopogon martini*, var. *motia*, found in the East Indies and Java.

Grades: Technical; F.C.C.

Uses: Perfumery; manufacture of geraniol; flavoring. See also geranium oil.

palm butter. See palm oil.

"Palmetto."⁸⁴ Trademark for agricultural dusting sulfur; used as an insecticide and fungicide.

"Palmex."¹⁵² Trademark for a series of metal processing oils available in several grades for hot dip thinning, pickling, and rolling of sheet, strip and thin tinplate.

palmitic acid (hexadecanoic acid; cetylic acid)

$\text{CH}_3(\text{CH}_2)_{14}\text{COOH}$. A saturated fatty acid. It occurs in natural fats and oils and in tall oil, and in most commercial-grade stearic acid.

Properties: White crystals; soluble in alcohol and ether; insoluble in water; sp. gr. 0.8414 (80.4°C); m.p. 62.9°C; b.p. 351.5°C, 271.5°C (100 mm), 139.0°C (1 mm); refractive index 1.4309 (70°C). Combustible; nontoxic.

Derivation: From spermaceti by saponification; hydrolysis of natural fats.

Method of purification: Crystallization.

Grades: Technical; 99.8%; F.C.C.

Uses: Manufacture of metallic palmitates; soaps; lube oils; waterproofing; food-grade additives.

palmitic acid cetyl ester. See cetin.

palmitin. See tripalmitin.

palmitoleic acid (cis-9-hexadecenoic acid)

$\text{CH}_3(\text{CH}_2)_5\text{CH}:\text{CH}(\text{CH}_2)_9\text{COOH}$. An unsaturated fatty acid found in nearly every fat, especially in marine oils (15–20%).

Properties: Colorless liquid; m.p. 1.0°C ; b.p. $140\text{--}141^\circ\text{C}$ (5 mm). Insoluble in water; soluble in alcohol and ether. Combustible; nontoxic.

Grade: Purified product 99%.

Uses: Organic synthesis; chromatographic standard.

palmitoyl chloride (hexadecanoyl chloride; palmityl chloride, so-called) $\text{CH}_3(\text{CH}_2)_{14}\text{COCl}$.

Properties: Colorless liquid; soluble in ether, decomposes in water or alcohol; m.p. $11\text{--}12^\circ\text{C}$; b.p. 194.5°C (17 mm).

palmityl alcohol. See cetyl alcohol.

palm nut cake (palm cake). The cakes formed in the press when the palm nut kernels are expressed to obtain the oil. Contains various useful constituents, such as unexpressed oil, carbohydrates, proteins, and salts. Typical analysis: proteins 30.4%; fats 8.4%; fiber 41.0%; water 9.5%; ash 10.6%.

Containers: Bags; bulk.

Uses: Cattle-food; fertilizer ingredient.

palm oil.

Properties: Yellow-brown, buttery, edible solid at room temperature. Sp. gr. 0.952; m.p. about 30°C ; iodine number 13.5; saponification number 247.6. Soluble in alcohol, ether, chloroform, carbon disulfide. Combustible. Nontoxic.

Chief constituents: Triglycerides of oleic, palmitic, and lauric acids, the percentage depending on whether kernel or fruit pulp is used as source.

Derivation: Separation of fat from palm fruits by expression or centrifugation. Palms grow in West Africa, Nigeria, Malaya, Indonesia; chief commercial source is Malaysia.

Grades: Crude; refined.

Containers: Drums; tank wagons.

Uses: Soap manufacture; pharmacy; food shortening; cutting-tool lubricant; hot-dipped tin coating;terne plating; cosmetics; softener in rubber processing; cotton goods finishing; substitute for tallow.

PAM. Abbreviation of 2-pyridine aldoxime methiodide (q.v.).

"Pamak."²⁶⁶ Trademark for various tall oil products including a series of tall oil fatty acids and distilled tall oils containing varying percentages of rosin acids. "Pamak" TP and WTP are residues from fractionation of crude tall oil in the manufacture of tall oil fatty acids.

pamaquine naphthoate $\text{C}_{42}\text{H}_{45}\text{N}_3\text{O}_7$.

Properties: Yellow to orange yellow odorless almost tasteless powder. Insoluble in water; soluble in alcohol and acetone.

Use: Medicine (antimalarial).

"Pamisyl."³³⁰ Trademark for para-aminosalicylic acid. "Pamisyl" Sodium: sodium para-aminosalicylate.

"Panaflex."²¹⁶ Trademark for liquid hydrocarbon plasticizers; used as secondary plasticizers in compounding polyvinyl chloride; in vinyl plastisols; and in molded and extruded products.

"Panapol."²¹⁶ Trademark for liquid hydrocarbon polymers produced by polymerization of olefins and

diolefins; available in a wide color range with various physical properties.

Containers: Tank cars or 55-gal drums.

Use: Extender for drying oils, or where a low-cost resinous product is desirable.

"Panazol."²¹⁶ Trademark for petroleum aromatic solvents available in a variety of boiling ranges. Used in paint and varnish applications, and in the formulation of insecticides.

pancreatin. A mixture of enzymes, principally pancreatic amylase, trypsin, and pancreatic lipase. Obtained from the pancreas of hog or ox.

Properties: Cream-colored amorphous powder; characteristic odor; acts upon starch and proteins. Soluble in water; insoluble in alcohol. It changes protein into proteoses and derived substances, and starch into dextrins and sugars. Its greatest activity is in neutral or slightly alkaline media.

Derivation: Pancreas gland is extracted by macerating with chloroform, water, dilute boric acid, glycerol, or alcohol, filtered and evaporated.

Grades: N.F.

Containers: Glass bottles; fiber cans.

Uses: Medicine, as an emulsifying agent, and as a ferment; in bating compounds for leather; to remove starch and protein sizings from textiles.

"Pan Glaze."¹⁴⁹ Trademark for a resinous silicone coating developed to replace pan grease in the baking industry. It provides easy release for 100 or more bakes.

"Panmycin" Phosphate.³²⁷ Trademark for tetracycline phosphate complex.

"Pano-drench."⁴⁰¹ Trademark for a liquid soil treatment concentrate containing 0.6% cyano(methylmercuri)-guanidine.

Hazard: May be toxic by ingestion.

"Panogen."⁴⁰¹ Trademark for a series of fungicides containing methylmercury dicyandiamide. Toxic by ingestion.

pantethine $\text{C}_{22}\text{H}_{42}\text{N}_4\text{O}_8\text{S}_2$. The disulfide form of N-pantothenylthioethanolamine. Lactobacillus bulgaricus growth factor (LBF). A fragment of coenzyme A, a pantothenic acid derivative.

Use: Biochemical research.

panthenol. USAN name for pantothenol.

"Pantholin."¹⁰⁰ Trademark for racemic calcium pantothenate, U.S.P.

pantolactone (2,4-dihydroxy-3,3-dimethylbutyric acid, gamma lactone) $\text{HC}(\text{OH})\text{C}(\text{CH}_3)_2\text{CH}_2\text{OCO}$.

Properties: Crystals; sp. gr. (20/20°C), 1.180; m.p. 79.2°C ; soluble in water.

Grade: 80% aqueous solution.

Use: Preparation of pantothenic acid.

pantothenic acid [N-(2,4-dihydroxy-3,3-dimethylbutyryl)-beta-alanine]

$\text{HOCH}_2\text{C}(\text{CH}_3)_2\text{CHOHCONH}(\text{CH}_2)_2\text{COOH}$. A member of the vitamin B complex; it is a component of coenzyme A (q.v.), and may be considered a beta-alanine derivative with a peptide linkage. As a component of coenzyme A, it is involved in the release of energy from carbohydrate utilization, and is necessary for synthesis and degradation of fatty acids, sterols and steroid hormones; it also functions in the formation of porphyrins. It occurs in all living cells and tissues. Nontoxic. The natural product is dex-

trorotatory (D+), and is the only form having vitamin activity.

Sources: Food sources: liver, kidney, yeast, crude molasses, milk, whole grain cereals, rice. Commercial sources: produced synthetically from 2,4-dihydroxy-3,3-dimethylbutyric acid and beta-alanine. See calcium pantothenate.

pantothenol (D[+]-pantothenyl alcohol; panthenol, USAN name)

$\text{HOCH}_2\text{C}(\text{CH}_3)_2\text{CHOHCONH}(\text{CH}_2)_2\text{CH}_2\text{OH}$. The alcohol corresponding to pantothenic acid, with vitamin activity.

Properties: Viscous liquid; soluble in water, ethanol, methanol; specific rotation $+28.36^\circ$ to 30.7° in water ($c = 5$); refractive index 1.497 (20°C).

Uses: Biochemical research; food additive and dietary supplement.

papain (papayotin)

Properties: White or gray slightly hygroscopic powder; soluble in water and glycerine; insoluble in other common organic solvents. The most thermostable enzyme known. Digests proteins.

Derivation: Obtained as dried and purified latex of *Carica papaya*.

Grades: Technical; purified. Technical grade is susceptible to decomposition in storage.

Containers: Glass bottles; lined fiber drums.

Uses: Meat tenderizer; other food industries (mainly to prevent protein haze on chilling beer); tobacco, pharmaceutical, cosmetic, leather, textiles.

papaverine $(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{CH}_2\text{C}_6\text{H}_4\text{N}(\text{OCH}_3)_2$. 6,7-Dimethoxy-1-veratryloquinoline. An alkaloid.

Properties: White crystalline powder. Soluble in chloroform, hot benzene, aniline, glacial acetic acid, and acetone; slightly soluble in alcohol and ether; insoluble in water. M.p. 147°C .

Derivatoin: From opium.

Hazard: Moderately toxic narcotic.

Use: A vasodilator used for treatment of hypertension (also as the hydrochloride which is soluble in water.)

paper. A semisynthetic product made by chemically processing cellulosic fibers. Wide varieties of sources have been used for specialty papers (flax, bagasse, esparto, straw, papyrus, bamboo, jute, and others), but by far the largest quantity is made from softwoods (coniferous trees), such as spruce, hemlock, pine, etc.; some is also made from such hardwoods as poplar, oak, etc., as well as from synthetic fibers. Papermaking technology involves the following basic steps: (1) chipping or other subdivision of the logs (see groundwood); (2) manufacture of chemical or semichemical pulp by digestion in acid or alkaline solutions, which separates the cellulose from the lignin (see pulp, paper); (3) beating the pulp to break down the fibers and permit proper bonding when the sheet is formed; (4) addition of starches, resins, clays, and pigments to the liquid stock (or "furnish"); (5) formation of the sheet continuously on a fourdrinier machine, where the water is screened out and the sheet dried by passing over a series of heated drums; (6) high-speed calendering for brightness and finish; (7) coating, either by machine application or (for heavy finishes) by brushes.

Note: Wet paper stock and waste are flammable, and are considered as dangerous fire risks.

Further information can be obtained from the Technical Association of the Pulp and Paper Industry,

360 Lexington Ave., N.Y. (q.v.), or from the Institute of Paper Chemistry, Appleton, Wisconsin.

"Paperad."⁴⁵⁹ Trademark for a finely precipitated tri-hydrated alumina pigment filler and extender for use in the paper industry. Characterized by high brightness and blue-white color.

paper chromatography (PC). A micro type of chromatography (q.v.). A drop of the liquid to be investigated is placed near one end of a strip of paper. This end is immersed in solvent, which travels down the paper and distributes the materials present in the original drop selectively. Comparison with known substances makes identification possible.

paper, coated. A paper that is covered on one or both sides with a suspension of clays, starches, casein, rosin, wax, or combinations of these, to serve special purposes. Machine-coated paper is required for standard book printing; the rather light coating is applied by a roll-coating device. Heavier coatings are applied as a final step by means of brushes or spreading devices. These are required for high-grade printing of magazines, art books, etc., where excellent photographic reproduction is essential. Special-purpose coatings, as for packaging, are applied in a separate operation.

paper, synthetic. Paper or paper-like material made from a polyolefin; polypropylene is usually selected. This product reached pilot-plant production stage in 1974. A paper made from styrene copolymer fibers has been developed to production stage in Japan. Plastic-coated cellulosic papers are available for children's books, posters, and similar applications.

"Papi."⁵²⁰ Trademark for polymethylene polyphenylisocyanate. A dark non-volatile liquid; average viscosity 250 cp at 25°C . Used in one-shot rigid urethane foams.

"Papi" 50. 50% solution in monochlorobenzene. Used in adhesives (rubber to metals and synthetic fabrics); coating intermediate.

"Papricol."³⁴² Trademark for an oleoresin of paprika for food coloring and flavoring.

para- (p-). A prefix. For definition of para-compounds, see ortho-. For para-compounds, see specific compound; para-cresol is listed under cresol and para-dichlorobenzene under dichlorobenzene.

"Parabens."⁵⁵³ Trademark for the methyl, propyl, butyl, and ethyl esters of para-hydroxybenzoic acid. Antimicrobial agents for foods and pharmaceuticals. Nontoxic. Approved by FDA.

paracasein. See casein.

paracetaldehyde. See paraldehyde.

"Paracol."²⁶⁴ Trademark for a series of wax and wax-rosin emulsions produced from paraffin waxes, microcrystalline waxes, or combinations of these waxes with rosin. Used to impart water resistance to paper and allied materials.

"Paracort."³³⁰ Trademark for prednisone (q.v.).

"Paracril."²⁴⁵ Trademark for a group of synthetic rubbers of the Buna-N or nitrile type, produced by the copolymerization of butadiene and acrylonitrile. Resist deterioration by aliphatic hydrocarbon, mineral and vegetable oils, and animal fats and oils and are particularly resistant to petroleum products.

"Paracril" is also used as a plasticizer for vinyls and other thermoplastic and thermosetting resins.

"Paradene."²¹ Trademark for low-priced, dark, thermoplastic, coal-tar resins (coumarone-indene) available in low to high softening point ranges; used in rubber compounding.

"Paradi."⁶² Trademark for para-dichlorobenzene (q.v.).

"Paradors."¹² Trademark for products for use in the neutralization of objectionable odors in rubber.

"Paradow."²³³ Trademark for para-dichlorobenzene (q.v.).

paraffin (1) Also called alkane. A class of aliphatic hydrocarbons characterized by a straight or branched carbon chain; generic formula C_nH_{2n+2} . Their physical form varies with increasing molecular weight from gases (methane) to waxy solids. They occur principally in Pennsylvania and Midcontinent petroleum.

(2) Paraffin wax (q.v.).

paraffin distillate. A distilled petroleum fraction which, when cooled, consists of a mixture of crystalline wax and oil.

paraffin, chlorinated. A paraffin oil or wax in which some of the hydrogen atoms have been replaced by chlorine. Nonflammable; low toxicity. Used in high-pressure lubricants; as flame retardant in plastics and textiles; as plasticizer for polyvinyl chloride in polyethylene sealants; and in detergents.

paraffin oil. An oil either pressed or dry-distilled from paraffin distillate. Liquid petrolatum is also known as paraffin oil. Combustible.

Grades: By viscosity and color.

Containers: Up to tank cars.

Uses: Floor treatment; lubricant; when purified, medicine.

paraffin wax (paraffin scale; paraffin).

Properties: White, translucent, tasteless, odorless solid; consisting of a mixture of solid hydrocarbons of high molecular weight, e.g., $C_{36}H_{74}$. Soluble in benzene, ligroin, warm alcohol, chloroform, turpentine, carbon disulfide and olive oil; insoluble in water and acids; sp. gr. 0.880–0.915; m.p. 47–65°C. Combustible; essentially nontoxic. Flash point 390°F; autoignition temp. 473°F.

Grades: Yellow crude scale; white scale; refined wax; ASTM: N.F. Also graded by melting point, in °F and color. The higher-melting grades are the more expensive.

Containers: Kegs; cases (slabs); tank cars.

Hazard: (fume): Tolerance, 1 mg per cubic meter of air.

Uses: Candles; paper coating; protective sealant for food products, beverages, etc.; glass-cleaning preparations; hot-melt carpet backing; biodegradable mulch (hot melt-coated paper); impregnating matches; lubricants; crayons; surgery; stoppers for acid bottles; electrical insulation; floor polishes; cosmetics; photography; anti-frothing agent in sugar refining; packing tobacco products; protecting rubber products from sun-cracking; chewing gum base (to ASTM specifications).

"Parafint." Trademark for a polymethylene wax. It is white, odorless, and has congealing point of 205°F. Available in flaked form. Approved by F.D.A.

"Paraflow."²⁹ Trademark for a mixture of synthetic organic compounds of high molecular weight, which

are added to lubricating oils to reduce their pour points.

"Para-Flux."⁹⁴ Trademark for a series of petroleum-based plasticizers for natural and synthetic rubbers.

paraformaldehyde (paraform) $HO(CH_2O)_nH$. A polymer of formaldehyde in which n equals 8 to 100. Not to be confused with the trimer, symtrioxane (q.v.).

Properties: White solid with slight odor of formaldehyde; insoluble in alcohol and ether. Soluble in strong alkali solution. The higher polymers are insoluble in water. Melting range 120–170°C; flash point 160°F (closed cup). Combustible. Autoignition temp. 572°F.

Derivation: By evaporating an aqueous solution of formaldehyde.

Forms: Flake; powder.

Grades: Bags; carlots.

Hazard: Toxic by ingestion; irritant to tissue. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Fungicides, bactericides, and disinfectants; adhesives; hardener and waterproofing agent for gelatin.

paraldehyde (2,4,6-trimethyl-1,3,5-trioxane) $C_6H_{12}O_3$. A cyclic polymer (trimer) of acetaldehyde. A depressant drug.

Properties: Colorless liquid. Disagreeable taste; agreeable odor. Decomposes on standing. Stable toward alkalis but slowly decomposed to acetaldehyde when treated with a trace of mineral acid. Miscible with most organic solvents, volatile oils; soluble in water. Sp. gr. 0.9960 at 20°C/20°C; b.p. 124.5°C; m.p. 12.6°C; vapor pressure 25.3 mm (20°C); flash point 96°F (TOC); specific heat 0.434; refractive index 1.40 to 1.42 (20°C); wt 8.27 lb/gal (20°C). Autoignition temp. 460°F.

Derivation: Action of hydrochloric or sulfuric acid upon acetaldehyde.

Grades: Technical; U.S.P.

Containers: Drums; tank cars.

Hazard: Flammable, moderate fire risk; toxic by ingestion and inhalation.

Uses: Substitute for acetaldehyde; rubber accelerators; rubber antioxidants; synthetic organic chemicals; dyestuff intermediates; medicine; solvent for fats, oils, waxes, gums, resins; leather; solvent mixtures for cellulose derivatives; sedative.

"Paramine."³⁰⁰ Trademark for a cationic finishing agent for textiles; an aminofatty condensation product solubilized with a volatile acid.

paranitraniline. See nitroaniline, para-.

paranitraniline red. See para red.

"Paranox."²⁹ Trademark for a series of additives compounded for use in lubricating oils. Imparts high temperature detergency, low temperature sludge inhibition and anti-wear characteristics to oils compounded for lubrication of automobile and diesel engines and for automatic transmission fluids.

para-oxon (diethyl para-nitrophenyl phosphate) $(C_2H_5O)_2P(O)OC_6H_4NO_2$. Generic name for the oxygen analog of parathion.

Properties: Odorless, reddish-yellow oil; b.p. 148–151°C (1 mm); sp. gr. 1.269 (25/25°C); refractive index 1.5060 (25°C). Slightly soluble in water, soluble in most organic solvents. Decomposes rapidly in alkaline solutions.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Cholinesterase inhibitor. Use may be restricted.

Uses: Insecticide; nerve poison.

Shipping regulations: (Rail, Air) Organic phosphate, liquid, n.o.s., Poison label. Not accepted on passenger planes.

"Parapastels."¹⁸⁸ Trademark for a group of perfume and color combinations designed to impart agreeable fragrance and pleasing color to products made of para-dichlorobenzene or naphthalene.

"Paraplex."²³ Trademark for polymeric plasticizers for resinous coatings. Primarily polyester, but some grades also epoxides which impart heat and light stability. Supplied as viscous liquids, 100% solids or solutions in petroleum hydrocarbons. Most grades compatible with nitrocellulose, ethyl cellulose, polyvinyl butyral, and other high polymer film formers.

Use: Coatings for wood, metal, fabrics, paper, and rubber. Also in formulation of free films, caulking and sealing compounds.

"Parapol."²⁹ Trademark for a copolymer of isobutylene and styrene. This material is useful as a free film, as a supported film, and as a modifier for paraffin.

"Parapon."³⁰⁰ Trademark for a highly sulfated fatty ester dyeing assistant and leveling agent for dyed fabrics.

paraquat. Generic name for 1,1'-dimethyl-4,4'-bipyridinium salt, $[\text{CH}_3(\text{C}_5\text{H}_4\text{N})_2\text{CH}_3]^+ \cdot 2\text{CH}_3\text{SO}_3^-$.

Properties: Yellow solid; soluble in water.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.5 mg per cubic meter of air. Use may be restricted.

Use: Herbicide.

Shipping regulations: Not listed.

para red (paranitraniline red) $\text{C}_{10}\text{H}_6(\text{OH})\text{NNC}_6\text{H}_4\text{NO}_2$.

A pigment formed by coupling diazotized paranitroaniline with beta-naphthol. Ther term is also used to refer to a group of lakes based on this dye. See para toner.

"Para Resin" 2457.⁹⁴ Trademark for a petroleum base resin. Used as a plasticizer and softener for rubbers.

pararosanine $\text{HOC}(\text{C}_6\text{H}_4\text{NH}_2)_3$. A triphenylmethane dye. C.I. No. 42500.

Properties: Colorless to red crystals; m.p. 205°C (approx.). Soluble in alcohol; very slightly soluble in water and ether. Combustible.

Hazard: May be toxic.

Use: Dye (usually as the hydrochloride). Component of fuchsin (q.v.).

pararosolic acid. See aurin.

"Parasepts."¹³⁸ Trademark for a group of neutral esters of para-hydroxybenzoic acid; includes the methyl, ethyl, propyl, benzyl, and butyl esters. White powder. Use: Antimicrobial agents.

"Paratac."²⁰ Trademark for a high molecular weight isobutylene polymer used as an additive for both lubricating oils and greases, particularly in producing so-called "nondrip," "nonspatter" oils.

"Paratex."³⁰⁰ Trademark for a water softener used in textile processing.

parathion. Generic name for O,O-diethyl O-para-nitrophenyl phosphorothioate (ethyl parathion; O,O-diethyl para-nitrophenyl thiophosphate; AATP) $(\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{S})\text{OC}_6\text{H}_4\text{NO}_2$.

Properties: Deep brown to yellow liquid; usually has faint odor. Refractive index (n_D²⁵) 1.5367; sp. gr.

1.26 (25/4°C); b.p. 157-162°C (0.6 mm); 375°C; vapor pressure 0.003 mm (24°C); very slightly soluble in water (20 ppm); completely soluble in esters, alcohols, ketones, ethers, aromatic hydrocarbons, animal and vegetable oils; insoluble in petroleum ether, kerosine, spray oils. Stable in distilled water and in acid solution. Hydrolyzed in the presence of alkaline materials; slowly decomposes in air.

Purity: Technical grade is about 95% pure. Also supplied diluted with inert carriers of various types, and in various proportions.

Derivation: From sodium ethylate, thiophosphoryl chloride and sodium para-nitrophenate.

Containers: Tins; steel drums.

Hazard: Highly toxic by skin contact, inhalation or swallowing. Cholinesterase inhibitor. Repeated exposure may, without symptoms, be increasingly hazardous. Fatalities have resulted from its accidental use. Tolerance, 0.1 mg per cubic meter of air. Approved by EPA.

Uses: Insecticides and acaricide.

Shipping regulations: (Rail, Air) (liquid) Poison label. Not acceptable on passenger planes. (Rail) (dry and liquid mixtures) Poison label. (Air) Consult regulations for various mixtures, all of which require Poison label. Parathion and compressed gas mixture, Not acceptable.

See also methyl parathion.

"Paratone."²⁹ Trademark for organic compounds used as additives designed to improve viscosity index of lubricating oils.

para toner. An insoluble red pigment derived from beta-naphthol and para-nitroaniline. The former is sometimes partly replaced by mono-acid F, 2-naphthol-7-sulfonic acid. Through varying the conditions of temperature and acid concentration, different shades may be obtained.

Containers: Barrels.

Uses: Paint and printing ink pigments; making para lakes.

"Parco."⁶² Trademark for phosphoric acid and phosphate compounds for dissolving rust from the surface of metal.

"Parcolene."⁶² Trademark for chemicals for treating metal surfaces to remove extraneous matter and/or condition the surface prior to other finishing operations.

paregoric. A derivative of opium that is habit-forming on continued use. Its use is restricted by FDA. Used in medicine, especially for digestive disorders.

parethoxycaine hydrochloride. See beta-diethylaminoethyl-para-ethoxybenzoate hydrochloride.

"Parex" process.⁵⁰⁵ A proprietary continuous method for extracting para-xylene from mixed xylene feedstocks. See para-xylene.

"Parez."⁵⁷ Trademark for a series of melamine-formaldehyde and urea-formaldehyde resins, designed for use in papermaking.

"Paricin."²⁰² Trademark for various alkyl hydroxystearates (soft, low melting point waxes useful as firming agents in cosmetics and specialty inks and as coupling agents for incompatible mixtures of polar and non-polar materials in hot melt applications) and acetoxystearates (plasticizers for nitrocellulose, cellulose acetate butyrate, ethylcellulose, and vinyl resins.)

"Pariflux."²⁵⁰ Trademark for fluorspar. Used in welding electrode coatings for arc stabilization, fluxing weld metal and forming protective slag.

Paris green. See copper acetoarsenite.

Paris white. See whiting.

"Parkerex."⁶² Trademark for resins to be used for ion exchange purposes.

"Parkerizing."³⁴³ Trademark for a process for the inhibition of rust formation on iron or steel by coating surface with a phosphate layer, achieved by dipping in acid phosphate solution.

Parkes process. A standard process for the separation of silver from lead. From 1-2% molten zinc is added to the lead-silver mix, heated to above the melting point of zinc. A scum containing most of the silver and zinc forms on the surface. This is separated and the silver recovered. The separation of silver is not complete and the process is repeated several times.

"Parlon."²⁶⁶ Trademark for chlorinated rubber. White, odorless, nonflammable, granular powder. Available in five viscosity grades.

Uses: Film-former in paints, inks, adhesives, and concrete-treating compounds; traffic and marine paints; corrosion-resistant coatings.

"Parmo."⁵¹ Trademark for petrolatums meeting U.S.P. or N.F. requirements and having melting points, consistencies and colors suitable for pharmaceuticals and cosmetics.

"Parnol" 40.³⁰⁹ Trademark for sodium dodecylbenzene sulfonate in the form of a fine flake, containing approximately 40% of active matter.

Uses: Textile scouring and dyeing operations; synthetic detergents, and a household detergent additive.

"Parolite."¹⁵⁹ Trademark for normal zinc sulfoxylate formaldehyde. Used for the stripping of all forms of wool and synthetics, (nylon, acetates, Dacron, etc.).

paromomycin sulfate. Antibiotic from a strain of *Streptomyces*.

Properties: Creamy white, odorless, hygroscopic powder. Soluble in water; insoluble in chloroform and ether.

Grade: N.D.

Use: Medicine (antibiotic).

partial pressure. The pressure due to one of the several components of a gaseous or vapor mixture. In general this pressure cannot be measured directly but is obtained by analysis of the gas or vapor and calculation by use of Dalton's law. See also Raoult's law.

particle. Any discrete unit of material structure; the particulate basis of matter is a fundamental concept of science. The size ranges of particles may be summarized as follows: (1) Subatomic: protons, neutrons, electrons, deuterons, etc. These are collectively called fundamental particles. They are invisible by any means. (2) Molecular: includes atoms and molecules with size ranging from a few angstroms to about half a micron. (3) Colloidal: includes macromolecules, micelles, and ultrafine particles such as carbon black; resolved in electron microscope; size ranges from 1 millimicron up to lower limit of the optical microscope (1 micron). (4) Microscopic: units that can be resolved by an optical microscope (includes bacteria). (5) Macroscopic: all particles that can be resolved by the naked eye. See also matter; particle size.

particle accelerator. A device in which the speed of charged subatomic particles (protons, electrons) and heavier particles (deuterons, alpha particles) can be greatly increased by application of electric fields of varying intensity, often in conjunction with magnetic fields. It is possible to accelerate electrons and protons to speeds approaching the speed of light if sufficiently high voltage is used. Straight-line (linear) accelerators are used for protons, and doughnut-shaped betatrons for electrons; other types are the Van de Graaf electrostatic generator, the synchrotron, and the cyclotron. Before the development of nuclear reactors, the cyclotron was used to accelerate deuterons for use in bombarding stable nuclei to produce neutrons for inducing artificial radioactivity, fission, and formation of synthetic (transuranic) elements.

particle size. This term refers chiefly to the solid particles of which industrial materials are composed (carbon black, zinc oxide, clays, pigments, and the like). The smaller the particle, the greater will be the total exposed surface area of a given volume. Activity is a direct function of surface area; that is, the finer a substance is, the more efficiently it will react, both chemically and physically. A colloidal pigment is a more effective colorant than a coarse one because of the greater surface area of its particles. A pound of channel carbon black has a surface area of about eighteen acres, which largely accounts for its powerful reinforcing effect in rubber. Thus ultra-fine grinding of powders is of utmost importance in such products as paints, cement, plastics, rubber, dyes, pharmaceuticals, printing inks, and numerous others. See also particle; surface chemistry; colloid chemistry; sedimentation.

partition chromatography. See liquid chromatography.

"Parvan."⁵¹ Trademark for fully refined paraffin wax available in slabs and in liquid form in wide range of melting points and hardness.

"Parvo."⁵⁷ Trademark for folic acid feed supplement.

parylene. Generic name for thermoplastic film polymers based on para-xylylene and made of vapor-phase polymerization.

Derivation: para-Xylene, $\text{CH}_3\text{C}_6\text{H}_4\text{CH}_3$, is heated with steam at 950°C to produce the cyclic dimer dipara-xylylene, a solid which can be separated in pure form. The dimer is then pyrolyzed at 550°C to produce monomer vapor of para-xylylene

$\text{CH}_2\text{:C}_6\text{H}_4\text{:CH}_2$ which is then cooled below 50°C and condenses on the desired object as a polymer having the repeating structure $-(\text{CH}_2\text{C}_6\text{H}_4\text{CH}_2)_n-$, with n about 5000 and molecular weights of about 500,000. The polymer is used as a protective coating. Films as thin as 500 Å to 5 mils are obtained.

Uses: Thin coatings of high purity and uniformity on almost any substrate which will resist a high vacuum, as paper, fabric, polyethylene and polystyrene film, ceramics, metals, many solid chemicals; electronic miniaturization systems; capacitors; thin film circuits.

"Parzate."²⁸ Trademark for a series of fungicides.

"Parzate" Liquid is a solution containing 22% nabam to be combined with zinc sulfate in the spray tank.

"Parzate" C is a wettable powder containing 75% zineb. "Parzate" D is a finely divided powder containing 85% zineb.

Hazard: Irritant to skin and mucous membranes.

PAS. Abbreviation for para-aminosalicylic acid. See 4-aminosalicylic acid.

PAS sodium. See sodium para-aminosalicylate.

passivity. A property shown by iron, chromium and related metals, involving loss of their normal chemical activity in an electrochemical system or in a corrosive environment after treatment with strong oxidizing agents like nitric acid, and when oxygen is evolved upon them during electrolysis, forming an oxide coating.

paste. (1) An adhesive composition of semisolid consistency, usually water-dispersible. The common pastes are based upon starch, dextrin, or latex, often with the addition of gums, glue, and antioxidants. They are widely employed for the adhesion of paper and paperboard. (2) More generally, a soft, viscous mass of solids dispersed in a liquid. For example, paste resins are finely divided resins mixed with plasticizer to form fluid or semifluid mixtures, without use of low boiling solvents or water emulsions.

paste solder. A paste (2) containing flux, cleaner, tinning agent and powdered metallic solder.

Pasteur, Louis (1822-1895). French chemist and bacteriologist who made three notable contributions to science: (1) As a result of extensive study of fermentation, which led him to conclude that it is caused by infective bacteria, he extended the work of Jenner on smallpox serum made from cowpox (1775) to development of the concept of immunizing serums and the antibody-antigen relationship (1880). Pasteur was the first to inoculate for rabies and anthrax, and suggested the term vaccination (from Latin *vaccus* = cow) in recognition of Jenner's achievement. (2) initiation of the practice of heat-treating wine, and later milk and other food products, to kill or inactivate toxic microorganisms, especially the tuberculosis bacillus; (3) discovery of the optical properties of tartaric acid, present in wine residues, which laid the basis for modern knowledge of optical isomers (right- and left-handed molecular structure), a phenomenon now often called chirality. See also pasteurization; optical isomer.

pasteurization. Heat treatment of milk, fruit juices, canned meats, egg products, etc., for the purpose of killing or inactivating disease-causing organisms. For milk, the minimum exposure is 62°C for 30 minutes, or 72°C for 15 seconds, the latter being called flash pasteurization. Though this treatment kills all pathogenic bacteria and also inactivates enzymes which cause deterioration of the milk, the shelf-life is limited; to prolong storage life temperatures of 80 to 88°C for 20 to 40 seconds must be used. Complete sterilization (q.v.) requires ultra-high pasteurization at from 94°C for 3 seconds to 150°C for 1 second; in-can heating at 116°C for 12 minutes and 130°C for 3 minutes is also employed for maximum stability and long storage life. Some meat products are pasteurized by alpha-radiation.

PAT. Abbreviation for polyaminotriazole (q.v.).

patchouli oil.

Properties: Yellow-greenish brown or brown essential oil; penetrating camphoraceous odor; sp. gr. (15°C) 0.950-0.995; refractive index (n_D 20) 1.5070 to 1.5200; optical rotation -48° to -68°; soluble in 10 volumes of 90% alcohol. Soluble in ether, chloroform, benzyl benzoate, fixed oils, mineral oil; insoluble in glycerol. Combustible; nontoxic.

Derivation: Direct steam distillation of the dried leaves of *Pogostemon patchouli*.

Chief constituents: Patchouly alcohol (a tricyclic sesquiterpene alcohol), eugenol, cinnamic aldehyde, cadinene.

Uses: Perfumery; flavoring.

patentability. The qualifications for obtaining a patent on an invention (q.v.) or chemical process. These are: (1) the invention must not have been published in any country or in public use in the U.S., in either case for more than one year prior to date of filing the application; (2) it must not have been known in the U.S. before date of invention by the applicant; (3) it must not be obvious to an expert in the art; (4) it must be useful for a purpose not immoral and not injurious to the public welfare; (5) it must fall within the five statutory classes on which only patents may be granted, namely, (a) composition of matter, (b) process of manufacture or treatment, (c) machine, (d) design (ornamental appearance), or (e) a plant produced asexually. Special regulations relate to atomic energy developments and subjects directly affecting national security.

Robert Calvert

patent alum. See aluminum sulfate.

patent leather. Fashion leather used chiefly for formal shoes, bags, etc., characterized by a high, glossy finish applied as the final step in processing. The finish greatly reduces the poromeric nature of the leather.

pathfinder element. An element present in small proportions (less than 1%), generally metallic in nature, associated with ore deposits at the time of formation. Mapping of the concentration variation of the selected element serves to locate the main ore deposit. Examples are zinc as the "pathfinder" for lead, copper and silver ores and molybdenum associated with copper deposits.

"Pathilon"³¹⁵ Trademark for tridihexethyl chloride (q.v.).

pathway. A term used largely by biochemists for the series of chemical changes that occur during the transformation of one biochemical entity to another.

patina. Variously used to refer to an ornamental and/or corrosion-resisting film on the surface of copper, copper alloys, including bronzes, and also sometimes of iron and other metals. Such a film is formed by exposure to the air, or by a suitable chemical treatment.

patronite. A mixture of vanadium-bearing substances with the approximate formula VS₂, found in Peru.

Pattinson process. Process for the removal of silver from lead. The silver-lead mixture is melted in one of a series of pots and allowed to cool slowly. The lead which is free from silver or poorer in silver separates out as crystals which are removed, leaving the silver-rich lead in the molten state. From a number of such operations in series a lead rich in silver is obtained, collected, and the silver recovered. See also Parkes process.

Pauli exclusion principle. A fundamental generalization concerning the energy relationships of electrons within the atom, namely, that no two electrons in the same atom have the same value for all four quantum numbers; corollary to this is the fact that only two electrons can occupy the same orbital, in which case they have opposite spin, i.e., +½ and -½. This principle has an important bearing on the sequence of

elements in the Periodic Table and on the limiting numbers of electrons in the shells (2 in the first, 8 in the second, 18 in the third, 32 in the fourth, etc.). See also quantum number; shell; orbital theory.

"Paveril Phosphate."¹⁰⁰ Trademark for dioxyline phosphate (q.v.).

Pb Symbol for lead.

PBAA. Abbreviation for polybutadieneacrylic acid copolymer.

PBD. See 1,3,4-phenylbiphenyloxadiazole.

PBI. See polybenzimidazole.

PBPB. Abbreviation for pyridinium bromide perbromide.

PCB. Abbreviation for polychlorinated biphenyl (q.v.).

"PC-1244" Defoamer.⁵⁸ Trademark for a clear light yellow liquid; sp. gr. at 60/60°F, 0.86; 7.72 lb/gal. Used as a foam control in non-aqueous systems and also imparts a leveling action in paraffin wax formulations.

P.C.E. Abbreviation for pyrometric cone equivalent, a scale of melting or fusion points of refractory materials, based on comparison with the temperature at which pyrometric cones (q.v.) melt.

P-cellulose. See phosphorylation.

PCNB. Abbreviation for pentachloronitrobenzene (q.v.).

"PCON."²³³ Trademark for 4-chloro-2-nitroaniline (q.v.).

PCP. Abbreviation for pentachlorophenol (q.v.).

PCTFE. Abbreviation for polychlorotrifluoroethylene. See chlorotrifluoroethylene resin.

pcu. Abbreviation for pound centigrade unit, the amount of heat needed to raise one pound of water from 15 to 16°C. See also chu.

Pd Symbol for palladium.

PDB. Abbreviation for para-dichlorobenzene (q.v.).

PE. Abbreviation for pentaerythritol and for polyethylene.

"PE-100."²¹⁰ Trademark for a cationic polyelectrolyte containing a quaternary ammonium group. Used as a conductive coating, coagulant aid, and metal complexing agent.

peach-kernel oil. See persic oil.

peacock blue. A blue organic pigment used especially in inks for multicolor printing. It is a lake of acid glaucine blue dye on alumina hydrate. Structurally, the dye is alpha, alpha-bis[N-ethyl-N-(4-sulfobenzyl)aminophenyl]-alpha-hydroxy-ortho-toluenesulfonic acid sodium salt, $\text{HSO } \text{C}_6\text{H}_4\text{COH}[\text{C}_6\text{H}_4\text{N}(\text{C}_2\text{H}_5)\text{CH}_2\text{C}_6\text{H}_4\text{SO}_3\text{Na}]_2$, and is prepared from aniline, ethanol, benzyl chloride, ortho-chlorobenzaldehyde, sulfuric acid, and sodium bisulfite.

Containers: 250-lb barrels.

Note: The term peacock blue is sometimes applied to other pigments of similar color, such as Prussian blue which has been treated with phosphotungstic acid.

peanut cake. The press cake resulting from the extraction of oil from the peanut. See peanut oil meal.

peanut oil (arachis oil; groundnut oil). A fixed non-drying oil.

Properties: Yellow to greenish yellow. Soluble in ether, petroleum ether, carbon disulfide and chloroform; insoluble in alkalies, but saponified by alkali hydroxides with formation of soaps; insoluble in water; slightly soluble in alcohol. Sp. gr. 0.912–0.920 (25°C); solidifying point –5 to +3°C; saponification value 186–194; iodine number 88–98; refractive index 1.4625–1.4645 (40°C). Flash point 540°F. Combustible. Nontoxic. Autoignition temp. 883°F.

Chief known constituents: Principally glycerides of oleic and linoleic acids, with lesser amounts of the glycerides of palmitic, stearic, arachidic, behenic, and lignoceric acids.

Derivation: By pressing ground peanut meats or by extraction with hot or cold solvents.

Method of purification: Bleaching with fuller's earth or carbon. Hot-pressed oil is frequently allowed to stand to deposit stearin (which it will do even at ordinary temperatures) and then filtered.

Grades: U.S.P., crude; refined; edible.

Containers: 5-gal tins; 50-gal drums; tank cars.

Uses: Substitute for olive oil and other edible oils, both hydrogenated and unhydrogenated; soaps; vehicle for medicines; salad oil; mayonnaise; margarine.

peanut oil meal. The crushed form of peanut cake resulting from the extraction of oil from the seed. Prepared with or without the shells; the oil meal of commerce contains between 39–45% crude protein and is sold on that basis. Typical analysis of 39% protein meal: 39.1% crude protein; 5.3% crude fiber; 34.3% nitrogen-free extract; 6.2% ether-soluble (fats); 5.3% ash; total digestible nutrient approximately 80%.

Containers: Bulk or bags.

Uses: Animal feeds; fertilizer ingredient.

pearl alum. See aluminum sulfate.

pearl ash. See potassium carbonate.

"Pearlescent Pigment."³⁰⁴ Trademark for a lead monohydrogen phosphate.

pearl essence. See nacreous pigment.

pearl pigment. See nacreous pigment.

pearl white. See bismuth oxychloride; bismuth subnitrate.

pear oil. See amyl acetate.

peat. Partly decayed vegetable matter which has accumulated in marshes. Essentially the first stage in the development of lignite.

pectic acid. An acid derived from pectin by treating it with sodium hydroxide solution, washing with isopropyl alcohol, adding alcoholic hydrogen chloride and finally washing again with isopropyl alcohol and drying. Acidulant in pharmaceuticals.

pectin. A high molecular weight hydrocolloidal substance (polyuronide) related to carbohydrates and found in varying proportions in fruits and plants. Pectin consists chiefly of partially methoxylated galacturonic acids joined in long chains.

Properties: White powder or syrupy concentrates. Commonest characteristic of pectins is their property of jelling at room temperature, after addition of sugar to fruit juices in the preparation of jams or jellies. Soluble in water; insoluble in organic solvents. Nontoxic.

Derivation: By dilute-acid extraction of the inner portion of the rind of citrus fruits, or of fruit pomaces, usually apple.

Method of purification: Following decolorization, the

extracts are concentrated by evaporation or the pectins precipitated with alcohol or acetone.

Grades: Pure (N.F.) containing not less than 6.7% methoxy groups and not less than 74% galacturonic acid; 150-, 200-, 250-jelly grades, containing various diluents.

Uses: Jellies, foods, cosmetics, drugs; protective colloids; emulsifying agents; dehydrating agents.

pectinase. An enzyme present in most plants. It catalyzes the hydrolysis of pectin to sugar and galacturonic acid.

Use: Biochemical research; juice and jelly industry.

"Pectinol."²³ Trademark for formulated enzyme concentrates, of fungal origin, with varying degrees of pectinase activity which hydrolyze pectic substances.

Uses: Clarification of wines and fruit juices and processing of jellies.

pectin sugar. See L-arabinose.

PEG. Abbreviation for polyethylene glycol (q.v.).

"Pegospere."⁷³ Trademark for a series of polyglycol esters of fatty acids.

Uses: Plasticizers; softeners; wetting agents; detergents; lubricants; emulsifying agents.

"Peladow."²³³ Trademark for calcium chloride, 94-97%, available as white, deliquescent pellets.

"Pelargol."¹⁸⁸ Trademark for a perfume base for soap perfumes of the geranium and rose types.

pelargonic acid (n-nonoic acid; n-nonanoic acid; n-nonylic acid) $\text{CH}_3(\text{CH}_2)_7\text{COOH}$.

Properties: Colorless or yellowish oil with slight odor; sp. gr. 0.9052 (20/4°C); m.p. 12.5°C; b.p. 255.6°C, 162.4°C (32 mm); refractive index 1.4322 (20°C); soluble in alcohol, ether, and organic solvents; almost insoluble in water. Combustible. Low toxicity.

Derivation: By the oxidation of nonyl alcohol or nonyl aldehyde; the oxidation of oleic acid, especially by ozone.

Grades: Technical; 99%.

Containers: Drums; tank cars.

Hazard: May be skin irritant.

Uses: Organic synthesis; lacquers; plastics; production of hydrotropic salts; pharmaceuticals; synthetic flavors and odors; flotation agent; esters for turbojet lubricants; vinyl plasticizer; gasoline additive.

See also nonoic acid.

pelargonic alcohol. See nonyl alcohol.

pelargonic aldehyde. See nonanal.

pelargonyl chloride (n-nonanoyl chloride) $\text{CH}_3(\text{CH}_2)_7\text{COCl}$.

Properties: B.p. 80-85°C (5 mm); min assay 97%; soluble in hydrocarbons and ethers; decomposes in water.

Containers: Bottles, carboys, drums.

Hazard: May be skin irritant.

Use: Intermediate in organic synthesis.

pelargonyl peroxide ($\text{C}_8\text{H}_{17}\text{COO}-$)₂.

Properties: Water-white liquid with a faint odor; sp. gr. 0.926 min (25/25°C); m.p. 10°C; refractive index 1.443 min (25°C). Insoluble in water and glycerol; soluble in alcohol and hydrocarbons.

Hazard: Strong skin irritant and oxidizing agent. Dangerous fire risk in contact with organic materials.

Use: Initiator of polymerization reactions.

Shipping regulations: (Rail) Peroxides, liquid, n.o.s., Yellow label. (Air) Not acceptable.

"Pelaspan."²³³ Trademark for a series of expandable polystyrenes in bead or pellet form. Each bead contains its own expanding agent, which is activated by heat.

Pelilot's salt. See potassium chlorochromate.

"Pelletex."²⁷⁵ Trademark for pelleted gas furnace carbon black for rubber.

pelletierine $\text{C}_5\text{H}_{10}\text{N}(\text{CH}_2)_2\text{CHO}$. beta-2-(Piperidyl) propionaldehyde.

Properties: Liquid alkaloid from the root of the pomegranate. Soluble in water, alcohol, ether, chloroform, benzene. Sp. gr. 20/4°C 0.988; b.p. 195°C.

Hazard: Probably toxic.

Use: Medicine (in form of its salts, sulfate, tannate, valerate).

"Peltex."⁴⁷⁶ Trademark for a ferrochrome complex of sodium lignosulfonate; used as a specialized dispersant in oil well drilling fluids.

"Pemco."²⁹⁶ Trademark for ceramic frits and coloring oxides.

"Penacolate"¹¹ Trademark for resorcinolformaldehyde and resorcinol-phenol-formaldehyde adhesives and thermosetting resins in a variety of formulations.

Uses: Bonding of wood and cellulosic products, some thermosetting and thermoplastic resins and plastics, natural and some synthetic rubbers.

"Penbro."⁷⁹ Trademark for B wood resin.

Uses: Adhesives; animal depilatories; asphalt emulsions; paper size; cleaning compounds (electroplating).

"Penchlor."²⁰⁴ Trademark for cold-setting silicate-type acid-resistant cements. Completely stable in dry storage.

Grades: Acid-Proof, S-25, Fireproof, and FCC.

Containers: Cement powder available in 100-lb bags, solution in 50-lb and 600-lb steel drums.

Use: Quick setting cement mortar used with acid-proof brick to resist acids and strong oxidizing agents, except hydrofluoric acid, up to 2000°F.

"Penco."²⁰⁴ Trademark for a group of agricultural chemical products, including many insecticides, herbicides, defoliant, and fungicides.

"Pencogel."³⁴² Trademark for extract of Irish gums.

"Pendane."³⁴² Trademark for lindane insecticide concentrates.

Hazard: See lindane.

penetrant. Any agent used to increase the speed and ease with which a bath or liquid permeates a material being processed by effectively reducing the interfacial tension between the solid and liquid. Penetrants are widely used in the textile, tanning and paper industries for improving dyeing, finishing, etc., operations. Sulfonated oils, soluble pine oils and soaps are popular among the older penetrants, and the salts of sulfated higher alcohols are typical of the synthetic organics developed for this purpose. See also wetting agent.

"Penex" Process.⁴¹⁶ Proprietary process for isomerization of normal pentane and normal hexane to corresponding branched-chain hydrocarbons in an environment of hydrogen over a specially prepared platinum-containing catalyst of high activity. Preferably, the charge should be either predominantly normal pentane or normal hexane, but mixtures can

be processed. Used in preparing high octane gasoline blending stock from the lower quality normal paraffin stocks.

"Pen-Gleam."²⁰⁴ Trademark for a mildly alkaline powdered cleaning compound used for manual washing of painted surfaces.

"Pen-Glo."²⁰⁴ Trademark for a powdered, inhibited acidic material used for the removal of soil and oxides from railroad car bodies without damaging paint; 400-lb fiber drums with polyethylene liners.

"Penglo 65."⁷⁹ Trademark for a pale maleic modified pentaerythritol ester of a special tall oil in mineral spirits.
Uses: Paint and varnish.

penicillamine (USAN) (D-3-mercaptovaline) $(\text{CH}_3)_2\text{C}(\text{SH})\text{CH}(\text{NH}_2)\text{COOH}$. Crystals, dec. 178°C . Used in medicine as a chelate for copper.

penicillin $(\text{CH}_3)_2\text{C}_5\text{H}_7\text{NSO}(\text{COOH})\text{NHCOR}$ (bicyclic). A group of isomeric and closely related antibiotic compounds with outstanding antibacterial activity, obtained from the liquid filtrate of the molds, *Penicillium notatum* and *Penicillium chrysogenum*, or by a synthetic process which includes fermentation.

Derivation: The mold is grown in a nutrient solution such as corn steep liquor, lactose, or dextrose. After several days of cultivation the mold excretes penicillin into its liquid culture medium. This liquid is then filtered off and the penicillin extracted and purified by countercurrent extraction with amyl acetate, adsorption on carbon, or other methods. Different varieties of penicillin are produced biosynthetically by adding the proper precursors to the nutrient solution.

Grades: Aluminum penicillin G; benzathine penicillin G; chloroprocaine penicillin O; hydrabamine penicillin V; phenoxymethylpenicillin; potassium penicillin G; potassium alpha-phenoxethylpenicillin; potassium phenoxymethylpenicillin; procaine penicillin G; sodium methicillin; sodium penicillin G.

Hazard: Strong allergen; reaction may be severe in susceptible people.

Uses: Medicine (antibiotic); food and feed additive.

penicillinase. An enzyme which antagonizes the antibacterial action of penicillin. Such enzymes are found in many bacteria.

Uses: Pharmaceutical; biological research.

See also antagonist, structural.

pennyroyal oil, European.

Properties: Yellowish to reddish-yellow essential oil, sometimes with bluish or greenish fluorescence; aromatic mint-like odor. Soluble in 1.5 to 2.5 vols. of 70% alcohol; soluble in fixed oils; insoluble in glycerol. Sp. gr. 0.928–0.940 (25°C); optical rotation $+15^\circ$ to $+25^\circ$; refractive index 1.483–1.4875 (20°C). Combustible; low toxicity.

Chief constituents: Pulegone, limonene, dipentene, menthol, menthone.

Derivation: By distillation of *Mentha pulegium*.

Grades: Technical; F.C.C.

Uses: Medicine; insecticide; perfumery; manufacture of pulegone and its derivatives; flavoring.

"Penros."⁷⁹ Trademark for polymerized wood rosin.

Uses: Adhesives; gloss oils; paper label coatings; oleo-resinous varnishes; solder flux; spirit varnishes; waxed paper and hot melt compounds; synthetic resins.

pentaborane B_5H_9 .

Properties: Colorless liquid with pungent odor; f.p. -46.6°C ; b.p. 58°C ; sp. gr. 0.61; vapor pressure (0°C) 66 mm; decomposes at 150°C ; ignites spontaneously in air if impure. Flash point (pure) 86°F . Hydrolyzes slowly in water.

Derivation: Hydrogenation of diborane.

Grades: Technical 95%; high purity 99%.

Hazard: Highly toxic by ingestion and inhalation; strong irritant. Tolerance, 0.005 ppm in air. Highly flammable; dangerous fire and explosion risk. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Fuel for air-breathing engines; propellant.

Shipping regulations: (Rail) Red label. Not accepted by express. (Air) Not acceptable.

"Pentac."⁶² Trademark for miticide whose active ingredient is bis(pentachloro-2,4-cyclopentadien-1-yl).

pentacene (2,3,6,7-dibenzoanthracene) $\text{C}_{22}\text{H}_{14}$. Highly reactive aromatic compound consisting of five fused benzene rings.

Properties: Deep blue-violet solid; sublimates 290 – 300°C ; decomposes in air above 300°C . Insoluble in water; slightly soluble in organic solvents.

Uses: Suggested as organic photoconductor (instead of selenium) in copying systems.

"Pentacetate."²⁰⁴ Trademark for synthetic amyl acetate, used as an extractant for antibiotics; lacquer solvent.

pentachloroethane (pentalin) $\text{CHCl}_2\text{CCl}_3$.

Properties: Dense, high-boiling colorless liquid; sp. gr. 1.685 ($15/4^\circ\text{C}$); b.p. 159.1°C ; f.p. -22°C ; refractive index 1.503 (24°C). Insoluble in water.

Derivation: By chlorination of trichloroethylene, obtained by a two-step process involving chlorination of acetylene to obtain tetrachloroethane, and removal of hydrochloric acid by action of alkali.

Containers: Drums; tank cars.

Hazard: Toxic by inhalation and ingestion. Moderate fire and explosion risk.

Uses: As solvent for oil and grease in metal cleaning. See tetrachloroethane for other uses. Also used for separation of coal from impurities by density difference.

Shipping regulations: (Rail) Poisonous liquid, n.o.s., Poison label. (Air) Poison label.

pentachloronaphthalene $\text{C}_{10}\text{H}_3\text{Cl}_5$. White powder.

Hazard: Toxic. Tolerance, 0.5 mg per cubic meter of air. Toxic action similar to chlorinated naphthalenes and chlorinated diphenyls.

pentachloronitrobenzene (PCNB) $\text{C}_6\text{Cl}_5\text{NO}_2$.

Properties: Cream crystals; musty odor; sp. gr. 1.718 ($25/4^\circ\text{C}$); m.p. 142 – 145°C ; b.p. 328°C (some decomposition). Practically insoluble in water; slightly soluble in alcohols; somewhat soluble in carbon disulfide, benzene, chloroform.

Derivation: By reacting pentachlorobenzene with fuming nitric acid.

Grades: Dust; emulsion concentrate; wettable powder.

Containers: Casks or drums.

Hazard: Moderately toxic; skin irritant.

Uses: Intermediate; soil fungicide; slime prevention in industrial waters; herbicide.

pentachlorophenol (PCP) $\text{C}_6\text{Cl}_5\text{OH}$.

Properties: White powder or crystals; m.p. 190°C ; b.p. 310°C with decomposition; sp. gr. 1.978 ($22/4^\circ\text{C}$). Slightly soluble in water; soluble in dilute alkali, alcohol, acetone, ether, pine oil, benzene,

- "Carbitol," and "Cellosolve"; slightly soluble in hydrocarbons.
 Derivation: Chlorination of phenol.
 Containers: Fiber drums; 50-lb bags; car lots.
 Hazard: Toxic by ingestion, inhalation and skin absorption. Tolerance, 0.5 mg per cubic meter of air.
 Uses: Fungicide; bactericide; algicide; herbicide; sodium pentachlorophenate; wood preservative (telephone poles, piling, etc.).
- pentachlorothiophenol.** See "RPA."
- "Pentacite."**³⁶ Trademark for resins based on pentaerythritol (q.v.).
- pentadecane** $C_{15}H_{32}$ and $CH_3(CH_2)_{13}CH_3$.
 Properties: Colorless liquid; soluble in alcohol; insoluble in water. Sp. gr. 0.776; b.p. 270.5°C; m.p. 10°C. Combustible; low toxicity.
 Grade: Technical.
 Use: Organic synthesis.
- n-pentadecanoic acid (pentadecylic acid)**
 $CH_3(CH_2)_{13}COOH$. A saturated fatty acid normally not found in vegetable fats, but made synthetically.
 Properties: Colorless crystals; sp. gr. 0.8423 (80/4°C); m.p. 51.8–52.8°C; b.p. 339.1°C, 212°C (16 mm); refractive index 1.4529 (60°C). Insoluble in water; soluble in alcohols and ethers.
 Grades: 99% pure.
 Uses: Organic synthesis; reference standard in gas chromatography.
- pentadecanolide (15-hydroxypentadecanoic acid lactone; pentadecalactone)** $CH_2(CH_2)_{13}C(O)O$.
 Properties: Colorless liquid with a strong musky odor; congeals to white crystals at room temperature. Minimum congealing point 36°C. Soluble in equal volume of 90% ethanol. Combustible. Low toxicity.
 Derivation: Angelica root oil.
 Grade: 98% min.
 Use: Perfumery.
- pentadecenyl phenol.** See "Cardanol."
- pentadecylic acid.** See n-pentadecanoic acid.
- 1,3-pentadiene.** See piperylene.
- pentaerythrite tetranitrate.** Legal label name for pentaerythritol tetranitrate (q.v.).
- pentaerythritol (PE; tetramethylomethane; monopentaerythritol)** $C(CH_2OH)_4$.
 Properties: White, crystalline powder. Readily esterified by common organic acids. Unaffected when boiled with dilute caustic alkali. Soluble in water; slightly soluble in alcohol; insoluble in benzene, carbon tetrachloride, ether, and petroleum ether. B.p. 276°C (30 mm); m.p. 262°C; refractive index (20°C) 1.54 to 1.56. Sp. gr. 1.399 (25/4°C). Combustible.
 Technical grade is approximately 88% monopentaerythritol and 12% dipentaerythritol.
 Derivation: Reaction of acetaldehyde with an excess of formaldehyde in an alkaline medium.
 Grades: Technical; nitration; C.P.
 Containers: Fiber cartons; multiwall bags; drums; car lots.
 Hazard: Classed as a nuisance particulate.
 Uses: Alkyd resins; rosin and tall oil esters; special varnishes; pharmaceuticals; plasticizers; insecticides; synthetic lubricants; explosives; paint swelling agents.

- pentaerythritol tetraacetate** $C(CH_2OOCCH_3)_4$.
 Properties: White, crystalline powder; extremely stable in sunlight. Soluble in water, alcohol and ether. M.p. 84°C; b.p. 225°C (30 m). Combustible.
 Derivation: By the esterification of pentaerythritol with acetic acid.
 Grade: Technical.
- pentaerythritol tetrakis(diphenyl phosphite)**
 (tetra(diphenylphosphito)pentaerythritol)
 $C[CH_2OP(OC_6H_5)_2]_4$. A low-melting, white waxy solid with a slight phenolic odor; sp. gr. 1.24 (25/15.5°C); m.p. 30 to 60°C; refractive index (n 25/D) 1.5823. Combustible.
 Use: Ingredient in stabilizer systems for resins.
- pentaerythritol tetra(3-mercaptopropionate)**
 $C(CH_2OOCCH_2CH_2SH)_4$.
 Properties: Liquid; sp. gr. 1.28 (25°C); refractive index (n 25/D) 1.5300. Insoluble in water, alcohol and hexane; soluble in acetone and benzene. Combustible.
 Uses: Curing or cross-linking agents for polymers, especially epoxy resins; intermediates for stabilizers and antioxidants.
- pentaerythritol tetranitrate (PETN; penthrite)**
 $C(CH_2ONO_2)_4$.
 Properties: White crystalline material; sp. gr. 1.75; m.p. 138–140°C; decomposes above 150°C. Very soluble in acetone; slightly soluble in alcohol and ether; insoluble in water.
 Derivation: Esterification of pentaerythritol with nitric acid.
 Containers: Specially lined 300-lb steel drums.
 Hazard: Highly shock-sensitive explosive. Detonates at 210°C.
 Uses: Demolition explosive; blasting caps; detonating compositions.
 Shipping regulations: (Rail) Consult regulations. Not accepted by express. (Air) Not acceptable. Legal label name: pentaerythrite tetranitrate.
- pentaerythritol tetrastearate** $C(CH_2OOCCH_2H_{35})_4$. Hard, high-melting wax; ivory-colored and essentially neutral; acid number 1; softening point 67°C. Combustible. Used in polishes, coatings, textile finishes.
- pentaerythritol tetrathio glycolate** $C(CH_2OOCCH_2SH)_4$.
 Properties: Liquid; sp. gr. 1.385 (25°C); refractive index (n 25/D) 1.5499. Insoluble in water, alcohol, and hexane; partially soluble in benzene; soluble in acetone. Combustible.
 Uses: Curing or cross-linking agents for polymers, especially epoxy resins; intermediate for stabilizers and antioxidants.
- pentaglycerine.** See trimethylolthane.
- pentahydroxycyclohexane.** See quercitol.
- 2',3,4',5,7-pentahydroxyflavone.** See morin.
- pentalin.** See pentachloroethane.
- "Pentalyn."**²⁶⁶ Trademark for a series of nonreactive and heat-reactive pentaerythritol esters of rosin. Available in solid and/or flake form in various grades. Used in varnishes, floor polishes, inks, and adhesives.
- 1,1,3,3,5-pentamethyl-4,6-dinitroindane** $C_{14}H_{18}N_2O_4$.
 Properties: Pale yellow crystals with a musk-type odor; m.p. min 132°C. Slightly soluble in alcohol; soluble in diethyl phthalate.
 Use: Perfumery.

pentamethylene. See cyclopentane.

pentamethyleneamine. See piperidine.

pentamethylene-1,1-bis(1-methylpyrrolidinium bitartrate). See pentolinium tartrate.

pentamethylenediamine. See cadaverine.

pentamethylene dibromide (1,5-dibromopentane)

Properties: Colorless, aromatic liquid; f.p. -35°C ; b.p. 224°C ; insoluble in water.

pentamethylene glycol. See 1,5-pentanediol.

pentamethylpararosaniline chloride. See methyl violet.

pentanal. See n-valeraldehyde.

n-pentane (amyl hydride) $\text{CH}_3(\text{CH}_2)_3\text{CH}_3$.

Properties: Colorless liquid; pleasant odor; freezing point -129.723°C ; b.p. 36.074°C ; refractive index (n 20/D) 1.35748; sp. gr. (20°C) 0.62624; soluble in hydrocarbons, oils, and ether; very slightly soluble in alcohol; soluble in water. Flash point -57°F . Autoignition temp. 588°F .

Derivation: Fractional distillation from petroleum; purified by reactivation.

Grades: Pure, technical; commercial.

Containers: Drums; tank cars.

Hazard: Highly flammable; dangerous fire and explosion risk. Explosive limits 1.4 to 8% in air. Tolerance, 500 ppm in air. Narcotic in high concentrations.

Uses: Artificial ice manufacture; low-temperature thermometers; solvent extraction processes; blowing agent in plastics, e.g., expandable polystyrene; pesticide.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

pentanedinitrile. See glutaronitrile.

pentanedioic acid. See glutaric acid.

pentanedioic acid anhydride. See glutaric anhydride.

1,5-pentanediol (pentamethylene glycol)

Properties: Colorless liquid; b.p. 260°C ; f.p. -15.6°C ; sp. gr. 0.9921 (20/20°C); wt/gal 8.2 lb (20°C); flash point (open cup) 265°F . Miscible with water and alcohol. Combustible; nontoxic. Autoignition temp. 633°F .

Grade: Technical.

Containers: Drums; tank cars.

Uses: Polyester and urethane resins; hydraulic fluid; lube oil additive; antifreeze.

2,3-pentanedione. See acetyl propionyl.

2,4-pentanedione. See acetylacetone.

pentanethiol (amyl mercaptan) $\text{C}_5\text{H}_{11}\text{SH}$. A mixture of isomers.

Properties: Water-white to light yellow liquid; sp. gr. (20°C) 0.83-0.84; mercaptan content at least 90.0%; initial b.p. not below 104.0°C ; final b.p. not above 130°C ; wt/gal 6.99 lb. Insoluble in water; soluble in alcohol. Flash point 65°F (open cup). These properties vary with proportions of isomers. Strong, offensive odor.

Derivation: Mixing amyl bromide and potassium hydrosulfide in alcohol.

Containers: Cans; drums.

Hazard: Flammable, dangerous fire risk. Toxic by inhalation.

Uses: Synthesis of organic sulfur compounds; chief constituent of odorant used in gas lines to locate leaks.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Legal label name, amyl mercaptan.

pentanoic acid. See n-valeric acid.

1-pentanol. See n-amyl alcohol, primary.

2-pentanol (sec-n-amyl alcohol; sec-amyl alcohol, active; methyl propyl carbinol; 1-methylbutyl alcohol) $\text{CH}_3\text{CH}_2\text{CH}_2\text{CHOHCH}_3$.

Properties (racemic form): Colorless liquid; b.p. 119.3°C ; sp. gr. (20/20°C) 0.811; wt/gal (20°C) 6.75 lb; refractive index (n 20/D) 1.4041; flash point (open cup) 105°F . Soluble in water; miscible with alcohol and ether. Autoignition temp. 657°F . Low toxicity. Combustible.

Derivation: Fractional distillation of the mixed alcohols resulting from the chlorination and hydrolysis of pentanes.

Containers: Drums; tank cars.

Hazard: Moderate fire risk.

Uses: Solvent for paints and lacquers; pharmaceutical intermediate.

3-pentanol (sec-n-amyl alcohol; 1-ethyl-1-propanol; diethyl carbinol) $\text{CH}_3\text{CH}_2\text{CHOHCH}_2\text{CH}_3$.

Properties: Colorless liquid; sp. gr. 0.82 (20°C); freezing point less than -75°C ; b.p. 115.6°C ; wt/gal 6.81 lb; refractive index 1.41 (20°C). Flash point (C.C.) 94°F ; autoignition temp. 650°F . Soluble in alcohol and ether; slightly soluble in water.

Containers: Drums; tank cars.

Hazard: Moderate fire risk.

Uses: Solvent; flotation agent; pharmaceuticals.

2-pentanone. See methyl propyl ketone.

3-pentanone. See diethyl ketone.

"Pentaphen."²⁰⁴ Trademark for para-tert-amyl phenol (q.v.).

pent resin. Ester gum made from rosin and pentaerythritol.

pentasodium diethylenetriaminepentaacetate. A sodium salt of diethylenetriaminepentaacetic acid (q.v.).

Use: A chelating agent.

pentasodium triphosphate. See sodium tripolyphosphate.

n-pentatriacontane $\text{C}_{35}\text{H}_{72}$ or $\text{CH}_3(\text{CH}_2)_{33}\text{CH}_3$.

Properties: Crystals; sp. gr. 0.782 at 75°C ; b.p. 331°C at 15 mm; m.p. 75°C . Combustible; low toxicity.

Use: Organic synthesis.

pentazocine $\text{C}_{19}\text{H}_{27}\text{NO}$ (2-dimethylallyl-5,9-dimethyl-2'-hydroxy-benzomorphan). A synthetic drug claimed to be as effective as morphine but without its addictive properties. Has a noncumulative effect. FDA approval.

"Pentecat L."²³⁰ Trademark for a 50% aqueous solution of lithium naphthenate.

Use: As alcoholysis catalyst in alkyd varnish cooking.

"Pentek."¹³⁸ Trademark for pentaerythritol, technical.

1-pentene (alpha-n-amylenes; propylethylene)

Properties: Colorless liquid; soluble in alcohol; insoluble in water; f.p. -165°C ; b.p. 30°C ; sp. gr. 0.6410 (20°C); flash point 0°F (open cup); autoignition temp. 523°F .

Derivation: Natural gasoline.

Hazard: Flammable, dangerous fire risk. Moderately toxic by ingestion, inhalation, and skin absorption.

Uses: Organic synthesis; blending agent for high octane motor fuel.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

2-pentene (beta-n-amylenes, sym-methylethylethylene) $\text{CH}_3\text{CH}_2\text{CH}=\text{CHCH}_3$. Mixed cis- and trans-isomers are available commercially.

cis-isomer.

Properties: B.p. 37°C ; f.p. -152°C ; sp. gr. 0.656 ($20/4^\circ\text{C}$); flash point 0°F . Soluble in alcohol; insoluble in water.

Grades: Technical; 95.0 mole %.

trans-isomer.

Properties: B.p. 36.4°C ; f.p. -139°C ; sp. gr. 0.6482 (20°C); soluble in alcohol; insoluble in water. Flash point 0°F .

Derivation: Natural gasoline.

Hazard: Flammable; dangerous fire risk.

Uses: Polymerization inhibitor; organic synthesis.

Shipping regulations: See 1-pentene.

"Pentergent" T.³⁰⁹ Trademark for a complete detergent containing alkyl, aryl, and fatty alcohol sulfonate with required alkali. Used in textile industry.

"Pentex."²⁴⁸ Trademark for tetrabutylthiuram monosulfide (q.v.).

Uses: Rubber accelerator. When mixed with 87.5% clay, it is used for sponge rubbers and called "Pentex Flour."

"Pentids."⁴¹² Trademark for crystalline penicillin G. See penicillin.

"Pentite."⁶² Trademark for tetra(diphenylphosphito)-pentaerythritol. See pentaerythritol tetrakis(diphenyl phosphite).

pentlandite (Fe, Ni)S.

Properties: Light bronze-yellow mineral; metallic luster. Contains 35.57% of nickel. Soluble in nitric acid.

Sp. gr. 4.6-5. Hardness 3.5-4.

Occurrence: Canada (Ontario), Norway.

Use: Nickel ore.

pentobarbital $\text{C}_{11}\text{H}_{18}\text{O}_3\text{N}_2$. 5-Ethyl-5-(1-methylbutyl)-barbituric acid. See barbiturate.

pentolinium tartrate $\text{C}_{23}\text{H}_{42}\text{N}_2\text{O}_{12}$. Pentamethylene-1,1-bis(1-methylpyrrolidinium bitartrate).

Properties: White to light cream-colored, crystalline powder; slightly soluble in alcohol; insoluble in ether, chloroform; very soluble in water; pH of 1% solution in water is 3.0-4.0. Decomposes 203°C .

Use: Medicine.

pentolite. A high explosive, consisting of equal parts of pentaerythritol tetranitrate and trinitrotoluene (q.v.).

Hazard: Dangerous; explodes on shock or heating.

Shipping regulations: (Rail) Consult regulations. (Air) Not acceptable.

"Penton."²⁶⁶ Trademark for a thermoplastic resin derived from 3,3-bis(chloromethyl)oxetane

$(\text{CH}_2\text{Cl})_2\text{CCH}_2\text{OCH}_2$. A chlorinated polyether.

Properties: A linear polymer extremely resistant to chemicals, and to thermal degradation at molding and extrusion temperatures; sp. gr. 1.4; self-extinguishing; dimensionally stable; very low water absorption, outstanding chemical resistance. Natural, black or olive green molding powder. Finely divided powder for coatings.

Uses: Solid and lined valves, pumps, pipe and fittings; monofilament for filter supports and column packing.

pentosan. A complex carbohydrate (hemicellulose) present with the cellulose in many woody plant tissues, particularly cereal straws and brans; characterized by hydrolysis to give five-carbon-atom sugars (pentoses). Thus the pentosan xylan yields the sugar xylose ($\text{HOH}_2\text{C} \cdot \text{CHOH} \cdot \text{CHOH} \cdot \text{CHOH} \cdot \text{CHO}$) which is dehydrated with sulfuric acid to yield furfural ($\text{C}_5\text{H}_4\text{O}_2$).

pentose. General term for sugars with five carbon atoms per molecule.

"Pentothal."³ Trademark for sodium thiopental; a barbiturate. See thiopental sodium.

"Pentox."⁴⁹⁵ Trademark for a pale liquid, polyglycidyl ether which can be converted by suitable curing agents into a solid, insoluble state. An aliphatic liquid epoxy resin for air-drying solventless two-component finishes. Can also be used in formulating solventless one coat systems on concrete, wood, metal, etc.

"Pentoxone."¹²⁵ Trademark for 4-methoxy-4-methylpentanone-2 (q.v.).

pentyl. Synonym for the amyl group, C_5H_{11} -.

pentyl acetate. See amyl acetate.

pentylamine. See n-amylamine.

alpha-pentylcinnamaldehyde. See alpha-amylcinnamic aldehyde.

peppermint oil.

Properties: Colorless or slightly yellowish, volatile, essential oil; strong, aromatic, odor and taste, followed by a sensation of coolness. Odor varies with origin of oil. Sp. gr. 0.895-0.921; refractive index 1.4590-1.4650 (20°C); optical rotation -18 to -32° . Soluble in alcohol, ether and chloroform. Combustible; nontoxic.

Chief constituent: Menthol (F.C.C. and U.S.P. require not less than 50% menthol); esters of menthol, pinene, limonene, cineole, menthone, etc.

Derivation: By distilling the leaves and flowering tops of the peppermint plant (Washington, Oregon, Indiana).

Method of purification: Rectification.

Grades: Technical; U.S.P., F.C.C.

Containers: Drums.

Uses: Source of menthol; ingredient of mouth washes; flavoring of chewing gum, confectionery, liqueurs, etc.

pepsin (pepsinum).

Properties: A digestive enzyme. White or yellowish-white powder or lustrous transparent or translucent scales; should have no odor; converts proteins into albumoses and peptones. Soluble in water; insoluble in alcohol, chloroform and ether.

Derivation: From the glandular layer of fresh hogs' stomachs.

Grades: Technical; N.F.

Uses: Medicine (digestive ferment); substitute for rennet in cheese making.

pepsinogen. An inactive precursor of pepsin (q.v.).

peptidase. See protease.

peptide. See polypeptide.

peptization. A form of aggregation (q.v.) in which hydrophobic colloidal sols are stabilized by addition of electrolytes, which provide the necessary electric double layer of ionic charges around each particle. Such electrolytes are known as peptizing agents. The ions of the electrolyte are strongly adsorbed on the particle surfaces. Stable sols of non-ionizing substances acquire a charge in contact with water by preferential adsorption of the hydroxyl ions, which may be considered peptizing agents. The term is also loosely applied to the softening or liquefaction of one substance by trace quantities of another, analogous to the digestion of a protein by an enzyme (pepsin).

peptone.

Properties: (a) From albumin: White or pale yellow, amorphous powder. (b) From meat: Light brown, amorphous powder. (c) From milk: Light brown powder. Soluble in water; insoluble in alcohol or ether.

Derivation: (a) By digestion of egg albumin by pepsin and a small quantity of dilute hydrochloric acid at 38–40°C (body temperature). (b) By digestion of red meat with pancreatin at body temperature. (c) By digestion of casein.

Grades: Technical; reagent.

Uses: Preparation of nutrient media in bacteriology; nutrient.

per- A prefix signifying complete or extreme, and specifically denoting: (1) a compound containing an element in its highest state of oxidation, as perchloric acid; (2) presence of the peroxy group, $-\text{O}-\text{O}-$, as peracetic and perchromic acids; (3) exhaustive substitution or addition, as perchloroethylene.

peracetic acid (peroxyacetic acid) CH_3COOOH .

Properties: Colorless liquid; strong odor; b.p. 105°C; f.p. (approx.) -30°C; sp. gr. (20°C) 1.15; flash point (open cup) 105°F. Solubility similar to acetic acid.

Derivation: (a) oxidation of acetaldehyde; (b) reaction of acetic acid and hydrogen peroxide with sulfuric acid catalyst.

Grades: Technical; 40% solution in acetic acid.

Containers: 65-lb glass carboys; 250-lb aluminum drums.

Hazard: Strong irritant. Oxidizing material; dangerous in contact with organic materials. Explodes at 110°C.

Uses: Bleaching textiles, paper, oils, waxes, starch; polymerization catalyst; bactericide and fungicide, especially in food processing; epoxidation of fatty acid esters and epoxy resin precursors; reagent in making caprolactam; synthetic glycerol.

Shipping regulations: (Rail) Yellow label. (Air) Solutions not over 40% by weight, Oxidizer label; over 40% by weight, Not acceptable.

per-acids. Derivatives of hydrogen peroxide, the molecules of which contain one or more directly linked pairs of oxygen atoms, $-\text{O}-\text{O}-$. See per- (2). Examples are persulfuric, perchromic, peracetic acids. Permanganic, perchloric, and periodic acids are not per-acids in this sense. See per- (1).

"Perapret."⁴⁴⁰ Trademark for finishing agents and binders (polymer dispersions); additives for wash-and-wear finishing.

"Perazil."¹⁰¹ Trademark for chlorcyclizine hydrochloride; an antihistamine.

"Perchlor."¹⁷⁷ Brand name for perchloroethylene.

percarbamide. See urea peroxide.

perchloric acid HClO_4 .

Properties: Colorless, hygroscopic liquid. Unstable in concentrated form. Sp. gr. 1.764; f.p. -18°C; b.p. 203°C. Soluble in water and alcohol; forms a maximum boiling point mixture containing 71.6% acid. This is quite stable when other materials are absent.

Derivation: By distilling potassium perchlorate with strong sulfuric acid (96%), under reduced pressure in an oil bath at 140–190°C.

Method of purification: Rectification.

Grades: Technical; C.P., strength of solution 6 to 20%; 60%; 70–72%.

Containers: Glass bottles; carboys.

Hazard: Strong oxidizing agent; will explode in contact with organic materials, or by shock or heat. Strong irritant. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Medicine; analytical chemistry; catalyst; manufacture of various esters; ingredient of the electrolytic bath in the deposition of lead; electro-polishing; explosives.

Shipping regulations: (not over 72%) (Rail) White label; (Air) Corrosive label. Not acceptable on passenger planes. (over 72%) (Rail) Consult regulations; (Air) Not acceptable.

perchlorobenzene. See hexachlorobenzene.

perchlorocyclopentadiene. See hexachlorocyclopentadiene.

perchloroethane. See hexachloroethane.

perchloroethylene ("per"; tetrachloroethylene)

$\text{Cl}_2\text{C}:\text{CCl}_2$.

Properties: Colorless liquid; ether-like odor. Extremely stable. Resists hydrolysis. Sp. gr. (20/20°C) 1.625; b.p. 121°C; f.p. -22.4°C; weight 13.46 lb/gal (26°C); refractive index 1.5029 (25°C); flash point, none. Miscible with alcohol, ether, and oils, in all proportions. Insoluble in water. Nonflammable.

Derivation: (a) By chlorination of hydrocarbons, and pyrolysis of the carbon tetrachloride also formed; (b) from acetylene and chlorine via trichloroethylene.

Method of purification: Distillation.

Grades: Purified; technical; U.S.P., as tetrachloroethylene; spectrophotometric.

Containers: Drums; tank cars.

Hazard: Moderately toxic. Irritant to eyes and skin. Tolerance, 100 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Dry-cleaning solvent; vapor-degreasing solvent; drying agent for metals and certain other solids; vermifuge; heat-transfer medium; mfg. of fluorocarbons.

perchloromethane. See carbon tetrachloride.

perchloromethyl mercaptan. See trichloromethylsulfenyl chloride.

perchloropentacyclodecane $\text{C}_{10}\text{Cl}_{12}$. White crystalline solid; m.p. (sealed tube) 485°C. Nonflammable.

Uses: Fire-retardant additive in elastomeric resin systems.

perchloropropylene. See hexachloropropylene.

perchloryl fluoride ClFO_3 .

Properties: Colorless, noncorrosive gas with sweet odor; f.p. -146°C; b.p. -46.8°C; sp. gr. (liquid) 1.434 (20°C). Nonflammable, but supports combustion.

Containers: Steel cylinders as liquid under pressure. Stable under anhydrous conditions.

Hazard: Tolerance, 3 ppm in air. Dangerous in contact with organic materials; strong oxidizing agent.
Uses: Oxidant in rocket fuels; oxidizing and fluorinating agent in chemical reactions.
Shipping regulations: Oxidizing material, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

perchromic acid. Probably $(\text{HO})_2\text{Cr}(\text{OOH})_2$ or $\text{H}_3\text{CrO}_8 \cdot 2\text{H}_2\text{O}$.

Properties: Unstable acid formed when a solution of chromic acid is added to hydrogen peroxide. Below -15°C , forms deep blue crystals; the blue color can be extracted from solutions by ether. Decomposes in acid solution to form chromic salts and in alkaline solution to form chromates. The blue color can be used as a test for chloride or chromate.

Hazard: Probably toxic and irritant.

"Perclene."²⁸ Trademark for a drycleaning composition consisting of perchloroethylene and surfactant additives.

"Perdiox."²⁸ Trademark for sodium borate perhydrate (q.v.).

"Peregal."³⁰⁷ Trademark for a series of textile chemicals.

O. Polyoxyethylated fatty alcohol; nonionic.

OK. Methyl polyethanol quaternary amine; cationic.

ST. Polymeric dye complexing agent.

TW. Alkyl polyoxyethylene glycol amine.

"Perfecta."⁴⁵ Trademark for petrolatum, U.S.P., of high melting point and medium consistency.

perfect gas. See gas.

"Perflow."¹³⁴ Trademark for proprietary sulfur-free, semibright nickel plating additive.

perfluoro-2-butene. See octafluoro-2-butene.

perfluorobutyric acid. See heptafluorobutyric acid.

perfluorocarbon compound. A fluorocarbon in which the hydrogen directly attached to the carbon atoms is completely replaced by fluorine.

perfluorocyclobutane. See octafluorocyclobutane.

perfluorodimethylcyclobutane. An inert fluorocarbon liquid; b.p. 113°F ; stable to 500°F . Evaporative coolant for electronic equipment.

perfluoroethylene. See tetrafluoroethylene.

perfluoropropane. Legal label name (Air) for octafluoropropane.

perfluoropropene. See hexafluoropropylene.

perfluorosulfonic acid. See "Nafion."

performic acid (peroxyformic acid) HCOOOH .

Properties: Colorless liquid. Miscible with water, alcohol, ether; soluble in benzene, chloroform. Solutions are unstable.

Derivation: Mixture of formic acid, peroxide and sulfuric acid is allowed to interact for 2 hours and then distilled.

Grades: 90% solution.

Hazard: Strong irritant and oxidizing agent. Explodes when shocked or heated, or in contact with reducing materials, metals, and metallic oxides.

Uses: Oxidation, epoxidation and hydroxylation reactions.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

perfume. A blend of pleasantly odorous substances (usually liquids) obtained from the essential oils of flowers, leaves, fruit, roots, or wood of a wide variety of plants, either by steam distillation or solvent extraction. Flower oils (rose, jasmine) are extracted with a non-polar solvent to give a waxy mixture called a concrete (q.v.); the wax is then removed by a second solvent (an alcohol), which is then in turn removed to form an absolute (q.v.). It is necessary that all the solvent be eliminated to obtain the finest perfumes. The center of this industry has long been in Grasse, France.

Perfume materials are also derived from animal sources (musk, ambergris), from resinous extracts (terpenes and balsams); they are also made synthetically. Cologne and toilet water are weak alcoholic solutions (5% or less) of perfumes. Fine perfumes may contain as many as 30 ingredients, and their blending is an art rather than a science. The largest volume use of perfumes is in soaps, lotions, shaving creams, and cosmetics.

See also fragrance; odorant.

"Perglow."¹³⁴ Trademark for proprietary bright nickel-plating additive.

"Pergut."⁴⁷⁰ Trademark for a chlorinated rubber.

perhydrosqualene. See squalane.

peri acid. See 1-naphthylamine-8-sulfonic acid.

periclase MgO . A natural or calcined magnesium oxide used as a lining and maintenance material for basic oxygen steel-making furnaces and other refractories.

periodic acid $\text{HIO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals; loses $2\text{H}_2\text{O}$ at about 100°C . Soluble in water, alcohol; slightly soluble in ether.

Derivation: By the interaction of iodine and concentrated perchloric acid; by low-temperature electrolysis of concentrated iodic acid.

Method of purification: Crystallization.

Hazard: Dangerous in contact with organic materials. Irritant and oxidizing material.

Uses: Oxidizing agent; increasing wet strength of paper; photographic paper.

periodic law. Originally stated in recognition of an empirical periodic variation of physical and chemical properties of the elements with atomic weight, this law is now understood to be based fundamentally on atomic number and atomic structure. A modern statement is: *The electronic configurations of the atoms of the elements vary periodically with their atomic number. Consequently all properties of the elements that depend on their atomic structure (electronic configuration) tend also to change with increasing atomic number in a periodic manner.*

R. T. Sanderson

periodic table. Any of a large number of possible arbitrary arrangements of the chemical elements by symbol in a geometric pattern designed to represent the periodic law by aligning the elements in periods so that the corresponding parts of the several periods are adjacent. When the elements are aligned in order of increasing atomic number, they constitute a succession of periods, each beginning with an alkali metal (one electron in the outermost principal quantum level) and ending with an element of the helium

Based on chart published by Fisher Scientific Co.

Shown above is a form of the Periodic Table that has been generally accepted in recent years; it is by no means the only possible arrangement, nor even the best one, according to some authorities. [Ed.]

family, helium, neon, argon, krypton, xenon, and radon, (each having 8 electrons in the outermost principal quantum level, except for helium which is limited to 2). Each helium family element is followed directly in atomic number by an alkali metal, which begins a new period.

The advantage of placing each successive period so that it is adjacent to the preceding period in its corresponding parts is that similar elements are thus brought together in groups. For example, the alkali metals that begin each period have similar properties that correspond to their atomic structure, each having one outermost shell electron. In a periodic table, the elements exhibit a steady trend in properties from the beginning of each period, where they are metals, to the end where they are nonmetals. Within each group the elements are quite similar. A given element can be predicted, on the basis of its position in a periodic table, to resemble the other elements of its group and be intermediate in properties between its adjacent neighbors within its period. The chief function of a periodic table is to serve as a fundamental framework for the systematic organization of chemistry. See also Mendeleef.

R. T. Sanderson

Perkin, Sir William Henry (1838–1907). An English chemist who was the first to make a synthetic dyestuff (1856). He studied under Hofmann at the Royal College of London. Perkin's first dye was called mauveine, but he proceeded to synthesize alizarin and coumarin, the first man-made perfume. In 1907 he was awarded the first Perkin Medal, which has ever since been awarded by the American Division of the Society of Chemical Industry for distinguished work in chemistry. Notwithstanding the fact

that Perkin patented and manufactured mauve dye in England, the center of the synthetic organic dye industry shifted to Germany, where it remained till 1914. See also Hofmann.

"Perlux."⁵⁶ Trademark for a dry-cleaning solvent consisting of perchloroethylene or tetrachloroethylene.

"Perma-,"³¹⁹ Trademark for a series of vitamin preparations; used in animal feeds.

"Permachlor Red."¹⁴¹ Azo pigments made from para-chloro-ortho-nitraniline and beta-naphthol. Used in bright, light red and pink house paints.

"Permchrom Red."¹⁴¹ Permanent red azo pigments derived from beta-hydroxynaphthoic acid.
Grades: Medium red; dark red; maroon.
Uses: Printing inks, paints, enamels, lacquers, plastics.

permafil. A mixture in which the liquid completely undergoes polymerization and hardens without the necessity of any evaporation. Anaerobic permafiles harden out of contact with air.

"Permafresh."⁴² Trademark for a series of resins used in the textile industry. They include cellulose reactants, melamine derivatives designed as a replacement for conventional trimethylol melamine and related products; partially condensed modified carbamide resins; cyclic nitrogenous reactant; bis-keto-triazine; methylol imidazolidone; modified carbamide resin; urea-formaldehyde liquid; durable thermosetting urea-formaldehyde reactive resin.

Uses: Wash-and-wear fabrics; crease resistance; shrinkage control; durable finishes; bodying agent.

"Permagreen Gold."¹⁴¹ Trademark for a yellow nickel azo pigment. Used in paints, printing inks, plastics.

"Permagrid."¹⁵⁵ Trademark for electronic tube alloy of 99.3% nickel, 0.4% titanium, and 0.3% magnesium. Used for grid wire.

"Permalloy." Trademark for an alloy containing 78.5% nickel and 21.5% iron. It has high magnetic permeability and electrical resistivity. Used in trans-ocean submarine cables.

"Permalume G."²⁸⁸ Trademark for a semi-bright nickel electroplating process. The plating bath contains nickel sulfate, nickel chloride, boric acid, and organic addition agents.

"Permalux."²⁸ Trademark for a di-ortho-tolylguanidine salt of dicatchol borate, $(\text{HOC}_6\text{H}_4\text{O})_2\text{B}\cdot\text{HNC}(\text{NHC}_6\text{H}_4\text{CH}_3)_2$.

Properties: Light grayish brown powder; sp. gr. 1.27; f.p. not lower than 165°C.

Uses: Rubber antioxidant; vulcanization of neoprene.

"Permalyn" 330²⁶⁶ Trademark for a pale, hard resin, a glycerol ester of selected stabilized resin acids. Softening point 87°C; acid number 7; USDA color WW-X.

Permanent Orange. See dinitraniline orange.

permanent-press resin (durable-press resin). A thermosetting resin used as a textile impregnant or fiber coating to impart crease resistance and permanent hot-creasing to suitings, dress fabrics, etc. Chemicals such as formaldehyde and maleic anhydride are the basis of these products. The resin is "cured" after the fabric has been tailored into a garment. A permanent-press fabric that requires no resin has been developed (a blend of polyester with cotton or rayon).

Permanent Red 2B Amine. See 4-amino-2-chlorotoluene-5-sulfonic acid.

"Permanickel" 300.²⁸³ Trademark for an alloy which contains 98.6% nickel and small quantities of other metals.

"Permanite."²⁵⁰ Trademark for purified natural magnetic iron ore for use in radio cores, shields, etc.

"Permansa."¹⁴¹ Trademark for a series of organic pigments.

Uses: Printing inks, paints, wallpaper, textiles.

"Permasep."²⁸ Trademark for a method of desalinating water by reverse osmosis using membranes composed of hollow nylon fibers, which provide maximum membrane surface. See also osmosis.

permenorm. Nickel-iron alloy produced by magnetic annealing and drastic cold reduction, and used for mechanical rectifiers and low-frequency amplifiers. This alloy has a rectangular hysteresis loop that eliminates arcing at the contacts of mechanical rectifiers, as well as other desirable properties.

permissible explosive. See explosive, permissible.

"Permolite."³⁰⁰ Trademark for a solubilized alkyl resin used as a slip-proof finish for low-count viscose and acetate fabrics.

"Permolith."¹⁴¹ Trademark for lithopone (q.v.) available in various grades and forms.

"Permox."⁴⁶⁸ Trademark for a series of anti-corrosive pigments, primarily basic lead silicochromate.

"Permutit."¹⁸⁴ Trademark for a series of ion exchange agents. Commercial grades of cation exchangers include sulfonated polystyrene copolymer (designated by Q) and carboxylic acid (H-70); commercial grades of anion exchangers include aliphatic polyamide intermediate base (A and AB), phenolic intermediate base (CCG), strong base polystyrene alkyl quaternary ammonium (S-1), strong base polystyrene alkanol quaternary ammonium (S-2), strong base pyridinium quaternary amine (SK); nuclear grade ion exchangers include as cation exchanger, sulfonated polystyrene copolymer (organic); as anion exchanger, strong base polystyrene alkyl quaternary amine (organic). These are designated by a series of letters beginning with N.

Used in water purification and a wide variety of separation processes.

"Perone."²⁸ Trademark for hydrogen peroxide, 30, 35, and 50% solutions by weight. See hydrogen peroxide.

perovskite. A natural or synthetic crystalline mineral composed of calcium dioxide and titanium dioxide. The natural material was discovered in Russia about 1850; the synthetic type can be so made as to incorporate particles of catalysts (platinum or palladium) which are protected by the crystal structure from contamination by lead and other poisons, thus permitting use of leaded gasoline in cars equipped with emission-control devices.

peroxidase. An enzyme found in most plant cells and some animal cells which promote the oxidation of various substrates, such as phenols, aromatic amines, etc., by means of hydrogen peroxide.

peroxide. (1) Any compound containing a bivalent O-O group, i.e., the O atoms are univalent. Such compounds release atomic (nascent) oxygen readily. Thus they are strong oxidizing agents, and fire hazards when in contact with combustible materials, especially under high-temperature conditions. The chief industrial uses of peroxides are as oxidizing agents, bleaching agents, and initiators of polymerization. (2) Hydrogen peroxide.

"Peroxidol."²⁸ Trademark for a series of epoxy-type plasticizers for vinyl resins.

peroxyacetic acid. See peracetic acid.

peroxybenzoyl nitrate. A component of photochemical smog, found to be 200 times as irritating to the eyes as formaldehyde. A concentration of 0.02 ppm in air causes moderate to severe conjunctival irritation. See also smog.

peroxyformic acid. See performic acid.

peroxysulfuric acid. See Caro's acid.

perphenazine $\text{C}_{21}\text{H}_{26}\text{ClN}_3\text{OS}$.

Properties: Crystals; sensitive to light; m.p. 97-100°C; insoluble in water, soluble in ethanol and acetone.

Grade: N.D.

Use: Medicine.

perrhenic acid HReO_4 . Exists only in solution; commercially available as aqueous syrup. Strong, very stable monobasic acid; extremely soluble in water and organic solvents.

"Persistol."⁴⁴⁰ Trademark for agents for the wash-proof water-repellent finishing of textiles of natural and synthetic fibrous materials and fiber mixtures.

persulfuric acid. See Caro's acid.

"Perthane."²³ Trademark for an agricultural insecticide based on 1,1-dichloro-2,2-bis(para-ethylphenyl)ethane. Supplied as a wettable powder or emulsifiable concentrate.

Peru balsam. See balsam.

pesticide. Any substance, organic or inorganic, used to destroy or inhibit the action of plant or animal pests; the term thus includes insecticides, herbicides, rodenticides, miticides, etc. See specific entry. Virtually all pesticides are toxic to man to a greater or lesser degree. Microencapsulated controlled-release forms are available. See note under methyl parathion; see also insecticide (Hazard). For additional information consult International Pesticide Institute, Syracuse, N.Y.

"Pestmaster" Soil Fumigant-1.⁴²⁶ Trademark for a mixture of methyl bromide 98%, chloropicrin 2%. Properties: Colorless liquefied gas with a sharp pungent odor.

Containers: 1-lb cans; steel cylinders to 400-lb net.

Hazard: See methyl bromide.

Uses: To control insects, weeds, nematodes, and certain fungi in the soil.

petalite $\text{LiAl}(\text{Si}_2\text{O}_5)_2$ or $\text{Li}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 8\text{SiO}_4$.

Properties: Colorless, white, gray or occasionally pink mineral, white streak, vitreous luster. Resembles spodumene in appearance. Contains up to 4.9% lithia, sometimes with partial replacement by sodium or, less often, by potassium. Insoluble in acids. Sp. gr. 2.39–2.46; Mohs hardness 6–6.5.

Occurrence: United States (Massachusetts, Maine); Sweden.

Uses: Source of lithium salts; in ceramics and glass.

pettigrain oil

Properties: Yellowish liquid; odor similar to neroli oil. Soluble in 70% alcohol, ether, chloroform and most fixed oils. Insoluble in glycerol. Sp. gr. 0.878–0.889 (25°C); refractive index 1.4580–1.4640 (20°C); angular rotation -4° to $+1^\circ\text{C}$. Combustible; nontoxic.

Derivation: From leaves and twigs of the bitter orange tree, *Citrus aurantium amara*, especially in Paraguay.

Grades: Technical; F.C.C.

Uses: Perfumery (soaps; synthetic neroli; skin creams); flavoring.

PETN. Abbreviation for pentaerythritol tetranitrate (q.v.).

"Petrex."²⁶⁶ Trademark for a series of terpene-derived alkyd resins.

"Petrobases."²⁵ Trademark for a series of emulsifying and rust-preventive bases. On dilution with suitable petroleum oils or light distillates the proper concentrate provides soluble cutting and grinding oils; solvent emulsion cleaner; preservative, slushing and household oils; and water-displacing fluids.

"Petro Bond."²³⁶ Trademark for a bonding agent in the preparation of waterless foundry sands; used with oil and catalyst. Fine sands giving excellent reproduction of detail can be used since high permeability of the foundry sand is not required with this binder.

petrochemical. An organic compound for which petroleum or natural gas is the ultimate raw material. Thus, cracking of petroleum produces ethylene which is converted to ethylene glycol, the latter being a typical petrochemical. The term is also applied to

substances such as ammonia, because the hydrogen used to form the ammonia is derived from natural gas. Thus synthetic fertilizers are considered to be petrochemicals. At least 175 substances are designated as petrochemicals including many paraffin, olefin, naphthene, and aromatic hydrocarbons (methane, ethane, propane, ethylene, propylene, butenes, cyclohexane, benzene, toluene, naphthalene, etc.) and their derivatives, even though some of their commercial production is from sources other than petroleum. The percentage of total hydrocarbon consumption represented by petrochemicals is steadily increasing; some authorities maintain that petroleum is too valuable to be used for fuel and that it should be conserved for future petrochemical development.

petrolatum (mineral wax; petroleum jelly; mineral jelly).

Properties: Colorless to amber, oily, transparent, amorphous mass whose consistency varies with the temperature. Soluble in chloroform, ether, carbon disulfide, benzene and oils; insoluble in water. Sp. gr. 0.815–0.880 at 60°C; m.p. 38–60°C. Combustible; nontoxic.

Derivation: By fractional distillation of still residues from the steam distillation of paraffin-base petroleum, or from steam-reduced crude oils from which the light fractions have been removed.

Grades: Natural, produced as above; artificial, made by mixing heavy petroleum lubricating oil with a low m.p. paraffin wax; U.S.P. (white petrolatum); N.F. (yellow petrolatum); F.C.C. (includes both types).

Containers: Glass bottles; tins; drums.

Uses: Protective dressing and substitute for fats in ointments; lubricating greases; metal polishes; leather grease; rust preventive; perfume extractor; insect repellents; in foods as defoaming agent, lubricant, release agent, protective coating; softener in white or colored rubber compounds.

petrolatum, liquid (white mineral oil)

Properties: Colorless, transparent oily liquid, a mixture of liquid hydrocarbons; almost tasteless and odorless; sp. gr. 0.828–0.880 (20°C) (light), 0.860–0.905 (25°C) (heavy); soluble in ether, chloroform, carbon disulfide, benzene, boiling alcohol, and fixed or volatile oils; insoluble in water, cold alcohol, glycerin. Combustible; nontoxic.

Derivation: Distillation of high-boiling (330–390°C) petroleum fractions.

Method of purifications: Treatment with sulfuric acid, caustic soda, filtration through decolorizing carbon, and crystallization to remove waxes.

Grades: Technical; U.S.P. (as mineral oil, formerly liquid petrolatum, heavy); N.F. (light); F.C.C. (as mineral oil, white).

Containers: Glass bottles; drums; tank cars.

Uses: Medicine (laxative); cosmetics; dispersants; diluents, etc. in white or colored rubber and plastic compounds; compressor and textile lubricants; dispersants for reactive compounds such as metal hydrides; catalyst carrier; in foods as binder, defoaming agent, lubricant, release agent, fermentation aid, protective coating.

petrolatum wax. A microcrystalline wax containing hydrocarbons from $\text{C}_{33}\text{H}_{70}$ to $\text{C}_{43}\text{H}_{88}$. Solidifying range 71 to 83°C. See also wax, microcrystalline.

"Petrolene."²⁰⁰ Trademark for a petroleum solvent prepared by straight-run distillation.

Properties: Water-white; initial boiling point 140–145°F, 95% distills between 195 and 200°F; sp. gr.

0.701 (60°F); flash point (TCC) -16°F; mild; non-residual odor.

Hazard: Highly flammable; dangerous fire risk.

Use: Rubber cements; sealers; fast-drying lacquers; lacquer dopes; roto inks used on high-speed presses.

petroleum (crude oil). A highly complex mixture of paraffinic, cycloparaffinic (naphthenic), and aromatic hydrocarbons, containing low percentages of sulfur and trace amounts of nitrogen and oxygen compounds. Said to have originated from both plant and animal sources from 10 to 20 million years ago. In the U.S., the chemical basis of petroleum varies with location; in general, Pennsylvania crudes are aliphatic (wax-base), Far Western crudes are aromatic (asphalt-base), and Mid-Continent crudes mixed-base. The most important petroleum fractions, obtained by cracking or distillation, are various hydrocarbon gases (butane, ethane, propane), naphtha of several grades, gasoline, kerosene, fuel oils, gas oil, lubricating oils, paraffin wax, and asphalt. From the hydrocarbon gases, ethylene, butylene and propylene are obtained; these are important industrial intermediates, being the source of alcohols, ethylene glycols, and monomers for a wide range of plastics, elastomers, and pharmaceuticals. Benzene, phenol, toluene, and xylene can be made from petroleum, and hundreds of other products, including biosynthetically produced proteins, are petroleum-derived. About 5% of the petroleum consumed in the U.S. is used as feedstocks by the chemical industries.

Occurrence: At present about two-thirds of the world's proven resources are in the Middle East and North Africa, the other third being divided among the U.S., Canada, Venezuela, and U.S.S.R., with minor sources in the North Sea area, Indonesia, Mexico, Rumania and Australia. Existence of sizable off-shore deposits on the eastern continental shelf has still to be proved.

Properties: Viscous dark-brown liquid; unpleasant odor; sp. gr. 0.78-0.97. Flash point 20-90°F.

Hazard: Flammable, moderate fire risk. Moderately toxic by ingestion; local skin irritant.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. For further information, refer to American Petroleum Institute, 1271 Ave. of the Americas, New York, N.Y.

See also natural gas; petrochemical.

Note: Authorities state that the world's petroleum resources will be exhausted before the year 2050 at present rate of consumption. The need for both conservation and full-scale development of alternative energy sources is an urgent necessity. See energy sources.

petroleum benzin. A special grade of ligroin (q.v.).

petroleum coke. See coke.

petroleum ether. This term is used synonymously with petroleum naphtha by MCA. It is also sometimes used as a synonym for ligroin or petroleum benzin. It is technically a misnomer, for it is not an ether in the chemical sense. For details about specified distillation ranges and other distinctive properties, consult ASTM and API specifications. Also see naphtha, petroleum.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

petroleum gas, liquefied. See liquefied petroleum gas.

petroleum jelly. See petrolatum.

petroleum naphtha. See naphtha. (1)

petroleum spirits. See naphtha (1a). In Great Britain the term "petroleum spirits" refers to a volatile hydrocarbon mixture having a flash point below 32°F. Hazard: Highly flammable, dangerous fire risk.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

See also spirits.

petroleum, synthetic. See pyrolysis.

petroleum thinner. See naphtha (1a).

petroleum wax. A high molecular weight solid hydrocarbon derived from petroleum. There are three types: paraffin waxes, microcrystalline waxes, and petrolatum waxes. All three are made mostly by solvent dewaxing, although pressing and sweating processes are still used. See specific entry.

"Petrolite."¹²⁸ Trademark for a series of petroleum and synthetic microcrystalline waxes.

"Petromix."⁴⁵ Trademark for a soluble oil base, made from petroleum sulfonates.

"Petronates."⁴⁵ Trademark for salts of petroleum sulfonic acids varying in molecular weight and color. Uses: Emulsifying agents; dispersing agents; wetting agents; corrosion-preventive.

"Petronauba."¹²⁸ Trademark for a series of emulsifiable microcrystalline waxes.

"Petrosul."²⁵ Trademark for a series of highly purified natural petroleum sulfonate products available in high, medium and low molecular weight ranges. Useful in applications requiring the surface active functions of foaming, detergency, emulsibility, dispersion, solubilization, spreading and rust protection.

"Protect."²⁵ Trademark for a series of rust-preventive and hydraulic fluids in general meeting military specifications. The rust preventives are classified as solvent cut backs, petrolatum barriers, general purpose preservatives, and engine preservative lubricants. Hydraulic fluids include both preservative and operational types.

"Petrothene."¹⁹² Trademark for polypropylene resins for blown, cast, and water-quenched films; substrate coating; wire and cable coating; injection molding; blow molding; thermoforming; pipe extrusion, calendaring. Available as solid cubes and pellets in natural and black.

"Petrotone."²³⁶ Trademark for an organophilic clay that increases suspending properties of crude or refined oils and oil muds without appreciably increasing gels. Makes the use of weighted oil muds safer and more economical.

"Petrowet" R.²⁸ Trademark for a surface-active agent composed of saturated-hydrocarbon sodium sulfonate. A wetting and penetrating agent effective in high concentrations of electrolytes and acids, suitable for use in acidizing of oil wells.

pewter. Tin alloys with 5-15% antimony, 0-3% copper, and 0-15% lead. White metal (q.v.) and britannia metal are also of this general composition.

"Pexol."²⁶⁶ Trademark for fortified rosin sizes based on rosin adducts. Available as dry products and pastes in both pale and dark types.

PF resins. Abbreviation for phenol-formaldehyde resins (q.v.).

PG. Abbreviation for polypropylene glycol (q.v.).

PGA. Abbreviation for pteroylglutamic acid. See folic acid.

pH

pH is a value taken to represent the acidity or alkalinity of an aqueous solution; it is defined as the logarithm of the reciprocal of the hydrogen-ion concentration of a solution:

$$\text{pH} = \ln \frac{1}{[\text{H}^+]}$$

Pure water is the standard used in arriving at this value. Under ordinary conditions water molecules dissociate into the ions H^+ and OH^- , with recombination at such a rate that with very pure water at 22°C there is a concentration of oppositely charged ions of 1/10,000,000, or 10^{-7} , mole per liter. This is commonly expressed by saying that pure water has a pH of 7, which means that its concentration of hydrogen ions is expressed by the exponent 7, without its minus sign.

When acids or hydroxyl-containing bases are in water solution they ionize more or less completely, furnishing varying concentrations of H^+ and OH^- ions, respectively, to the solution. Strong acids and bases ionize much more completely than weak acids and bases; thus strong acids give solutions of pH 1 to 3, while solutions of weak acids have a pH of about 6. Strong bases give solutions of pH 12 or 13, while weak bases give solutions of pH about 8. As the pH scale is logarithmic, the intervals are exponential, and thus represent far greater differences in concentration than the values themselves seem to indicate. (See table).

	pH Value	Ratio of H^+ or OH^- Concentration to That of Pure Water at 22°C
Acid side (excess of H^+ ions)	1	1,000,000
	2	100,000
	3	10,000
	4	1,000
	5	100
	6	10
Neutrality	7	1
Alkaline side (excess of OH^- ions)	8	10
	9	100
	10	1,000
	11	10,000
	12	100,000
	13	1,000,000

Liquid	pH Value
Pure water	7
Sea water	8.5-10
Electroplating bath	6.5-5
.01 N HCl	2
.01 N NaOH	12
.1 N acetic acid	3
.1 N NH_4OH	11
Gastric juices	2
Urine	5-7
Blood	7.3-7.5
Milk	6.5-7
Soil (optimum for crops)	6-7

In acid-base titrations, changes in pH can be detected by indicators (q.v.) such as methyl orange,

phenolphthalein, etc. Litmus paper can also be used as a rough indication of acidity or alkalinity. In carrying out titrations the point at which the solution is found to be neutral (pH 7) is not always the correct end point.

pH control is of critical importance in a large number of industrial operations such as water purification, chrome tanning process for leather, in preservation of food products, in electroplating baths, dyeing, agriculture, and numerous other instances.

See also acid; base.

"Phaltan."²⁵³ Trademark for fungicide formulations containing N-trichloromethylthiophthalimide.

"Phanadorn" Calcium.¹⁶² Trademark for cyclobarbitol calcium.

"Phantolid."¹⁰⁵ Trademark for a standardized mixture of structural isomers of 1,1,2,3,3,5-hexamethylindan methyl ketone.

Properties: Waxy, white solid with musk-like odor that begins to sinter at about 35°C and becomes liquid at about 40°C. Soluble in conventional solvents and essential oils.

Use: Perfumery.

pharmaceutical. A broad term that includes not only all types of drugs, medicinal and curative products but also such ancillary products as tonics, dietary supplements, vitamins, deodorants and the like. See also drug.

"Pharmasorb."⁹⁹ Trademark for a pharmaceutical grade of attapulugus clay.

"Pharmolin."⁹⁹ Trademark for a pharmaceutical grade of kaolin.

phase.

(1) One of the three states or conditions in which substances can exist, i.e., solid, liquid, or gas(vapor). The condition depends primarily on the concentration of atoms or molecules: solids are the most dense, gases the least, and liquids occupy the intermediate position. Solids are normally crystalline, liquids are amorphous, and gases are without structure. See also matter.

(2) A physically distinct and mechanically separable portion of a dispersion or solution. Phases may be either solid, liquid, or gaseous (vapor). In any mixture or solution the major component is called the continuous or external phase and the minor component the dispersed or internal phase. The latter may or may not be uniformly dispersed in the continuous phase. See colloid chemistry; solution.

phase rule. Propounded by J. Willard Gibbs (q.v.) in 1877, the phase rule is a general system $F = n - r - 2$ stating the boundaries of thermodynamic equilibrium in a system of chemical reactants. The number of degrees of freedom (F) allowed in a given heterogeneous system may be examined by analysis or observation and plotted on a graph by proper choice of the components (n), the phases (r), and the independently variable factors of temperature and pressure.

The principles of the phase rule apply to all multicomponent systems, including solvent blends, glass, alloys and plastics.

Phe Abbreviation for phenylalanine.

alpha-phellandrene (4-isopropyl-1-methyl-1,5-cyclohexadiene) $\text{CH}_3\text{C}(\text{CH}_3)\text{CH}_2\text{CH}[\text{CH}(\text{CH}_3)_2]\text{CH}:\text{CH}$. A

monocyclic terpene occurring as (a) *d*- and (b) *l*-optical isomers.

Properties: Colorless oil; insoluble in water; soluble in ether. (a) Sp. gr. 0.8463 (25°C); b.p. 66–68°C (16 mm); refractive index 1.4777. (b) Sp. gr. 0.8324 (20°C); b.p. 58–59°C (16 mm); refractive index 1.4724. Combustible.

Derivation: (a) Found in ginger oil; Ceylon and Seychelles cinnamon oil. (b) Found in eucalyptus oil.

Hazard: Moderately toxic by ingestion and skin absorption; strong irritant.

Uses: Flavoring; perfumery.

beta-phellandrene (4-isopropyl-1-methylene-2-cyclohexene) $\text{CH}_2=\text{CCH}:\text{CHCH}[\text{CH}(\text{CH}_3)_2]\text{CH}_2\text{CH}_2$. A mo-

nocyclic terpene occurring as (a) *d*- and (b) *l*-optical isomers.

Properties: (a) Mobile oil with pleasant odor and a burning taste. Sp. gr. 0.8520 (20°C); b.p. 171–172°C (760 mm); refractive index 1.4788. (b) Mobile oil; sp. gr. 0.8497 (15°C); b.p. 178–179°C; flash point 120°F (T.C.C.). Refractive index 1.4800. Both are insoluble in water and alcohol; soluble in ether. Combustible.

Derivation: (a) lemon oil. (b) Japanese peppermint oil.

Hazard: Moderate fire risk.

"Phemerol."³³⁰ Trademark for benzethonium chloride (q.v.).

phenacaine hydrochloride

$\text{C}_2\text{H}_5\text{OC}_6\text{H}_4\text{NCH}(\text{CH}_3)\text{NC}_6\text{H}_4\text{OC}_2\text{H}_5 \cdot \text{HCl} \cdot \text{H}_2\text{O}$.

N,N'-Bis(para-ethoxyphenyl) acetamidine hydrochloride.

Properties: Small, white crystals; odorless; faintly bitter taste. Incompatible with alkalis. M.p. 190°C. Soluble in alcohol, boiling water and chloroform; less so in cold water, insoluble in ether.

Grades: N.F.; technical.

Use: Medicine.

phenacemide (phenylacetylurea)

$\text{C}_6\text{H}_5\text{CH}_2\text{CONHCONH}_2$.

Properties: White to creamy white, odorless, tasteless crystalline solid; m.p. 212–216°C; slightly soluble in alcohol, benzene, chloroform and ether; very slightly soluble in water.

Use: Medicine.

phenacetin. U.S.P. name for acetophenetidin (q.v.).

phenacyl chloride. See chloroacetophenone.

phenacyl fluoride. See fluoroacetophenone.

"Phenamine."³⁰⁷ Trademark for a series of direct dyes, used for the dyeing of cotton and paper.

phenanthraquinone. See phenanthrenequinone.

phenanthrene $\text{C}_{14}\text{H}_{10}$.

Properties: Colorless, shining crystals. Soluble in alcohol, ether, benzene, carbon disulfide and acetic acid; insoluble in water. Sp. gr. 1.063; m.p. 100.35°C; b.p. 340°C. Combustible.

Derivation: Fractional distillation of high-boiling coal-tar oils, with subsequent recrystallization from alcohol.

Hazard: Carcinogenic agent. Tolerance, 0.2 mg per cubic meter in air.

Uses: Dyestuffs; explosives; synthesis of drugs; biochemical research; phenanthrenequinone.

phenanthrenequinone. (Erroneously: phenanthraquinone) $\text{C}_{14}\text{H}_8\text{O}_2$.

Properties: Yellow-orange, needle-like crystals. Soluble in sulfuric acid, benzene; glacial acetic acid and hot alcohol; slightly soluble in ether; insoluble in water. Sp. gr. 1.4045; m.p. 206–207°C; b.p. sublimes above 360°C.

Derivation: By oxidation of a boiling solution of phenanthrene in glacial acetic acid with chromic acid, solution in sodium disulfite, precipitation by means of hydrochloric acid and recrystallization.

Uses: Organic synthesis; dyes.

1,10-phenanthroline (4,5-phenanthroline; ortho-phenanthroline) $\text{C}_{12}\text{H}_8\text{N}_2 \cdot \text{H}_2\text{O}$. A heterotricyclic compound.

Properties: White crystalline powder; m.p. 93–94°C, anhydrous 117°C. Slightly soluble in water; soluble in alcohol, benzene.

Derivation: Made by heating ortho-phenylenediamine with glycerin, nitrobenzene and concentrated sulfuric acid; or in like manner from 8-aminoquinoline.

Uses: Forms a complex compound with ferrous ions used as an indicator; drier in coatings industry.

phenarsazine chloride. See diphenylaminechloroarsine.

phenazine (azophenylene) $\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4$. A tricyclic compound.

Properties: Yellow crystals; m.p. 170–171°C; b.p. > 360°C; very slightly soluble in water; soluble in alcohol and ether. Combustible.

Uses: Organic synthesis; manufacture of dyes; larvicide.

phenethicillin. See potassium alpha-phenoxethyl penicillin.

phenethyl acetate. See 2-phenylethyl acetate.

phenethyl alcohol (phenylethyl alcohol; 2 phenylethanol; benzyl carbinol) $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid; floral odor; sharp burning taste; sp. gr. 1.017–1.020 (25°C); refractive index (n_D 20/D) 1.5310–1.5340; f.p. –27°C; b.p. 219°C. Flash point 216°F. Soluble in 50% alcohol; soluble 1 part in 50 parts of water; soluble in fixed oils, alcohol, and glycerol; slightly soluble in mineral oil. Combustible.

Derivation: (a) By reduction of phenylacetic ethyl ester by sodium in absolute alcohol. (b) By the action of ethylene oxide on phenylmagnesium bromide and subsequent hydrolysis.

Grades: Technical; N.F.; F.C.C.

Containers: Tin cans and glass bottles; drums.

Uses: Organic synthesis; synthetic rose oil; soaps; flavors; antibacterial; preservative; medicine.

sec-phenethyl alcohol. See alpha-methylbenzyl alcohol.

phenethylamine. See 2-phenylethylamine.

phenethyl anthranilate. See 2-phenylethyl anthranilate.

phenethyl isobutyrate. See 2-phenylethyl isobutyrate.

phenethyl phenylacetate. See 2-phenylethyl phenylacetate.

phenethyl propionate. See 2-phenylethyl propionate.

phenethyl salicylate. See 2-phenylethyl salicylate.

ortho-phenetidine (2-aminophenetole) $\text{NH}_2\text{C}_6\text{H}_4\text{OC}_2\text{H}_5$.

Properties: Oily liquid; rapidly becomes brown on exposure to light or air. Solidifies below –20°C; b.p.

228–230°C. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Reduction of ortho-nitrophenetole with iron filings and hydrochloric acid.

Hazard: Toxic by ingestion and inhalation.

Use: Manufacture of dyes; laboratory reagent.

para-phenetidine (4-aminophenetole) $\text{NH}_2\text{C}_6\text{H}_4\text{OC}_2\text{H}_5$.

Properties: Colorless oily liquid; becomes red to brown on exposure to air and light. Sp. gr. 1.0613 (15°C); m.p. 2–4°C; b.p. 253–255°C. Insoluble in water; soluble in alcohol. Combustible.

Derivation: Ethylating para-nitrophenol with ethyl sulfate or chloride in presence of sodium hydroxide followed by reduction with iron filings and hydrochloric acid.

Hazard: Toxic by ingestion and inhalation.

Uses: Dyestuffs intermediate; pharmaceuticals; medicine; laboratory reagent.

phenetole (phenyl ethyl ether) $\text{C}_6\text{H}_5\text{OC}_2\text{H}_5$.

Properties: Colorless liquid; b.p. 172°C; f.p. –30°C; sp. gr. 0.967 (20/4°C); insoluble in water; soluble in alcohol and ether. Combustible; low toxicity.

phenetsal. See para-acetylaminophenyl salicylate.

"Phenex."⁹⁴ Trademark for alpha-ethyl-beta-propylacrylaniline. Used as an accelerator for natural and synthetic rubber and latexes.

"Phenidone."²¹⁹ Trademark for 1-phenyl-3-pyrazolidone (q.v.).

phenindione (2-phenyl-1,3-indanedione) $\text{C}_{15}\text{H}_{10}\text{O}_2$.

Properties: Pale yellow crystalline material; practically odorless; insoluble in water; soluble in methanol, alcohol, ether, acetone, benzene. Solutions in alkalis are red; in concentrated sulfuric acid blue.

Use: Medicine (blood anticoagulant).

pheniramine maleate (prophenpyridamine maleate) $\text{C}_{16}\text{H}_{20}\text{N}_2 \cdot \text{C}_4\text{H}_4\text{O}_4$. 1-Phenyl-1-(2-pyridyl)-3-dimethylaminopropane maleate.

Properties: White crystalline powder with faint amine-like odor. M.p. 104–108°C. Very soluble in alcohol and water, only slightly soluble in benzene and ether. 1% solution has pH between 4.5–5.5.

Grade: N.F.

Use: Medicine (antihistamine).

"Phenmad."¹²⁹ Trademark for a 10% phenylmercuric acetate aqueous solution. Used as a turf fungicide.

Hazard: Highly toxic.

phenobarbital (phenylbarbital; phenylethylmalonylurea; 5-ethyl-5-phenylbarbituric acid) $\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}_3$.

Properties: White, shining, crystalline powder odorless, stable. M.p. 174–178°C. Soluble in alcohol, ether, chloroform, benzene, alkali hydroxides, alkali carbonate solutions; sparingly soluble in water.

Derivation: Condensation of phenylethylmalonic acid derivatives and urea.

Grade: U.S.P.

Containers: Glass bottles; fiber cans, drums.

Hazard: Toxic; may have damaging side effects. See barbiturate.

Use: Medicine (sedative); laboratory reagent. Also available as the sodium salt, which has good water-solubility.

fenocoll hydrochloride (aminoacetophenetidine hydrochloride; glyccoll-para-phenetidine hydrochloride) $\text{C}_2\text{H}_5\text{OC}_6\text{H}_4\text{NHCOCH}_2\text{NH}_2 \cdot \text{HCl}$.

Properties: Fine, white crystalline powder; soluble in water and warm alcohol; slightly soluble in chloroform, ether and benzene. M.p. 95°C.

Derivation: By the action of aminoacetic acid upon phenetidine and acidifying.

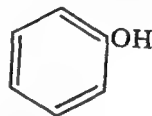

Use: Medicine.

"Pheno" Dyes.⁵⁷ Trademark for a group of direct dyes used for coloring paper.

"Phenoform."³⁰⁷ Trademark for a series of dyestuffs and pigments used to color phenol-formaldehyde resins.

phenol

(1) A class of aromatic organic compounds in which one or more hydroxy groups are attached directly to the benzene ring. Examples are phenol itself (benzophenol), the cresols, xylenols, resorcinol, naphthols. Though technically alcohols, their properties are quite different. (2) Phenol (carbolic acid; phenylic acid; benzophenol; hydroxybenzene) $\text{C}_6\text{H}_5\text{OH}$.

Properties: White, crystalline mass which turns pink or red if not perfectly pure or if under influence of light; absorbs water from the air and liquefies; distinctive odor; sharp burning taste. When in very weak solution it has a sweetish taste; sp. gr. 1.07; m.p. 42.5–43°C; b.p. 182°C; flash point 172.4°F. (C.C.). Soluble in alcohol, water, ether, chloroform, glycerol, carbon disulfide, petrolatum, fixed or volatile oils and alkalis. Combustible. Autoignition temp. 1319°F.

Derivation: Most of the phenol in the U.S. is made by the oxidation of cumene, yielding acetone as a by-product. The first step in the reaction yields cumene hydroperoxide, which decomposes with dilute sulfuric acid to the primary products, plus acetophenone and phenyl dimethyl carbinol. Other processes include sulfonation, chlorination of benzene, Raschig, and oxidation of benzene.

Method of purification: Rectification.

Grades: Fused, crystals or liquid, all as technical (82%, 90%, 95%, other components mostly cresols); C.P. and U.S.P.

Containers: 25- and 55-gal drums; tank cars; tank trucks.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Strong irritant to tissue. Tolerance, 5 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Phenolic resins; epoxy resins (bisphenol-A); nylon-6 (caprolactam); 2,4-D; selective solvent for refining lubricating oils; adipic acid; salicylic acid; phenolphthalein; pentachlorophenol; acetophenetidine; picric acid; germicidal paints; pharmaceuticals; laboratory reagent; dyes and indicators; slimicide.

Shipping regulations: (Rail, Air) Solid, or liquid if containing over 50% benzophenol: Poison label. Legal name: carbolic acid.

Note: High-boiling phenols are mixtures containing predominantly meta-substituted alkyl phenols. Their boiling point ranges from 238 to 288°C; they set to a glass below –30°C. They are used in phenolic resins, as fuel-oil sludge inhibitors, as solvents and as rubber chemicals.

phenolate process. A process for removing hydrogen sulfide from gas by the use of sodium phenolate, which reacts with the hydrogen sulfide to give sodium hydrosulfide and phenol. This can be reversed by steam heat to regenerate the sodium phenolate.

phenol coefficient. In determining the effectiveness of a disinfectant using phenol as a standard of comparison, the phenol coefficient is a value obtained by dividing the highest dilution of the test disinfectant by the highest dilution of phenol that sterilizes a given culture of bacteria under standard conditions of time and temperature.
See also disinfectant.

phenol-formaldehyde resin. The first synthetic thermosetting polymer, the reaction product of phenol with aqueous 37–50% formaldehyde at 50–100°C, with basic catalyst; discovered by Baekeland (q.v.) in 1907 and trademarked "Bakelite" in 1911. Polymerization is of the condensation type, proceeding through three stages. With an acid catalyst novolak resins (q.v.) are produced, which are thermoplastic.

Properties: Gray to black, hard, infusible solid when cured; resistant to moisture, solvents and heat up to 200°C; dimensionally stable; good electrical resistance; noncombustible; sound- and noise-absorbent; decomposed by oxidizing acids; fair resistance to alkalis. Cannot be successfully colored. Generally nontoxic.

Uses: Molded and cast articles; bonding powders; ion exchange; laminating and impregnating; plywood and glass-fiber composites; ablative coatings for aerospace use; binder for oil-well sands; paint and baked enamel coatings; thermal and acoustic insulation, brake linings, clutch facings, shell molds; chemical equipment, machine and instrument housings, machine parts, electrical devices. See also A-, B-, and C-stage resin; novolak; Baekeland; phenolic resin.

phenol-furfural resin. A phenolic resin that has a somewhat sharper transition than phenol-formaldehyde from the soft, thermoplastic stage to the cured, infusible state and can be fabricated by injection molding since it has little tendency to harden before curing conditions are reached.

phenolic resin. Any of several types of synthetic thermosetting resin obtained by the condensation of phenol or substituted phenols with aldehydes such as formaldehyde, acetaldehyde, and furfural. Phenol-formaldehyde resins (q.v.) are typical and constitute the chief class of phenolics.

phenolphthalein (C_6H_4OH)₂C₂O₂C₆H₄ (an approximation). 3,3-Bis(para-hydroxyphenyl)phthalide.

Properties: Pale yellow powder; forms an almost colorless solution in neutral or acid solution in presence of alkali, but colorless in the presence of large amounts of alkali. Soluble in alcohol, ether, and alkalis; insoluble in water. Sp. gr. 1.2765; m.p. 261°C.

Derivation: Interaction of phenol and phthalic anhydride in sulfuric acid.

Grades: Technical; pure reagent; N.F.

Containers: Bottles; cans; drums.

Uses: Dyes; acid-base indicator; laboratory reagent; medicine (laxative).

phenol red. See phenolsulfonephthalein.

phenolsulfonephthalein (phenol red)

(C_6H_4OH)₂COSO₂C₆H₄ (an approximation).

Properties: Bright to dark red crystalline powder. Stable in air. Slightly soluble in water, alcohol, and acetone; almost insoluble in chloroform and ether; soluble in alkali hydroxides and carbonates.

Derivation: Reaction of phenol with ortho-sulfoben-

zoic acid anhydride. Differs from phenolphthalein in containing an SO₂ group in place of CO.

Grades: Technical; reagent; U.S.P. The U.S.P. spelling is phenolsulfonphthalein.

Uses: Acid-base indicator; diagnostic reagent in medicine; laboratory reagent.

phenolsulfonic acid (sulfocarbolic acid) HOC₆H₄SO₃H.

Properties: Yellowish liquid, becoming brown on exposure to air. A mixture of ortho- and paraphenolsulfonic acids. Soluble in water and alcohol.

Derivation: Action of sulfuric acid on phenol.

Grades: Technical; reagent.

Hazard: Strong irritant to skin and tissue; moderately toxic.

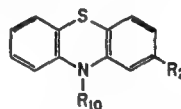

Uses: Water analysis; laboratory reagent; electroplated tin coating baths; manufacture of intermediates and dyes; pharmaceuticals.

Shipping regulations: (Rail) Corrosive material, n.o.s., White label. (Air) Corrosive label.

phenol trinitrate. See picric acid.

"Phenoplast."²⁸⁹ Trademark for a cold-setting liquid phenolic resin coating.

phenothiazine (thiodiphenylamine)

Properties: Grayish-green to greenish-yellow powder, granules or flakes. Tasteless; slight odor. Insoluble in ether and water; soluble in acetone. M.p. 175–185°C; b.p. 371°C; sublimes 130°C (1 mm).

Derivation: By reaction of diphenylamine and sulfur in presence of an oxidizing catalyst.

Grades: Technical; N.F.

Hazard: Moderately toxic by ingestion. Absorbed by skin. Tolerance, 5 mg per cu meter of air.

Uses: Insecticide; manufacture of dyes; parent compound for chlorpromazine and related antipsychotic drugs; polymerization inhibitor; antioxidant.

phenoxyacetic acid $C_6H_5OCH_2COOH$.

Properties: Light tan powder; b.p. 285°C; m.p. 98°C; soluble in ether, water, methanol, carbon disulfide, glacial acetic acid. Combustible.

Uses: Intermediate for dyes, pharmaceuticals, pesticides, other organics; fungicides; flavoring; laboratory reagent.

phenoxybenzamine hydrochloride

$C_6H_5OCH_2CH(CH_3)N(CH_2C_6H_5)(CH_2)_2Cl \cdot HCl$.

Properties: Crystals; m.p. 137.5–140°C; soluble in alcohol, propylene glycol; slightly soluble in water.

Use: Medicine.

phenoxydihydroxypropane. See phenoxypropanediol.

2-phenoxyethanol. See ethylene glycol monophenyl ether.

alpha-phenoxyethylpenicillin. See penicillin.

phoxymethylpenicillin (penicillin V) $C_{16}H_{18}N_2O_5S$.

Properties: White, odorless, crystalline powder; very slightly soluble in water; soluble in alcohol and acetone. Insoluble in fixed oils; pH of saturated solution is 2.5–4.0.

Grade: N.F.

Use: Medicine (antibiotic for oral use). Available also as potassium salt.

phenoxypropanediol (1-phenoxypropanediol-2,3)
 $C_6H_5OCH_2CHOHCH_2OH$.

Properties: White crystalline solid; m.p. 53°C; b.p. 150–155°C (4 mm); soluble in water, alcohol, glycerin, carbon tetrachloride, warm benzene; insoluble in gasoline. Combustible.

Derivation: Phenol and glycerol.

Uses: Medicine; plasticizer; resins; lacquers.

phenoxypropylene oxide $C_6H_5OCH_2\overline{CHCH_2}O$.

Properties: Practically colorless liquid with characteristic odor. Very slightly soluble in water; sp. gr. 1.1110 (20/20°C); b.p. 244.2°C (760 mm); vapor pressure less than 0.1 mm (20°C); f.p. 2.8°C; viscosity 6.93 cp (20°C).

phenoxy resin. A high molecular weight thermoplastic copolymer of bisphenol A and epichlorohydrin having the basic molecular structure $—[OC_6H_4C(CH_3)_2C_6H_4OCH_2CH(OH)CH_2]_n—$ (n is about 100). It uses the same raw materials as epoxy resins, but contains no epoxy groups. It may be cured by reacting with polyisocyanates, anhydrides or other cross-linking agent capable of reacting with hydroxyl groups.

The ductility of phenoxy resins resembles that of metals. They are transparent and are also characterized by low mold shrinkage, good dimensional stability and moderately good resistance to temperature and corrosives. Phenoxy resins are soluble in methyl ethyl ketone and have been used for coatings and adhesives. A typical injection-molded specimen has a tensile strength of 9000 psi, heat distortion point 188°F at 264 psi load, and specific gravity 1.18.

They may be extruded or blow-molded. Parts may be thermally formed and heat- or solvent-welded. Some applications are blow-molded containers, pipe, ventilating ducts and molded parts.

"Phenurone."³ Trademark for phenacemide (q.v.).

phenyl. The univalent C_6H_5 group derived from benzene, and characteristic of phenol and other derivatives. See following entries.

phenylacetaldehyde (alpha-toluic aldehyde)
 $C_6H_5CH_2CHO$.

Properties: Colorless liquid; strong hyacinth-like odor. Soluble in 2 parts of 80% alcohol; soluble in ether and most fixed oils; very slightly soluble in water. Sp. gr. 1.023 to 1.030 (25°C); f.p. below -10°C; b.p. 193 to 194°C; refractive index 1.520–1.530. Becomes more viscous on aging. Combustible.

Derivation: From phenyl-alpha-chloroacetic acid, by action of alkalis; oxidation of phenylethyl alcohol.

Grades: Technical; 50% solution in benzyl alcohol; F.C.C.

Uses: Perfumes; flavoring; laboratory reagent.

phenylacetaldehyde dimethylacetal (alpha-tolyl aldehyde dimethyl acetal) $C_6H_5CH_2CH(OCH_3)_2$.

Properties: Colorless liquid; strong odor; more stable than phenylacetaldehyde; not known to cause discoloration; sp. gr. 1.000–1.004 (25/25°C); refractive index 1.493–1.496 (20°C); soluble in 2 parts of 70% alcohol. Flash point 191°F (TCC). Combustible.

Grades: Technical; F.C.C.

Uses: Perfumery; flavoring; laboratory reagent.

phenylacetamide (alpha-phenylacetamide)

$C_6H_5CH_2CONH_2$.

Properties: White crystals; b.p. 280–290°C (decomposes); m.p. 156–160°C; soluble in hot water and alcohol; very slightly soluble in cold water and ether. Combustible; low toxicity.

Derivation: Partial hydrolysis of benzyl cyanide; dehydration of ammonium phenyl acetate.

Containers: Fiber drums.

Uses: Organic synthesis; pharmaceuticals; penicillin precursors; laboratory reagent.

N-phenylacetamide. See acetanilide.

phenyl acetate (acetylphenol) $C_6H_5OOCCH_3$.

Properties: Water-white liquid; soluble in alcohol and ether; slightly soluble in water. Sp. gr. 1.073 (25/25°C); boiling point 195–196°C; flash point 176°F. Combustible. Low toxicity.

Derivation: (a) From phenol and acetyl chloride. (b) By heating triphenyl phosphate with potassium acetate and alcohol.

Containers: Glass bottles; carboys; drums.

Uses: Solvent; organic synthesis; laboratory reagent.

phenylacetic acid (alpha-toluic acid) $C_6H_5CH_2CO_2H$.

Properties: Shiny, white plate crystals; sp. gr. 1.0809; floral odor; f.p. 76–78°C; b.p. 262°C; soluble in alcohol and ether; slightly soluble in cold water. Combustible.

Derivation: From benzyl cyanide.

Grades: Technical; F.C.C.

Uses: Perfume; medicine; manufacture of penicillin; fungicide; plant hormones; flavoring; laboratory reagent.

phenylacetonitrile. See benzyl cyanide.

alpha-phenylacetophenone. See deoxybenzoin.

phenylacetyl chloride $C_6H_5CH_2COCl$.

Properties: Colorless liquid; refractive index 1.5320 (20°C).

Containers: Carboys, nickel drums.

Hazard: Strong irritant.

Uses: Acylating agent, including manufacture of esters for flavors; laboratory reagent.

phenylacetylurea. See phenacemide.

beta-phenylacrylic acid. See cinnamic acid.

phenylacrylyl chloride. See cinnamoyl chloride.

phenylalanine (alpha-amino-beta-phenylpropionic acid) $C_6H_5CH_2CH(CH_2)COOH$. An essential amino acid.

Properties: L(-)-phenylalanine: Plates and leaflets from concentrated aqueous solutions; hydrated needles from dilute aqueous solutions; decomposes 283°C; soluble in water; slightly soluble in methanol and ethanol.

D(+)-phenylalanine: Leaflets from water; decomposes 285°C; soluble in water; slightly soluble in methanol.

DL-phenylalanine: Leaflets or prisms from water or alcohol; sweet tasting; decomposes 318–320°C; soluble in water.

Sources: (L-)-Phenylalanine is isolated commercially from proteins (ovalbumin, lactalbumin, zein, and fibrin). DL-Phenylalanine is synthesized from alpha-acetaminocinnamic acid.

Grades: Technical; F.C.C.

Containers: Glass bottles; fiber cans; drums.

Uses: Biochemical research; dietary supplement; synthetic sweeteners; laboratory reagent. Available commercially as DL-dihydroxyphenylalanine and as DL-phenylalanine.

phenylallylic alcohol. See cinnamic alcohol.

phenylamine. See aniline.

phenylamino cadmium dilactate.

Hazard: Probably toxic by ingestion.

Use: Seed disinfectant.

phenyl-2-amino-5-naphthol-7-sulfonic acid (phenyl J acid; 6-anilino-1-naphthol-3-sulfonic acid)

$\text{HOC}_{10}\text{H}_5(\text{NHC}_6\text{H}_5)(\text{SO}_3\text{H})$.

Properties: Slate-colored crystals; soluble in alkali. Combustible.

Derivation: From H acid and aniline (condensation with heat).

Hazard: Probably toxic by ingestion.

Use: Dyes.

phenyl-2-amino-8-naphthol-6-sulfonic acid (phenyl gamma acid; 7-anilino-1-naphthol-3-sulfonic acid)

$\text{HOC}_{10}\text{H}_5(\text{NHC}_6\text{H}_5)(\text{SO}_3\text{H})$.

Properties: Gray crystals; soluble in alkali. Combustible.

Derivation: From gamma acid and aniline (condensation with heat).

Hazard: Probably toxic by ingestion.

Use: Dyes.

1-phenyl-2-aminopropane. See amphetamine.

N-phenylaniline. See diphenylamine.

ortho-phenylaniline. See ortho-aminobiphenyl.

phenylarsonic acid $\text{C}_6\text{H}_5\text{AsO}(\text{OH})_2$.

Properties: Crystalline powder; m.p. 160°C with decomposition; soluble in water and alcohol; insoluble in chloroform.

Preparation: The Bart reaction between the diazonium salt and sodium arsenite.

Hazard: Highly toxic by ingestion.

Use: Analytical reagent for tin.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

phenylazoaniline. See aminoazobenzene.

1-(phenylazo)-2-naphthylamine. See yellow AB.

phenylbarbital. See phenobarbital.

phenylbenzamide. See benzanilide.

3-phenyl-3-benzoborepin. A synthetic carbon-boron heterocyclic compound with aromatic properties. Stable in air. Key intermediate in its synthesis is the nonaromatic carbon-tin heterocycle 3,3-dimethyl-3-benzostannepin.

phenylbiphenyloxadiazole. See 1,3,4-phenylbiphenyloxadiazole.

1,3,4-phenylbiphenyloxadiazole (PBD; phenylbiphenyloxadiazole) $\text{C}_{20}\text{H}_{14}\text{N}_2\text{O}$.

Properties: Crystals; m.p. $166\text{--}168^\circ\text{C}$.

Grade: Purified.

Use: As primary fluors or as wave length shifters in solution scintillators.

phenylbis[1-(2-methyl)aziridinyl]phosphine oxide $\text{C}_6\text{H}_5(\text{C}_3\text{H}_6\text{N})_2\text{PO}$.

Properties (technical): Straw-colored liquid; limited solubility in water; soluble in most organic solvents. The pure material is a low-melting solid. Combustible.

Hazard: Probably toxic.

Use: Polymerization additive.

phenyl bromide. See bromobenzene.

1-phenylbutane. See n-butylbenzene.

2-phenylbutane. See sec-butylbenzene.

phenylbutazone (4-n-butyl-1,2-diphenyl-3,5-pyrazolidinedione) $\text{C}_{19}\text{H}_{20}\text{N}_2\text{O}_2$. A synthetic pyrazolone derivative; also occurs naturally in certain herbs.

Properties: White or very light yellow powder; slightly bitter taste and very slight aromatic odor; m.p. $103\text{--}106^\circ\text{C}$; freely soluble in acetone, ether and ethyl acetate; very slightly soluble in water; stable if stored at room temperature in closed containers in absence of moisture. Also available as sodium salt.

Grade: N.F.

Hazard: Toxic; use by prescription only.

Use: Medicine. Antiinflammatory drug licensed for human use; veterinary medicine.

1-phenylbutene-2 $\text{C}_6\text{H}_5\text{CH}_2\text{CH}:\text{CHCH}_3$.

Properties: Colorless liquid. Boiling range $174\text{--}176^\circ\text{C}$; sp. gr. 0.888 ($60/60^\circ\text{F}$); refractive index 1.511 (n_{D}^{20}); flash point 160°F . (TOC). Combustible.

Grades: Technical, 95 mole %.

Uses: Organic synthesis; laboratory reagent.

phenylbutynol (3-phenyl-1-butyne-3-ol)

$\text{HC}:\text{CC}(\text{C}_6\text{H}_5)(\text{OH})\text{CH}_3$.

Properties: Crystals; camphor odor; m.p. $51\text{--}52^\circ\text{C}$; b.p. $217\text{--}218^\circ\text{C}$; sp. gr. 1.0924 ($20/20^\circ\text{C}$); slightly soluble in water; soluble in acetone benzene, most organic solvents. Combustible.

Uses: Acid inhibitor; organic synthesis.

2-phenylbutyric acid. See phenylethylacetic acid.

1-phenyl-3-carbethoxypyrazolone-5 $\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}_3$.

Properties: White to light buff powder, stable in aqueous solution. M.p. $182\text{--}188^\circ\text{C}$. Combustible.

Containers: Drums.

Use: Dyestuff intermediate; laboratory reagent.

phenyl carbimide. See phenyl isocyanate.

phenylcarbinol. See benzyl alcohol.

phenylcarbylamine chloride $\text{C}_6\text{H}_5\text{NCCl}_2$.

Properties: Pale-yellow, oily liquid; onion-like odor. Mildly volatile. Soluble in alcohol, benzene, ether; insoluble in water. Sp. gr. 1.30 at 15°C ; b.p. $208\text{--}210^\circ\text{C}$.

Derivation: Chlorination of phenylisothiocyanate.

Grade: Technical.

Hazard: Highly toxic by inhalation and skin absorption. Strong irritant to skin and mucous membranes.

Uses: Organic synthesis; military poison gas.

Shipping regulations: (Air) Not acceptable. (Rail) Poison Gas label. Not accepted by express.

phenyl "Cellosolve."²¹⁴ Trademark for ethylene glycol monophenyl ether (q.v.).

phenyl chloride. See chlorobenzene.

phenylchloroform. See benzotrichloride.

phenyl chloromethyl ketone. See chloroacetophenone.

1-phenyl-3-chloropropane. See phenylpropyl chloride.

phenyl cyanide. See benzonitrile.

phenylcyclohexane (cyclohexylbenzene) $\text{C}_6\text{H}_5\text{C}_6\text{H}_{11}$.

Properties: Colorless, oily liquid; pleasant odor; sp. gr. 0.938 ($25/15^\circ\text{C}$); m.p. 5°C ; b.p. 237.5°C ; refractive index (n_{D}^{25}) 1.523; flash point 400°F (o.c.). Insoluble in water, glycerin; very soluble in alcohol, acetone, benzene, carbon tetrachloride, castor oil, hexane, xylene. Combustible; low toxicity.

Uses: High-boiling solvent; penetrating agent; intermediate; laboratory reagent.

2-phenylcyclohexanol $\text{HOCH}(\text{CH}_2)_4\text{CH}(\text{C}_6\text{H}_5)$.

Properties: Colorless to pale, straw-colored liquid; pour point -18°C ; b.p. $276\text{--}281^\circ\text{C}$; sp. gr. 1.033

(25/25°); refractive index 1.536 (n 25/D); flash point 280°F; very slightly soluble in water; soluble in methanol, ether. Combustible; low toxicity. Uses: Solvent; intermediate.

N-phenyl-N'-cyclohexyl-para-phenylenediamine

$C_6H_5HNC_6H_4NHC_6H_{11}$.

Properties: Gray-violet powder; sp. gr. 1.16; m.p. 103–107°C; soluble in acetone, benzene, MEK, ethyl acetate, ethylene dichloride; insoluble in water. Uses: Antiozonant-antiozonant for elastomers.

phenyldichloroarsine $C_6H_5AsCl_2$.

Properties: Liquid; microcrystalline mass at the f.p. Decomposed by water. Soluble in alcohol, benzene, and ether; insoluble in water. Sp. gr. 1.654 (20°C); b.p. 255–257°C; f.p. –20°C; vapor tension 0.014 mm (15°C); volatility 404 mg/cu m (20°C); coefficient of thermal expansion 0.00073.

Derivation: Arsenic trichloride and phenylmercuric chloride are heated together at 100°C.

Grade: Technical.

Containers: Steel bottles.

Hazard: Highly toxic by ingestion and inhalation. Strong irritant to eyes, skin, and tissue.

Uses: Lachrymator poison gas; solvent for diphenylcyanarsine.

Shipping regulations: (Rail, Air) Poison label. Not accepted on passenger planes.

phenyldidecyl phosphite $C_6H_5OP(OC_{10}H_{21})_2$.

Properties: Nearly water-white liquid with an odor of alcohol; sp. gr. 0.940 (25/15.5°C); m.p. below 0°C; refractive index (n 25/D) 1.4785; flash point 425°F (COC). Combustible.

Containers: 55-gal steel drums; tank trucks.

Uses: Chemical intermediate; antioxidant; ingredient in stabilizer systems for resins.

phenyl diethanolamine $C_6H_5N(C_2H_4OH)_2$.

Constants: Colorless liquid. M.p. 58°C; b.p. 190°C (1 mm); vapor pressure <0.01 mm (20°C); wt 10.0 lb/gal (20°C); sp. gr. 1.1203 at 60/20°C; viscosity 1.19 poise (20°C). Slightly soluble in water; soluble in ethyl alcohol and acetone. Flash point 375°F (o.c.). Combustible. Low toxicity.

Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Uses: Organic synthesis; dyestuff; laboratory reagent.

phenyl diglycol carbonate [diethyl glycol bis(phenyl carbonate)] $(C_6H_5OOCCH_2CH_2)_2O$.

Properties: Colorless solid; sp. gr. 1.23 (20/4°C); m.p. 40°C; b.p. 225–229°C; refractive index (n 20/D) 1.525; evaporation rate 0.026 mg/sq cm/hr at 100°C; insoluble in water (very stable to hydrolysis); widely soluble in organic solvents; compatible with many resins and plastics. Combustible.

Use: Plasticizer.

N-phenyl-N'-(1,3-dimethyl butyl)-para-phenylenediamine $C_6H_5HNC_6H_4NHC_4H_9$.

Properties: Dark violet, staining, low-melting solid; m.p. 50°C; sp. gr. 1.07.

Uses: Antiozonant, antioxidant, and polymer stabilizer.

3-phenyl-1,1-dimethylurea. See fenuron.

meta-phenylenediamine (meta-diaminobenzene) $C_6H_4(NH_2)_2$.

Properties: Colorless needles; unstable in air; usually in the form of the stable hydrochloride; sp. gr. 1.1389; m.p. 63°C; b.p. 282–287°C; soluble in alcohol, ether, and water.

Derivation: Reduction of meta-dinitrobenzene or nitroaniline with iron and hydrochloric acid. Purified by crystallization.

Grades: Technical; 99% min purity.

Hazard: Strong irritant to skin. Toxic by inhalation.

Uses: Dyestuff manufacture; detection of nitrous acid; textile developing agent; laboratory reagent.

ortho-phenylenediamine (orthamine; ortho-diaminobenzene) $C_6H_4(NH_2)_2$.

Properties: Colorless monoclinic crystals; darkens in air; m.p. range 102–104°C; b.p. 252–258°C; soluble in alcohol, ether, water, and chloroform.

Derivation: Reduction of ortho-dinitrobenzene or nitroaniline with iron and hydrochloric acid. Purified by crystallization.

Grades: Technical; 99.0% min purity.

Uses: Manufacture of dyes; photographic developing agent; organic synthesis; laboratory reagent.

para-phenylenediamine (para-diaminobenzene) $C_6H_4(NH_2)_2$.

Properties: White to light purple crystals (oxidizes on standing in air to purple and black); m.p. about 147°C; b.p. 267°C; soluble in alcohol, ether; soluble in water and alcohol; affected by light. Flash point 312°F. Combustible.

Derivation: Reduction of para-dinitrobenzene or nitroaniline with iron and hydrochloric acid. Purified by crystallization.

Grades: Technical; 99% min purity.

Hazard: Toxic by inhalation; absorbed by skin. Tolerance, 0.1 mg per cubic meter of air.

Uses: Azo dye intermediate; photographic developing agent; photochemical measurements; intermediate in manufacture of antioxidants and accelerators for rubber; laboratory reagent; dyeing hair and fur.

phenylephrine hydrochloride (1-(1-(meta-hydroxyphenyl)-2-methylaminoethanol hydrochloride)

$HOC_6H_4CH(OH)CH_2NHCH_3 \cdot HCl$.

Properties: White or nearly white crystals; odorless; has bitter taste; solutions are acid to litmus paper; freely soluble in water and in alcohol; m.p. 140–145°C; levorotatory in solution.

Grade: U.S.P.

Use: Medicine.

phenylethane. See ethylbenzene.

2-phenylethanol. See phenethyl alcohol.

phenylethanolamine $C_6H_5NHCH_2CH_2OH$.

Constants: Liquid; sp. gr. 1.0970 (20/20°C); b.p. 285.2°C; vapor pressure <0.01 mm (20°C); wt 9.1 lb/gal (20°C); f.p. 10.6°C; viscosity 1.01 poise (20°C). Flash point 305°F (o.c.). Combustible.

Hazard: Moderately toxic.

Uses: Organic synthesis; dyestuffs.

phenyl ether. See diphenyl oxide.

2-phenylethyl acetate (phenethyl acetate)

$C_6H_5CH_2CH_2OOCCH_3$. (Not the same as sec-phenylethyl acetate).

Properties: Colorless liquid; peach-like odor. Soluble in alcohol, ether, and most fixed oils. Sp. gr. 1.030–1.034; refractive index 1.497–1.501 (20°C); b.p. 226°C; flash point 230°F; combustible.

Derivation: (a) Interaction of ethyl acetate and aluminumphenyl ethylate. (b) Interaction of acetic anhydride and phenylethyl alcohol in the presence of sodium acetate.

Grades: Technical; F.C.C.

Containers: Glass bottles.

Use: Perfumery; laboratory reagent.

sec-phenylethyl acetate. See alpha-methylbenzyl acetate.

phenylethylacetic acid (2-phenylbutyric acid)
 $C_2H_5CH(C_6H_5)COOH$.

Properties: White crystals with aromatic odor; m.p. 41.0°C (min); insoluble in water; soluble in alcohol, ketones, and esters. Combustible.

Use: Organic synthesis; laboratory reagent.

2-phenylethyl alcohol. See phenethyl alcohol.

2-phenylethylamine (phenethylamine; 1-amino-2-phenylethane) $C_6H_5CH_2CH_2NH_2$.

Properties: Liquid with a fishy odor; absorbs carbon dioxide from the air; strong base; sp. gr. 0.9640; b.p. 194.5°C; soluble in water, alcohol, and ether. Combustible.

Derivation: From phenylethyl alcohol and ammonia under pressure.

Grades: Technical; scintillation.

Containers: Drums.

Hazard: Skin irritant.

Uses: Organic synthesis; laboratory reagent; scintillation counter (CO_2 absorber).

2-phenylethyl anthranilate (phenethyl anthranilate)
 $H_2NC_6H_4COOC_2H_4C_6H_5$.

Properties: Colorless liquid which yellows with age; odor of grape and orange; sp. gr. 1.14 (25/25°C). Combustible; nontoxic.

Uses: Perfumes; flavoring.

phenylethyl carbinol. See phenylpropyl alcohol.

phenylethylene. See styrene.

N-phenylethylethanolamine $C_6H_5N(C_2H_5)C_2H_4OH$.

Properties: Solid; m.p. 37.2°C; b.p. 268°C (740 mm); sp. gr. 1.04 (20/20°C); very slightly soluble in water. Flash point 270°F (COC). Soluble in alcohol, acetone, benzene. Combustible. Low toxicity.

Containers: Drums.

Uses: Solvents; chemical intermediates; preparation of dyes for acetate rayons; laboratory reagent.

phenyl ethyl ether. See phenetole.

5-phenyl-5-ethylhydantoin
 $(C_6H_5)(C_2H_5)CNHCONHCO$.

Properties: Colorless, odorless crystalline powder; m.p. 199°C; insoluble in water.

Use: Medicine.

2-phenylethyl isobutyrate (phenethyl isobutyrate)
 $(CH_3)_2CHCOOC_2H_4C_6H_5$.

Properties: Colorless liquid; pleasant odor; sp. gr. 0.988 (25/25°C); refractive index (n_D 20/D) 1.488; soluble in alcohol and ether. Combustible; nontoxic.

Uses: Perfumes; flavoring.

phenylethylmalonylurea. See phenobarbital.

2-phenylethyl mercaptan $C_6H_5CH_2CH_2SH$.

Properties: Liquid. Boiling range 193–225°C; unpleasant odor; sp. gr. 1.0264 (60/60°F); refractive index 1.5582 (n_D 20/D); flash point 160°F. Combustible.

Containers: Bottles.

Hazard: Probably toxic.

Uses: Organic synthesis; laboratory reagent.

2-phenylethyl phenylacetate (phenethyl phenylacetate)
 $C_6H_5(CH_2)_2OOCCH_2C_6H_5$.

Properties: White crystals; hyacinth odor. Sp. gr. 1.080–1.082; congealing point 27°C. Combustible; low toxicity.

Containers: Bottles.

Uses: Perfumery; flavors.

2-phenylethyl propionate (phenethyl propionate)
 $C_2H_5COOC_2H_4C_6H_5$.

Properties: Synthetic colorless liquid; flower-fruit odor; miscible with alcohols and ether; sp. gr. 1.012 (25/25°C). Combustible; low toxicity.

Uses: Perfumes; flavors.

2-phenylethyl salicylate (phenethyl salicylate)
 $C_6H_5C_2H_4OOC_6H_4OH$.

Properties: Snow-white crystals; very faint aromatic odor. Soluble in 14 parts of 95% alcohol. Congealing point 41.5°C. Combustible. Low toxicity.

Use: Flavors.

phenyl ferrocenyl ketone. See benzoylferrocene.

phenyl fluoride. See fluorobenzene.

phenyl fluoromethyl ketone. See fluoroacetophenone.

phenylformamide. See formanilide.

phenylformic acid. See benzoic acid.

phenyl gamma acid. See phenyl-2-amino-8-naphthol-6-sulfonic acid.

phenyl glycidyl ether (1,2-epoxy-3-phenoxypropane; PGE) $H_2COCHCH_2OC_6H_5$.

Properties: Colorless liquid; sp. gr. 1.11; b.p. 245°C; m.p. 3.5°C.

Hazard: Toxic by skin absorption; moderately irritating to eyes and skin. Tolerance, 10 ppm in air.

D(–)-alpha-phenylglycine $C_6H_5CH(NH_2)COOH$.

Properties: Crystals; m.p. 245–248°C; insoluble in water, ether, alcohol; soluble in acid.

Containers: Fiber drums.

Use: Intermediate.

phenylglycolic acid. See mandelic acid.

phenylhydrazine $C_6H_5NHNH_2$.

Properties: Pale yellow crystals or oily liquid; becomes red-brown on exposure to air. Soluble in alcohol, ether, chloroform, benzene, and dilute acids. Soluble in water, alcohol, and benzene. Sp. gr. 1.0978; m.p. 19.35°C; b.p. 243.5°C, with decomposition. Flash point 192°F (c.c.). Combustible. Autoignition temp. 345°F. Also available as the hydrochloride.

Derivation: Reduction of diazotized aniline; followed by reaction with sodium hydroxide.

Grades: Commercial; C.P.; reagent.

Containers: Glass bottles; drums.

Hazard: Toxic by inhalation, ingestion, and skin absorption. Tolerance, 5 ppm in air.

Uses: Analytical chemistry (reagent for detecting aldehydes, sugars, etc.); organic synthesis (intermediates, dyestuffs, pharmaceuticals).

alpha-phenylhydroxyacetic acid. See mandelic acid.

phenylic acid. See phenol.

phenylindan dicarboxylic acid. See 1,1,3-trimethyl-5-carboxy-3-(p-carboxyphenyl)indan.

phenyl isocyanate (phenyl carbimide; carbanil)
 C_6H_5NCO .

Properties: Liquid; b.p. 165°C; f.p. –30°C (approx); sp. gr. 1.095 (20/4°C); refractive index (n_D 20/D) 1.53684; decomposes in water and alcohol; very soluble in ether. Flash point 132°F (TOC). Combustible.

Hazard: Moderate fire risk. Toxic; strong irritant; a lachrymator.
Uses: Reagent for identifying alcohols and amines; intermediate.
Shipping regulations: (Air) Poison label. Not acceptable on passenger planes.

phenyl isothiocyanate. See phenyl mustard oil.

phenyl J acid. See phenyl-2-amino-5-naphthol-7-sulfonic acid.

phenyllithium C_6H_5Li . Available in a 20% by weight solution of a 70:30 volume % benzene-ether mixture. Used for organic synthesis.
Hazard: Flammable, dangerous fire risk.

phenylmagnesium bromide C_6H_5MgBr . A Grignard reagent available as a solution in ether; sp. gr. 1.14.
Derivation: From magnesium and bromobenzene.
Containers: Glass bottles; drums.
Hazard: Dangerous fire risk; solution highly flammable.
Use: Arylating agent in organic synthesis.

phenylmagnesium chloride C_6H_5MgCl . Available dissolved in tetrahydrofuran.
Hazard: Dangerous fire risk; solution highly flammable.
Use: Grignard reagent.

phenyl "MAPO."²⁹³ Trademark for phenylbis[1-(2-methyl)aziridinyl]phosphine oxide (q.v.).

phenyl mercaptan C_6H_5SH .
Properties: Water-white liquid; offensive odor; oxidizes on exposure to air; supplied under nitrogen atmosphere. Sp. gr. 1.080 (15.5/15.5°C); refractive index (n_D²⁵) 1.5815; f.p. -15°C; b.p. 169°C. Insoluble in water; very soluble in aromatic and aliphatic hydrocarbons.
Hazard: Probably toxic; store out of contact with air and acids.
Uses: Chemical intermediate; mosquito larvicide.

phenylmercuric acetate $C_6H_5HgOCOCH_3$.
Properties: White to cream prisms; m.p. 148-150°C. Slightly soluble in water; soluble in alcohol, benzene, and glacial acetic acid. Slightly volatile at ordinary temperatures.
Derivation: Action of heat on benzene and mercuric acetate.
Grades: C.P.; technical; commercial.
Containers: Fiber drums, bottles.
Hazard: Highly toxic by ingestion, inhalation and skin absorption. Strong irritant. Tolerance, 0.05 mg per cubic meter of air.
Uses: Antiseptic, fungicide, herbicide; mildewicide for paints; slimeicide in paper mills.
Shipping regulations: (Air) Poison label. (Rail) Mercury compounds, n.o.s., Poison label.

phenylmercuric benzoate $C_6H_5HgOOCCH_3$. Crystals; m.p. 94°C (min); used as a denaturant for alcohol; bactericide; fungicide.
Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter in air. Solutions of 1% strength or greater are also poisonous.
Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

phenylmercuric borate $(C_6H_5Hg)_2HBO_3$.
Properties: White crystalline powder; m.p. 120-130°C. Slightly soluble in water; soluble in alcohol.
Derivation: Reaction of phenylmercuric acetate with boric acid.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter in air. Solutions of 1% strength or greater are also poisonous.
Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

phenylmercuric chloride C_6H_5HgCl .
Properties: White satiny crystals; m.p. 251°C. Insoluble in water; slightly soluble in hot alcohol; soluble in benzene, ether, pyridine.
Derivation: Reaction of phenylmercuric acetate and sodium chloride.
Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter in air. Solutions of 1% strength or greater are also poisonous.
Uses: Antiseptic; fungicide, germicide.
Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

phenylmercuric hydroxide C_6H_5HgOH .
Properties: Fine white to cream crystals; m.p. 197-205°C; slightly soluble in water; soluble in acetic acid; alcohol.
Grade: Technically pure.
Containers: Bottles; fiber drums.
Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter in air. Solutions of 1% strength or greater are also poisonous.
Uses: Manufacture of phenylmercuric salts; fungicide and germicide. Principal compound in manufacturing organic mercury derivatives; denaturant for alcohol.
Shipping regulations: (Rail) Mercury compounds, n.o.s., Poison label. (Air) Poison label.

phenylmercuric lactate $C_6H_5HgOOCCHOHCH_3$. Used as bactericide and fungicide.
Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter in air. Solutions of 1% strength or greater are also poisonous.
Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

phenylmercuric naphthenate.
Prepared by interaction of phenylmercuric acetate and naphthenic acid, producing a colored solution. Used as a wood preservative and as a mildewproofing agent for paints and adhesives.
Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter in air. Solutions of 1% strength or greater are also poisonous.
Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

phenylmercuric nitrate (basic)
 $C_6H_5HgNO_3 \cdot C_6H_5HgOH$.
Properties: Fine white crystals, or grayish powder; mercury content 63-65% (theory, 63.2%); melting range 175-185°C, with decomposition; ash 0.1% max; very slightly soluble in water; slightly soluble in alcohol; insoluble in ether; moderately soluble in glycerin.
Grade: N.F.
Containers: Bottles; fiber drums.
Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter in air. Solutions of 1% strength or greater are also poisonous.
Shipping regulations: (Rail) Mercury compounds, n.o.s., Poison label. (Air) Poison label.

phenylmercuric oleate $C_6H_5HgOOC(CH_2)_7CH:CHC_8H_{17}$.

Properties: White crystalline powder; m.p. 45°C; insoluble in water; soluble in organic solvents and some oils.

Derivation: Reaction of phenylmercuric acetate with oleic acid.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.05 mg per cubic meter in air. Solutions of 1% strength or greater are also poisonous.

Uses: Mildewproofing agent for paints; fungicide and germicide.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

phenylmercuric propionate $C_6H_5HgOCOCH_2CH_3$.

Properties: Technical grades: White to off-white wax-like free flowing powder; m.p. 65–70°C; stable to 200°C for short periods; 57% min Hg content.

Containers: ½-lb container to 50-lb fiber drums.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance 0.05 mg per cubic meter of air.

Uses: Fungicide and bactericide for paints and industrial finishes.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

phenylmercuric salicylate $C_6H_4(OH)(COOHgC_6H_5)$.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance 0.05 mg per cubic meter of air.

Uses: Seed disinfectant.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

phenylmercuriethanolammonium acetate $[(HOC_2H_4)NH_2(C_6H_5Hg)]OOCCH_3$.

Properties: White crystalline solid; soluble in water.

Derivation: Reaction of phenylmercuric acetate with monoethanolamine.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance 0.05 mg per cubic meter of air.

Uses: Insecticide and fungicide; may not be used on food crops.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

phenylmercuritriethanolammonium lactate [tris(2-hydroxyethyl)(phenylmercuri)ammonium lactate] $[(HOC_2H_4)_3NHgC_6H_5]OOCCHOHCH_3$.

Properties: White crystalline solid; soluble in water.

Derivation: Reaction of phenylmercuric acetate with triethanolamine and lactic acid.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance 0.05 mg per cubic meter of air.

Uses: Turf fungicide and eradicator fungicide for fruit trees.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

phenyl mercury compounds. See phenylmercuric compounds.

phenylmercury formamide $HCONHHgC_6H_5$.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance 0.05 mg per cubic meter of air.

Use: Seed disinfectant.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

phenylmercury urea $C_6H_5HgNHCONH_2$.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Tolerance 0.05 mg per cubic meter of air.

Uses: Disinfectant and fungicide for seed treatment.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

phenylmethane. See toluene.

phenylmethanol. See benzyl alcohol.

phenylmethyl acetate. See benzyl acetate.

phenylmethylcarbinol. See alpha-methylbenzyl alcohol.

phenylmethylcarbonyl acetate. See alpha-methylbenzyl acetate.

N-phenylmethylethanolamine $C_6H_5N(CH_3)C_2H_4OH$.

Properties: Liquid which sets to a glass at –30°C; b.p. 192°C (100 mm); sp. gr. 1.0661 (20/20°C); slightly soluble in water; flash point 280°F (COC); combustible; low toxicity.

Uses: Chemical intermediate; solvent for dyes for acetate fibers.

phenyl methyl ketone. See acetophenone.

1-phenyl-3-methyl-5-pyrazolone. See 3-methyl-1-phenyl-2-pyrazolin-5-one.

phenyl alpha-methylstyryl ketone. See dypnone.

N-phenylmorpholine $C_6H_5NCH_2CH_2OCH_2CH_2$.

Properties: White solid. Soluble in water. B.p. 268°C; m.p. 57°C; vapor pressure <0.1 mm (20°C). Flash point 220°F; sp. gr. 1.06 (57/20°C); combustible.

Grade: Technical.

Hazard: Probably toxic. Details unknown.

Uses: Chemical intermediate for dyestuffs, rubber accelerators, corrosion inhibitors and photographic developers; insecticide.

phenyl mustard oil (thiocarbanil; phenyl isothiocyanate; phenylthiocarbonimide) C_6H_5NCS .

Properties: Pale yellow or colorless liquid; penetrating, irritating odor; readily volatilized with steam. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.1382; f.p. –21°C; b.p. 221°C. Combustible.

Derivation: (a) By action of concentrated hydrochloric acid on sulfocarbanilide; (b) by reaction of thiophosgene with aniline.

Hazard: Irritant to tissue; moderately toxic by ingestion and inhalation.

Uses: Medicine; organic synthesis.

N-phenyl-alpha-naphthylamine $C_{10}H_7NHC_6H_5$.

Properties: Crystallizes in prisms; white to slightly yellowish. Soluble in alcohol, ether, and benzene. M.p. 62°C; b.p. 335°C (260 mm). Combustible. Low toxicity.

Derivation: From alpha-naphthylamine and aniline. Purified by distillation.

Uses: Dyes and other organic chemicals; rubber antioxidant.

N-phenyl-beta-naphthylamine $C_{10}H_7NHC_6H_5$.

Properties: Light gray powder; m.p. 107°C; b.p. 395°C; sp. gr. 1.24; insoluble in water; soluble in alcohol, acetone, benzene. Combustible; low toxicity.

Uses: Rubber antioxidant; lubricant; inhibitor (butadiene).

N-phenyl-1-naphthylamine-8-sulfonic acid (N-phenyl peri acid) $C_{16}H_{13}NO_3S$.

Properties: Greenish-gray needles. Insoluble in water; soluble in alcohol.

Derivation: Arylation of 1-naphthylamine-8-sulfonic acid with aniline.

Grades: Technical; mostly as sodium salt.

Containers: Barrels or steel drums.

Use: Azo dyes.

phenylneopentyl phosphite $(\text{CH}_3)_2\text{C}(\text{CH}_2\text{O})_2\text{POC}_6\text{H}_5$.

Properties: Water-white liquid; m.p. 19°C ; b.p. 138 – 140°C (10 mm); refractive index ($n_{25/D}$) 1.517; sp. gr. 1.135 (25/15°C).

Use: Chemical intermediate.

1-phenylnonane. See nonylbenzene.

1-phenylpentane. See *n*-amylbenzene.

2-phenylpentane. See *sec*-amylbenzene.

ortho-phenylphenol (ortho-hydroxydiphenyl; ortho-xenol) $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{OH}$.

Properties: Nearly white or light buff crystals; m.p. 56 – 58°C ; b.p. 280 – 284°C ; sp. gr. 1.217 (25/25°C); flash point 255°F . Combustible. Soluble in alcohol, sodium hydroxide solution; insoluble in water.

Derivation: From reaction of chlorobenzene and caustic soda solution at elevated temperatures and pressure.

Hazard: Moderately toxic by ingestion.

Uses: Intermediate for dyes; germicide; fungicide; rubber chemicals; laboratory reagent; food packaging.

para-phenylphenol (para-hydroxydiphenyl; para-xenol) $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{OH}$.

Properties: Nearly white crystals; m.p. 164 – 165°C ; b.p. 308°C . Flash point 330°F . Soluble in alcohol, also in alkalis and most organic solvents; insoluble in water. Combustible.

Derivation: From reaction of chlorobenzene and caustic soda solution at elevated temperatures and pressure.

Hazard: Moderately toxic by ingestion.

Uses: Intermediate for dyes; resins; rubber chemicals; laboratory reagent; fungicide.

N-phenyl-para-phenylenediamine. See para-aminodiphenylamine.

phenylphosphine (phosphaniline). $\text{C}_6\text{H}_5\text{PH}_2$.

Properties: Colorless liquid; b.p. 160°C ; sp. gr. 1.001 (15°C).

Hazard: Highly toxic by inhalation and ingestion. Tolerance, 0.05 ppm in air.

Shipping regulations: Not listed.

phenylphosphinic acid. See benzenephosphinic acid.

phenylphosphonic acid. See benzenephosphonic acid.

N-phenylpiperazine $\text{C}_6\text{H}_5\text{N}(\text{CH}_2\text{CH}_2\text{NHCH}_2\text{CH}_2)$.

Properties: Pale yellow oil; insoluble in water; soluble in alcohol and ether; sp. gr. 1.0621 (20/4°C); b.p. 286.5°C , 156 – 7°C (10 mm); m.p. 18.8°C ; flash point 285°F . Combustible. Probably low toxicity.

Uses: Intermediate for pharmaceuticals, anthelmintics, surface-active agents, synthetic fibers.

3-phenyl-1-propanol. See phenylpropyl alcohol.

phenylpropanolamine hydrochloride

$\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{CH}(\text{CH}_3)(\text{NH}_2) \cdot \text{HCl}$.

Properties: White crystalline powder with odor similar to benzoic acid; m.p. 198 – 199°C ; freely soluble in alcohol and water; insoluble in benzene, chloroform, and ether; aqueous solution neutral to litmus.

Containers: Drums.

Use: Medicine.

1-phenylpropanone-1. See propiophenone.

3-phenylpropenal. See cinnamic aldehyde.

3-phenylpropenoic acid. See cinnamic acid.

3-phenylpropenol. See cinnamic alcohol.

1-(alpha-phenyl)-propenylveratrole. See benzyl isoeugenol.

3-phenylpropionaldehyde. See phenylpropyl aldehyde.

3-phenylpropionic acid. See hydrocinnamic acid.

phenylpropyl acetate (hydrocinnamyl acetate)

$\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{CH}_2\text{OOCCH}_3$.

Properties: White crystals. Soluble in 70% alcohol. Sp. gr. 1.012–1.016; refractive index, 1.497. Combustible; low toxicity.

Uses: Perfumery; flavoring; laboratory reagent.

phenylpropyl alcohol (hydrocinnamic alcohol; 3-phenyl-1-propanol; phenylethyl carbinol)

$\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid; floral odor; b.p. 219°C . Soluble in 70% alcohol; insoluble in water. Sp. gr. 0.998–1.000; refractive index 1.524–1.528 (20°C). Combustible; low toxicity.

Grades: Technical; F.C.C.

Uses: Perfumery; flavoring; laboratory reagent.

phenylpropyl aldehyde (3-phenylpropionaldehyde; hydrocinnamic aldehyde) $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{CHO}$.

Properties: Colorless liquid; floral odor. Soluble in 50% alcohol. Sp. gr. 1.010–1.020; refractive index 1.520–1.532. Combustible; low toxicity.

Grade: Chlorine-free.

Containers: Glass bottles; copper flasks.

Uses: Perfumery; flavors.

phenylpropyl chloride (hydrocinnamyl chloride; 1-phenyl-3-chloropropane) $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{CH}_2\text{Cl}$.

Properties: Colorless to pale yellow liquid; b.p. 219 – 220°C ; sp. gr. 1.056 (25/4°C); refractive index 1.5220 (20°C). Combustible; low toxicity.

Uses: Organic synthesis; laboratory reagent.

phenylpropylmethylamine (N,beta-dimethylphenylethylamine) $\text{C}_6\text{H}_5\text{CH}(\text{CH}_3)\text{CH}_2\text{NHCH}_3$.

Properties: Colorless to pale yellow liquid; 98% distills between 205 – 210°C ; very soluble in alcohol, benzene, and ether; 1.2 parts dissolve in 100 parts water; aqueous solutions alkaline to litmus.

Uses: Medicine. Also available as hydrochloride.

1-phenyl-3-pyrazolidone (phenidone)

$\text{C}_6\text{H}_5\text{NNHC}(\text{O})\text{CH}_2\text{CH}_2$.

Properties: Crystals; m.p. 121°C . Soluble in water. Combustible; low toxicity.

Uses: Photographic developer; laboratory reagent.

4-phenylpropylpyridine $\text{C}_6\text{H}_5(\text{CH}_2)_3\text{C}_5\text{H}_4\text{N}$.

Properties: Colorless liquid. B.p. 322°C ; soluble in organic solvents.

Uses: Heat-transfer agent; chemical intermediate.

phenyl salicylate (salol) $\text{C}_6\text{H}_4\text{OHCOOC}_6\text{H}_5$.

Properties: White crystalline powder; faint aromatic odor and taste. Soluble in alcohol, ether, chloroform, benzene and fixed or volatile oils; sparingly soluble in water. Sp. gr. 1.2614; m.p. 41.9°C ; b.p. 172 – 173°C . Absorbs light, especially at 290 – 330μ . Combustible; low toxicity.

Derivation: Heating salicylic acid and phenol with phosphorus pentachloride or other dehydrating agent.

Grades: N.F.; granular; powder.

Uses: Medicine; preservative; UV absorber in plastics, waxes, polishes, suntan oil; laboratory reagent.

phenylstearic acid. An organic fatty acid having a high degree of fluidity and no definite melting point. Pour point is -15°F . Its chief use is as a lubricant stabilizer; its potential uses include corrosion inhibitor, plasticizer and textile auxiliary.

Phenylstearic acid and its quaternary and ethoxylated derivatives are used in synthetic latices, as mineral oil emulsifiers, and in invert systems.

phenylsulfonic acid. See benzenesulfonic acid.

4-phenyl-1,4-thiazane $\text{SCH}_2\text{CH}_2\text{N}(\text{C}_6\text{H}_5)\text{CH}_2\text{CH}_2\text{S}$.

Properties: White powder. Soluble in hot toluene. M.p. $108-111^{\circ}\text{C}$.

Derivation: Interaction of dichlorodiethyl sulfide and an aliphatic amine in the presence of alcohol and sodium carbonate.

phenylthiocarbonimide. See phenyl mustard oil.

phenyltrichlorosilane $\text{C}_6\text{H}_5\text{SiCl}_3$.

Properties: Colorless liquid. B.p. 201°C ; sp. gr. 1.321 (25/25°C); refractive index (n_D²⁵) 1.5240; flash point (COC) 185°F . Soluble in benzene, ether, perchloroethylene. Readily hydrolyzed by moisture, with liberation of hydrochloric acid. Combustible.

Derivation: By Grignard reaction of silicon tetrachloride and phenylmagnesium chloride; reaction of benzene with trichlorosilane; of chlorobenzene, silicon and copper.

Hazard: Highly toxic. Strong irritant to tissue.

Uses: Intermediate for silicones; laboratory reagent.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

1-phenyltridecane. See tridecylbenzene.

phenyltrimethoxysilane $\text{C}_6\text{H}_5\text{Si}(\text{OCH}_3)_3$.

Properties: Liquid. Sp. gr. 1.063 (25°C); refractive index 1.4710 (25°C); b.p. 211°C . Soluble in acetone, benzene, perchloroethylene, methyl alcohol. Combustible.

Uses: In polymers to be applied to powders, glass, paper and fabrics.

phenylurethane. See ethyl phenylcarbamate.

phenyl valerate $\text{C}_6\text{H}_5\text{COOC}_6\text{H}_5$. Colorless liquid; slightly soluble in water; soluble in alcohol and ether. Used in flavors and odorants.

pheromone. A group of organic compounds produced by insects which function as communication means and as sex attractants. Synthetic pheromones are used to control insect pests by disrupting their mating behavior, e.g., 4-methyl-3-heptanone. See pheromone.

"Philprene."³⁰³ Trademark for a series of styrene-butadiene rubbers, hot and cold, oil-extended, pigmented and non-pigmented, including special types for specific needs.

Containers: 70-90-lb bales.

Uses: Tire carcasses and treads, molded and extruded goods, sporting goods, footwear, coated fabrics, wire and cable jackets, hospital goods, floor tile, insulation.

"Phi-O-Sol WA."³²⁸ Trademark for the sodium salt of a sulfonated fatty acid ester, for textile and industrial wetting applications. Removes wall paper and poultry feathers.

phloroglucinol (phloroglucine; 1,3,5-trihydroxybenzene) $\text{C}_6\text{H}_3(\text{OH})_3 \cdot 2\text{H}_2\text{O}$.

Properties: White to yellowish crystals, odorless; m.p. $212-217^{\circ}\text{C}$ if rapidly heated; $200-209^{\circ}\text{C}$, if slowly heated; b.p., sublimes with decomposition. Soluble in alcohol, ether, and pyridine; slightly soluble in water. Combustible.

Derivation: By fusion of resorcinol with caustic soda; by reduction of trinitrobenzene.

Containers: Glass bottles; fiber drums.

Uses: Analytical chemistry (reagent for pentoses and with vanillin for determining the presence of free hydrochloric acid); medicine; decalcifying agent for bones; preparation of pharmaceuticals and dyes, resins; preservative for cut flowers.

phorate. Generic name for O,O-diethyl S-[(ethylthio)methyl]phosphorodithioate, $(\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{S})\text{SCH}_2\text{SC}_2\text{H}_5$.

Properties: Liquid; b.p. $118-120^{\circ}\text{C}$ (0.8 mm). Insoluble in water; miscible with carbon tetrachloride, dioxane, xylene.

Hazard: Highly toxic by skin contact, inhalation, or ingestion. Rapidly absorbed through skin. Repeated inhalation or skin contact may, without symptoms, progressively increase susceptibility. Use may be restricted. Tolerance, 0.05 mg per cubic meter of air.

Use: Insecticide.

Shipping regulations: Organic phosphate, liquid, n.o.s., (Rail, Air) Poison label. Not acceptable on passenger planes.

Note: Approved by EPA as substitute for some uses of DDT.

phorbol (4,9,12-beta,13,20-pentahydroxy-1,6-tigliadien-3-on). The parent alcohol of tumor-producing compounds in croton oil (q.v.). A carcinogenic agent. Used in biochemical and medical research.

phoromone (7-ethyl-5-methyl-6,8-dioxabicyclo[3.2.1]-octane). Product excreted by bark beetles which acts as sex attractant. It has been isolated and synthesized for possible use in protection of forest timber. Details of use have not been developed.

phorone (diisopropylidene acetone).

$(\text{CH}_3)_2\text{CCHCOCH}(\text{CH}_3)_2$.

Properties: Yellow liquid or yellowish green prisms. Sp. gr. 0.8791 at $20/20^{\circ}\text{C}$; b.p. 197.9°C ; freezing point 28.0°C ; vapor pressure 0.38 mm (20°C); flash point 185°F ; wt 7.3 lb/gal (20°C). Slightly soluble in water; soluble in alcohol. Combustible.

Uses: Solvent for nitrocellulose; lacquers; coating compositions; stains; intermediate (organic synthesis).

"Phorwite."⁴²² Trademark for a line of optical brighteners.

4205. Used for polyacrylonitrile, triacetate, acetate and polyester fibers.

BUP. A stilbene derivative used for brightening papers and other fibrous materials.

K 2002. Used for thermoplastic and thermosetting materials.

"Phos-Chek"⁵⁸ Trademark for fire-fighting solutions of phosphorus pentoxide: 201 and 202 contain 46.5% and 47% min P_2O_5 , designed for application from aircraft; 258 contains 47.7% min P_2O_5 , applied from

ground equipment and helicopters. Said to be solutions of ammonium phosphate thickened with sodium methyl cellulose.

"Phosdrin."¹²⁵ Trademark for a mixture which contains not less than 60% of the alpha isomer of 2-carbomethoxy-1-methylvinyl dimethyl phosphate, $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{OC}(\text{CH}_3):\text{CHCOOCH}_3$, (generic name mevinphos, q.v.) and not more than 40% of insecticidally active related compounds; it is 100% active. Properties: Yellow to orange liquid; b.p. 210–218°F (0.03 mm) miscible with water, alcohols and aromatic and chlorinated hydrocarbons. Slightly soluble in aliphatic hydrocarbons. Flash point 175°F. Combustible.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Tolerance, 0.1 mg per cubic meter of air. Use may be restricted.

Use: Insecticide.

Shipping regulations: See mevinphos.

"Phos-Feed."¹⁹⁶ Trademark for a brand of dicalcium phosphate used as a mineral supplement of animal and poultry feeds.

"Phosflake."¹⁷⁷ Trademark for a uniform blend of caustic soda and trisodium phosphate prepared in flake form, especially for bottle-washing use.

"Phosfon."⁴⁰ Trademark for tributyl-2,4-dichlorobenzylphosphonium chloride (q.v.).

"Phosgard" C-22-R.⁵⁸ Trademark for a flame retardant organophosphorus compound with high efficiency through high phosphorus and chlorine content. Used in urethane foams, phenolics, polymethacrylates, polyester resins and epoxies.

phosgene (carbonyl chloride; carbon oxychloride; chloroformyl chloride) COCl_2 .

Properties: Liquid, or easily liquefied gas. Colorless to light yellow; odor varies from strong and stifling when concentrated, to hay-like in dilute form. Sp. gr. 1.392 (19/4°C); f.p. -128°C; b.p. 8.2°C. Slightly soluble in water and slowly hydrolyzed by it; soluble in benzene and toluene; specific volume (70°F) 3.9 cu ft/lb. Noncombustible.

Derivation: By passing a mixture of carbon monoxide and chlorine over activated carbon.

Containers: Steel cylinders; special one-ton containers.

Hazard: Highly toxic by inhalation; strong irritant to eyes. Tolerance, 0.1 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Organic synthesis, especially of isocyanates, polyurethane and polycarbonate resins, carbamates, organic carbonates and chloroformates; pesticides; herbicides; dye manufacture.

Shipping regulations: (Air) Not acceptable. (Rail) Consult regulations. Not accepted by express.

"Phos Kil."⁵⁵ Trademark for parathion-based insecticidal dusts and sprays.

Hazard: Highly toxic by ingestion and inhalation.

phosphamidon. Generic name for 2-chloro-2-diethylcarbamoyl-1-methylvinyl dimethyl phosphate, $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{OC}(\text{CH}_3):\text{C}(\text{Cl})\text{C}(\text{O})\text{N}(\text{C}_2\text{H}_5)_2$.

Properties: Colorless liquid; b.p. 162°C (1.5 mm); soluble in water and organic solvents.

Hazard: Toxic by ingestion, inhalation and skin absorption. Cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

Shipping regulations: Organic phosphate, liquid, n.o.s., (Rail, Air) Poison label. Not acceptable on passenger planes.

phosphatase, alkaline. An enzyme excreted into the bile by the liver and found in the blood. It is concerned with bone formation, probably being produced by osteoblasts. It hydrolyzes phosphoric acid esters at pH 7–8, liberating phosphate ions.

Use: Biochemical research.

phosphate, condensed. A phosphorus compound with two or more phosphorus atoms in the molecule. Examples are polyphosphates; pyrophosphates. See polyphosphoric acid.

phosphate glass. A type of glass containing phosphorus pentoxide. Aluminum meta-phosphate is frequently the basic material. Such glasses have properties not attainable in silicate glasses; e.g., resistance to hydrofluoric acid.

phosphate rock (phosphorite). A natural rock consisting largely of calcium phosphate and used as a raw material for manufacture of phosphate fertilizers, phosphoric acid, phosphorus, and animal feeds. A large amount is ground and applied directly to the soil. A primary source of superphosphate, prepared by treatment of the pulverized rock with sulfuric acid (superphosphate having 16–18% P_2O_5) or by acidifying with phosphoric acid (triple superphosphate having 40–48% P_2O_5). Nitric acid is sometimes used (see nitrophosphate). Defluorinated phosphate rock is the source of phosphate used in animal feeds and feed concentrates. Important deposits are in U.S. (Florida, North Carolina, Tennessee, California, Wyoming, Montana, Utah, Idaho), North Africa (Morocco, Tunisia, Algeria), U.S.S.R. and various islands in the Pacific.

phosphate slag. Glassy calcium silicate, by-product of electric furnace phosphorus manufacture.

Properties: Lumps; loose bulk density approximately 85 lb/cu ft.

Containers: Hopper cars, gondolas.

phosphatide. See phospholipid.

phosphatidyl choline. See lecithin.

phosphatidyl ethanolamine. See cephalin.

phosphatidyl serine. See cephalin.

phosphazene. A ring or chain polymer that contains alternating phosphorus and nitrogen atoms, with two substituents on each phosphorus atom. Characteristic structures are cyclic trimers, cyclic tetramers, and high polymers. The substituent can be a wide variety of organic groups, halogen, amino, etc. Most cyclic trimers are crystalline, solids, organosoluble and stable to weather conditions; the high polymers (polyphosphazenes) are elastomeric or thermoplastic.

"Phosphen."²³³ Trademark for a group of aryl phosphates.

phosphinate. A derivative of the hypothetical phosphinic acid, $\text{H}_2\text{P}(\text{O})\text{OH}$.

phosphine (hydrogen phosphide) PH_3 .

Properties: Colorless gas; disagreeable, garlic-like odor. Soluble in alcohol, ether and cuprous chloride; slightly soluble in cold water; insoluble in hot water. Sp. gr. 1.185; f.p. -133.5°C; b.p. -85°C. Autoignition temp. 100°F.

Derivation: By action of nascent hydrogen or of caustic potash on phosphorus.

Hazard: Highly toxic by inhalation; strong irritant. Tolerance, 0.3 ppm in air. Spontaneously flammable. **Uses:** Organic preparations; phosphonium halides; doping agent for solid state electronic components; polymerization initiator; condensation catalyst. **Shipping regulations:** (Air) Not acceptable. **Note:** A synthetic dye, chrysianiline yellow, is sometimes called phosphine.

phosphodiesterase. An enzyme which cleaves hydrolytically the carboxy- and phosphoesters of phosphatides (phospholipids).

"Phosphodust."¹⁹⁶ Trademark for a pesticide dust diluent derived from phosphate rock.

2-phosphoglyceric acid $\text{HOCH}_2\text{CH}[\text{OPO}(\text{OH})_2]\text{COOH}$. An intermediate in the metabolism of carbohydrates in biological systems. See enolase.

phosphoglyceride. See phospholipid.

"Phospholeum."⁵⁸ Trademark for so-called super-phosphoric acid.

Properties: Clear liquid containing 76% P_2O_5 and equivalent to 105% H_3PO_4 . An azeotropic mixture of orthophosphoric and polyphosphoric acids which on dilution with water hydrolyze to orthophosphoric acid. Sp. gr. 1.90 (approx) (20.4°C); viscosity 800 cp (20.4°C); temperature rise, 15.5°C on dilution to 75% H_3PO_4 ; f.p. less than -50°C .

Grade: Technical.

Containers: Tank cars and tank trucks.

Uses: High-analysis liquid fertilizer; metal phosphatizing and aluminum bright dip bath component; desiccant; sequestrant for common trace minerals; catalyst or dehydrator in organic synthesis; rust-proofing compounds; special bricks; steel pickling.

phospholipid (phosphatide). A group of lipid compounds that yield on hydrolysis phosphoric acid, an alcohol, fatty acid, and a nitrogenous base. They are widely distributed in nature and include such substances as lecithin, cephalin, and sphingomyelin.

phosphomolybdate. See heteromolybdate.

phosphomolybdic acid (phospho-12-molybdic acid; PMA; 12-molybdophosphoric acid) $\text{H}_3\text{OMo}_{12}\text{O}_{40} \cdot x\text{H}_2\text{O}$.

Properties: Yellowish crystals; soluble in water, alcohol, and ether; density, 3.15 g/cc; m.p. $78-90^\circ\text{C}$. Strong oxidizing agent in aqueous solution; strong acid in the free acid form.

Grades: Technical; C.P.; reagent.

Hazard: (solution) May ignite combustible materials.

Uses: Reagent for alkaloids; pigments; catalyst; fixing agent in photography; additive in plating processes; imparts water resistance to plastics, adhesives and cement.

phosphomolybdic pigment (molybdenum lake). A pigment made by precipitating a basic organic dye with phosphomolybdic acid or a mixture of phosphomolybdic and phosphotungstic acids. See also phosphotungstic pigment.

phosphonate. A derivative of the hypothetical phosphonic acid, $\text{HP}(\text{O})(\text{OH})_2$.

phosphonitrile. See phosphazene.

phosphonitrilic polymer. See fluoroclastomer.

phosphonium iodide (iodophosphonium) PH_4I .

Properties: Colorless or slightly yellowish crystals.

Sp. gr. 2.86; m.p. 18.5°C ; sublimes 61.8°C ; b.p. 80°C ; decomposed by water or alcohol.

Derivation: Action of phosphine upon hydrogen iodide.

Hazard: Probably toxic.

Use: Chemical synthesis.

"Phosphonol."³⁵⁴ Trademark for polyphosphate esters used as surfactants, antistatic agents, plasticizers, and corrosion inhibitors.

phosphor (fluor). A substance, either organic or inorganic, liquid or crystalline, that is capable of luminescence, that is, of absorbing energy from sources such as x-rays, cathode rays, ultraviolet radiations, alpha particles and emitting a portion of the energy in the ultraviolet, visible or infrared. When the emission of the substance ceases immediately or in the order of 10^{-8} second after excitation, the material is said to be fluorescent. Material that continues to emit light for a period after the removal of the exciting energy is said to be phosphorescent. The half-life of the afterglow varies with the substance and may range from 10^{-6} second to days.

Uses: Fluorescent light tubes; television, radar, and cathode ray tubes; instrument dials; scintillation counters.

See also fluorescence; phosphorescence.

phosphor bronze. A tin bronze (see brass and bronze) which has been deoxidized by the addition of up to 0.5% phosphorus. Relatively hard, strong, and corrosion-resistant. Has good cold work properties and high strength.

Grades: Grade A (5% tin), grade C (8% tin), grade D (10% tin), grade E (1.25% tin).

Uses: Springs, electrical switches, contact fingers, chains; fourdrinier wire.

phosphorescence. A type of luminescence (q.v.) in which the emission of radiation resulting from excitation of a crystalline or liquid material occurs after excitation has ceased, and may last from a fraction of a second to an hour or more. This phenomenon is characteristic of some organic compounds, as in the firefly, and also of a number of inorganic solid materials, both natural and synthetic. These are used industrially as phosphors (q.v.).

See also fluorescence.

phosphoric acid (orthophosphoric acid) H_3PO_4 . Ninth highest-volume chemical produced in U.S. (1975).

Properties: Colorless, odorless, sparkling liquid or transparent crystalline solid, depending on concentration and temperature. At 20°C the 50 and 75% strengths are mobile liquids, the 85% is of a syrupy consistency, while the 100% acid is in the form of crystals; sp. gr. 1.834 (18°C); m.p. 42.35°C ; loses $\frac{1}{2}\text{H}_2\text{O}$ at 213°C (to form pyrophosphoric acid); soluble in water and alcohol; corrosive to ferrous metals and alloys.

Derivation: (a) Action of sulfuric acid on pulverized phosphate rock; (b) Action of hydrochloric acid on phosphate rock, with extraction by tributylphosphate; (c) By heating phosphate rock, coke, and silica in an electric furnace, burning the elemental phosphorus produced, and then hydrating the phosphoric oxide (furnace acid).

Grades: Agricultural; technical (50, 75, 85, 90, 100%); food (50, 75, 85%); N.F. (85-88%); F.C.C. (75-85%). (Polyphosphoric acid is sometimes called 115% phosphoric acid).

Containers: Carboys; drums and barrels; tank trucks; tank cars.

Hazard: Toxic by ingestion and inhalation. Irritant to skin and eyes. Tolerance, 1 mg per cubic meter of air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Fertilizers; soaps and detergents; inorganic phosphates; pickling and rust-proofing metals; pharmaceuticals; sugar refining; gelatin manufacture; water treatment; animal feeds; electro-polishing; gasoline additive; conversion coatings for metals; catalyst for ethanol manufacture; lakes in cotton dyeing; yeasts; soil stabilizer; waxes and polishes; binder for ceramics; activated carbon; in foods and carbonated beverages as acidulant and sequestrant; laboratory reagent; source of uranium (experimental). Shipping regulations: (Air) Corrosive label (solid or solution). (Rail) Not listed.

phosphoric acid, anhydrous. See phosphoric anhydride.

phosphoric acid, meta- (metaphosphoric acid; phosphoric acid, glacial) approximately $(\text{HPO}_3)_x$.

Properties: Transparent, highly deliquescent, glassy mass; sp. gr. 2.2–2.488. Soluble in water, slowly forming the ortho-acid; soluble in alcohol. Noncombustible.

Derivation: By heating orthophosphoric acid to redness; by treating phosphorus pentoxide with a calculated quantity of water; by heating diammonium phosphate.

Grades: Technical; C.P.

Containers: Glass bottles; carboys.

Uses: Phosphorylating agent; dehydrating agent; manufacture of dental cements; laboratory reagent.

See also polyphosphoric acid.

phosphoric anhydride (phosphorus pentoxide; phosphoric oxide; phosphoric acid, anhydrous) P_2O_5 .

Properties: Soft, white powder. Absorbs moisture from the air with avidity, forming meta-, pyro-, or orthophosphoric acid, depending upon amount of water absorbed and upon conditions of absorption. Sp. gr. 2.387; m.p. 580–585°C; b.p., sublimates at 300°C.

Derivation: By burning phosphorus in dry air.

Grades: Technical; nitrogen-complex coated (for slow solution).

Containers: Glass bottles; cans; drums.

Hazard: Strong, caustic irritant. Reacts violently with water to evolve heat. Dangerous fire risk. Keep tightly sealed or stoppered. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Preparation of phosphorus oxychloride and metaphosphoric acid; acrylate esters; surfactants; dehydrating agent; organic synthesis; medicine; sugar refining; laboratory reagent; fire extinguishing; special glasses.

Shipping regulations: (Rail) Yellow label. (Air) Flammable solid label. Not accepted on passenger planes.

phosphoric bromide. See phosphorus pentabromide.

phosphoric chloride. See phosphorus pentachloride.

phosphoric oxide. See phosphoric anhydride.

phosphoric perbromide. See phosphorus pentabromide.

phosphoric perchloride. See phosphorus pentachloride.

phosphoric sulfide. See phosphorus pentasulfide.

phosphorous acid, ortho- H_3PO_3 .

Properties: White, or yellowish, crystalline mass. Very

hygroscopic. Keep tightly sealed or stoppered. Absorbs oxygen very readily with formation of orthophosphoric acid. Soluble in alcohol, water. Sp. gr. 1.651; b.p. 200°C (dec); m.p. 70°C (approx).

Grades: Reagent; technical; 70%

Uses: Analysis (testing for mercury); chemical reducing agent; phosphite salts.

phosphorus P Nonmetallic element of atomic number 15, group VA of Periodic Table. Atomic weight 30.9738; valences 1, 3, 4, 5. Allotropes: white (or yellow), red, and black phosphorus. No stable isotopes. Several artificial radioactive isotopes from mass numbers 29 to 34.

Occurrence and derivation: Occurs in nature in phosphate rock [impure $\text{Ca}_3(\text{PO}_4)_2$], in apatite [$\text{Ca}_5(\text{PO}_4)_3\text{F}$], in bones, teeth, and in organic compounds of living tissue. Also as phosphorite nodules on ocean floor.

Derivation: (1) Produced in an electric furnace from phosphate rock, sand and coke. The phosphorus vapor is driven off and condensed under water. (2) By reaction of phosphate rock with sulfuric acid, the resulting CaSO_4 being removed by filtration and the phosphoric acid concentrated by evaporation (wet process).

Grades: Technical 99.9%; electronic grade, 99.9999%.

Containers: White (or yellow) (shipped under water): steel drums; tank cars. Red: tins and drums.

White (yellow) phosphorus:

Properties: Crystalline, wax-like, transparent solid; metastable with respect to red phosphorus, an impurity present in white allotrope. B.p. 280°C; vapor density corresponds to formula P_4 ; m.p. 44.1°C; sp. gr. (solid, 20°C) 1.82, (liquid, 44.5°C) 1.745. Mohs hardness 0.5; high electrical resistivity. Insoluble in water and alcohol; soluble in carbon disulfide. Exhibits phosphorescence at room temperature; an essential dietary nutrient.

Hazard: Ignites spontaneously in air at 86°F. Store under water and away from heat. Dangerous fire risk. Highly toxic by ingestion and inhalation. Tolerance, 0.1 mg per cubic meter of air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Manufacture of phosphoric acid (q.v.) and other phosphorus compounds; phosphor bronzes; metallic phosphides; additive to semiconductors; electroluminescent coatings; incendiaries, pyrotechnics, and rotenticides.

Shipping regulations: (dry) (Rail) Yellow label. Not accepted by express. (Air) Not acceptable. (in water) (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

Red phosphorus:

Properties: Violet-red, amorphous or crystalline powder, obtained from white phosphorus by heating at 240°C with catalyst. Sublimes at 416°C; sp. gr. 2.34. Autoignition temp. 500°F. High electrical resistivity. Much less reactive than white phosphorus. Insoluble in most solvents.

Hazard: Large quantities ignite spontaneously, and on exposure to oxidizing materials. Reacts with oxygen and water vapor to evolve phosphine (q.v.). Extinguish with foam or dry chemical (not water).

Uses: Safety matches; phosphorus compounds.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

Black phosphorus:

Black crystalline or amorphous solid resembling graphite; sp. gr. 2.25–2.69. Obtained by heating white phosphorus under pressure. Insoluble in most solvents. Electrically conducting. No present uses.

phosphorus 32. Radioactive phosphorus of mass number 32.

Properties: Half-life, 14.3 days; radiation, beta.

Derivation: Pile irradiation of potassium dihydrogen phosphate or sulfur and sulfur compounds.

Forms available: Phosphate ion in weak hydrochloric acid solution; solid potassium dihydrogen phosphate; P-32 sterile solution; in tagged compounds such as hexaethyltetraphosphate, ribonucleic acid, triphenylphosphine, etc.

Grades: U.S.P. as sodium phosphate P-32 solution.

Hazard: Moderate.

Uses: Biochemical radioactive tracer studies; medical treatment of leukemia, skin lesions, etc.; industrial measurements, e.g., tire tread, wear, thickness of ink and paint films, lead detection.

Shipping regulations: Consult regulations.

phosphorus chloride. See phosphorus trichloride.**phosphorus heptasulfide** (tetraphosphorus heptasulfide)

P_4S_7 . Light yellow crystals; sp. gr. 2.19; m.p. 310°C; b.p. 523°C. Slightly soluble in carbon disulfide.

Hazard: Flammable, dangerous fire risk.

Shipping regulations: (Air) Flammable Solid label. Not acceptable on passenger planes.

phosphorus nitride P_3N_5 .

Properties: Amorphous white solid; insoluble in cold water; decomposes in hot water; soluble in common organic solvents. Nonhygroscopic and stable in air. Decomposes at 800°C.

Hazard: Probably toxic.

Use: Doping semiconductors.

phosphorus oxybromide $POBr_3$.

Properties: Colorless crystals; sp. gr. 2.82; m.p. 56°C; b.p. 189°C; decomposed by water; soluble in ether and benzene. Reacts strongly with organic matter.

Hazard: Highly toxic. Strong irritant to skin and tissue.

Use: Chemical intermediate.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

phosphorus oxychloride (phosphoryl chloride) $POCl_3$.

Properties: Colorless, fuming liquid; pungent odor. Sp. gr. 1.675 (20/20°C); m.p. 1.2°C; b.p. 107.2°C; refractive index 1.460 (25/D). Decomposed by water and alcohol.

Derivation: From phosphorus trichloride, phosphorus pentoxide and chlorine.

Grades: Technical; 99.999+%.

Containers: Steel-jacketed lead cylinders and carboys; nickel-lined drums and tank cars.

Hazard: Toxic by inhalation and ingestion; strong irritant to skin and tissue. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Manufacture of cyclic and acyclic esters for plasticizers, gasoline additives, hydraulic fluids, and organophosphorus compounds; chlorinating agent and catalyst; dopant for semiconductor grade silicon; tricresyl phosphate and fire-retarding agents.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

phosphorus pentabromide (phosphoric bromide; phosphoric perbromide) PBr_5 .

Properties: Yellow crystalline mass. Keep hermetically sealed! Soluble in water (dec); in carbon disulfide, carbon tetrachloride, benzene. B.p. 106°C (dec).

Grades: Technical.

Hazard: Toxic and irritant to skin and tissue.

Use: Organic synthesis.

phosphorus pentachloride (phosphoric chloride; phosphoric perchloride) PCl_5 .

Properties: Slightly yellow, crystalline mass; irritating odor; fuming in moist air. Sp. gr. 3.60; m.p. (under pressure) 148°C. Ordinarily sublimes without melting at 160–165°C. Soluble in carbon disulfide and carbon tetrachloride.

Derivation: By action of chlorine on phosphorus or phosphorus trichloride.

Grades: Technical; reagent.

Hazard: Flammable, irritant to eyes and skin; tolerance, 1 mg per cubic meter of air. Reacts strongly with water. Use carbon dioxide or dry chemical to extinguish. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Chlorinating and dehydrating agent; catalyst.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

phosphorus pentafluoride PF_5 . Colorless nonflammable gas; b.p. -84.8°C; decomposed by water. Available in small cylinders.

Grade: 99%.

Hazard: Toxic; strong irritant to eyes and skin. Tolerance (as F), 2.5 mg per cubic meter of air.

Shipping regulations: (Air) Nonflammable Gas label. Not acceptable on passenger planes.

phosphorus pentasulfide (phosphoric sulfide; phosphorus persulfide; thiophosphoric anhydride) P_2S_5 .

Properties: Light-yellow or greenish-yellow crystalline masses. Odor similar to hydrogen sulfide. Keep in sealed containers. Very hygroscopic. Burns in air forming P_2O_5 and SO_2 . Decomposed by moist air. Soluble in solutions of alkali hydroxides; slightly soluble in carbon disulfide. M.p. 286–290°C; b.p. 515°C; sp. gr. 2.03; vapor pressure 1 mm (300°C). Autoignition temp. 287°F.

Derivation: By reaction of phosphorus and sulfur.

Grades: Technical; distilled.

Containers: Fiber or steel drums; tote bins.

Hazard: Toxic by inhalation; strong irritant. Dangerous fire risk; ignites by friction. Contact with water or acids liberates poisonous and flammable hydrogen sulfide. Tolerance, 1 mg per cubic meter of air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Intermediate for lube oil additives, insecticides (chiefly parathion and malathion); flotation agents.

Shipping regulations: (Air) Flammable Solid label. Not acceptable on passenger planes.

phosphorus pentoxide. See phosphoric anhydride.**phosphorus persulfide.** See phosphorus pentasulfide.**phosphorus salt.** See sodium ammonium phosphate.**phosphorus sesquisulfide** (tetraphosphorus trisulfide) P_4S_3 .

Properties: Yellow, crystalline mass; soluble in carbon disulfide; insoluble in cold water; decomposed by hot water. Sp. gr. 2.00; m.p. 172°C; b.p. 407.8°C. Autoignition temp. 212°F.

Derivation: By gently heating phosphorus and sulfur. Hazard: Dangerous fire risk; ignites by friction. Toxic and irritant.

Uses: Organic synthesis; manufacture of matches.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

phosphorus sulfide. See phosphorus trisulfide.

phosphorus tribromide PBr_3 .

Properties: Fuming, colorless liquid; penetrating odor; soluble in acetone, alcohol, carbon disulfide, hydrogen sulfide, water (decomposes). Sp. gr. 2.852 (15°C); b.p. 175°C; f.p. -40°C.

Hazard: Toxic; strong irritant to skin and tissue.

Uses: Analysis (testing for sugar and oxygen); catalyst; synthesis.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

phosphorus trichloride (phosphorus chloride) PCl_3 .

Properties: Clear, colorless fuming liquid; decomposes rapidly in moist air. Soluble in ether, benzene, carbon disulfide and carbon tetrachloride. Sp. gr. 1.574; f.p. -111.8°C; b.p. 76°C.

Derivation: By passing a current of dry chlorine over gently heated phosphorus, which ignites. The trichloride, admixed with some pentachloride, distills over. A small amount of phosphorus is added and the whole distilled.

Grades: Technical; 99.9%.

Containers: Carboys; cylinders; tank cars.

Hazard: Highly toxic; strong irritant to skin and tissue. Dangerous fire risk in contact with water. Tolerance, 0.5 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Making phosphorus oxychloride; intermediate for organophosphorus pesticides, surfactants, phosphites (reaction with alcohols and phenols), gasoline additives, plasticizers, dyestuffs; chlorinating agent; catalyst; preparing rubber surfaces for electrodeposition of metal; ingredient of textile finishing agents.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not accepted on passenger planes.

phosphorus triiodide PI_3 .

Properties: Red crystals; hygroscopic. Soluble in alcohol, carbon disulfide, water (dec). M.p. 61°C (dec); sp. gr. 4.18.

Grades: Technical; reagent.

Hazard: Toxic and flammable; reacts with water. Irritant.

Use: Organic synthesis.

phosphorus trisulfide (phosphorus sulfide; tetraphosphorus hexasulfide; thiophosphorous anhydride) P_2S_3 , or P_4S_6 .

Properties: Grayish-yellow masses; tasteless; odorless. Keep well stoppered! Decomposes in moist air. Soluble in alcohol, carbon disulfide, ether. B.p. 490°C; m.p. 290°C.

Hazard: Highly toxic; flammable, dangerous fire risk; reacts with water.

Use: Organic chemistry (reagent).

Shipping regulations: (Air) Flammable Solid label. Not acceptable on passenger planes.

phosphorylase. An enzyme occurring in muscle and liver which catalyzes the conversion of glycogen into glucose-1-phosphate.

phosphorylation. A reaction in which phosphorus combines with an organic compound, usually in the form of the trivalent phosphoryl group $\text{P}=\text{O}$. It occurs naturally in cellular metabolism and is of particular importance in vitamin activity and enzyme formation. It is also used to produce a modified cellulose (P-

cellulose) for cation exchange in chromatographic separations.

phosphoryl chloride. See phosphorus oxychloride.

phosphotungstic acid (phospho-12-tungstic acid; phosphowolframic acid; 12-tungstophosphoric acid) $\text{H}_3\text{PW}_{12}\text{O}_{40} \cdot x\text{H}_2\text{O}$.

Properties: Yellowish-white solid; m.p. (for $24\text{H}_2\text{O}$ hydrate) 89°C. Very soluble in water, acetone, and diethyl ether. Relatively insoluble in nonpolar organic solvents. Strong oxidizing agent in aqueous solution; strong acid in the free acid form.

Derivation: Addition of phosphates to sodium tungstate in the presence of hydrochloric acid.

Grades: Reagent; technical.

Uses: Reagent in analytical chemistry and biology; manufacture of organic pigments; additive in plating industry; imparts water resistance to plastics, adhesives and cement; catalyst for organic reactions; photographic fixing agent; textile antistatic agent.

phosphotungstic acid, sodium salt. See sodium 12-tungstophosphate.

phosphotungstic pigment (tungsten lake). A green or blue pigment manufactured by precipitating basic dyestuffs such as malachite green or Victoria blue with solutions of phosphotungstic acid, or phosphomolybdic acid, or mixtures of both. See also phosphomolybdic pigment.

Uses: Printing inks; white paper; paints and enamels.

"Phostane" MDP.⁵⁸ Trademark for methyl diphenyl phosphate (q.v.).

"Phos-Trode."⁴⁰⁷ Trademark for a phosphor bronze Grade C electrode and filler rod for joining both like and dissimilar metals and overlaying surfaces resistant to wear and corrosion.

photochemistry. The branch of chemistry concerned with the effect of absorption of radiant energy (light) in inducing or modifying chemical changes. Natural photosynthesis is the most important example of a photochemical reaction; others are the photosensitization of solids, applied in photography, photocells, etc. and occurring naturally in the formation of visual pigments; photochemical decomposition (photolysis); photo-induced polymerization, oxidation, and ionization; fluorescence and phosphorescence; and the reaction of chlorine with organic compounds. Free-radical chain mechanisms are usually involved. See also free radical.

photochromism. The ability of a transparent material to darken reversibly when exposed to light. See also glass, photochromic.

Plastics can be made light-sensitive by certain aromatic organic nitro compounds such as 2-(2,4-dinitrobenzyl)pyridine. Such chemicals are compatible with most transparent plastics and are either blended with the base resin or applied as coatings.

photo-glycin. See para-hydroxyphenylglycine.

photographic chemistry. In photographic films and papers the sensitive surface consists of microscopic grains of a silver halide, suspended in gelatin. Exposure to light renders the halide particles susceptible to reduction to metallic silver by developing agents (q.v.) containing a reducing agent, as well as an accelerator, preservative, and restrainer. The accelerator increases the activity of the reducing agent (due principally to ionization of the phenolic agents to their active form) and is usually an alkaline compound. The preservative, usually sodium sulfite,

minimizes air oxidation. The restrainer helps to prevent "fog" (reduction of silver halide grains which have not been exposed to light) and is almost always potassium bromide.

Color sensitizers are dyes added to silver halide emulsions to broaden their response to various wavelengths. Unsensitized emulsions are most responsive in the blue region of the spectrum and thus do not correctly represent the light spectrum striking them. Widely used sensitizers include the cyanine dyes (q.v.), the merocyanines, the benzoxazoles, and the benzothiazoles. Cryptocyanine sensitizes the extreme red and infrared.

In color photography diethyl-para-phenylenediamine is an important developer, since its oxidation product readily couples with a large number of phenol and reactive methylene compounds to form indophenol and indoaniline dyes, which are the basis of most of the current color processes.

"Photogray."²⁰ Trademark for a photochromic glass that darkens in sunlight to 45% light transmittance. See glass, photochromic.

photolysis. Decomposition of a compound into simpler units as a result of absorbing one or more quanta of radiation; examples are splitting of hydrogen iodide by the reaction $2\text{HI} + h\nu \rightarrow \text{H}_2 + \text{I}_2$, and of ketene ($\text{H}_2\text{C}=\text{CO}$) into carbon monoxide and carbene (methylene) ($:\text{CH}_2$). Photodecomposition may also occur with aldehydes, ketones, azo compounds, and organometallic compounds. See also flash photolysis; photochemistry.

photon. The unit (quantum) of electromagnetic radiation. Light waves, gamma rays, x-rays, etc., consist of photons. Photons are concentrations of energy that behave partly like particles and partly like waves. They have no rest mass and exist only when moving at the speed of light. Their nature can be described only in mathematical terms. Photons are emitted when electrons move from one energy state to another, as in an excited atom. See also radiation.

photophor. See calcium phosphide.

photopolymer. A polymer or plastic so made that it undergoes a change on exposure to light. Such materials can be used for printing and lithography plates, for photographic prints and microfilm copying. The effect of the light may be to cause further polymerization or crosslinking, or may cause degradation. One application involves the use of esters of polyvinyl alcohol which crosslink and so become insoluble, whereas unexposed portions of the material remain soluble.

photosynthesis. The utilization of sunlight by plants to convert two inorganic substances (carbon dioxide and water) into carbohydrates. Chlorophyll (q.v.) acts as the energy-converter in this reaction, which is perhaps the most important on earth. The specific reaction is: $6\text{CO}_2 + 6\text{H}_2\text{O} + 672 \text{ kcal} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$. This significance of this process lies in the conversion of energy from radiant to chemical form. The chemical energy a green plant stores by photosynthesis provides the total energy requirement of the plant. Directly or indirectly plants supply the primary organic nutrient for most other living organisms. Most fossil fuels are storehouses of the radiant energy transformed by photosynthesis in earlier geologic eras.

Photosynthesis is the principal source of atmo-

spheric oxygen. At least two-thirds of the total photosynthetic activity of the earth takes place in the oceans (see algae). Its exact chemical mechanism is extremely complex, and even now has not been wholly elucidated. Essential features are the reduction of carbon dioxide and utilization of the hydrogen of water to form carbohydrates, the oxygen being liberated; the nucleotides uridine and adenosine triphosphate are involved in this conversion. Sugar (sucrose) is formed in the cytoplasm surrounding the chloroplasts.

Photosynthesis has been suggested as a possible source of fuels by the development of "energy plantations" (intensive growth of crops) and conversion of a small fraction of the solar energy to generation of electric power.

photovoltaic cell. See solar cell.

"Photox."²⁶⁶ Trademark for photoconductive lead-free zinc oxides manufactured by the French process produced from zinc metal. Used in electrophotography.

"PH 990 Resin."⁴⁶⁹ Trademark for a phosphonitrilic-modified phenolic resin. Stable, off-white, free-flowing powder. Soluble in most organic solvents. Flame retardant and retains electrical and structural properties at temperatures up to 500–800°F.

"Phthalamaquin."³⁴² Trademark for an aureoquin preparation, described as 4-(2-dimethylaminoethylamino)-6-methoxyquinoline diethylaminotetrahydrophthalate. Used in medicine.

phthalamide $\text{C}_6\text{H}_4(\text{CONH}_2)_2$. The double acid amide of phthalic acid.

Properties: Colorless crystals; m.p. 200–210°C (decomposes into phthalimide and ammonia). Very slightly soluble in water and alcohol; insoluble in ether.

Derivation: By stirring phthalamide with cold concentrated ammonia solution; by the reaction of phthalyl chloride and ammonia; or from the addition of ammonia to phthalic anhydride under pressure.

Use: Intermediate in organic synthesis; laboratory reagent.

phthalic acid (ortho-phthalic acid; ortho-benzene dicarboxylic acid) $\text{C}_6\text{H}_4(\text{COOH})_2$.

Properties: Colorless crystals; soluble in alcohol; sparingly soluble in water and ether. Sp. gr. 1.585; m.p., decomposes at 191°C.

Derivation: From phthalic anhydrides.

Grades: Technical; reagent.

Uses: Dyes; medicine; phenolphthalein; phthalimide; anthranilic acid; synthetic perfumes; laboratory reagent.

para-phthalic acid. See terephthalic acid.

phthalic anhydride $\text{C}_6\text{H}_4(\text{CO})_2\text{O}$.

Properties: White, crystalline needles; sublimes below b.p.; mild odor. Sp. gr. 1.527 (4°C); m.p. 131.16°C; b.p. 285°C. Flash point 305°F (C.C.). Combustible. Autoignition temp. 1083°F. Soluble in alcohol; slightly soluble in ether and hot water.

Derivation: Catalytic oxidation of naphthalene or ortho-xylene (catalyst is 10% vanadium pentoxide plus 20–30% potassium sulfate on silica gel carrier). Both fixed bed and fluidized bed processes are used.

Method of purification: Sublimation.

Grades: Pure; technical, 130.8°C min f.p.

Containers: Drums; paper bags; molten in tank trucks; tank cars.

Hazard: Toxic and skin irritant. Tolerance, 2 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Alkyd resins; plasticizers; hardener for resins; polyesters; synthesis of phenolphthalein and other phthaleins, many other dyes; chlorinated products; pharmaceutical intermediates; insecticides; diethyl phthalate; dimethyl phthalate; laboratory reagent.

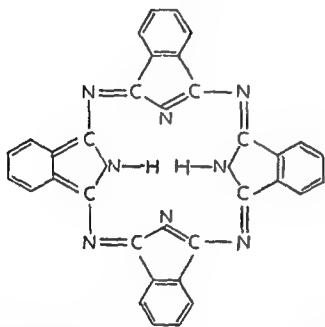

ortho-phthalimide $C_6H_4(CO)_2NH$.

Properties: White, crystalline leaflets. Slightly soluble in ether; insoluble in cold benzene; soluble in boiling benzene and in aqueous alkalis. M.p. 233–238°C; b.p., sublimes. Combustible. Low toxicity.

Derivation: By dissolving phthalic anhydride in ammonium hydroxide, evaporating to dryness and using the residue.

Uses: Synthetic indigo, via anthranilic acid; fungicide; organic synthesis; laboratory reagent.

phthalocyanine. Any of a group of benzoporphyrins which have strong pigmenting power, forming a family of dyes. The basic structure of the molecule comprises four isoindole groups, $(C_6H_4)C_2N$, joined by four nitrogen atoms. Four commercially important modifications are: (1) metal-free phthalocyanine $(C_6H_4C_2N)_4N_4$ having a blue-green color (structure shown below); (2) copper phthalocyanine, in which a copper atom is held by secondary valences of the isoindole nitrogen atoms; (see Pigment Blue 15); (3) chlorinated copper phthalocyanine, green, in which 15 to 16 hydrogen atoms are replaced by chlorine (see Pigment Green 7); and (4) sulfonated copper phthalocyanine, water-soluble, green, in which two hydrogen atoms are replaced by sulfonic acid (HSO_3) groups.

Uses: Decorative enamels, automotive finishes, linoleum plastics, roofing granules, printing inks, wallpaper, rubber goods, and similar applications where light fastness and chemical stability are required.

phthalonitrile (ortho-dicyanobenzene) $C_6H_4(CN)_2$.

Properties: Buff-colored crystals; m.p. 138°C; insoluble in water; soluble in acetone and benzene. Combustible.

Derivation: Vapor phase reaction of ammonia and phthalic anhydride over alumina catalyst at high temperature.

Hazard: May be toxic.

Uses: Intermediate in organic synthesis, especially pigments and dyes; base material for high-temperature lubricants and coatings; insecticide.

phthaloyl chloride (phthaloyl dichloride; phthalyl chloride) $C_6H_4(COCl)_2$.

Properties: Colorless, oily liquid; m.p. 16°C; b.p.

277°C; refractive index (n_D²⁰) 1.568. Decomposed by water or alcohol; soluble in ether. Combustible.

Derivation: By the action of phosphorus pentachloride on phthalic anhydride.

Hazard: Irritant by inhalation and skin contact.

Use: Chemical intermediate, especially for plasticizers and resins; laboratory reagent.

See also isophthaloyl chloride.

phycocolloid. One of several carbohydrate polymers (polysaccharides) occurring in algae (seaweed) (q.v.). They are hydrophilic colloids having a tendency to absorb water with swelling, and to form gels of varying strength and consistency. The chief types of phycocolloid are carrageenan from Irish moss, algin from brown algae (kelp), and agar from red algae. They contain complex galactose and mannose sugars, and are sometimes considered as seaweed mucilages. See specific entries for details.

"Phyllicin." Trademark for theophylline-calcium salicylate.

physical chemistry. The science that concerns itself with application of the concepts and laws of physics to chemical phenomena in order to describe in quantitative (mathematical) terms a vast amount of qualitative (observational) information. A selection of only the most important concepts of physical chemistry would include: the electron wave equation and the quantum mechanical interpretation of atomic and molecular structure; the study of the subatomic fundamental particles of matter; application of thermodynamics to heats of formation of compounds and to heats of chemical reaction; the theory of rate processes and chemical equilibrium; orbital theory and chemical bonding; surface chemistry, including catalysis and finely divided particles; the principles of electrochemistry and ionization. Though physical chemistry is closely related to both inorganic and organic chemistry, it is considered a separate discipline.

physiological salt solution. A solution of sodium chloride and water (0.9%), which is identical with the concentration found in the body. Used in medicine to replace acute loss of water, as from burns, etc. Also called isotonic salt solution.

physostigmine (eserine; calabarine) $C_{15}H_{21}O_2N_3$. An alkaloid.

Properties: Colorless or pinkish crystals. Slightly soluble in water; soluble in alcohol and diluted acids. M.p. 86–87°C and 105–106°C (unstable and stable forms). Specific rotation -119 to -121° .

Derivation: By solvent extraction from the seeds of *Physostigma venenosum*.

Grade: U.S.P.

Hazard: Highly toxic by ingestion.

Use: Medicine. Available as the salicylate and sulfate.

phytane (2,6,10,14-tetramethylhexadecane) $C_{20}H_{42}$. A hydrocarbon. Found in rock specimens 2.5 to 3 billion years old. Is known to be synthesized only by living organisms (is a derivative of chlorophyll) and to withstand heat and pressure; so serves to date the existence of life on earth. See also pristane.

phytic acid (inositolhexaphosphoric acid)

$C_6H_6[OPO(OH)]_6$. Occurs in nature in the seeds of many cereal grains, generally as the insoluble calcium-magnesium salt. It inhibits absorption of calcium in the intestine.

Properties: White to pale yellow liquid; odorless with

acid taste; pH less than 1.0 (in 1% solution); soluble in water and alcohol; sp. gr. 1.58; wt/gal 13.1 lb.

Derivation: From corn steep liquor.

Grade: Technical (as a 70% solution).

Uses: Chelation of heavy metals in processing of animal fats and vegetable oils; rust inhibitor; preparation of phytate salts; metal cleaning; treatment of hard water; nutrient.

phytochemistry. That branch of chemistry dealing with (1) plant growth and metabolism and (2) plant products. The former includes the absorption of inorganic nutrients (nitrogen, phosphorus, potassium, carbon dioxide, water, etc.) to form sugars, starches, proteins, fats, vitamins, etc., and is closely associated with photosynthesis (q.v.). Plant products comprise a vast group of natural materials and chemicals; besides those used directly as foods, these include alkaloids, cellulose, lignin, dyes, glucosides, essential oils, resins, gums, tannins, rubbers, terpene hydrocarbons, and glycerides (fats and oils). Some of these are basic raw materials for industry (paper, pharmaceutical, food, paint, perfume, flavoring, leather, rubber); there are also many miscellaneous plant products such as drugs, poisons, and vitamins. Phytochemistry also embraces the study of plant hormones or growth regulators (auxin, gibberellin, synthetic types).

phytol

$\text{CH}_3[\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{CH}_2]_3\text{C}(\text{CH}_3):\text{CHCH}_2\text{OH}$.

An alcohol obtained by the decomposition of chlorophyll.

Properties: Odorless liquid; b.p. 202–204°C (10 mm); sp. gr. 0.8497 (25/4°C); soluble in the common organic solvents; insoluble in water. Combustible; non-toxic.

Use: Synthesis of vitamins E and K.

phytonadione (2-methyl-3-phytyl-1,4-naphthoquinone; vitamin K₁) $\text{CH}_3\text{C}_{10}\text{H}_4\text{O}_2\text{C}_{20}\text{H}_{39}$.

Properties: Clear yellow, viscous, odorless liquid; sp. gr. 0.967 (25/25°C); refractive index 1.5230–1.5252 (25°C); stable in air. Protect from sunlight! Insoluble in water; soluble in benzene, chloroform and vegetable oils; slightly soluble in alcohol.

Derivation: Synthetically, from 2-methyl-1,4-naphthoquinone and phytol.

Grade: U.S.P.

Uses: Medicine; food supplement.

phytosterol. See sterol.

pi bond. A covalent bond formed between atoms by electrons moving in orbitals which extend above and below the plane of an organic molecule containing double bonds. A double bond consists of one pi and one sigma bond (q.v.) and a triple bond consists of one sigma and two pi bonds. See also metallocene; orbital theory.

"Picfume."²³³ Trademark for fumigants containing chloropicrin.

pickle alum. See aluminum sulfate.

pickling (1) Removal of scale, oxides, and other impurities from metal surfaces by immersion in an inorganic acid, usually sulfuric, hydrochloric, or phosphoric. Rate of scale removal varies inversely with concentration and temperature; the usual concentration is 15%, at or above 212°F. The rate is also increased by electrolysis.

(2) A method of food preservation involving use of salt, sugar, spices, and organic acids (acetic).

(3) Preserving or preparing hides for tanning by immersion in a 6 to 12% salt solution, together with enough acid to maintain pH at 2.5 or less.

picloram (4-amino-3,5,6-trichloropicolinic acid). An herbicide used as defoliant in forest warfare. See also "Tordon." Claimed to leave toxic residue in soils. Toxic. Use may be restricted.

pico- Prefix meaning 10^{-12} unit (symbol = p). 1 pg = 1 picogram = 10^{-12} gram.

alpha-picoline (2-methylpyridine; 2-picoline)

$\text{C}_5\text{H}_4\text{N}(\text{CH}_3)$, or $\text{NC}(\text{CH}_3)\text{CHCHCHCH}$.

Properties: Colorless liquid; strong, unpleasant odor; sp. gr. 0.952; b.p. 129°C; f.p. -69.9°C; refractive index 1.4957 (n 20/D); miscible with water and alcohol. Flash point 102°F (O.C.). Autoignition temp. 1000°F. Combustible.

Derivation: Dry distillation of bones or coal.

Containers: Drums; tank cars.

Hazard: Moderate fire risk. Moderately toxic and irritant.

Uses: Organic intermediate for pharmaceuticals, dyes, rubber chemicals; solvent; source for vinyl pyridine; laboratory reagent.

beta-picoline (3-methylpyridine; 3-picoline)

$\text{NCHC}(\text{CH}_3)\text{CHCHCH}$.

Properties: Colorless liquid; unpleasant odor; b.p. 143.5°C; f.p. -18.3°C; sp. gr. 0.9613 (15/4°C); refractive index 1.5060 (n 20/D); soluble in water, alcohol, and ether. Combustible.

Derivation: Dry distillation of bones or coal.

Containers: Drums; tank cars.

Hazard: Moderate fire risk. Moderately toxic and irritant.

Uses: Solvent in synthesis of pharmaceuticals, resins, dyestuffs, rubber accelerators, insecticides; preparation of nicotinic acid, and nicotinic acid amide; waterproofing agents; laboratory reagent.

gamma-picoline (4-methylpyridine; 4-picoline)

$\text{NCHCHC}(\text{CH}_3)\text{CHCH}$.

Properties: Colorless, moderately volatile liquid; sp. gr. 0.957 (15/4°C); b.p. 144.9°C; refractive index 1.5050 (n 20/D); m.p. 3.8°C; soluble in water, alcohol, and ether. Flash point 134°F (O.C.). Combustible.

Derivation: Dry distillation of bones or coal.

Containers: Drums; tank cars.

Hazard: Moderately toxic and irritant. Moderate fire risk.

Uses: Solvent in synthesis of pharmaceuticals, resins, dyestuffs, rubber accelerators, pesticides, and waterproofing agents; laboratory reagent; making isoniazid; catalyst; curing agent.

picoline-N-oxide $\text{N}(\text{O})\text{C}(\text{CH}_3)\text{CHCHCHCH}$ (formula

for 2-picoline-N-oxide).

Properties: Crystals; very soluble in water. M.p. (2-isomer) 49.5°C; (3-isomer) 40.5°C; (4-isomer) 186.3°C. Combustible.

Use: Chemical synthesis.

4-picolyamine. $(\text{CH}_2\text{NH}_2)\text{CHCHNCHCH}$. A heterocyclic compound; a pyridine derivative. Highly reactive; strong base. Combustible.

Uses: Manufacture of polyamides, epoxy curing agents, carbinols, and amine polyols.

picramic acid (picraminic acid; 2-amino-4,6-dinitrophenol; dinitroaminophenol) $C_6H_2(NO_2)_2(NH_2)OH$.

Properties: Red crystals. Soluble in alcohol, benzene, glacial acetic acid, aniline, and ether; sparingly soluble in water. M.p. 168°C.

Derivation: By partial reduction of picric acid.

Hazard: May explode when shocked or heated. Dangerous fire risk.

Uses: Azo dyes; indicator; reagent for albumin.

Shipping regulations: (Rail) Consult regulations. (Air) Not listed. Consult authorities.

picramide. Legal label name (Air) for trinitroaniline (q.v.).

picraminic acid. See picramic acid.

picric acid (picronitric acid; trinitrophenol; nitroxanthic acid; carbazotic acid; phenoltrinitrate) $C_6H_2(NO_2)_3OH$.

Properties: Yellow crystals or liquid. Soluble in water, alcohol, chloroform, benzene, and ether. Very bitter taste. Sp. gr. 1.767; m.p. 122°C. B.p. explodes above 300°C. Flash point 302°F; autoignition temp. 572°F.

Derivation: Nitration of phenolsulfonic acid, obtained by heating phenol with concentrated sulfuric acid.

Grades: Technical paste; pure paste.

Containers: 1-, 5-lb bottles; 25-lb boxes; 100-lb kegs; 300-lb barrels.

Hazard: Severe explosion risk when shocked or heated; especially reactive with metals or metallic salts. Toxic by skin absorption. Tolerance, 0.1 mg per cubic meter of air.

Uses: Explosives; medicine (external); dyes; matches; electric batteries; etching copper; dyeing and printing textile fabrics with compound dyes which contain also such dyes as benzaldehyde green, methyl violet and indigo carmine; picrates.

Shipping regulations: (Rail) Consult regulations. (Air) Dry or wet with less than 10% water, Not acceptable. Wet with not less than 10% water, Flammable Solid label.

picrolonic acid $NO_2C_6H_4NNC(CH_3)C(NO_2)COH$. 3-Methyl-4-nitro-1-(para-nitrophenyl)-5-pyrazolone.

Properties: Yellow leaflets; m.p. 116–117°C; decomposes 125°C; slightly soluble in water; soluble in alcohol.

Uses: Reagent for alkaloid identifications, for tryptophan and phenylalanine; for the detection and estimation of calcium.

picronitric acid. See picric acid.

microtoxin (cocculin) $C_{30}H_{34}O_{13}$. A glucoside.

Properties: Flexible shining, prismatic crystals or microcrystalline powder; odorless; very bitter taste; stable in air; affected by light; m.p. 200°C. Soluble in boiling water, boiling alcohol, diluted acids and alkalis; sparingly soluble in ether and chloroform.

Derivation: Derived from the fruit of *Anamirta paniculata* or *cocculus indicus*, fishberries.

Hazard: Highly toxic in overdose.

Use: Medicine, as CNS stimulant and antidote for barbiturate poisoning.

Shipping regulations: (Air) Cocculus, solid, Poison label.

picryl chloride (2-chloro-1,3,5-trinitrobenzene)

$C_6H_2(NO_2)_3Cl$. A high explosive.

Hazard: Severe explosion and fire risk.

Shipping regulations: (Rail) Consult regulations. (Air)

(wet with not less than 10% water) Flammable Solid label; (dry, or wet with less than 10% water) Not acceptable.

"Pictol."³²⁹ Trademark for monomethyl para-amino-phenol sulfate, photo-developer.

PIDA. Abbreviation for phenylindane dicarboxylic acid. See 1,1,3-trimethyl-5-carboxy-3-(p-carboxyphenyl) indane.

Pidgeon process (ferrosilicon process; silicothermic process). Process for the production of high-purity magnesium metal from dolomite or magnesium oxide by reduction with ferrosilicon at 1150°C under high vacuum.

piezochemistry. Study of reactions occurring at very high pressure, e.g., in interior of the earth's crust.

piezoelectricity. Opposite electric charges acquired by certain crystals on different surfaces as a result of mechanical stresses. Conversely, the property of expansion along one axis and contraction along another when subjected to an electric field.

pig iron. Product of blast-furnace reduction of iron oxide in presence of limestone. About half the ore is converted to iron. Average analysis is: 1% silicon, 0.03% sulfur, 0.27% phosphorus, 2.4% manganese, 4.6% carbon, balance iron. Pig iron is the basic raw material for steel (q.v.) and cast iron. In metal terminology, a "pig" is a bar or ingot of cooled metal. See also iron.
